

+3.3V, 622Mbps, SDH/SONET 1:8 Deserializer with TTL Outputs

General Description

The MAX3680/MAX3680A deserializer is ideal for converting 622Mbps serial data to 8-bit-wide, 77Mbps parallel data in ATM and SDH/SONET applications. Operating from a single +3.3V supply, this device accepts PECL serial clock and data inputs, and delivers TTL clock and data outputs. The MAX3680 also provides a TTL synchronization input that enables data realignment and reframing.

The MAX3680/MAX3680A is available in the extended-industrial temperature range (-40°C to +85°C), in a 28-pin SSOP package.

Applications

622Mbps SDH/SONET Transmission Systems
622Mbps ATM/SONET Access Nodes
Add/Drop Multiplexers
Digital Cross-Connects

Features

- ◆ Single +3.3V Supply
- ◆ 622Mbps Serial to 77Mbps Parallel Conversion
- ◆ 165mW Power
- ◆ Synchronization Input for Data Realignment and Reframing (MAX3680)
- ◆ Differential 3.3V PECL Clock and Data Inputs
- ◆ TTL Data Outputs

ABSOLUTE MAXIMUM RATINGS

Terminal Voltage (with respect to GND)

V _{CC}	-0.5V to +5V
PECL Inputs (SD+/-, SCLK+/-)	-0.5V to (V _{CC} + 0.5V)
TTL Input (SYNC)	-0.5V to (V _{CC} + 0.5V)
TTL Outputs (PCLK, PD_)	-0.5V to (V _{CC} + 0.5V)

Continuous Power Dissipation (T_A = +85°C)

SSOP (derate 9.52mW/°C above +85°C)	619mW
Operating Temperature Range	-40°C to +85°C
Storage Temperature Range	-65°C to +160°C
Lead Temperature (soldering, 10s)	+300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

DC ELECTRICAL CHARACTERISTICS

(V_{CC} = +3.0V to +3.6V, T_A = -40°C to +85°C, unless otherwise noted. Typical values are at V_{CC} = +3.3V, T_A = +25°C.)

Detailed Description

The MAX3680/MAX3680A deserializer uses an 8-bit shift register, 8-bit parallel output register, 3-bit counter, PECL input buffers, and TTL input/output buffers to convert 622Mbps serial data to 8-bit-wide, 77Mbps parallel data (Figure 1).

The input shift register continuously clocks incoming data on the positive transition of the serial clock (SCLK) input signal. The 3-bit counter generates a parallel output clock (PCLK) by dividing down the serial clock frequency. The PCLK signal is used to clock the parallel output register. During normal operation, the counter divides the SCLK frequency by eight, causing the output register to latch every eight bits of incoming serial data.

The MAX3680 synchronization input (SYNC) is used for data realignment and reframing. When the SYNC signal is pulsed high for at least two SCLK cycles, PCLK is delayed by one SCLK cycle, causing the first incoming bit of the serial input data stream to be dropped. This realignment is guaranteed to occur within two PCLK cycles of the SYNC rising edge.

See Figure 2 for the functional timing diagrams and Figure 3 for the timing parameters diagram.

PECL Inputs

The serial data and clock PECL inputs (SD+, SD-, SCLK+, SCLK-) require 50Ω termination to ($V_{CC} - 2V$) when interfacing with a PECL source (see *Alternative PECL Input Termination*).

Applications Information

Alternative PECL Input Termination

Figure 4 shows alternative PECL input-termination methods. Use Thevenin-equivalent termination when a ($V_{CC} - 2V$) termination voltage is not available. If AC coupling is necessary, such as when interfacing with an ECL-output device, use the ECL AC-coupling termination.

Layout Techniques

For best performance, use good high-frequency layout techniques. Filter voltage supplies and keep ground connections short. Use multiple vias where possible. Also, use controlled impedance transmission lines to interface with the MAX3680 data inputs.
