PIN CONFIGURATION DESCRIPTION

Pin	Name	Input Function
CLK	*System clock*	Active on the positive going edge to sample all inputs.
$\overline{CS}$	*Chip select*	Disables or enables device operation by masking or enabling all inputs except CLK, CKE and DQM
CKE	*Clock enable*	Masks system clock to freeze operation from the next clock cycle. CKE should be enabled at least one cycle prior to new command. Disable input buffers for power down in standby. CKE should be enabled 1CLK+t_{SS} prior to valid command.
A0 ~ A12	*Address*	Row/column addresses are multiplexed on the same pins. Row address : RA0 ~ RA12 Column address : (x8 : CA0 ~ CA9), (x16 : CA0 ~ CA8)
BA0 ~ BA1	*Bank select address*	Selects bank to be activated during row address latch time. Selects bank for read/write during column address latch time.
$\overline{RAS}$	*Row address strobe*	Latches row addresses on the positive going edge of the CLK with $\overline{RAS}$ low. Enables row access & precharge.
$\overline{CAS}$	*Column address strobe*	Latches column addresses on the positive going edge of the CLK with $\overline{CAS}$ low. Enables column access.
$\overline{WE}$	*Write enable*	Enables write operation and row precharge. Latches data in starting from $\overline{CAS}$, $\overline{WE}$ active.
DQM0 ~ 7	*Data input/output mask*	Makes data output Hi-Z, t_{SHZ} after the clock and masks the output. Blocks data input when DQM active. (Byte masking)
$DQ_{0 \sim 63}$	*Data input/output*	Data inputs/outputs are multiplexed on the same pins.
V_{DD}/V_{SS}	*Power supply/ground*	Power and ground for the input buffers and the core logic.

$\overline{RAS}$ to $\overline{CAS}$ delay	t_{RCD}(min)	20	ns	1
Row precharge time	t_{RP}(min)	20	ns	1
Row active time	t_{RAS}(min)	45	ns	1
	t_{RAS}(max)	100	us	
Row cycle time	t_{RC}(min)	65	ns	1
Last data in to row precharge	t_{RDL}(min)	2	CLK	2,5
Last data in to Active delay	t_{DAL}(min)	2 CLK + tRP	-	5
Last data in to new col. address delay	t_{CDL}(min)	1	CLK	2
Last data in to burst stop	t_{BDL}(min)	1	CLK	2
Col. address to col. address delay	t_{CCD}(min)	1	CLK	3
Number of valid output data	CAS latency=3	2	ea	4
	CAS latency=2	1		

Notes : 1. The minimum number of clock cycles is determined by dividing the minimum time required with clock cycle time and then rounding off to the next higher integer.
2. Minimum delay is required to complete write.
3. All parts allow every cycle column address change.
4. In case of row precharge interrupt, auto precharge and read burst stop.
5. In 100MHz and below 100MHz operating conditions, tRDL=1CLK and tDAL=1CLK + 20ns is also supported. SAMSUNG recommends tRDL=2CLK and tDAL=2CLK + tRP.

AC CHARACTERISTICS (AC operating conditions unless otherwise noted)

REFER TO THE INDIVIDUAL COMPONENET, NOT THE WHOLE MODULE.

Parameter		Symbol	7A		Unit	Note
			Min	Max		
CLK cycle time	CAS latency=3	tCC	7.5	1000	ns	1
	CAS latency=2		10			
CLK to valid output delay	CAS latency=3	tSAC		5.4	ns	1,2
	CAS latency=2			6		
Output data hold time	CAS latency=3	tOH	3		ns	2
	CAS latency=2		3

Input setup time		tSS	1.5		ns	3
Input hold time		tSH	0.8		ns	3
CLK to output in Low-Z		tSLZ	1		ns	2
CLK to output in Hi-Z	CAS latency=3	tSHZ		5.4	ns	
	CAS latency=2			6		

Notes : 1. Parameters depend on programmed CAS latency.
2. If clock rising time is longer than 1ns, (tr/2-0.5)ns should be added to the parameter.
3. Assumed input rise and fall time (tr & tf) = 1ns.
If tr & tf is longer than 1ns, transient time compensation should be considered,
i.e., [(tr + tf)/2-1]ns should be added to the parameter.

Notes :

1. OP Code : Operand code
   A_0 ~ A_{12} & BA_0 ~ BA_1 : Program keys. (@ MRS)
2. MRS can be issued only at all banks precharge state.
   A new command can be issued after 2 clock cycles of MRS.
3. Auto refresh functions are as same as CBR refresh of DRAM.
   The automatical precharge without row precharge command is meant by "Auto".
   Auto/self refresh can be issued only at all banks precharge state.
4. BA_0 ~ BA_1 : Bank select addresses.
   If both BA_0 and BA_1 are "Low" at read, write, row active and precharge, bank A is selected.
   If BA_0 is "High" and BA_1 is "Low" at read, write, row active and precharge, bank B is selected.
   If BA_0 is "Low" and BA_1 is "High" at read, write, row active and precharge, bank C is selected.
   If both BA_0 and BA_1 are "High" at read, write, row active and precharge, bank D is selected.
   If A_{10}/AP is "High" at row precharge, BA_0 and BA_1 is ignored and all banks are selected.
5. During burst read or write with auto precharge, new read/write command can not be issued.
   Another bank read/write command can be issued after the end of burst.
   New row active of the associated bank can be issued at t_{RP} after the end of burst.
6. Burst stop command is valid at every burst length.
7. DQM sampled at positive going edge of a CLK and masks the data-in at the very CLK (Write DQM latency is 0),
   but makes Hi-Z state the data-out of 2 CLK cycles after. (Read DQM latency is 2)
