PROM VERSION of M37410M3HXXXFP, M37410M4HXXXFP, M37410M6HXXXFP

DESCRIPTION

The M37410E6HFS, M37410E6HXXXFP are single-chip microcomputers designed with CMOS silicon gate technology. M37410E6HXXXFP is housed in a 80-pin shrink plastic molded QFP. M37410E6HFS is housed in a 80-pin ceramic QFP. The features of M37410E6HXXXFP are similar to those of the M37410M4HXXXFP except that this chip has a 12288 bytes PROM built in. This single-chip microcomputer is useful for home electrical appliances and consumer appliance controllers.

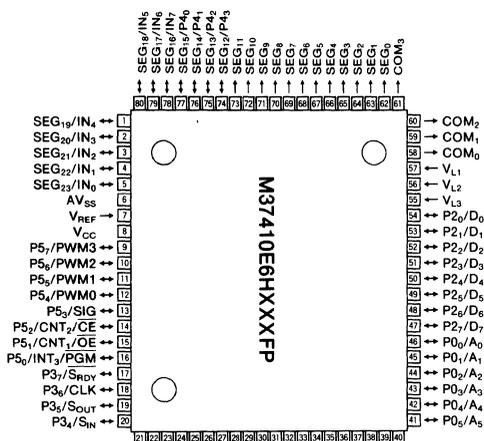

In addition to its simple instruction sets, the PROM, RAM, and I/O addresses are placed on the same memory map to enable easy programming. Since general purpose PROM writers can be used for the built-in PROM, this chip is suitable for small quantity production runs.

The M37410E6HFS are the window type. The differences between the M37410E6HXXXFP and the M37410E6HFS are the package outline and the power dissipation ability (absolute maximum ratings).

EPROM MODE

The M37410E6HXXXFP, M37410E6HFS feature an EPROM mode in addition to its normal modes. When the RESET signal level is low ("L"), the chip automatically enters the EPROM mode. Table 1 list the correspondence between pins and Figure 1, Figure 2 give the pin connections in the EPROM mode. When in the EPROM mode, ports P0, P1, P2, P5₀ ~ P5₂, and CNV_{SS} are used for the PROM (equivalent to the M5L27128). When in this mode, the built-in PROM can be written to or read from using these pins in the same way as with the M5L27128. The oscillator should be connected to the X_{IN} and X_{OUT} pins, or external clock should be connected to the X_{IN} pin.

PROM READING, WRITING AND ERASING
Reading

To read the PROM, set the \overline{CE} and \overline{OE} pins to a "L" level, and the \overline{PGM} pin to a "H" level. Input the address of the data ($A_0 \sim A_{13}$) to be read and the data will be output to the I/O pins $D_0 \sim D_7$. The data I/O pins will be floating when either the \overline{CE} or \overline{OE} pins are in the "H" state.

Writing

To write to the PROM, set the \overline{CE} pin to a "L" level and the \overline{OE} pin to a "H" level. The CPU will enter the program mode when V_{PP} is applied to the V_{PP} pin. The address to be written to is selected with pins $A_0 \sim A_{13}$, and the data to be written is input to pins $D_0 \sim D_7$. Set the \overline{PGM} pin to a "L" level to begin writing.

Erasing

Data can only be erased on the M37410E6HFS ceramic package, which includes a window. To erase data on this chip, use an ultraviolet light source with a 2537 Angstrom wave length. The minimum radiation power necessary for erasing is $15W \cdot s/cm^2$.

NOTES ON HANDLING

- (1) Sunlight and fluorescent light contain wave lengths capable of erasing data. For ceramic package types, cover the transparent window with a seal (provided) when this chip is in use. However, this seal must not contact the lead pins.

- (2) Before erasing, the glass should be cleaned and stains such as finger prints should be removed thoroughly. If these stains are not removed, complete erasure of the data could be prevented.
- (3) Since a high voltage (21V) is used to write data, care should be taken when turning on the PROM writer's power.
- (4) Note that ports P3₀ and P3₁ of M37410E6HXXXFP or M37410E6HFS can not use as I/O ports when the external A-D start enable bit is set to "1" (enabled). This is because that bit 5 of the serial I/O mode register of M37410M3HXXXFP or M37410M4HXXXFP, M37410M6HXXXFP acts differently from that of M37410E6HXXXFP or M37410E6HFS, as compared in the table.
Bit 5 of serial I/O mode register when external A-D start enable bit is "1".

M37410E6HXXXFP M37410E6HFS	Automatically set to "1", and is fixed to "1" while external A-D start enable bit remains "1"

- (5) For the programmable microcomputer (shipped in blank or OTP type), Mitsubishi does not perform PROM write test and screening in the assembly process and following processes. To improve reliability after write, performing write and test according to the flow below before use is recommended.

Note : Since the screening temperature is higher than storage temperature, never expose to 150°C exceeding 100 hours.
