## **2097152-BIT (262144-WORD BY 8-BIT) CMOS STATIC RAM**

## **DESCRIPTION**

The M5M5V208 is 2,097,152-bit CMOS static RAM organized as 262,144-words by 8-bit which is fabricated using high-performance quadruple-polysilicon and double metal CMOS technology. The use of thin film transistor(TFT) load cells and CMOS periphery results in a high density and low power static RAM. The M5M5V208 is designed for memory applications where high reliability, large storage, simple interfacing and battery back-up are important design objectives.

The M5M5V208VP,RV,KV,KR are packaged in a 32-pin thin small outline package which is a high reliability and high density surface mount device(SMD).Two types of devices are available.

VP,KV(normal lead bend type package),RV,KR(reverse lead bend type package). Using both types of devices, it becomes very easy to design a printed circuit board.

**2097152-BIT (262144-WORD BY 8-BIT) CMOS STATIC RAM****FUNCTION**

The operation mode of the M5M5V208 is determined by a combination of the device control inputs  $\bar{S}_1$ ,  $S_2$ ,  $\bar{W}$  and  $OE$ . Each mode is summarized in the function table.

A write cycle is executed whenever the low level  $\bar{W}$  overlaps with the low level  $\bar{S}_1$  and the high level  $S_2$ . The address must be set up before the write cycle and must be stable during the entire cycle. The data is latched into a cell on the trailing edge of  $W$ ,  $S_1$  or  $S_2$ , whichever occurs first, requiring the set-up and hold time relative to these edge to be maintained. The output enable  $OE$  directly controls the output stage. Setting the  $OE$  at a high level, the output stage is in a high-impedance state, and the data bus contention problem in the write cycle is eliminated.
