Procedure for using the Self-Diagnosis Function (Error History Display Mode).

Note: Perform the self-diagnosis function in the “er ror history display mode” in the test mode. The following describes the least req uired procedure. Be careful not to enter other modes by mistak e. If you set other modes accidentall y, press the MENU/NO button to exit the mode.

1. While pressing the ⏮ AMS ⏭ knob and ■ button, connect the power plug to the outlet, and release the ⏮ AMS ⏭ knob and ■ button.
2. Rotate the ⏮ AMS ⏭ knob and when “[Service]” is displayed, press the YES button.
3. Rotate the ⏮ AMS ⏭ knob and display “ERR DP MODE”.
4. Pressing the YES button sets the error history mode and displays “total rec”.
5. Select the contents to be displayed or executed using the ⏮ AMS ⏭ knob.
6. Pressing the ⏮ AMS ⏭ knob will display or execute the contents selected.

Items of Error History Mode Items and Contents

Selecting the Test Mode

Display	Details of History
total rec	Displays the recording time. Displayed as "r□□□□□□h". The displayed time is the total time the laser is set to the high power state. This is about 1/4 of the actual recording time. The time is displayed in decimal digits from 0h to 65535h.
total play	Displays the play time. Displayed as "p□□□□□□h". The time displayed is the total actual play time. Pauses are not counted. The time is displayed in decimal digits from 0h to 65535h.
retry err	Displays the total number of retries during recording and number of retry errors during play. Displayed as "r□□ p□□". "r" indicates the retries during recording while "p" indicates the retry errors during play. The number of retries and retry errors are displayed in hexadecimal digits from 00 to FF.
total err	Displays the total number of errors. Displayed as "total □□". The number of errors is displayed in hexadecimal digits from 00 to FF.
err history	Displays the 10 latest errors. Displayed as "0□ E@@". □ indicates the history number. The smaller the number, the more recent is the error. (00 is the latest). @@ indicates the error code. Refer to the following table for the details. The error history can be switched by rotating the [⏮ AMS ⏭] knob.

After pressing the [⏮ AMS ⏭] button and "er refresh?" is displayed, press the [YES] button to erase the history. "Complete!" will be displayed momentarily. Be sure to check the following when this mode has been executed. • The data has been erased. • The mechanism operates normally when recording and play are performed.
tm refresh	Mode which erases the "total rec" and "total play" histories. These histories serve as approximate indications of when to replace the optical pickup. If the optical pickup has been replaced, perform this operation and erase the history. After pressing the [⏮ AMS ⏭] button and "tm refresh?" is displayed, press the [YES] button to erase the history. "Complete!" will be displayed momentarily. Be sure to check the following when this mode has been executed. • The data has been erased. • The mechanism operates normally when recording and play are performed.

TABLE OF CONTENTS

SAFETY CHECK-OUT

After correcting the original service problem, perform the following safety check before releasing the set to the customer:
Check the antenna terminals, metal trim, "metallized" knobs, screws, and all other exposed metal parts for AC leakage.
Check leakage as described below.

LEAKAGE TEST

The AC leakage from any exposed metal part to earth ground and from all exposed metal parts to any exposed metal part having a return to chassis, must not exceed 0.5 mA (500 microampers.).
Leakage current can be measured by any one of three methods.

1. A commercial leakage tester, such as the Simpson 229 or RCA WT-540A. Follow the manufacturers' instructions to use these instruments.
2. A battery-operated AC milliammeter. The Data Precision 245 digital multimeter is suitable for this job.
3. Measuring the voltage drop across a resistor by means of a VOM or battery-operated AC voltmeter. The "limit" indication is 0.75 V, so analog meters must have an accurate low-voltage scale. The Simpson 250 and Sanwa SH-63Trd are examples of a passive VOM that is suitable. Nearly all battery operated digital multimeters that have a 2V AC range are suitable. (See Fig. A)

Record Precedure:

1. While pressing the [⏮ AMS ⏭] knob and [■] button, connect the power plug to the outlet, and release the [⏮ AMS ⏭] knob and [■] button.
2. Rotate the [⏮ AMS ⏭] knob to display "[Service]", and press the [YES] button.
3. Rotate the [⏮ AMS ⏭] knob to display "lop.Write" (C28), and press the [YES] button.
4. The display becomes "Ref=@@@.@" (@ is an arbitrary number) and the numbers which can be changed will blink.
5. Input the IOP value written on the optical pick-up.
   To select the number : Rotate the [⏮ AMS ⏭] knob.
   To select the digit : Press the [⏮ AMS ⏭] knob.
6. When the [YES] button is pressed, the display becomes "Measu=@@@.@" (@ is an arbitrary number).
7. As the adjustment results are recorded for the 6 value. Leave it as it is and press the [YES] button.
8. "Complete!" will be displayed momentarily. The value will be recorded in the non-volatile memory and the display will become "Iop Write".
9. Press the [REPEAT] button to complete. "Standby" will be displayed.

Display Precedure:

1. While pressing the [⏮ AMS ⏭] knob and [■] button, connect the power plug to the outlet, and release the [⏮ AMS ⏭] knob and [■] button.
2. Rotate the [⏮ AMS ⏭] knob to display "[Service]", and press the [YES] button.
3. Rotate the [⏮ AMS ⏭] knob to display "lop.Read" (C27).
4. "@@.@/##.#" is displayed and the recorded contents are displayed.
   @@.@ : indicates the Iop value labeled on the pick-up.
   ##.# : indicates the Iop value after adjustment
5. To end, press the [⏮ AMS ⏭] button or [MENU/NO] button to display "Iop Read". Then press the [REPEAT] button to display "Standby".

3. Press the [YES] button. (Or press the [I◁◁ AMS ▷▷I] knob)
4. When “All Erase??” is displayed on the fluorescent display tube, the music calendar number blinks.
5. Press the [YES] button to displa y “Complete!!”, and press the [■] button immedia tely. Wait for about 15 seconds w hile pressing the button. (The [I◁◁ AMS ▷▷I] knob can be pressed instead of the [YES] button for the same results.)
6. When the “TOC” displayed on the fluorescent display tube goes of f, release the [■] button.
7. Press the [● REC] button to start recording. Then press the [❚❚] button and start recording.

Higher bit : 4 = 0100 ⟶ b6
Lower bit : 2 = 0010 ⟶ b1
In this case, the retry cause is combined of “CLV unlock” and “ader5”.

When A2 is displayed:
Higher bit : A = 1010 ⟶ b7+b5
Lower bit : 2 = 0010 ⟶ b2
The retry cause in this case is combined of “access fault”, “IVR rec error”, and “ader5”.

Reading the Retry Cause Display

	Higher Bits				Lower Bits				Hexa-decimal	Details	
Hexadecimal	8	4	2	1	8	4	2	1

Reading the Display:
Convert the hexadecimal display into binary display. If more than two causes, they will be added.

Example When 84 is displayed:
Higher bit: 8 = 1000 ⟶ b7
Lower bit : 4 = 0100 ⟶ b2
In this case, as b2 and b7 are 1 and others are 0, it can be determined that the retry cause is combined of “emphasis OFF”, “monaural”, “original”, “copyright exists”, and “write allowed”.

Example When 07 is displayed:
Higher bit : 0 = 1000 ⟶ All 0
Lower bit : 7 = 0111 ⟶ b0+b1+b2
In this case, as b0, b1, and b2 are 1 and others are 0, it can be determined that the retry cause is combined of “emphasis ON”, “stereo”, “original”, “copyright exists”, and “write prohibited”.

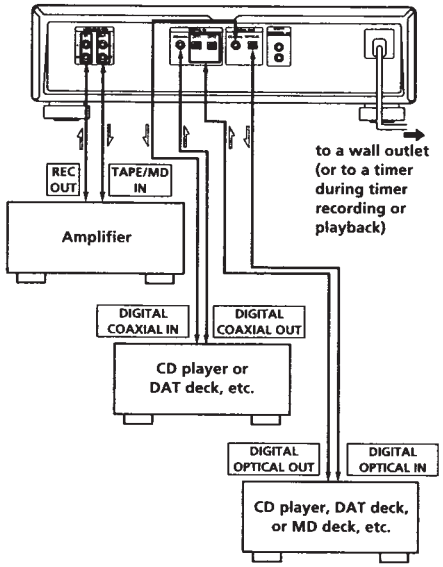
Hooking Up the System

Overview

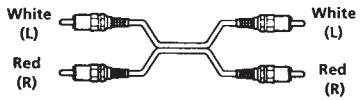
This section describes how to hook up the MD deck to an amplifier or other components such as a CD player or DAT deck. Be sure to turn off the power of each component before connection.



: Signal flow

What cords will I need?

- Audio connecting cords (supplied) (2)



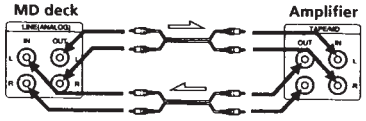
- Optical cables (not supplied) (3)

- Coaxial digital connecting cables (not supplied) (2)

Hookups

Connecting the deck to an amplifier

Connect the amplifier to the LINE(ANALOG) IN/OUT jacks using the audio connecting cords (supplied), making sure to match the color-coded cords to the appropriate jacks on the components: red (right) to red and white (left) to white. Be sure to make connections firmly to prevent hum and noise.



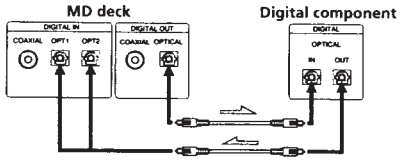
: Signal flow

Connecting the deck to a digital component such as a CD player, DAT deck, digital amplifier, or another MD deck

Connect the component through the DIGITAL IN/OUT connectors with two (or three) optical cables (not supplied) and/or two coaxial digital connecting cables (not supplied).

When using the optical cables

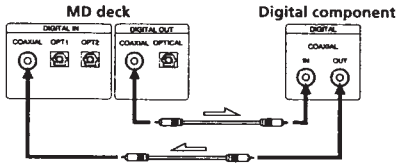
Take the caps off the connectors and then insert the plugs parallelly until they click into place.
Be sure not to bend or tie together the optical cables.



You can connect the optical cable to either OPT1 or OPT2

: Signal flow

When using the coaxial digital connecting cable



: Signal flow

If "Din Unlock" and "C71" appear in the display
Make sure the optical cable or the coaxial digital connecting cable is connected properly.

Automatic conversion of digital sampling rates during recording
A built-in sampling rate converter automatically converts the sampling frequency of various digital sources to the 44.1 kHz sampling rate of your MD deck. This allows you to record sources such as 32- and 48-kHz DAT or satellite broadcasts, as well as compact discs and other MDs.

Note
If "Din Unlock" alternates with "C71", or "Cannot Copy" appears in the display, recording through the digital connector is not possible. In this case, record the program source through the LINE(ANALOG) IN jacks with the INPUT set at ANALOG.

Connecting the AC power cord

Connect the AC power cord to a wall outlet or to the outlet of a timer.

About the CONTROL A1 Control System

This MD deck is compatible with the CONTROL A1 Control System.
The CONTROL A1 Control System was designed to simplify the operation of audio systems composed of separate Sony components. CONTROL A1 connections provide a path for the transmission of control signals which enable automatic operation and control features usually associated with integrated systems.
Currently, CONTROL A1 connections between a Sony MD deck, CD player, amplifier (receiver), and cassette deck provide automatic function selection and synchronized recording.

Note
The CONTROL A1 Control System is designed to maintain upward compatibility as the Control System is upgraded to handle new functions. In this case, however, older components will not be compatible with the new functions.

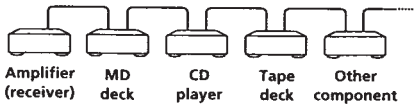
Compatibility with the former CONTROL A System
Although the CDP-CX153 is equipped with a CONTROL A terminal, it can be connected to CONTROL A1 components using a special connecting cable*.
The CDP-CX151 however, cannot be connected to CONTROL A1.

* Use the Sony RK-G139HG (1 meter [39 3/8 in]) monaural mini-plug ⟷ stereo mini-plug connecting cable or a similar cable (less than 2 meters [78 3/4 in] long with no resistance).

Be sure to connect the STEREO mini-plug to the CONTROL A component and the MONO mini-plug to the CONTROL A1 component.

Connecting the CONTROL A1 Control System

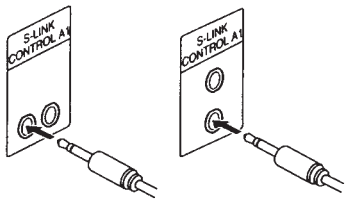
- Connect the CONTROL A1 cables in series to the CONTROL A1 jacks on the back of each component. Be sure to connect a CONTROL A1 compatible amplifier (receiver) to take advantage of the automatic function selection feature.



- The components can be connected in any order.
- You can connect up to ten CONTROL A1 compatible components.
- The CONTROL A1 functions will work when the component you want to operate is turned on, even if all of the connected components are not turned on.
- As a rule, the CONTROL A1 remote control system should not incorporate more than one of each type of component (i.e., 1 MD deck, 1 CD player, 1 tape deck and 1 receiver). You may, however, be able to connect more than one of certain CD players. Refer to the operating instructions supplied with the respective component for details.

About the CONTROL A1 cable

- Use a commercially available 2P (mono) mini-plug cable less than 2 meters (78 3/4 in) long, with a maximum outer diameter no greater than 11 mm (7/16 in), and no resistance. Some CONTROL A1 compatible components are supplied with a CONTROL A1 cable as an accessory.
- If a component has more than one CONTROL A1 jack, you can use either one, or connect a different component to each jack.



"S-LINK" is a general name for Sony's Bus System, and includes the CONTROL A1 Control System.

Basic Functions of the CONTROL A1 Control System

Automatic function selection

When you connect CONTROL A1 compatible Sony components using CONTROL A1 cables, the function selector on the amplifier (or receiver) automatically switches to the correct input when you press the play button on one of the connected components.
(If you press ► (play button) on the MD deck while the CD is playing, the function selector on the amplifier switches from CD to MD.)

Notes

- This function only works when the components are connected to the amplifier (or receiver) inputs according to the names on the function buttons. Certain receivers allow you to switch the names of the function buttons. In this case, refer to the operating instructions supplied with the receiver.
- When recording, do not play any components other than the recording source. It will cause the automatic function selection to operate.

Synchronized recording

This function lets you conduct synchronized recording between the MD deck and selected source component.

1 Set the source selector on the amplifier (or receiver) to the source component.

2 Set the source component to pause mode (make sure both the ► and ❚❚ indicators light together).

3 Set the deck to recording pause mode.

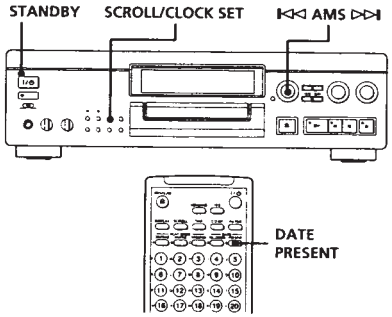
4 Press ❚❚ on the deck.
The source component is released from the pause mode, and recording begins shortly thereafter. When playback ends from the source component, recording stops.

Notes

- Do not set more than one component to the pause mode.
- This MD deck is equipped with a special synchronized recording function that uses the CONTROL A1 Control System (see "Making a synchro recording from a CD player connected with a control A1 cable" on page 20). You can also make a synchro recording using the Mega CD Control Function via the CONTROL A1 Control System (see "Controlling a CD Changer from the MD Deck to Make a Synchro Recording" on page 39).

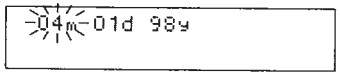
Setting the Clock

Once you set the MD deck's internal clock, the MD deck will automatically record the date and time of all recordings. When playing a track, you can display the date and time the track was recorded (see page 25). Time on this deck is displayed on a 12-hour clock (USA and Canadian models only) or a 24-hour clock (European model only).

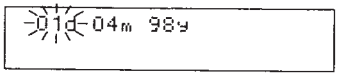


1 With the deck in standby status (the STANDBY indicator lights red), press SCROLL/CLOCK SET down for about 2 seconds until the month (or day) indication in the display starts flashing.

USA and Canadian models



European model



2 Turn AMS to enter the current month (or day), then press AMS.
The month (or day) indication stops flashing, and the day (or month) indication starts flashing.

(Continued)

3 Repeat Step 2 to enter the month, day, year, hour, and minute.

For precise time and date stamping of recordings
Reset the time at least once a week.

Note
If the AC power cord is disconnected for a long time, the memorized clock settings will disappear and "Standby" will flash in the display the next time you plug in and turn on the deck. If this happens, reset the clock.

Displaying the current date and time

You can display the current date and time any time even when the deck is in standby status.

Press DATE PRESENT.
Each press of the button changes the display as follows:

→ Current display → Date → Time →

You can display the current date and time with an on-deck button
Press the SCROLL/CLOCK SET button. Each press of the button changes the display in the same order as the DATE PRESENT button on the remote does.

Changing the date and/or time

1 With the deck in standby status (the STANDBY indicator lights red), press SCROLL/CLOCK SET down for about 2 seconds until the month (or day) indication in the display starts flashing.

2 Press SCROLL/CLOCK SET or AMS repeatedly until the item you want to change flashes.

3 Turn AMS to change the contents of the selected item.

4 To complete the setting, press AMS repeatedly until all items stop flashing.

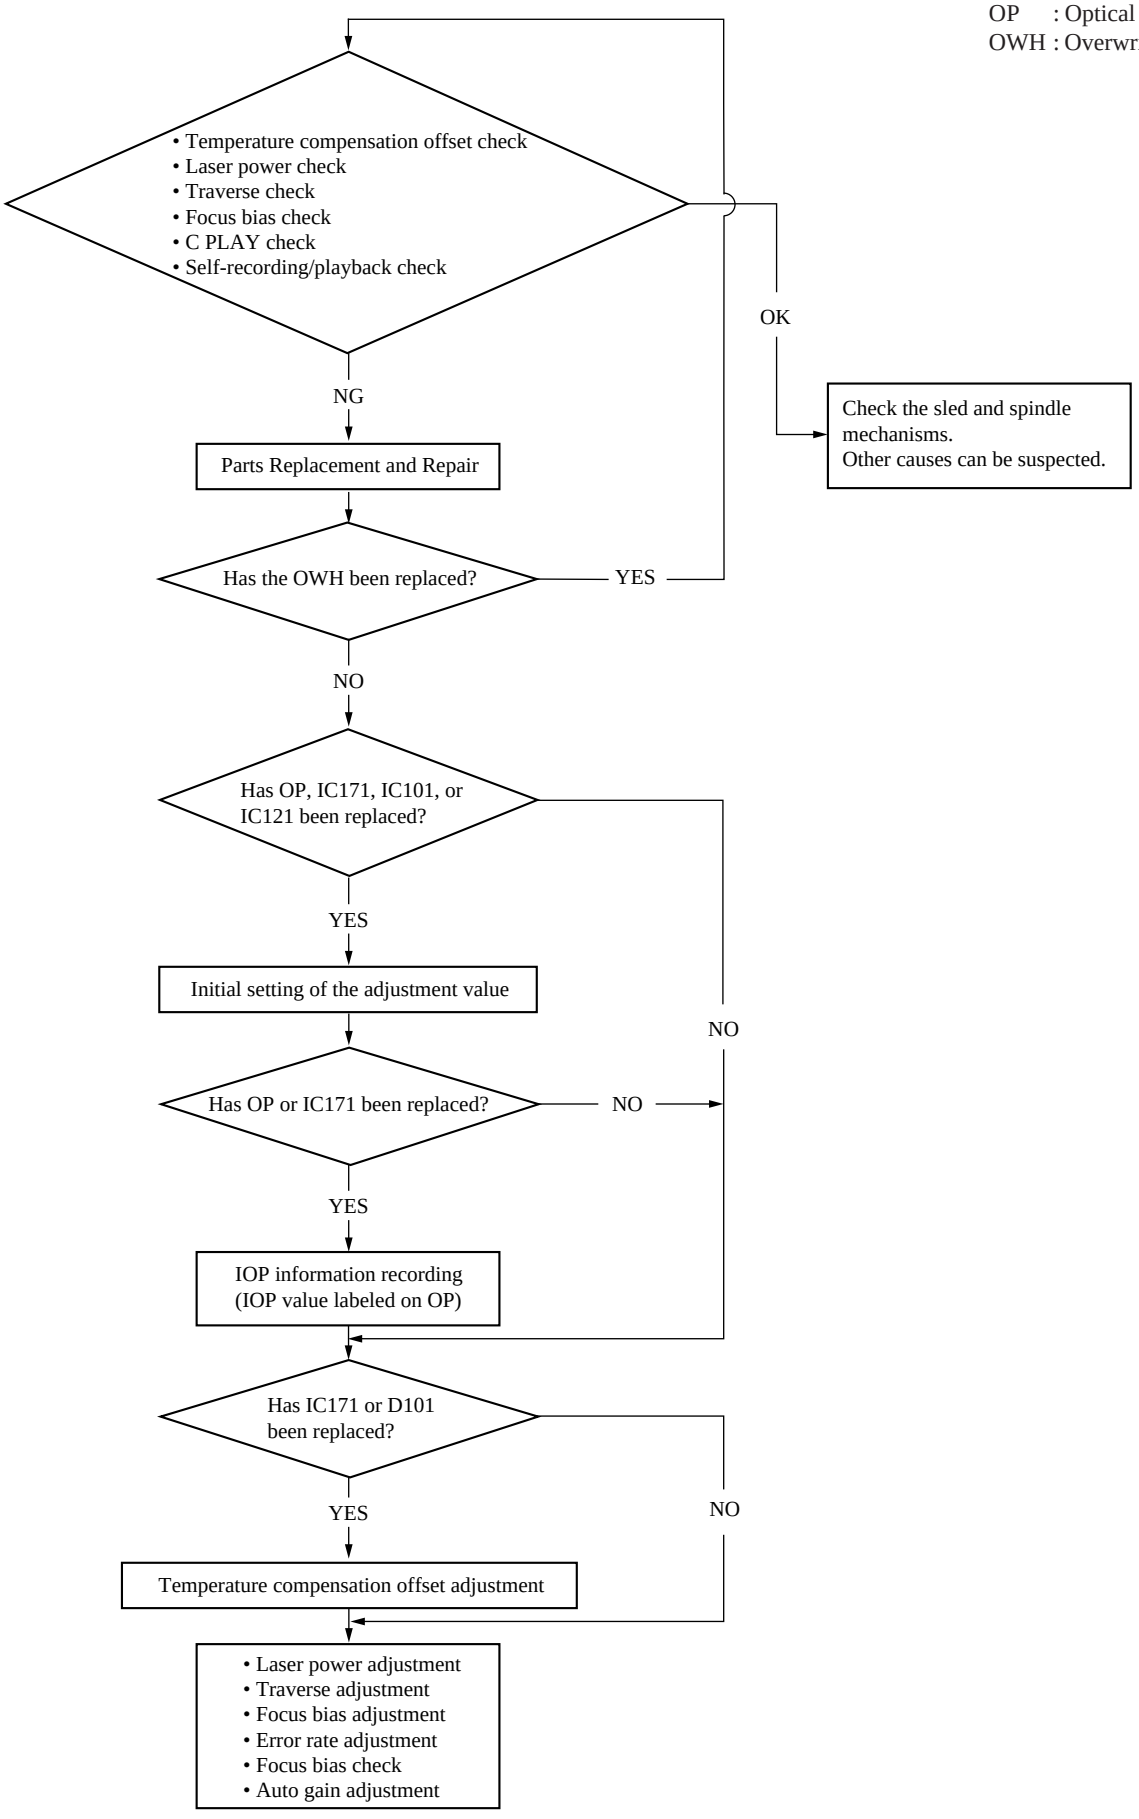
  The procedure changes according to the part replaced

- Abbreviation
  OP : Optical pick-up
  OWH : Overwrite head

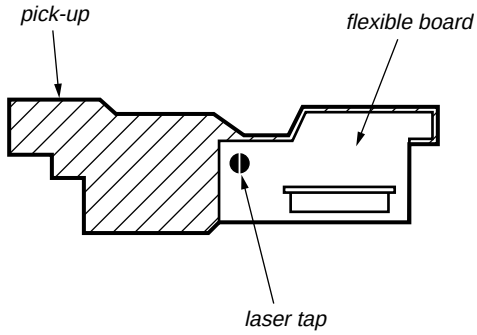


5-2. PRECAUTIONS FOR CHECKING LASER DIODE EMISSINON

To check the emission of the laser diode during adjustments, never view directly from the top as this may lose your eye-sight.

5-3. PRECAUTIONS FOR USE OF OPTICAL PICK-UP (KMS-260A)

As the laser diode in the optical pick-up is easily damaged by static electricity, solder the laser tap of the flexible board when using it. Before disconnecting the connector , desolder f irst. Before connecting the connector , be car eful not to r emove the solder . Also take adequa te measures to pr event damage b y sta tic electr icity. Handle the flexib le board with care as it breaks easily.



Optical pick-up flexible board

5-4. PRECAUTIONS FOR ADJUSTMENTS

1. When replacing the following parts, perform the adjustments and checks with O in the order shown in the following table.

	Optical Pick-up	BD Board			
		IC171	D101	IC101, IC121	IC192
1. Initial setting of adjustment value	O	O	×	O	×
2. Recording of IOP information (Value written in the pick-up)	O	O	×	×	×

5. Traverse adjustment	OO	O×			×
6. Focus bias adjustment	OO	O×			×
7. Error rate check	OO	O×			×
8. Auto gain output level adjustment	OO	O×			×

2. Set the test mode when performing adjustments.
   After completing the adjustments, exit the test mode.
   Perform the adjustments and checks in “group S” of the test mode.
3. Perform the adjustments to be needed in the order shown.
4. Use the following tools and measuring devices.
   - Check Disc (MD) TDYS-1
     (Parts No. 4-963-646-01)
   - TEST DISK (MDW-74/AU-1) (Parts No. 8-892-341-41)
   - Laser power meter LPM-8001 (Parts No. J-2501-046-A)
     or MD Laser power meter 8010S (Parts No. J-2501-145-A)
   - Oscilloscope (Measure after performing CAL of prove.)
   - Digital voltmeter
   - Thermometer
   - Jig for checking BD board waveform
     (Parts No. : J-2501-149-A)
5. When observing several signals on the oscilloscope, etc., make sure that VC and ground do not connect inside the oscilloscope.
   (VC and ground will become short-circuited.)
6. Using the above jig enables the waveform to be checked without the need to solder .
   (Refer to Servicing Notes on page 7.)
7. As the disc used will af fect the adjustment results, make sure that no dusts nor fingerprints are attached to it.

Laser power meter

When performing laser power checks and adjustment (electrical adjustment), use of the new MD laser power meter 8010S (J-2501-145-A) instead of the conventional laser power meter is convenient.
It sharply reduces the time and trouble to set the laser power meter sensor onto the objective lens of the pick-up.

5-5. CREATING CONTINUOUSLY RECORDED DISC
