

## HYBRID-HIGH RELIABILITY RADIATION HARDENED DC-DC CONVERTER

### Description

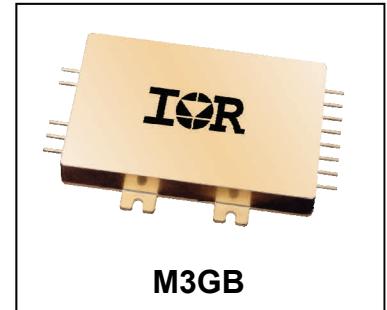

M3GB-Series is part of the International Rectifier HiRel family of products. The M3GB-Series of DC-DC converters are second generation design of the legacy M3G-Series product family but with enhanced overall performance. M3GB-Series is form, fit and functional equivalent to the first generation M3G-Series. It is designed to be backward compatible to the M3G-Series with the addition of an output voltage adjustment pin for the single output models. Much the same as the original M3G-Series, these converters are radiation hardened, high reliability converters designed for extended operation in hostile environments. Their small size and low weight make them ideal for applications such as geostationary earth orbit satellites and deep space probes. They exhibit a high tolerance to total ionizing dose, single event effects and environmental stresses such as temperature extremes, mechanical shock, and vibration.

The converters incorporate a fixed frequency single ended forward topology with magnetic feedback and an internal EMI filter that utilizes multilayer ceramic capacitors that are subjected to extensive lot screening for optimum reliability. These converters are capable of meeting the conducted emissions and conducted susceptibility requirements of MIL-STD-461C without any additional components. External inhibit and synchronization input and output allow these converters to be easily incorporated into larger power systems. They are enclosed in a hermetic 3" x 2" x 0.475" package constructed of an Aluminum/Silicon-Carbide (Al/SiC) base and an Alloy 48 ring frame and they weigh less than 110 grams. The package utilizes rugged ceramic feed-through copper core pins and is sealed using parallel seam welding.

Manufactured in a facility fully qualified to MIL-PRF-38534, these converters are fabricated utilizing DLA Land and Maritime qualified processes. For available screening options, refer to device screening table in the data sheet.

Non-flight versions of the M3GB-Series converters are available for system development purposes. Variations in electrical specifications and screening to meet custom requirements can be accommodated.

### 120V Input, Single/Dual Output

### Features

- Total Dose > 200 kRads(Si)  
typically usable to > 300 kRads(Si)
- SEE Hardened to LET up to 82 MeV·cm<sup>2</sup>/mg
- Low Input & Output Noise
- Low Weight < 110 grams
- Magnetically Coupled Feedback
- 95V to 140V DC Input Range
- Up to 40W Output Power
- Single and Dual Output Models Include 3.3, 5, 12, 15, 28, ±5, ±12 and ±15V
- High Efficiency - to 82%
- -55°C to +125°C Operating Temperature Range
- 100MΩ @ 500VDC Isolation
- Under-Voltage Lockout
- Short Circuit and Overload Protection
- Remote Sense on Single Output Models
- Adjustable Output Voltage for all Models
- Synchronization Input and Output
- External Inhibit
- > 5,000,000 hour MTBF

### Applications

- Geostationary Earth Orbit Satellites (GEO)
- Deep Space Satellites / Probes
- Strategic Weapons and Communication System

## Circuit Description

The M3BG-Series converters utilize a single-ended forward topology with resonant reset. The nominal switching frequency is 500kHz. Electrical isolation and tight output regulation are achieved through the use of a magnetically coupled feedback. Voltage feed-forward with duty factor limiting provides high line rejection and protection against output over voltage in the event of an internal control loop failure. This mechanism limits the maximum output voltage to approximately 30% over the nominal regardless of the line voltage.

An internal EMI filter reduces the conducted emissions to less than 5mA rms on the input power leads. A two-stage output filter reduces the typical output ripple to less than 20mV peak-to-peak.

Output current is limited under any load fault condition to approximately 125% of rated. An overload condition causes the converter output to behave like a constant current source with the output voltage dropping below nominal. The converter will resume normal operation when the load current is reduced below the current limit point. This protects the converter from both overload and short circuit conditions.

An under-voltage lockout circuit prohibits the converter from operating when the line voltage is too low to maintain the output voltage. The converter will not start until the line voltage rises to approximately 85 volts and will shut down when the input voltage drops below 81 volts. The four volts of hysteresis reduces the possibility of line noise interfering with the converter's start-up and shut down.

An external inhibit port is provided to control converter operation. The nominal threshold relative to the input return (pin 2) is 1.4V. If 2.0 volts or greater are applied to the Inhibit pin (pin 3) then the converter will operate normally. A voltage of 0.8V or less will cause the converter to shut-down. The pin may be left open for normal operation and has a nominal open circuit voltage of 4.0V.

Synchronization input and output allow multiple converters to operate at a common switching frequency. Converters can be synchronized to one another or to an externally provided clock. This can be used to eliminate beat frequency noise or to avoid creating noise at certain frequencies for sensitive systems.

Remote sense is provided on the single output models to compensate for voltage drops in the interconnects between the converter and the load. The output voltage of dual output models can be adjusted by a single external resistor.

## Design Methodology

The M3GB-Series was developed using a proven conservative design methodology which includes selecting radiation tolerant and established reliability components and fully de-rating to the requirements of MIL-STD-1547 and MIL-STD-975 (except for the CDR type ceramic capacitors, where capacitors with 50V ratings may be used with voltage stresses of less than 10V). Careful sizing of decoupling capacitors and current limiting resistors minimizes the possibility of photo-current burn-out. Heavy de-rating of the radiation hardened power MOSFET virtually eliminates the possibility of SEGR and SEB. A magnetic feedback circuit is utilized instead of opto-couplers to minimize temperature, radiation and aging sensitivity. PSPICE and RadSPICE were used extensively to predict and optimize circuit performance for both beginning and end-of-life. Thorough design analyses include Radiation Susceptibility (TREE), Worst Case, Stress, Thermal, Failure Modes and Effects (FMEA) and Reliability (MTBF).

## Specifications

Absolute Maximum Ratings		Recommended Operating Conditions		
Input Voltage	-0.5V <sub>DC</sub> to +160V <sub>DC</sub>	Input Voltage	+95V <sub>DC</sub> to +140V <sub>DC</sub>	
Output power	Internally limited	Input Voltage <sup>1</sup>	+95V <sub>DC</sub> to +140V <sub>DC</sub>	
Lead Temperature	+300°C for 10 seconds	Output power	0 to Max. Rated	
Operating temperature	-55°C to +135°C	Operating temperature <sup>2</sup>	-55°C to +125°C	
Storage temperature	-55°C to +135°C	Operating temperature <sup>1</sup>	-55°C to +70°C	

<sup>1</sup> Meets de-rating per MIL-STD-975

<sup>2</sup> For operation at +125°C see table Note 13

**Notes: Electrical Performance Characteristics Table**

1. Parameter is guaranteed to the limits specified in table I by design, but not tested. Limits apply to the operating range specified in table I, unless otherwise specified. No Group A subgroups are specified for this test.
2. Parameter verified during line and load regulation tests.
3. Limit represents 80% of total rated output current. To achieve rated output power, the remaining 20% of the total rated output current must be provided by the other output.
4. Load current split equally between outputs on dual output models.
5. Cross regulation is measured with 20% rated load on output under test while changing the load on the other output from 20% to 80% of rated.
6. Guaranteed for a D.C. to 20MHz bandwidth. Tested using a 20kHz to 10MHz bandwidth.
7. Capacitive load may be any value from 0 to the maximum limit without compromising dc performance. A capacitive load in excess of the maximum limit may interfere with the proper operation of the converter's overload protection, causing erratic behavior during turn-on.
8. Overload power dissipation is defined as the device power dissipation with the load set such that V<sub>OUT</sub> = 90% of nominal.
9. Load step transition time ≥ 10 μs.
10. Recovery time is measured from the initiation of the transient to where V<sub>OUT</sub> has returned to within ±1% of its steady state value.
11. Line step transition time ≥ 100 μs.
12. Turn-on delay time from either a step application of input power or a logic low to a logic high transition on the inhibit pin (pin 3) to the point where V<sub>OUT</sub> = 90% of nominal.
13. Although operation at temperatures between +85°C and +125°C is guaranteed, no parametric limits are specified.

## Application Notes

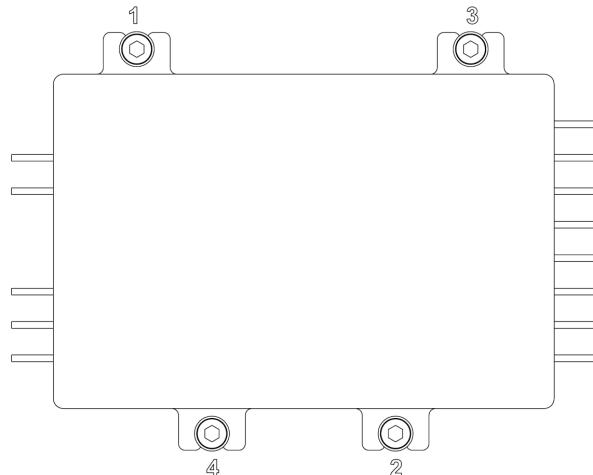

### A) Attachment of the Converter:

The following procedure is recommended for mounting the converter for optimum cooling and to circumvent any potential damage to the converter.

Ensure that flatness of the plate where M3GB converter to be mounted is no greater than 0.003" per linear inch. It is recommended that a thermally conductive gasket is used to promote the thermal transfer and to fill any voids existing between the two surfaces. IR HiRel recommends Sil-Pad 2000 with the thickness of 0.010". The shape of the gasket should match the footprint of the converter including the mounting flanges. The gasket is available from IR HiRel. The M3GB-Series converter requires either M3 or 4-40 size screws of attachment purposes.

The procedure for mounting the converter is as follows:

1. Check the mounting surfaces and remove foreign material, burrs if any or anything that may interfere with the attachment of the converter.
2. Place the gasket on the surface reserved for the converter and line it up with the mounting holes.
3. Place the converter on the gasket and line both up with mounting holes.
4. Install screws using appropriate washers and tighten by hand (~ 4 in·oz) in the sequence shown below.
5. Tighten the screws with an appropriate torque driver. Torque the screws up to 6 in·lb in the sequence shown below.

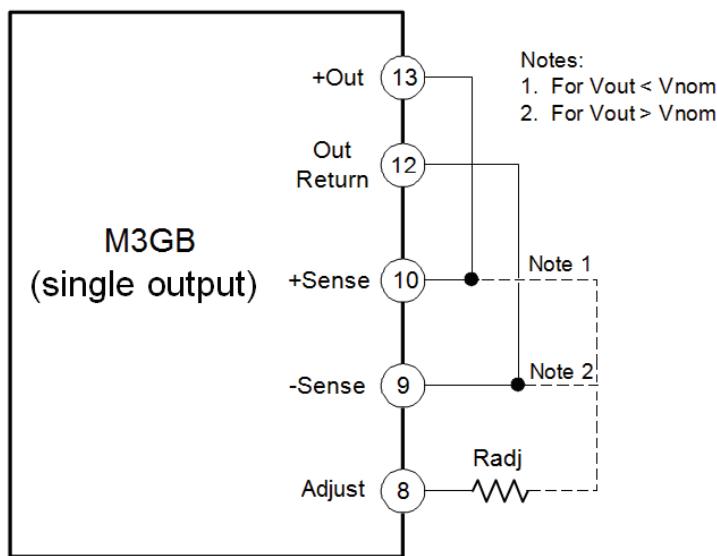

## B) Output Voltage Adjustment

### Single Output:

To adjust the output voltage of the single output models, a resistor ( $R_{ADJ}$ ) is connected between the Adjust pin (Pin 8) and either the positive or negative remote sense pins, depending on whether the output voltage is to be adjusted higher or lower than the nominal set-point. This allows the outputs to be reliably adjusted by approximately +10% to -20% of the nominal output voltage. Refer to Fig. 3 and use equations provided to calculate the required resistance ( $R_{ADJ}$ ).

**Note:** The output voltage adjust equation does not work as described for the 3.3V Single model. The adjust range for 3.3V model is limited to 3.252V to 3.460V.

**Fig 3. Configuration for Adjusting Single Output Voltage**

For **all Single Output Models**, to adjust the output voltages higher:

$$R_{ADJ} = \frac{10 \times (V_{NOM} - 2.5)}{V_{OUT} - V_{NOM}} - 50$$

Where:  $R_{ADJ}$  is in kOhms

$R_{ADJ}$  is connected to the -Out pin and  $V_{NOM} < V_{OUT} < 1.1V_{NOM}$  (Fig. 3, Note 2)

$V_{NOM}$  is the nominal output voltage with the Adjust Pin left open

$V_{OUT}$  is the desired output voltage

For **all Single Output Models**, to adjust the output voltages lower:

$$R_{ADJ} = \frac{4 \times (V_{NOM} - 2.5) \times (V_{OUT} - 2.5)}{V_{NOM} - V_{OUT}} - 50$$

Where:  $R_{ADJ}$  is in kOhms

$R_{ADJ}$  is connected to the +Out pin and  $0.8V_{NOM} < V_{OUT} < V_{NOM}$  (Fig. 3, Note 1)

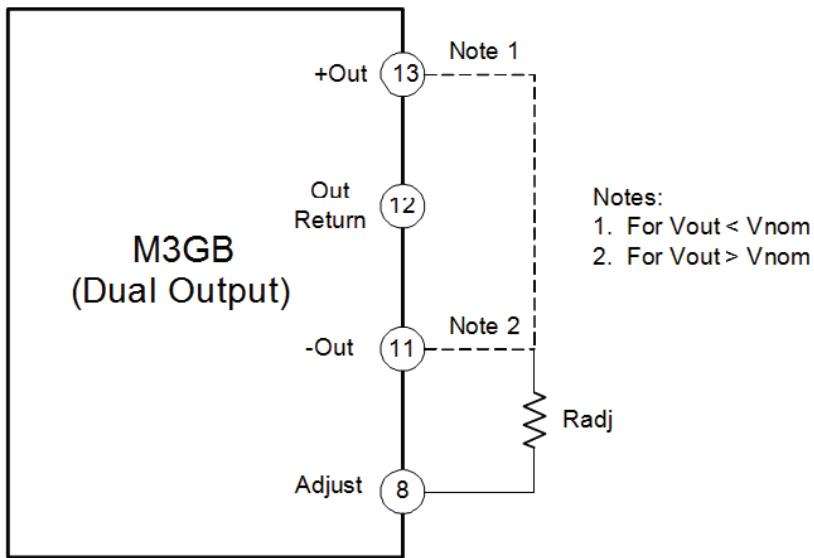

$V_{NOM}$  is the nominal output voltage with the Adjust Pin left open

$V_{OUT}$  is the desired output voltage

**Dual Output:**

The dual output voltage of the dual output models, a resistor ( $R_{ADJ}$ ) is connected between the Adjust pin (Pin 8) and either output. This allows the outputs to be reliably adjusted by approximately +10% to -20% of the nominal output voltage. Refer to Fig. 4 and use equations provided to calculate the required resistance ( $R_{ADJ}$ ).

**Fig. 4. Configuration for Adjusting Dual Output Voltage**

For all Dual Output Models, to adjust the output voltages higher:

$$R_{ADJ} = \frac{10 \times (V_{NOM} - 1.25)}{V_{OUT} - V_{NOM}} - 75$$

Where:  $R_{ADJ}$  is in kOhms

$R_{ADJ}$  is connected to the -Out pin and  $V_{NOM} < V_{OUT} < 1.1V_{NOM}$  (Fig. 4, Note 2)

$V_{NOM}$  is the nominal magnitude of the output voltages with the Adjust pin left open

$V_{OUT}$  is the desired magnitude of the output voltages

For all Dual Output Models, to adjust the output voltages lower:

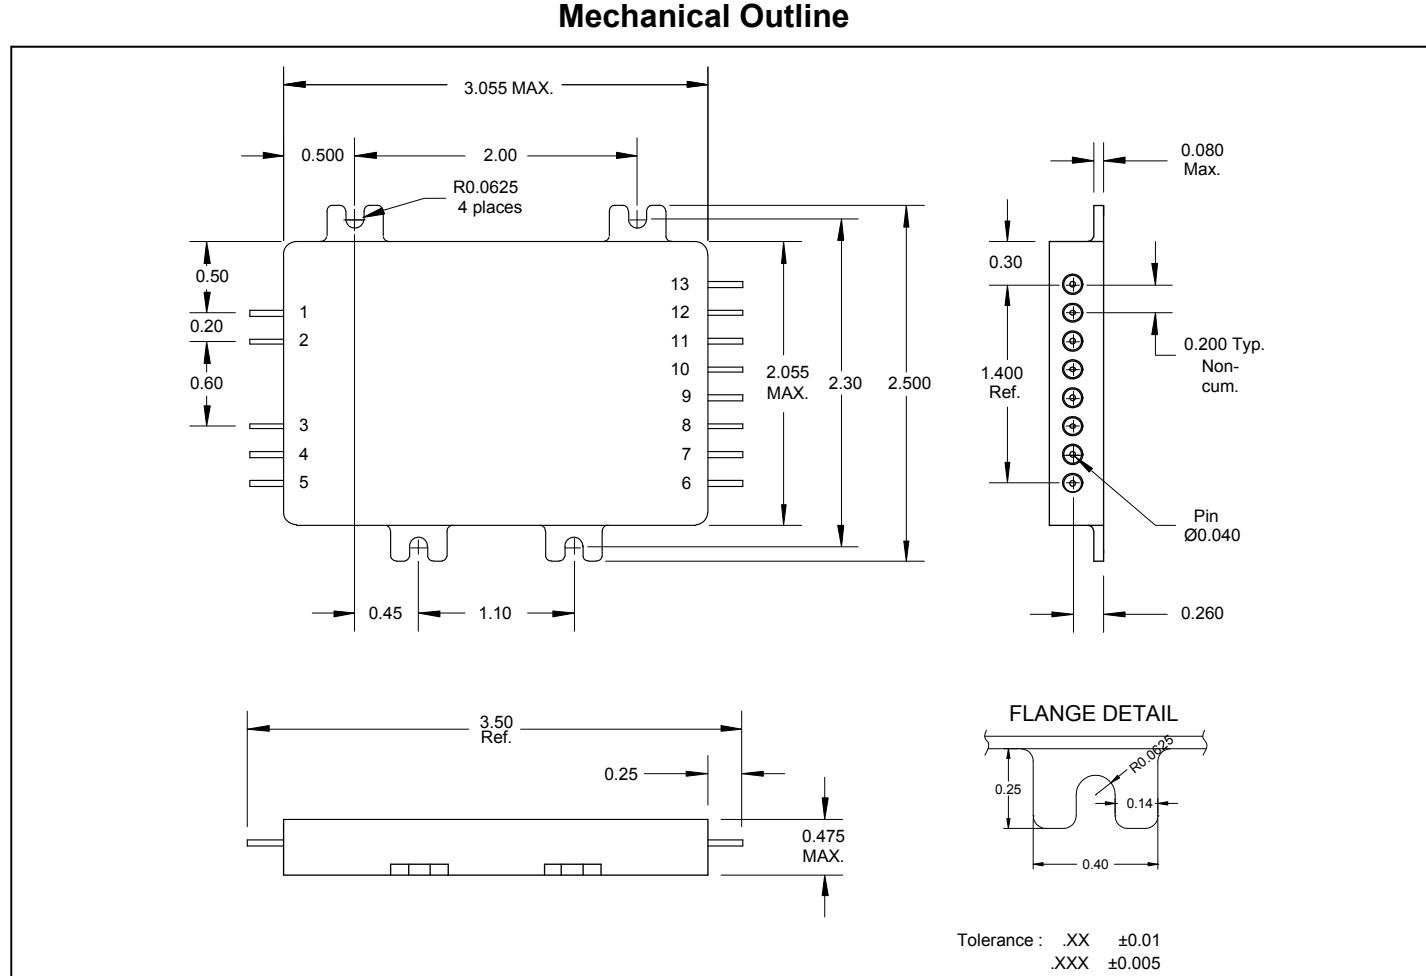

$$R_{ADJ} = \frac{8 \times (V_{NOM} - 1.25) \times (V_{OUT} - 1.25)}{V_{NOM} - V_{OUT}} - 75$$

Where:  $R_{ADJ}$  is in kOhms

$R_{ADJ}$  is connected to the +Out pin and  $0.8V_{NOM} < V_{OUT} < V_{NOM}$  (Fig. 4, Note 1)

$V_{NOM}$  is the nominal magnitude of the output voltages with the Adjust pin left open

$V_{OUT}$  is the desired magnitude of the output voltages

### Pin Designation (Single/Dual)

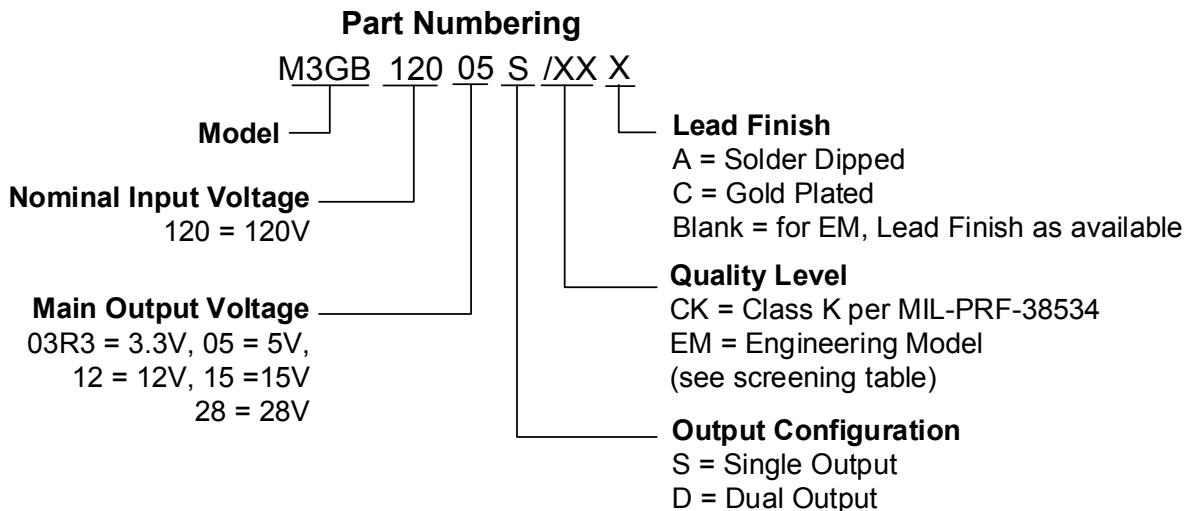

Pin #	Designation	Pin #	Designation
1	Vin	8	VADJ
2	RETURN	9	- SENSE / NC
3	INHIBIT	10	+ SENSE / NC
4	SYNC. INPUT	11	NC / - OUTPUT
5	SYNC. OUTPUT	12	RETURN
6	CASE GROUND	13	+ OUTPUT
7	NC
