

1/3-Inch CMOS Digital Image Sensor

MT9M024 Data Sheet, Rev. G

For the latest data sheet, please visit www.onsemi.com

Features

- Superior low-light performance
- HD video (720p60)
- Linear or high dynamic range capture
- Video/Single Frame modes
- On-chip AE and statistics engine
- Parallel and serial output
- Auto black level calibration
- Context switching
- Temperature Sensor

Applications

- Video surveillance
- 720p60 video applications
- High dynamic range imaging

General Description

The ON Semiconductor MT9M024 is a 1/3-inch CMOS digital image sensor with an active-pixel array of 1280H x 960V. It captures images in either linear or high dynamic range modes, with a rolling-shutter readout. It includes sophisticated camera functions such as auto exposure control, windowing, and both video and single frame modes. It is designed for both low light and high dynamic range scene performance. It is programmable through a simple two-wire serial interface. The MT9M024 produces extraordinarily clear, sharp digital pictures, and its ability to capture both continuous video and single frames makes it the perfect choice for a wide range of applications, including surveillance and HD video.

Table 1: Key Parameters

| Parameter | | Typical Value |
|---|-----------------|---|
| Optical format | | 1/3-inch (6 mm) |
| Active pixels | | 1280 x 960 = 1.2 Mp |
| Pixel size | | 3.75μm |
| Color filter array | | RGB Bayer or monochrome |
| Shutter type | | Electronic rolling shutter |
| Input clock range | | 6 – 50 MHz |
| Output clock maximum | | 74.25 MHz |
| Output | Serial | HiSPi 12-, 14-, or 20-bit |
| | Parallel | 12-bit |
| Frame rate | Full resolution | 45 fps |
| | 720p | 60 fps |
| Responsivity | | 5.48 V/lux-sec |
| SNR _{MAX} | | 43.9 dB |
| Maximum dynamic range | | >115 dB |
| Supply voltage | I/O | 1.8 or 2.8V* |
| | Digital | 1.8 V |
| | Analog HiSPi | 2.8 V0.4 V or 1.8 V |
| Power consumption (typical) | | 270 mW (1280 x 720 60 fps Parallel output Linear Mode) 460 mW (1280 x 720 60 fps Parallel output HDR Mode) |
| Operating temperature (ambient) -T _A | | –30°C to + 70° C (surveillance) |
| Package options | | 9x9 mm iBGA |
| | | Bare die |

*1.8V V_{DD_IO} is recommended due to better row noise performance

General Description

The ON Semiconductor MT9M024 can be operated in its default mode or programmed for frame size, exposure, gain, and other parameters. The default mode output is a 960p-resolution image at 45 frames per second (fps). In linear mode, it outputs 12-bit raw data, using either the parallel or serial (HiSPi™) output ports. In high dynamic range mode, it outputs 12-bit compressed data using parallel output or 12-bit or 14-bit compressed or 20-bit linearized data using the HiSPi port. The device may be operated in video (master) mode or in single frame trigger mode.

FRAME_VALID and LINE_VALID signals are output on dedicated pins, along with a synchronized pixel clock in parallel mode.

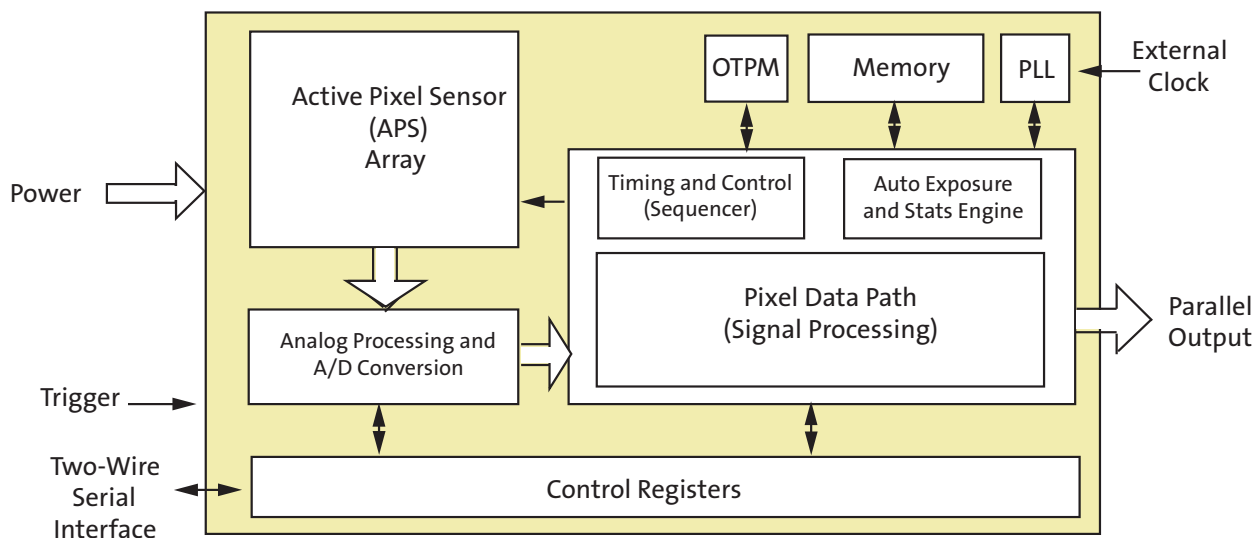

The MT9M024 includes additional features to allow application-specific tuning: windowing and offset, adjustable auto-exposure control, auto black level correction, and on-board temperature sensor. Optional register information and histogram statistic information can be embedded in first and last 2 lines of the image frame.

The sensor is designed to operate in a wide temperature range (–30°C to +70°C).

Functional Overview

The MT9M024 is a progressive-scan sensor that generates a stream of pixel data at a constant frame rate. It uses an on-chip, phase-locked loop (PLL) that can be optionally enabled to generate all internal clocks from a single master input clock running between 6 and 50 MHz. The maximum output pixel rate is 74.25 Mp/s, corresponding to a clock rate of 74.25 MHz. Figure 1 shows a block diagram of the sensor.

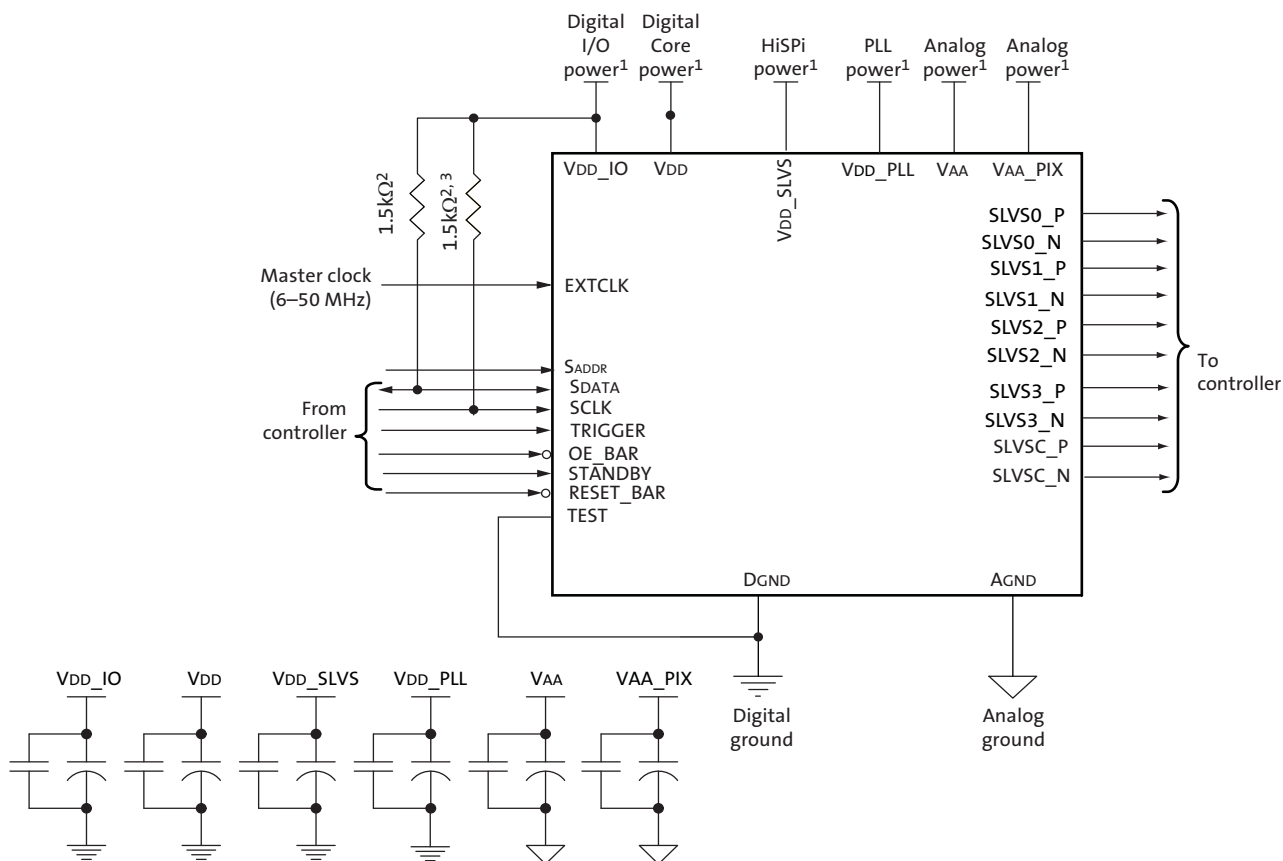

Figure 1: Block Diagram

User interaction with the sensor is through the two-wire serial bus, which communicates with the array control, analog signal chain, and digital signal chain. The core of the sensor is a 1.2 Mp Active-Pixel Sensor array. The timing and control circuitry sequences through the rows of the array, resetting and then reading each row in turn. In the time interval between resetting a row and reading that row, the pixels in the row integrate incident light. The exposure is controlled by varying the time interval between reset and

readout. Once a row has been read, the data from the columns is sequenced through an analog signal chain (providing offset correction and gain), and then through an analog-to-digital converter (ADC). The output from the ADC is a 12-bit value for each pixel in the array. The ADC output passes through a digital processing signal chain (which provides further data path corrections and applies digital gain). The sensor also offers a high dynamic range mode of operation where multiple images are combined on-chip to produce a single image at 20-bit per pixel value. A compressing mode is further offered to allow this 20-bit pixel value to be transmitted to the host system as a 12-bit value with close to zero loss in image quality. The pixel data are output at a rate of up to 74.25 Mp/s, in parallel to frame and line synchronization signals.

Figure 2: Typical Configuration: Serial Four-Lane HiSPi Interface

- Notes:
1. All power supplies must be adequately decoupled.
 2. ON Semiconductor recommends a resistor value of 1.5kΩ, but a greater value may be used for slower two-wire speed.
 3. This pull-up resistor is not required if the controller drives a valid logic level on SCLK at all times.
 4. The parallel interface output pads can be left unconnected if the serial output interface is used.
 5. ON Semiconductor recommends that 0.1μF and 10μF decoupling capacitors for each power supply are mounted as close as possible to the pad. Actual values and results may vary depending on layout and design considerations. Check the MT9M024 demo headboard schematics for circuit recommendations.
 6. ON Semiconductor recommends that analog power planes are placed in a manner such that coupling with the digital power planes is minimized.
 7. I/O signals voltage must be configured to match VDD_IO voltage to minimize any leakage currents.

The schematic diagram illustrates the AD9288 ADC interface and power connections. The central component is the AD9288 ADC, represented by a large rectangle. It has several pins and connections:

- Power Pins:**
 - VDD_IO:** Connected to Digital I/O power¹.
 - VDD:** Connected to Digital core power¹.
 - VDD_PLL:** Connected to PLL power¹.
 - VAA:** Connected to Analog power¹.
 - VAA_PIX:** Connected to Analog power¹.
- Grounds:**
 - DGND:** Connected to Digital ground.
 - AGND:** Connected to Analog ground.
- Control and Data Pins:**
 - EXTCLK:** Master clock (6–50 MHz).
 - SADDR:** Address bus.
 - SDATA:** Data bus.
 - SCLK:** Serial clock.
 - TRIGGER:** Trigger input.
 - OE_BAR:** Output enable (active low).
 - STANDBY:** Standby input.
 - RESET_BAR:** Reset (active low).
 - TEST:** Test pin.
- Outputs:**
 - DOUT [11:0]:** 12-bit digital output data.
 - PIXCLK:** Pixel clock output.
 - LINE_VALID:** Line valid signal output.
 - FRAME_VALID:** Frame valid signal output.
- External Components:**
 - Resistors:** Two 1.5 kΩ resistors are connected between the Master clock (EXTCLK) and the SADDR and SDATA pins.
 - Capacitors:** Decoupling capacitors are shown for VDD_IO, VDD, VDD_PLL, VAA, and VAA_PIX, connected to their respective power planes.

The outputs DOUT [11:0], PIXCLK, LINE_VALID, and FRAME_VALID are grouped together and labeled "To controller".

- Notes:
1. All power supplies must be adequately decoupled.
 2. ON Semiconductor recommends a resistor value of $1.5k\Omega$, but a greater value may be used for slower two-wire speed.
 3. This pull-up resistor is not required if the controller drives a valid logic level on SCLK at all times.
 4. ON Semiconductor recommends that $0.1\mu F$ and $10\mu F$ decoupling capacitors for each power supply are mounted as close as possible to the pad. Actual values and results may vary depending on layout and design considerations. Check the demo headboard schematics for circuit recommendations.
 5. ON Semiconductor recommends that analog power planes are placed in a manner such that coupling with the digital power planes is minimized.
 6. I/O signals voltage must be configured to match VDD_IO voltage to minimize any leakage currents.
 7. The serial interface output pads and VDDSLVS can be left unconnected if the parallel output interface is used.

| DOUT10 | F3 | Output | Parallel pixel data output. |
| DOUT11 | F4 | Output | Parallel pixel data output (MSB) |
| TEST | F7 | Input | Manufacturing test enable pin (connect to DGND). |
| DOUT4 | G1 | Output | Parallel pixel data output. |
| DOUT5 | G2 | Output | Parallel pixel data output. |
| DOUT6 | G3 | Output | Parallel pixel data output. |
| DOUT7 | G4 | Output | Parallel pixel data output. |
| TRIGGER | G7 | Input | Exposure synchronization input. |
| OE_BAR | G8 | Input | Output enable (active LOW). |
| DOUT0 | H1 | Output | Parallel pixel data output (LSB) |
| DOUT1 | H2 | Output | Parallel pixel data output. |
| DOUT2 | H3 | Output | Parallel pixel data output. |
| DOUT3 | H4 | Output | Parallel pixel data output. |

Table 1: Pin Descriptions, 9 x 9 mm, 63-ball iBGA

| Name | iBGA Pin | Type | Description |
|-----------|----------|--------|--|
| RESET_BAR | H8 | Input | Asynchronous reset (active LOW). All settings are restored to factory default. |
| FLASH | E4 | Output | Flash control output. |
| NC | E7, E8 | | No connection. |
| Reserved | F8 | | No connection. |

Pixel Data Format

Pixel Array Structure

The MT9M024 pixel array is configured as 1412 columns by 1028 rows, (see Figure 5). The dark pixels are optically black and are used internally to monitor black level. Of the right 100 columns, 64 are dark pixels used for row noise correction. Of the top 24 rows of pixels, 12 of the dark rows are used for black level correction. There are 1296 columns by 976 rows of optically active pixels. While the sensor's format is 1280 x 960, the additional active columns and active rows are included for use when horizontal or vertical mirrored readout is enabled, to allow readout to start on the same pixel. The pixel adjustment is always performed for monochrome or color versions. The active area is surrounded with optically transparent dummy pixels to improve image uniformity within the active area. Not all dummy pixels or barrier pixels can be read out.

Figure 5: Pixel Array Description

Figure 6: Pixel Color Pattern Detail (Top Right Corner)

Default Readout Order

By convention, the sensor core pixel array is shown with pixel (0,0) in the top right corner (see Figure 6). This reflects the actual layout of the array on the die. Also, the first pixel data read out of the sensor in default condition is that of pixel (112, 44).

When the sensor is imaging, the active surface of the sensor faces the scene as shown in Figure 7. When the image is read out of the sensor, it is read one row at a time, with the rows and columns sequenced as shown in Figure 7 on page 8.

Figure 7: Imaging a Scene

Digital Gain Control

MT9M024 supports four digital gains for the color channels: Red, Green1 (green pixels on the red rows), Green2 (green pixels on the blue rows), and Blue. Digital gain control of the MT9M024 is dependent on the configuration of the `x_addr_start` register. Table 4 illustrates how the digital gains are applied when `x_addr_start` is even or odd number.

Table 2: Digital Gain Control for odd and even `x_addr_start` (R0x3004)

| Pixels | <code>x_addr_start</code> | Gain | Register |
|-----------------------|---------------------------|-------------|----------|
| Red | Even | red_gain | R0x305A |
| | Odd | green1_gain | R0x3056 |
| Green1 (on Red rows) | Even | green1_gain | R0x3056 |
| | Odd | red_gain | R0x305A |
| Green2 (on Blue rows) | Even | green2_gain | R0x305C |
| | Odd | blue_gain | R0x3058 |
| Blue | Even | blue_gain | R0x3058 |
| | Odd | green2_gain | R0x305C |

Output Data Format

The MT9M024 image data is read out in a progressive scan. Valid image data is surrounded by horizontal and vertical blanking (see Figure 8). The amount of horizontal row time (in clocks) is programmable through R0x300C. The amount of vertical frame time (in rows) is programmable through R0x300A. Line_Valid (LV) is HIGH during the shaded region of Figure 8. Optional Embedded Register setup information and Histogram statistic information are available in first 2 and last row of image data.

Figure 8: Spatial Illustration of Image Readout

Readout Sequence

Typically, the readout window is set to a region including only active pixels. The user has the option of reading out dark regions of the array, but if this is done, consideration must be given to how the sensor reads the dark regions for its own purposes.

Parallel Output Data Timing

The output images are divided into frames, which are further divided into lines. By default, the sensor produces 968 rows of 1284 columns each. The FV and LV signals indicate the boundaries between frames and lines, respectively. PIXCLK can be used as a clock to latch the data. For each PIXCLK cycle, with respect to the falling edge, one 12-bit pixel datum outputs on the DOUT pins. When both FV and LV are asserted, the pixel is valid. PIXCLK cycles that occur when FV is de-asserted are called vertical blanking. PIXCLK cycles that occur when only LV is de-asserted are called horizontal blanking.

Figure 9: Default Pixel Output Timing

LV and FV

The timing of the FV and LV outputs is closely related to the row time and the frame time. FV will be asserted for an integral number of row times, which will normally be equal to the height of the output image. LV will be asserted during the valid pixels of each row. The leading edge of LV will be offset from the leading edge of FV by 6 PIXCLKs. Normally, LV will only be asserted if FV is asserted; this is configurable as described below.

LV Format Options

The default situation is for LV to be de-asserted when FV is de-asserted. By configuring R0x306E[1:0], the LV signal can take two different output formats. The formats for reading out four lines and two vertical blanking lines are shown in Figure 10.

Figure 10: LV Format Options

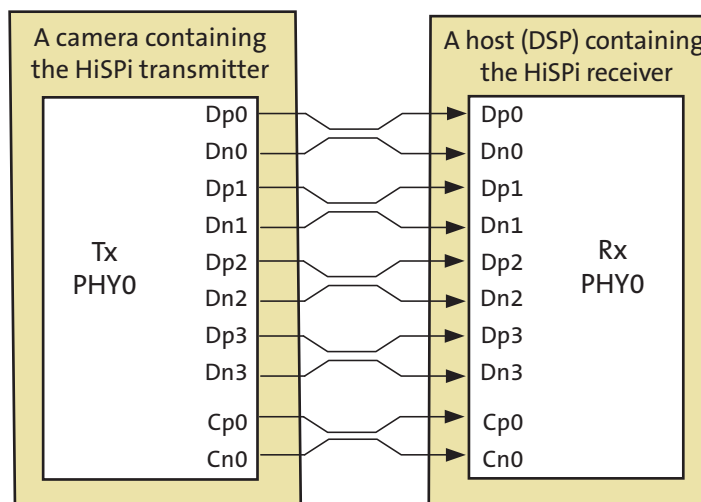

The timing of an entire frame is shown in Figure 16: “Line Timing and FRAME_VALID/ LINE_VALID Signals,” on page 15.

Serial Output Data Timing

The MT9M024 also uses ON Semiconductor's High-Speed Serial Pixel Interface (“HiSPi”). The physical interface comprises differential serial data lines and a differential clock line. The protocol layer formats the data and synchronization signals separately, with Sync codes defined for active image boundaries. Figure 11 shows the configuration between the HiSPi transmitter and the receiver. There are two options for HiSPi output SLVS or HiVCM mode selectable through register 0x306E bit 9. Setting this bit to 0 selects SLVS ; setting the bit to 1 selects HiVCM.

Figure 11: HiSPi Transmitter and Receiver Interface Block Diagram

HiSPi Physical Layer

The HiSPi physical layer has four data lanes and an associated clock lane. Depending on the sensor operating mode and data rate, it can be configured to use either 2, 3, or 4 lanes. The PHY will serialize a 12- to 20-bit data word and transmit each bit of data

centered on a rising edge of the clock, the second on the following falling edge of clock. Figure 12 shows bit transmission. In this example, the word is transmitted in order of MSB to LSB. The receiver latches data at the rising and falling edge of the clock.

Figure 12: Timing Diagram

DLL Timing Adjustment

The MT9M024 includes a DLL to compensate for differences in group delay for each data lane. The DLL is connected to the clock lane and each data lane, which acts as a control master for the output delay buffers. Once the DLL has gained phase lock, each lane can be delayed in 1/8 unit interval (UI) steps. This additional delay allows the user to increase the setup or hold time at the receiver circuits and can be used to compensate for skew introduced in PCB design.

Delay compensation may be set for clock and/or data lines in the hispi_timing register R0x31C0. If the DLL timing adjustment is not required, the data and clock lane delay settings should be set to a default code of 0x000 to reduce jitter, skew, and power dissipation.

Figure 13: Block Diagram of DLL Timing Adjustment

Figure 14: Delaying the Clock with Respect to Data

Figure 15: Delaying Data with Respect to the Clock

Frame Time

The pixel clock (PIXCLK) represents the time needed to sample 1 pixel from the array. The sensor outputs data at the maximum rate of 1 pixel per PIXCLK. One row time (t_{ROW}) is the period from the first pixel output in a row to the first pixel output in the next row. The row time and frame time are defined by equations in Table 3.

Figure 16: Line Timing and FRAME_VALID/LINE_VALID Signals

Table 3: Frame Time (Example Based on 1280 x 960, 45 Frames Per Second)

| Parameter | Name | Equation | Default Timing at 74.25 MHz |
|-------------------|----------------------|--|-------------------------------------|
| A | Active data time | Context A: R0x3008 - R0x3004 + 1 Context B: R0x308E - R0x308A + 1 | 1280 pixel clocks = 17.23μs |
| P1 | Frame start blanking | 6 (fixed) | 6 pixel clocks = 0.08μs |
| P2 | Frame end blanking | 6 (fixed) | 6 pixel clocks = 0.08μs |
| Q | Horizontal blanking | R0x300C - A | 370 pixel clocks = 4.98μs |
| A+Q (t_{ROW}) | Line (Row) time | R0x300C | 1650 pixel clocks = 22.22μs |
| V | Vertical blanking | Context A: (R0x300A - (R0x3006 - R0x3002 + 1)) x (A + Q) Context B: ((R0x30AA - (R0x3090 - R0x308C + 1)) x (A + Q)) | 49,500 pixel clocks = 666.66μs |
| Nrows x (A + Q) | Frame valid time | Context A: ((R0x3006 - R0x3002 + 1) * (A + Q)) - Q + P1 + P2 Context B: ((R0x3090 - R0x308C + 1) * (A + Q)) - Q + P1 + P2 | 1,584,000 pixel clocks = 21.33ms |
| F | Total frame time | V + (Nrows x (A + Q)) | 1,633,500 pixel clocks = 22.22ms |

Sensor timing is shown in terms of pixel clock cycles (see Figure 8 on page 10). The recommended pixel clock frequency is 74.25 MHz. The vertical blanking and the total frame time equations assume that the integration time (coarse integration time plus fine integration time) is less than the number of active lines plus the blanking lines:

$$\text{Window Height} + \text{Vertical Blanking} \quad (EQ 1)$$

If this is not the case, the number of integration lines must be used instead to determine the frame time, (see Table 4). In this example, it is assumed that the coarse integration time control is programmed with 2000 rows and the fine shutter width total is zero.

For Master mode, if the integration time registers exceed the total readout time, then the vertical blanking time is internally extended automatically to adjust for the additional integration time required. This extended value is **not** written back to the frame_length_lines register. The frame_length_lines register can be used to adjust frame-to-frame readout time. This register does not affect the exposure time but it may extend the readout time.

Table 4: Frame Time: Long Integration Time

| Parameter | Name | Equation (Number of Pixel Clock Cycles) | Default Timing at 74.25 MHz |
|-----------|--|--|-------------------------------------|
| F' | Total frame time (long integration time) | Context A: $(R0x3012 \times (A + Q)) + R0x3014 + P1 + P2$ Context B: $(R0x3016 \times (A + Q)) + V R0x3018 + P1 + P2$ | 3,300,012 pixel clocks = 44.44ms |

Note: The MT9M024 uses column parallel analog-digital converters; thus short line timing is not possible. The minimum total line time is 1650 columns (horizontal width + horizontal blanking) for HDR mode and 1400 for linear mode. The minimum horizontal blanking is 370.

Exposure

Total integration time is the result of Coarse_Integration_Time and Fine_Integration_Time registers, and depends also on whether manual or automatic exposure is selected.

The actual total integration time, t_{INT} is defined as:

$$t_{INT} = t_{INTCoarse} - 410 - t_{INTFine} \quad (EQ 2)$$

= (number of lines of integration x line time) - (410 pixel clocks of conversion time overhead) - (number of pixels of integration x pixel time)

where:

- Number of Lines of Integration (Auto Exposure Control: Enabled)
When automatic exposure control (AEC) is enabled, the number of lines of integration may vary from frame to frame, with the limits controlled by R0x311E (minimum auto exposure time) and R0x311C (maximum auto exposure time).
- Number of Lines of Integration (Auto Exposure Control: Disabled)
If AEC is disabled, the number of lines of integration equals the value in R0x3012 (context A) or R0x3016 (context B).
- Number of Pixels of Integration
The number of fine shutter width pixels is independent of AEC mode (enabled or disabled):
 - Context A: the number of pixels of integration equals the value in R0x3014.
 - Context B: the number of pixels of integration equals the value in R0x3018. Maximum value for $t_{INTFine}$ is *line length pixel clocks - 611*.

Typically, the value of the Coarse_Integration_Time register is limited to the number of lines per frame (which includes vertical blanking lines), such that the frame rate is not affected by the integration time. For more information on coarse and fine integration time settings limits, please refer to the Register Reference document.

Note: In HDR mode, there are specific limitations on coarse_integration_time due to the number of line buffers available. Please refer to the section called “HDR Specific Exposure Settings” on page 19.

For best image quality, it is recommended that the integration time be set to two rows or greater for the shortest exposure, particularly for monochrome sensors. For linear mode, this would be the coarse integration time (R0x3012). For HDR mode, the integration time should be set such that the T3 exposure is 2 rows or greater. Setting the exposure time to 1 row may result in non-uniformity between rows.

High Dynamic Range Mode

By default, the sensor powers up in Linear Mode, however, the MT9M024 can be configured to run in HDR mode. The HDR scheme used is multi-exposure HDR. This allows the sensor to handle 120dB of dynamic range. The sensor also features a linear mode. In HDR mode, the sensor sequentially captures three exposures by maintaining 3 separate read and reset pointers that are interleaved within the rolling shutter readout. The intermediate pixel values are stored in line buffers while waiting for the 3 exposures values to be present. As soon as a pixel's 3 exposure values are available, they are combined to create a linearized 20-bit value for each pixel's response. This 20-bit value is then optionally compressed back to a 12- or 14-bit value for output. For 14-bit mode, the compressing is lossless. In 12-bit mode, there is minimal data loss. Figure 17 shows the HDR data compression:

Figure 17: HDR Data Compression

The HDR mode is selected when Operation_Mode_Ctrl, R0x3082[1:0] = 0. Further controls on exposure time limits and compressing are controlled by R0x3082[5:2], and R0x31D0. More details can be found in the MT9M024 Register Reference.

In HDR mode, when compression is used, there are two types of knee-points: (i) T1/T2 and T2/T3 capture knee-points and (ii) POUT and POUT2 compression knee-points (Figure 17). Aligning the capture knee-points on top of the compression knee-points, can avoid code losses (SNR loss) in the compression. Table 5 and Table 6 below show the knee points for the different modes. Alternatively, the sensor automatically reports the knee points and can be read directly from registers R0x319A and R0x319C.

Table 5: Knee Points for Compression to 14 Bits

| T1/T2 Exposure Ratio (R1) R0x3082[3:2] | P1 | POUT ¹ = P1 | P2 | POUT2 = (P2 - P1)/ R1 + POUT1 | T2/T3 Exposure Ratio (R2) R0x3082[5:4] | P _{MAX} | POUT _{MAX} = (P _{MAX} - P2)/ (R1*R2) + POUT2 |
|---|-----------------|---------------------------|-----------------|----------------------------------|---|------------------|--|
| 4x | 2 ¹² | 4096 | 2 ¹⁴ | 7168 | 4x | 2 ¹⁶ | 10240 |
| | | | | | 8x | 2 ¹⁷ | 10752 |
| | | | | | 16x | 2 ¹⁸ | 11008 |

HDR Specific Exposure Settings

In HDR mode, pixel values are stored in line buffers while waiting for all 3 exposures to be available for final pixel data combination. There are 42 line buffers used to store intermediate T1 data. Due to this limitation, the maximum coarse integration time possible is equal to $42 \times T1/T2$ lines.

For example, if $R0x3082[3:2] = 2$, the sensor is set to have $T1/T2$ ratio = 16x. Therefore the maximum number of integration lines is $42 \times 16 = 672$ lines. If coarse integration time is greater than this, the T2 integration time will stay at 42. The sensor will calculate the ratio internally, enabling the linearization to be performed. If companding is being than relinearization would still follow the programmed ratio. For example if the $T1/T2$ ratio was programmed to 16x but coarse integration was increased beyond 672 than one would still use the 16x relinearization formulas.

An additional limitation is the maximum number of exposure lines in relation to the `frame_length_lines` register. In Linear mode, as described on page 20, $\text{maximum_coarse_integration_time} = \text{frame_length_lines} - 1$. However in HDR mode, since the coarse integration time register controls T1, the max coarse integration time is $\text{frame_length_lines} - 45$.

Putting the two criteria listed above together, it can be summarized as follows:

$$\text{maximum_coarse_integration_time} = \text{minimum}(42 \times T1/T2, \text{frame_length_lines} - 45) \quad (\text{EQ } 3)$$

In HDR mode, subline integration is not utilized. As such, fine integration time register changes will have no effect on the image.

There is also a limitation of the minimum number of exposure lines that can be used. This is summarized in the following formula:

$$\text{minimum_coarse_integration_time} = (0.5) \times (T1/T2) \times (T2/T3) \quad (\text{EQ } 4)$$

Due to limitation on the internal floating point calculation, the exact ratio specified by the `RATIO_T2_T3` (`R0x3082[5:4]`) may not be achievable.

When using companded output in combination with certain exposure ratios (other than $T1/T2 = 16x$ and $T2/T3 = 16x$), digital gain needs to be set to a fixed value. Table below provides the proper digital gain settings for each $T1/T2$ and $T2/T3$ ratio.

Table 7: Digital Gain Setting for Each $T1/T2$ and $T2/T3$ Ratio

| T1/T2 Ratio | T2/T3 Ratio | Setting for Digital Gain Register (0x305E Context A or 0x30C4 Context B) |
|-------------|-------------|---|
| 4 | 4 | 0x02h |
| 4 | 8 | 0x04h |
| 4 | 16 | 0x08h |
| 8 | 4 | 0x04h |
| 8 | 8 | 0x08h |
| 8 | 16 | 0x10h |
| 16 | 4 | 0x08h |
| 16 | 8 | 0x10h |
| 16 | 16 | Any legal value |

Motion Compensation

In typical multi-exposure HDR systems, motion artifacts can be created when objects move during the T1, T2 or T3 integration time. When this happens, edge artifacts can potentially be visible and might look like a ghosting effect.

To correct this feature, the MT9M024 has special 2D motion compensation circuitry that detects motion artifacts and corrects the image accordingly.

There are two motion compensation options available. One using the default HDR motion compensation by setting $R0x318C[14] = 1$. Additional parameters are available to control the extent of motion detection and correction as per the requirements of the specific application. These can be set in $R0x318C$ – $R0x3190$. The other is using the DLO method of HDR combination. When using DLO, $R0x318C[14]$ is ignored. DLO is enabled by setting $R0x3190[13] = 1$. Noise filtering is enabled by setting $R0x3190[14] = 1$. For more information, please refer to the MT9M024 Register Reference document.

Real-Time Context Switching

In the MT9M024, the user may switch between two full register sets (listed in Table 8) by writing to a context switch change bit in R0x30B0[13]. This context switch will change all registers (no shadowing) at the frame start time and have the new values apply to the immediate next exposure and readout time.

Table 8: Real-Time Context-Switch Registers

| Register Description | Register Number | |
|-------------------------|-----------------|--------------|
| | Context A | Context B |
| Y_Addr_Start | R0x3002 | R0x308C |
| X_Addr_Start | R0x3004 | R0x308A |
| Y_Addr_End | R0x3006 | R0x3090 |
| X_Addr_End | R0x3008 | R0x308E |
| Coarse_Integration_Time | R0x3012 | R0x3016 |
| Fine_Integration_Time | R0x3014 | R0x3018 |
| Y_Odd_Inc | R0x30A6 | R0x30A8 |
| Column Gain | R0x30B0[5:4] | R0x30B0[9:8] |
| Green1_Gain (GreenR) | R0x3056 | R0x30BC |
| Blue_Gain | R0x3058 | R0x30BE |
| Red_Gain | R0x305A | R0x30C0 |
| Green2_Gain (GreenB) | R0x305C | R0x30C2 |
| Global_Gain | R0x305E | R0x30C4 |
| Frame_Length_Lines | R0x300A | R0x30AA |

| Operation_Mode_Ctrl | 0x3082 | 0x3084 |

Features

See the MT9M024 Register Reference for additional details.

Reset

The MT9M024 may be reset by using RESET_BAR (active LOW) or the reset register.

Hard Reset of Logic

The RESET_BAR pin can be connected to an external RC circuit for simplicity. The recommended RC circuit uses a 10kΩ resistor and a 0.1μF capacitor. The rise time for the RC circuit is 1μs maximum.

Soft Reset of Logic

Soft reset of logic is controlled by the R0x301A Reset register. Bit 0 is used to reset the digital logic of the sensor while preserving the existing two-wire serial interface configuration. Furthermore, by asserting the soft reset, the sensor aborts the current frame it is processing and starts a new frame. This bit is a self-resetting bit and also returns to “0” during two-wire serial interface reads.

Clocks

The MT9M024 requires one clock input (EXTCLK).

PLL-Generated Master Clock

The PLL contains a prescaler to divide the input clock applied on EXTCLK, a VCO to multiply the prescaler output, and two divider stages to generate the output clock. The clocking structure is shown in Figure 18. PLL control registers can be programmed to generate desired master clock frequency.

Note: The PLL control registers must be programmed while the sensor is in the software Standby state. The effect of programming the PLL divisors while the sensor is in the streaming state is undefined.

Figure 18: PLL-Generated Master Clock PLL Setup

The PLL is enabled by default on the MT9M024. To configure and use the PLL:

1. Bring the MT9M024 up as normal; make sure that f_{EXTCLK} is between 6 and 50MHz and ensure the sensor is in software standby ($R0x301A-B[2]=0$). PLL control registers must be set in software standby.
2. Set `pll_multiplier`, `pre_pll_clk_div`, `vt_sys_clk_div`, and `vt_pix_clk_div` based on the desired input (f_{EXTCLK}) and output (f_{PIXCLK}) frequencies. Determine the M, N, P1, and P2 values to achieve the desired f_{PIXCLK} using this formula:

$$f_{PIXCLK} = (f_{EXTCLK} \times M) / (N \times P1 \times P2)$$

where

$M = PLL_Multiplier$

$N = Pre_PLL_Clk_Div$

$P1 = Vt_Sys_Clk_Div$

$P2 = Vt_PIX_Clk_Div$

3. Wait 1ms to ensure that the VCO has locked.
4. Set $R0x301A[2]=1$ to enable streaming and to switch from EXTCLK to the PLL-generated clock.

- Notes:**
1. The PLL can be bypassed at any time (sensor will run directly off EXTCLK) by setting $R0x30B0[14]=1$. The PLL is always bypassed in software standby mode. To disable the PLL, the sensor must be in standby mode ($R0x301A[2] = 0$)
 2. The following restrictions apply to the PLL tuning parameters:

$$32 \leq M \leq 255$$

$$1 \leq N \leq 63$$

$$1 \leq P1 \leq 16 (P1 = 1, 2, 4, 6, 8, 10, 12, 14, 16)$$

$$4 \leq P2 \leq 16$$

3. The VCO frequency, defined as $f_{VCO} = f_{EXTCLK} \times M/N$ must be within 384-768 MHz.
4. When PLL_Multiplier is odd, $2 \text{ MHz} \leq f_{EXTCLK} / N \leq 24 \text{ MHz}$
5. If using HiSPi output mode, use the following settings for P2 (Vt_Pix_Clk_Div).
 - 5a. If 20-bit mode (4 lanes): set P2 (R0x302A) = 5
 - 5b. If 12-/14-bit mode (3 lanes): set P2 (R0x302A) = 5
 - 5c. If 12-bit mode (2 lanes): set P2 (R0x302A) = 6
 - 5d. If 14-bit mode (2 lanes): set P2 (R0x302A) = 7

The user can utilize the Register Wizard tool accompanying DevWare to generate PLL settings given a supplied input clock and desired output frequency.

Spread-Spectrum Clocking

To facilitate improved EMI performance, the external clock input allows for spread spectrum sources, with no impact on image quality. Limits of the spread spectrum input clock are:

- 5% maximum clock modulation
- 35 KHz maximum modulation frequency
- Accepts triangle wave modulation, as well as sine or modified triangle modulations.

Stream/Standby Control

The sensor supports two standby modes: Hard Standby and Soft Standby. In both modes, external clock can be optionally disabled to further minimize power consumption. If this is done, then the “Power-Up Sequence” on page 54 must be followed.

Soft Standby

Soft Standby is a low power state that is controlled through register R0x301A[2]. Depending on the value of R0x301A[4], the sensor will go to standby after completion of the current frame readout (default behavior) or after the completion of the current row readout. When the sensor comes back from Soft Standby, previously written register settings are still maintained. Soft standby will not occur if the TRIGGER pin is held high.

A specific sequence needs to be followed to enter and exit from Soft Standby.

Entering Soft Standby:

1. Set R0x301A[2] = 0 and drive the TRIGGER pin LOW.
2. External clock can be turned off to further minimize power consumption (Optional)

Exiting Soft Standby:

1. Enable external clock if it was turned off
2. R0x301A[2] = 1 or drive the TRIGGER pin HIGH.

Hard Standby

Hard Standby puts the sensor in lower power state; previously written register settings are still maintained.

A specific sequence needs to be followed to enter and exit from Hard Standby.

Entering Hard Standby:

1. R0x301A[8] = 1
2. Assert STANDBY pin
3. External clock can be turned off to further minimize power consumption (Optional)

Exiting Hard Standby:

1. Enable external clock if it was turned off
2. De-assert STANDBY pin
3. Set R0x301A[8] = 0

Window Control

Registers x_addr_start, x_addr_end, y_addr_start, and y_addr_end control the size and starting coordinates of the image window.

The exact window height and width out of the sensor is determined by the difference between the Y address start and end registers or the X address start and end registers, respectively.

The MT9M024 allows different window sizes for context A and context B.

Blanking Control

Horizontal blank and vertical blank times are controlled by the line_length_pck and frame_length_lines registers, respectively.

- Horizontal blanking is specified in terms of pixel clocks. It is calculated by subtracting the X window size from the line_length_pck register. The minimum horizontal blanking is 370 pixel clocks.
- Vertical blanking is specified in terms of numbers of lines. It is calculated by subtracting the Y window size from the frame_length_lines register. The minimum vertical blanking is 26 lines.

The actual imager timing can be calculated using Table 3 on page 15 and Table 4 on page 16, which describe the Line Timing and FV/LV signals.

When in HDR mode, the maximum size is 1280 x 960.

Readout Modes

Digital Binning

By default, the resolution of the output image is the full width and height of the FOV as defined above. The output resolution can be reduced by digital binning. For RGB and monochrome mode, this is set by the register R0x3032. For Context A, use bits [1:0], for Context B, use bits [5:4]. Available settings are:

00 = No binning

01 = Horizontal binning

10 = Horizontal and vertical binning

Binning gives the advantage of reducing noise at the cost of reduced resolution. When both horizontal and vertical binning are used, a 2x improvement in SNR is achieved, therefore improving low light performance. Binning results in a smaller resolution image, but the FOVs between the binned and unbinned images are the same.

Bayer Space Resampling

All of the pixels in the FOV contribute to the output image in digital binning mode. This can result in a more pleasing output image with reduced subsampling artifacts. It also improves low-light performance. For RGB mode, resampling can be enabled by setting of register 0x306E[4] = 1.

Mirror

Column Mirror Image

By setting R0x3040[14] = 1, the readout order of the columns is reversed, as shown in Figure 19. The starting Bayer color pixel is maintained in this mode by a 1-pixel shift in the imaging array.

When using horizontal mirror mode, the user must retrigger column correction. Please refer to the column correction section to see the procedure for column correction retriggering. Bayer resampling must be enabled, by setting bit 4 of register 0x306E[4] = 1.

Figure 19: Eight Pixels in Normal and Column Mirror Readout Modes

Row Mirror Image

By setting R0x3040[15] = 1, the readout order of the rows is reversed as shown in Figure 20. The starting Bayer color pixel is maintained in this mode by a 1-pixel shift in the imaging array. When using horizontal mirror mode, the user must retrigger column correction. Please refer to the column correction section to see the procedure for column correction retriggering.

Figure 20: Six Rows in Normal and Row Mirror Readout Modes

Maintaining a Constant Frame Rate

Maintaining a constant frame rate while continuing to have the ability to adjust certain parameters is the desired scenario. This is not always possible, however, because register updates are synchronized to the read pointer, and the shutter pointer for a frame is usually active during the readout of the previous frame. Therefore, any register changes that could affect the row time or the set of rows sampled causes the shutter pointer to start over at the beginning of the next frame.

By default, the following register fields cause a “bubble” in the output rate (that is, the vertical blank increases for one frame) if they are written in video mode, even if the new value would not change the resulting frame rate. The following list shows only a few examples of such registers; a full listing can be seen in the MT9M024 Register Reference.

- x_addr_start
- x_addr_end
- y_addr_start
- y_addr_end
- frame_length_lines
- line_length_pclk
- coarse_integration_time
- fine_integration_time
- read_mode

The size of this bubble is $(\text{Integration_Time} \times t_{\text{ROW}})$, calculating the row time according to the new settings.

The Coarse_Integration_Time and Fine_Integration_Time fields may be written to without causing a bubble in the output rate under certain circumstances. Because the shutter sequence for the next frame often is active during the output of the current frame, this would not be possible without special provisions in the hardware. Writes to these registers take effect two frames after the frame they are written, which allows the integration time to increase without interrupting the output or producing a corrupt frame (as long as the change in integration time does not affect the frame time).

Synchronizing Register Writes to Frame Boundaries

Changes to most register fields that affect the size or brightness of an image take effect on two frames after the one during which they are written. These fields are noted as “synchronized to frame boundaries” in the MT9M024 Register Reference. To ensure that a register update takes effect on the next frame, the write operation must be completed after the leading edge of FV and before the trailing edge of FV.

As a special case, in single frame mode, register writes that occur after FV but before the next trigger will take effect immediately on the next frame, as if there had been a Restart. However, if the trigger for the next frame occurs during FV, register writes take effect as with video mode.

Fields not identified as being frame-synchronized are updated immediately after the register write is completed. The effect of these registers on the next frame can be difficult to predict if they affect the shutter pointer.

Restart

To restart the MT9M024 at any time during the operation of the sensor, write a “1” to the Restart register (R0x301A[1] = 1). This has two effects: first, the current frame is interrupted immediately. Second, any writes to frame-synchronized registers and the shutter width registers take effect immediately, and a new frame starts (in video mode). The current row completes before the new frame is started, so the time between issuing the Restart and the beginning of the next frame can vary by about t_{ROW} .

Image Acquisition Modes

The MT9M024 supports two image acquisition modes: video(master) and single frame.

Video

The video mode takes pictures by scanning the rows of the sensor twice. On the first scan, each row is released from reset, starting the exposure. On the second scan, the row is sampled, processed, and returned to the reset state. The exposure for any row is therefore the time between the first and second scans. Each row is exposed for the same duration, but at slightly different point in time, which can cause a shear in moving subjects as is typical with electronic rolling shutter sensors.

Single Frame

The single-frame mode operates similar to the video mode. It also scans the rows of the sensor twice, first to reset the rows and second to read the rows. Unlike video mode where a continuous stream of images are output from the image sensor, the single-frame mode outputs a single frame in response to a high state placed on the TRIGGER input pin. As long as the TRIGGER pin is held in a high state, new images will be read out. After the TRIGGER pin is returned to a low state, the image sensor will not output any new images and will wait for the next high state on the TRIGGER pin.

The TRIGGER pin state is detected during the vertical blanking period (i.e. the FV signal is low). The pin is level sensitive rather than edge sensitive. As such, image integration will only begin when the sensor detects that the TRIGGER pin has been held high for 3 consecutive clock cycles. If the trigger signal is applied to multiple sensors at the same time, the single frame output of the sensors will be synchronized to within 1 PIXCLK if PLL disabled or 2 PIXCLKs if PLL is enabled.

During integration time of single-frame mode and video mode, the FLASH output pin is at high.

Continuous Trigger

In certain applications, multiple sensors need to have their video streams synchronized (E.g. surround view or panorama view applications). The TRIGGER pin can also be used to synchronize output of multiple image sensors together and still get a video stream. This is called continuous trigger mode. Continuous trigger is enabled by holding the

TRIGGER pin high. Alternatively, the TRIGGER pin can be held high until the stream bit is enabled (R0x301A[2]=1) then can be released for continuous synchronized video streaming.

If the TRIGGER pins for all connected MT9M024 sensors are connected to the same control signal, all sensors will receive the trigger pulse at the same time. If they are configured to have the same frame timing, then the usage of the TRIGGER pin guarantees that all sensors will be synchronized within 1 PIXCLK cycle if PLL is disabled, or 2 PIXCLK cycles if PLL is enabled.

With continuous trigger mode, the application can now make use of the video streaming mode while guaranteeing that all sensor outputs are synchronized. As long as the initial trigger for the sensors takes place at the same time, all subsequent video streams will be synchronous.

Temperature Sensor

The MT9M024 sensor has a built-in PTAT-based temperature sensor, accessible through registers, that is capable of measuring die junction temperature.

The temperature sensor can be enabled by writing R0x30B4[0]=1 and R0x30B4[4]=1. After this, the temperature sensor output value can be read from R0x30B2[10:0].

The value read out from the temperature sensor register is an ADC output value that needs to be converted downstream to a final temperature value in degrees Celsius. Since the PTAT device characteristic response is quite linear in the temperature range of operation required, a simple linear function in the format of listed in the equation below can be used to convert the ADC output value to the final temperature in degrees Celsius.

$$Temperature = slope \times R0x30B2[10:0] + T_0 \quad (EQ\ 5)$$

For this conversion, a minimum of 2 known points are needed to construct the line formula by identifying the slope and y-intercept " T_0 ". These calibration values can be read from registers R0x30C6 and R0x30C8 which correspond to value read at 70°C and 55°C respectively. Once read, the slope and y-intercept values can be calculated and used in the above equation.

For more information on the temperature sensor registers, refer to the MT9M024 Register Reference.

Automatic Exposure Control

The integrated automatic exposure control (AEC) is responsible for ensuring that optimal settings of exposure and gain are computed and updated every other frame. AEC can be enabled or disabled by R0x3100[0].

When AEC is disabled (R0x3100[0] = 0), the sensor uses the manual exposure value in coarse and fine shutter width registers and the manual gain value in the gain registers.

When AEC is enabled (R0x3100[0]=1), the target luma value in linear mode is set by R0x3102. For the MT9M024 this target luma has a default value of 0x0800 or about half scale. For HDR mode, the luma target maximum auto exposure value is limited by R0x311C; the minimum auto exposure is limited by R0x311E. These values are in units of line-times.

The exposure control measures current scene luminosity by accumulating a histogram of pixel values while reading out a frame. It then compares the current luminosity to the desired output luminosity. Finally, the appropriate adjustments are made to the exposure time and gain. All pixels are used, regardless of color or mono mode. In HDR mode, the coarse and fine integration time is the longest integration time of the three integration, the other two shorter integration are generated automatically base on the pre-defined exposure ratios. When using non-default HDR exposure ratios, auto_dg_en should not be enabled (R0x3100[4] = 0) due to required digital gains as documented in Table 7, "Digital Gain Setting for Each T1/T2 and T2/T3Ratio," on page 19.

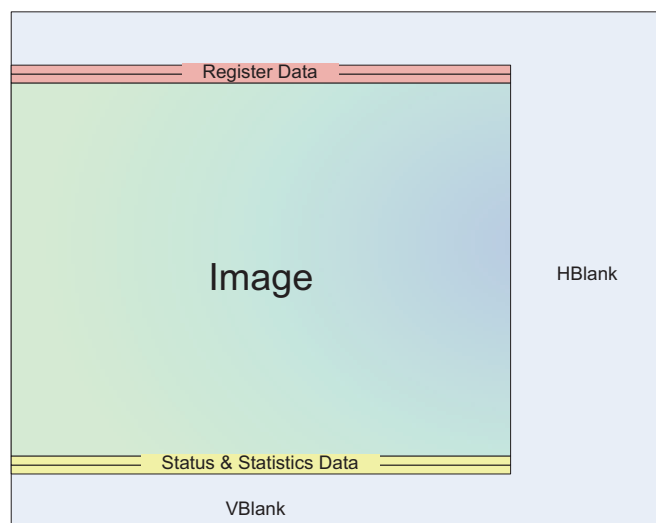

Embedded Data and Statistics

The MT9M024 has the capability to output image data and statistics embedded within the frame timing. There are 2 types of information embedded within the frame readout:

1. Embedded Data: If enabled, these are displayed on the 2 rows immediately before the first active pixel row is displayed.
2. Embedded Statistics: If enabled, these are displayed on the 2 rows immediately after the last active pixel row is displayed.

Note: Embedded data and embedded statistics must be enabled or disabled together.

Figure 21: Frame Format with Embedded Data Lines Enabled

Embedded Data

The embedded data contains the configuration of the image being displayed. This includes all register settings used to capture the current frame. The registers embedded in these rows are as follows:

Line 1: Registers R0x3000 to R0x312F

Line 2: Registers R0x3136 to R0x31BF, R0x31D0 to R0x31FF

Note: All non-defined registers will have a value of 0.

In parallel mode, since the pixel word depth is 12-bits/pixel, the sensor 16-bit register data will be transferred over 2 pixels where the register data will be broken up into 8msb and 8lsb. The alignment of the 8bit data will be on the 8MSB bits of the 12-bit pixel word. For example, if a register value of 0x1234 is to be transmitted, it will be transmitted over 2, 12-bit pixels as follows: 0x120, 0x340.

The first pixel of each line in the embedded data is a tag value of 0x0A0. This signifies that all subsequent data is 8 bit data aligned to the MSB of the 12-bit pixel.

The figure below summarizes how the embedded data transmission looks like. It should be noted that data, as shown in Figure 22, is aligned to the MSB of each word:

Figure 22: Format of Embedded Data Output within a Frame

The data embedded in these rows are as follows:

- 0x0A0 - identifier
- 0xAA0
- Register Address MSB of the first register
- 0xA50
- Register Address LSB of the first register
- 0x5A0
- Register Value MSB of the first register addressed
- 0x5A0
- Register Value LSB of the first register addressed
- 0x5A0
- Register Value MSB of the register at first address + 2
- 0x5A0
- Register Value LSB of the register at first address + 2
- 0x5A0
- etc.

Embedded Statistics

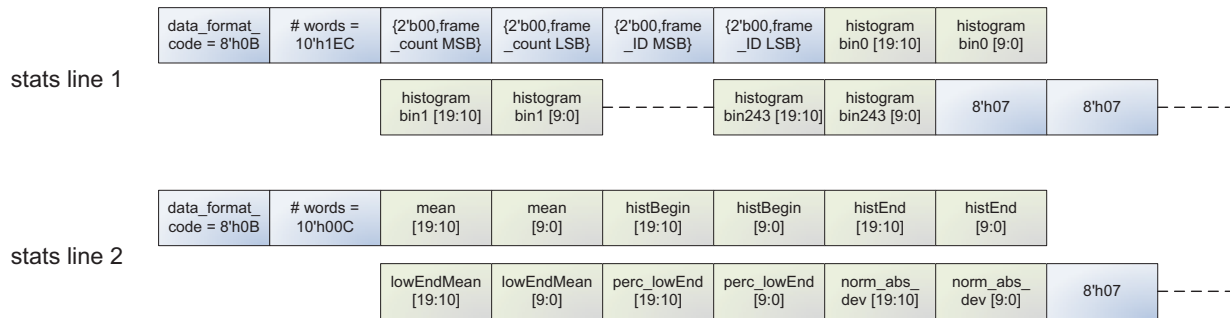

The embedded statistics contain frame identifiers and histogram information of the image in the frame. This can be used by downstream auto-exposure algorithm blocks to make decisions about exposure adjustment.

This histogram is divided into 244 bins with a bin spacing of 64 evenly spaced bins for digital code values 0 to 2^{12} , 120 evenly spaced bins for values 2^{12} to 2^{16} , 60 evenly spaced bins for values 2^{16} to 2^{20} . In HDR with a 16x exposure ratio, this approximately corresponds to the T1, T2, T3 exposures respectively.

The first pixel of each line in the embedded statistics is a tag value of 0x0B0. This signifies that all subsequent statistics data is 10 bit data aligned to the MSB of the 12-bit pixel.

The figure below summarizes how the embedded statistics transmission looks like. It should be noted that data, as shown in Figure 23, is aligned to the msb of each word:

Figure 23: Format of Embedded Statistics Output within a Frame

The statistics embedded in these rows are as follows:

Line 1:

- 0x0B0 - (identifier)
- Register 0x303A - frame_count
- Register 0x31D2 - frame ID
- Histogram data - histogram bins 0-243

Line 2:

- 0x0B0 (identifier)
- Mean
- Histogram Begin
- Histogram End
- Low End Histogram Mean
- Percentage of Pixels Below Low End Mean
- Normal Absolute Deviation

Gain

Digital Gain

Digital gain can be controlled globally by R0x305E (Context A) or R0x30C4 (Context B). There are also registers that allow individual control over each Bayer color (GreenR, GreenB, Red, Blue).

The format for digital gain setting is *xxx.yyyy* where 0b00100000 represents a 1x gain setting and 0b00110000 represents a 1.5x gain setting. The step size for *yyyy* is 0.03125 while the step size for *xxx* is 1. Therefore to set a gain of 2.09375 one would set digital gain to 01000011.

Analog Gain

The MT9M024 has a column parallel architecture and therefore has an Analog gain stage per column.

There are 2 stages of analog gain, the first stage can be set to 1x, 2x, 4x or 8x. This can be set in R0x30B0[5:4](Context A) or R0x30B0[9:8] (Context B). The second stage is capable of setting an additional 1x or 1.25x gain which can be set in R0x3EE4[9:8].

This allows the maximum possible analog gain to be set to 10x.

Black Level Correction

Black level correction is handled automatically by the image sensor. No adjustments are provided except to enable or disable this feature. Setting R0x30EA[15] disables the automatic black level correction. Default setting is for automatic black level calibration to be enabled.

The automatic black level correction measures the average value of pixels from a set of optically black lines in the image sensor. The pixels are averaged as if they were light-sensitive and passed through the appropriate gain. This line average is then digitally low-pass filtered over many frames to remove temporal noise and random instabilities associated with this measurement. The new filtered average is then compared to a minimum acceptable level, low threshold, and a maximum acceptable level, high threshold. If the average is lower than the minimum acceptable level, the offset correction value is increased by a predetermined amount. If it is above the maximum level, the offset correction value is decreased by a predetermined amount. The high and low thresholds have been calculated to avoid oscillation of the black level from below to above the targeted black level.

Row-wise Noise Correction

Row (Line)-wise Noise Correction is handled automatically by the image sensor. No adjustments are provided except to enable or disable this feature. Clearing R0x3044[10] disables the row noise correction. Default setting is for row noise correction to be enabled.

Row-wise noise correction is performed by calculating an average from a set of optically black pixels at the start of each line and then applying each average to all the active pixels of the line.

Column Correction

The MT9M024 uses column parallel readout architecture to achieve fast frame rate. Without any corrections, the consequence of this architecture is that different column signal paths have slightly different offsets that might show up on the final image as structured fixed pattern noise.

MT9M024 has column correction circuitry that measures this offset and removes it from the image before output. This is done by sampling dark rows containing tied pixels and measuring an offset coefficient per column to be corrected later in the signal path.

Column correction can be enabled/disabled via R0x30D4[15]. Additionally, the number of rows used for this offset coefficient measurement is set in R0x30D4[3:0]. By default this register is set to 0x7, which means that 8 rows are used. This is the recommended value. Other control features regarding column correction can be viewed in the MT9M024 Register reference. Any changes to column correction settings need to be done when the sensor streaming is disabled and the appropriate triggering sequence must be followed as described below.

Column Correction Triggering

Column correction requires a special procedure to trigger depending on which state the sensor is in.

Column Triggering on Startup

When streaming the sensor for the first time after powerup, a special sequence needs to be followed to make sure that the column correction coefficients are internally calculated properly.

1. Follow proper power up sequence for power supplies and clocks.
2. Apply sequencer settings if needed (Linear or HDR mode).
3. Apply frame timing and PLL settings as required by application.
4. Set analog gain to 1x and low conversion gain (R0x30B0=0x1300)
5. Enable column correction and settings (R0x30D4=0xE007).
6. Disable auto re-trigger for change in conversion gain or col_gain, and enable column correction always (R0x30BA = 0x0008).
7. Enable streaming (R0x301A[2]=1) or drive the TRIGGER pin HIGH.
8. Wait 9 frames to settle (First frame after coming up from standby is internally column correction disabled).
9. Disable streaming (R0x301A[2]=0).

After this, the sensor has calculated the proper column correction coefficients and the sensor is ready for streaming. Any other settings (including gain, integration time and conversion gain etc.) can be done afterwards without affecting column correction.

Column Correction Retriggering Due to Mode Change

Since column offsets is sensitive to changes in the analog signal path, such changes require column correction circuitry to be retriggered for the new path. Examples of such mode changes include: horizontal mirror, vertical mirror, changes to column correction settings.

When such changes take place, the following sequence needs to take place:

1. Disable streaming (R0x301A[2]=0) or drive the TRIGGER pin LOW.
2. Enable streaming (R0x301A[2]=1) or drive the TRIGGER pin HIGH.
3. Wait 9 frames to settle.

Note: The above steps are not needed if the sensor is being reset (soft or hard reset) upon the mode change.

Defective Pixel Correction

Defective Pixel Correction is intended to compensate for defective pixels by replacing their value with a value based on the surrounding pixels, making the defect less noticeable to the human eye. The defect pixel correction feature supports up to 200 defects.

The locations of defective pixels are stored in a table on chip during the manufacturing process; this table is accessible through the two-wire serial interface. There is no provision for later augmenting the defect table entries.

The DPC algorithm is one-dimensional, calculating the resulting averaged pixel value based on nearby pixels within a row. The algorithm distinguishes between color and monochrome parts; for color parts, the algorithm uses nearest neighbor in the same color plane.

At high gain, long exposure, and high temperature conditions, the performance of this function can degrade.

Test Patterns

The MT9M024 has the capability of injecting a number of test patterns into the top of the datapath to debug the digital logic. With one of the test patterns activated, any of the datapath functions can be enabled to exercise it in a deterministic fashion. Test patterns are selected by Test_Pattern_Mode register (R0x3070). Only one of the test patterns can be enabled at a given point in time by setting the Test_Pattern_Mode register according to Table 9. When test patterns are enabled the active area will receive the value specified by the selected test pattern and the dark pixels will receive the value in Test_Pattern_Green (R0x3074 and R0x3078) for green pixels, Test_Pattern_Blue (R0x3076) for blue pixels, and Test_Pattern_Red (R0x3072) for red pixels.

Note: Turn off black level calibration (BLC) when Test Pattern is enabled.

Table 9: Test Pattern Modes

| Test_Pattern_Mode | Test Pattern Output |
|-------------------|-------------------------------------|
| 0 | No test pattern (normal operation) |
| 1 | Solid color test pattern |
| 2 | 100% color bar test pattern |
| 3 | Fade-to-gray color bar test pattern |
| 256 | Walking 1s test pattern (12-bit) |

Color Field

When the color field mode is selected, the value for each pixel is determined by its color. Green pixels will receive the value in Test_Pattern_Green, red pixels will receive the value in Test_Pattern_Red, and blue pixels will receive the value in Test_Pattern_Blue.

Vertical Color Bars

When the vertical color bars mode is selected, a typical color bar pattern will be sent through the digital pipeline.

Walking 1s

When the walking 1s mode is selected, a walking 1s pattern will be sent through the digital pipeline. The first value in each row is 1.

Two-Wire Serial Register Interface

The two-wire serial interface bus enables read/write access to control and status registers within the MT9M024. The interface protocol uses a master/slave model in which a master controls one or more slave devices. The sensor acts as a slave device. The master generates a clock (SCLK) that is an input to the sensor and is used to synchronize transfers. Data is transferred between the master and the slave on a bidirectional signal (SDATA). SDATA is pulled up to VDD_IO off-chip by a 1.5kΩ resistor. Either the slave or master device can drive SDATA LOW—the interface protocol determines which device is allowed to drive SDATA at any given time.

The protocols described in the two-wire serial interface specification allow the slave device to drive SCLK LOW; the MT9M024 uses SCLK as an input only and therefore never drives it LOW.

Protocol

Data transfers on the two-wire serial interface bus are performed by a sequence of low-level protocol elements:

1. a (repeated) start condition
2. a slave address/data direction byte
3. an (a no) acknowledge bit
4. a message byte
5. a stop condition

The bus is idle when both SCLK and SDATA are HIGH. Control of the bus is initiated with a start condition, and the bus is released with a stop condition. Only the master can generate the start and stop conditions.

Start Condition

A start condition is defined as a HIGH-to-LOW transition on SDATA while SCLK is HIGH. At the end of a transfer, the master can generate a start condition without previously generating a stop condition; this is known as a “repeated start” or “restart” condition.

Stop Condition

A stop condition is defined as a LOW-to-HIGH transition on SDATA while SCLK is HIGH.

Data Transfer

Data is transferred serially, 8 bits at a time, with the MSB transmitted first. Each byte of data is followed by an acknowledge bit or a no-acknowledge bit. This data transfer mechanism is used for the slave address/data direction byte and for message bytes.

One data bit is transferred during each SCLK clock period. SDATA can change when SCLK is LOW and must be stable while SCLK is HIGH.

Slave Address/Data Direction Byte

Bits [7:1] of this byte represent the device slave address and bit [0] indicates the data transfer direction. A “0” in bit [0] indicates a WRITE, and a “1” indicates a READ. The default slave addresses used by the MT9M024 are 0x20 (write address) and 0x21 (read address) in accordance with the specification. Alternate slave addresses of 0x30 (write address) and 0x31 (read address) can be selected by enabling and asserting the SADDR input.

An alternate slave address can also be programmed through R0x31FC.

Message Byte

Message bytes are used for sending register addresses and register write data to the slave device and for retrieving register read data.

Acknowledge Bit

Each 8-bit data transfer is followed by an acknowledge bit or a no-acknowledge bit in the SCLK clock period following the data transfer. The transmitter (which is the master when writing, or the slave when reading) releases SDATA. The receiver indicates an acknowledge bit by driving SDATA LOW. As for data transfers, SDATA can change when SCLK is LOW and must be stable while SCLK is HIGH.

No-Acknowledge Bit

The no-acknowledge bit is generated when the receiver does not drive SDATA LOW during the SCLK clock period following a data transfer. A no-acknowledge bit is used to terminate a read sequence.

Typical Sequence

A typical READ or WRITE sequence begins by the master generating a start condition on the bus. After the start condition, the master sends the 8-bit slave address/data direction byte. The last bit indicates whether the request is for a read or a write, where a “0” indicates a write and a “1” indicates a read. If the address matches the address of the slave device, the slave device acknowledges receipt of the address by generating an acknowledge bit on the bus.

If the request was a WRITE, the master then transfers the 16-bit register address to which the WRITE should take place. This transfer takes place as two 8-bit sequences and the slave sends an acknowledge bit after each sequence to indicate that the byte has been received. The master then transfers the data as an 8-bit sequence; the slave sends an acknowledge bit at the end of the sequence. The master stops writing by generating a (re)start or stop condition.

If the request was a READ, the master sends the 8-bit write slave address/data direction byte and 16-bit register address, the same way as with a WRITE request. The master then generates a (re)start condition and the 8-bit read slave address/data direction byte, and clocks out the register data, eight bits at a time. The master generates an acknowledge bit after each 8-bit transfer. The slave’s internal register address is automatically incremented after every 8 bits are transferred. The data transfer is stopped when the master sends a no-acknowledge bit.

Single READ from Random Location

This sequence (Figure 24) starts with a dummy WRITE to the 16-bit address that is to be used for the READ. The master terminates the WRITE by generating a restart condition. The master then sends the 8-bit read slave address/data direction byte and clocks out one byte of register data. The master terminates the READ by generating a no-acknowledge bit followed by a stop condition. Figure 24 shows how the internal register address maintained by the MT9M024 is loaded and incremented as the sequence proceeds.

Figure 24: Single READ from Random Location

Single READ from Current Location

This sequence (Figure 25) performs a read using the current value of the MT9M024 internal register address. The master terminates the READ by generating a no-acknowledge bit followed by a stop condition. The figure shows two independent READ sequences.

Figure 25: Single READ from Current Location

Sequential READ, Start from Random Location

This sequence (Figure 26) starts in the same way as the single READ from random location (Figure 24). Instead of generating a no-acknowledge bit after the first byte of data has been transferred, the master generates an acknowledge bit and continues to perform byte READs until "L" bytes have been read.

Figure 26: Sequential READ, Start from Random Location

Sequential READ, Start from Current Location

This sequence (Figure 27) starts in the same way as the single READ from current location (Figure 25). Instead of generating a no-acknowledge bit after the first byte of data has been transferred, the master generates an acknowledge bit and continues to perform byte READs until “L” bytes have been read.

Figure 27: Sequential READ, Start from Current Location

Single WRITE to Random Location

This sequence (Figure 28) begins with the master generating a start condition. The slave address/data direction byte signals a WRITE and is followed by the HIGH then LOW bytes of the register address that is to be written. The master follows this with the byte of write data. The WRITE is terminated by the master generating a stop condition.

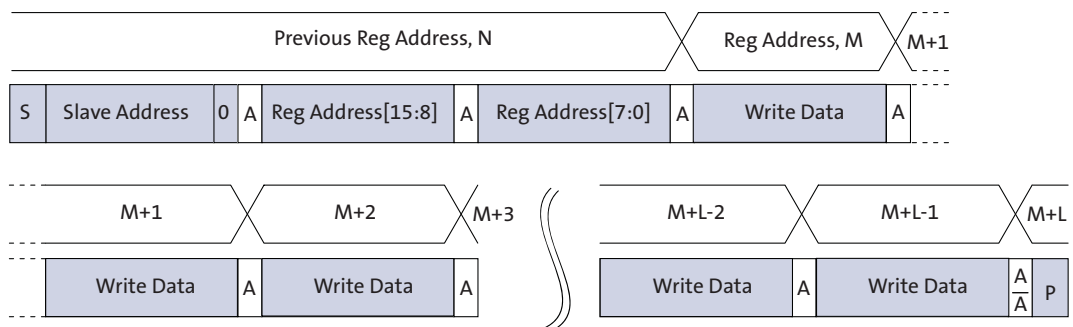

Figure 28: Single WRITE to Random Location

Sequential WRITE, Start at Random Location

This sequence (Figure 29) starts in the same way as the single WRITE to random location (Figure 28). Instead of generating a no-acknowledge bit after the first byte of data has been transferred, the master generates an acknowledge bit and continues to perform byte WRITES until “L” bytes have been written. The WRITE is terminated by the master generating a stop condition.

Figure 29: Sequential WRITE, Start at Random Location

Spectral Characteristics

Figure 31: Estimated Quantum Efficiency – Monochrome Sensor

Electrical Specifications

Unless otherwise stated, the following specifications apply to the following conditions:

$V_{DD} = 1.8V - 0.10/+0.15$; $V_{DD_IO} = V_{DD_PLL} = V_{AA} = V_{AA_PIX} = 2.8V \pm 0.3V$;

$T_A = -30^{\circ}C$ to $+70^{\circ}C$; output load = 10pF;

frequency = 74.25 MHz; HiSPi off.

Two-Wire Serial Register Interface

The electrical characteristics of the two-wire serial register interface (SCLK, SDATA) are shown in Figure 32 and Table 10.

Figure 32: Two-Wire Serial Bus Timing Parameters

Note: Read sequence: For an 8-bit READ, read waveforms start after WRITE command and register address are issued.

Table 10: Two-Wire Serial Bus Characteristics

$f_{EXTCLK} = 27$ MHz; $V_{DD} = 1.8V$; $V_{DD_IO} = 2.8V$; $V_{AA} = 2.8V$; $V_{AA_PIX} = 2.8V$;

$V_{DD_PLL} = 2.8V$; $V_{DD_DAC} = 2.8V$; $T_A = 25^{\circ}C$

| Parameter | Symbol | Standard-Mode | | Fast-Mode | | Unit |
|---|--------------|----------------|-------------------|------------------|------------------|---------|
| | | Min | Max | Min | Max | |
| SCLK Clock Frequency | f_{SCL} | 0 | 100 | 0 | 400 | KHz |
| Hold time (repeated) START condition. | | | | | | |
| After this period, the first clock pulse is generated | $t_{HD;STA}$ | 4.0 | - | 0.6 | - | μS |
| LOW period of the SCLK clock | t_{LOW} | 4.7 | - | 1.3 | - | μS |
| HIGH period of the SCLK clock | t_{HIGH} | 4.0 | - | 0.6 | - | μS |
| Set-up time for a repeated START condition | $t_{SU;STA}$ | 4.7 | - | 0.6 | - | μS |

| SDATA pull-up resistor | RSD | 1.5 | 4.7 | 1.5 | 4.7 | $\text{K}\Omega$ |

- Notes:
1. This table is based on I²C standard (v2.1 January 2000). Philips Semiconductor.
 2. Two-wire control is I²C-compatible.
 3. All values referred to $V_{IHmin} = 0.9 V_{DD}$ and $V_{ILmax} = 0.1 V_{DD}$ levels. Sensor EXCLK = 27 MHz.
 4. A device must internally provide a hold time of at least 300 ns for the SDATA signal to bridge the undefined region of the falling edge of SCLK.
 5. The maximum $t_{HD;DAT}$ has only to be met if the device does not stretch the LOW period (t_{LOW}) of the SCLK signal.
 6. A Fast-mode I²C-bus device can be used in a Standard-mode I²C-bus system, but the requirement $t_{SU;DAT} = 250 \text{ ns}$ must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCLK signal. If such a device does stretch the LOW period of the SCLK signal, it must output the next data bit to the SDATA line $t_r \text{ max} + t_{SU;DAT} = 1000 + 250 = 1250 \text{ ns}$ (according to the Standard-mode I²C-bus specification) before the SCLK line is released.
 7. C_b = total capacitance of one bus line in pF.

I/O Timing

By default, the MT9M024 launches pixel data, FV, and LV with the falling edge of PIXCLK. The expectation is that the user captures DOUT[11:0], FV, and LV using the rising edge of PIXCLK. This can be changed using register R0x3028.

See Figure 33 and Table 11 for I/O timing (AC) characteristics.

Figure 33: I/O Timing Diagram

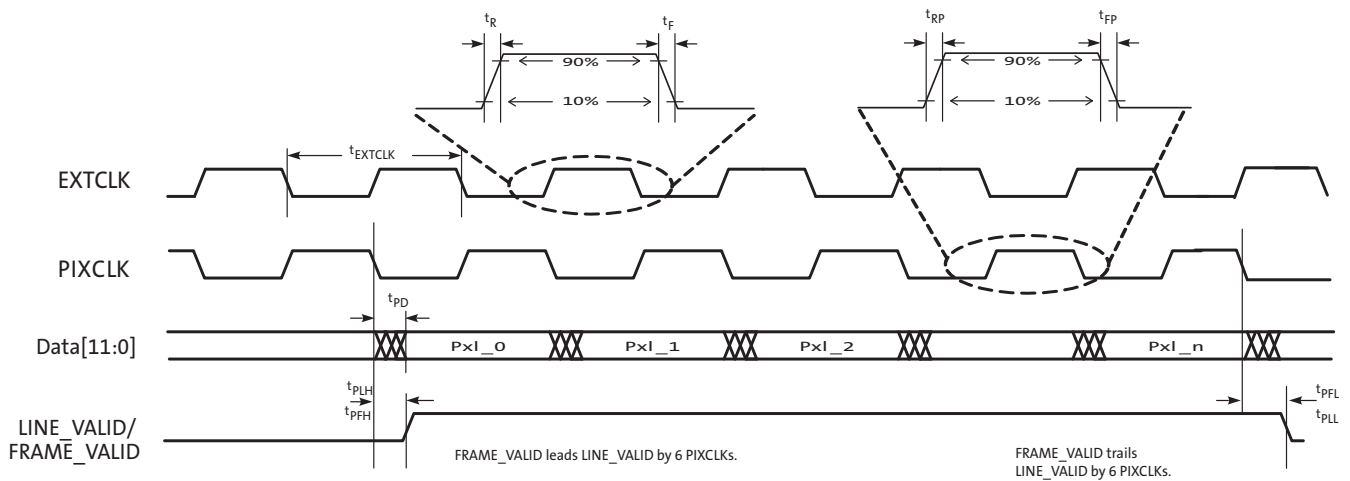

Table 11: I/O Timing Characteristics (2.8V V_{DD_IO})¹

| Symbol | Definition | Condition | Min | Typ | Max | Unit |
|---------------------|-------------------------------|---|-----|-----|-------|------|

| t _{PLL} | PIXCLK to LV LOW | PCLK slew rate = 6, Parallel slew rate = 7 | -2.5 | — | 2 | ns |

- Notes: 1. Minimum and maximum values are taken at the temperature and voltage limits; for instance, 70°C at 1.7 V, and -30°C at 1.95V. All values are taken at the 50% transition point. The loading used is 10 pF.
2. Jitter from PIXCLK is already taken into account as the data of all the output parameters.

Table 13: I/O Rise Slew Rate (2.8V V_{DD_IO})¹

| Parallel Slew Rate (R0x306E[15:13]) | Conditions | Min | Typ | Max | Units |
|-------------------------------------|------------|------|------|------|-------|
| 7 | Default | 1.08 | 1.77 | 2.72 | V/ns |
| 6 | Default | 0.77 | 1.26 | 1.94 | V/ns |
| 5 | Default | 0.58 | 0.95 | 1.46 | V/ns |
| 4 | Default | 0.44 | 0.70 | 1.08 | V/ns |
| 3 | Default | 0.32 | 0.51 | 0.78 | V/ns |
| 2 | Default | 0.23 | 0.37 | 0.56 | V/ns |
| 1 | Default | 0.16 | 0.25 | 0.38 | V/ns |
| 0 | Default | 0.10 | 0.15 | 0.22 | V/ns |

- Notes: 1. Minimum and maximum values are taken at the temperature and voltage limits; for instance, 70°C at 2.5V, and -30°C at 3.1 V. The loading used is 10 pF.

Table 14: I/O Fall Slew Rate (2.8V VDD_IO)¹

| Parallel Slew Rate (R0x306E[15:13]) | Conditions | Min | Typ | Max | Units |
|-------------------------------------|------------|------|------|------|-------|
| 7 | Default | 1.00 | 1.62 | 2.41 | V/ns |
| 6 | Default | 0.76 | 1.24 | 1.88 | V/ns |
| 5 | Default | 0.60 | 0.98 | 1.50 | V/ns |
| 4 | Default | 0.46 | 0.75 | 1.16 | V/ns |
| 3 | Default | 0.35 | 0.56 | 0.86 | V/ns |
| 2 | Default | 0.25 | 0.40 | 0.61 | V/ns |
| 1 | Default | 0.17 | 0.27 | 0.41 | V/ns |
| 0 | Default | 0.11 | 0.16 | 0.24 | V/ns |

Notes: 1. Minimum and maximum values are taken at the temperature and voltage limits; for instance, 70°C at 2.5 V, and -30°C at 3.1V. The loading used is 10 pF.

Table 15: I/O Rise Slew Rate (1.8V VDD_IO)¹

| Parallel Slew Rate (R0x306E[15:13]) | Conditions | Min | Typ | Max | Units |
|-------------------------------------|------------|------|------|------|-------|
| 7 | Default | 0.41 | 0.65 | 1.10 | V/ns |
| 6 | Default | 0.30 | 0.47 | 0.79 | V/ns |
| 5 | Default | 0.24 | 0.37 | 0.61 | V/ns |
| 4 | Default | 0.19 | 0.28 | 0.46 | V/ns |
| 3 | Default | 0.14 | 0.21 | 0.34 | V/ns |
| 2 | Default | 0.10 | 0.15 | 0.24 | V/ns |
| 1 | Default | 0.07 | 0.10 | 0.16 | V/ns |
| 0 | Default | 0.04 | 0.06 | 0.10 | V/ns |

Notes: 1. Minimum and maximum values are taken at the temperature and voltage limits; for instance, 70°C at 1.7 V, and -30°C at 1.95V. The loading used is 10 pF.

Table 16: I/O Fall Slew Rate (1.8V VDD_IO)¹

| Parallel Slew Rate (R0x306E[15:13]) | Conditions | Min | Typ | Max | Units |
|-------------------------------------|------------|------|------|------|-------|
| 7 | Default | 0.42 | 0.68 | 1.11 | V/ns |
| 6 | Default | 0.32 | 0.51 | 0.84 | V/ns |
| 5 | Default | 0.26 | 0.41 | 0.67 | V/ns |
| 4 | Default | 0.20 | 0.32 | 0.52 | V/ns |
| 3 | Default | 0.16 | 0.24 | 0.39 | V/ns |
| 2 | Default | 0.12 | 0.18 | 0.28 | V/ns |
| 1 | Default | 0.08 | 0.12 | 0.19 | V/ns |
| 0 | Default | 0.05 | 0.07 | 0.11 | V/ns |

Notes: 1. Minimum and maximum values are taken at the temperature and voltage limits; for instance, 70°C at 1.7 V, and -30°C at 1.95V. The loading used is 10 pF.

DC Electrical Characteristics

The DC electrical characteristics are shown in the tables below.

Table 17: DC Electrical Characteristics

| Symbol | Definition | Condition | Min | Typ | Max | Unit |
|----------|-------------------------------------|---|------------|-------------|------------|------|
| VDD | Core digital voltage | | 1.7 | 1.8 | 1.95 | V |
| VDD_IO | I/O digital voltage | | 1.7/2.5 | 1.8/ 2.8 | 1.9/3.1 | V |
| VAA | Analog voltage | | 2.5 | 2.8 | 3.1 | V |
| VAA_PIX | Pixel supply voltage | | 2.5 | 2.8 | 3.1 | V |
| VDD_PLL | PLL supply voltage | | 2.5 | 2.8 | 3.1 | V |
| VDD_SLVS | HiSPi supply voltage for SLVS mode | | 0.3 | 0.4 | 0.6 | V |
| VDD_SLVS | HiSPi supply voltage for HiVcm mode | | 1.7 | 1.8 | 1.95 | V |
| VIH | Input HIGH voltage | | VDD_IO*0.7 | — | — | V |
| VIL | Input LOW voltage | | — | — | VDD_IO*0.3 | V |
| IIN | Input leakage current | No pull-up resistor; VIN = VDD_IO or DGND | — | — | 20 | μA |
| VOH | Output HIGH voltage | | VDD_IO-0.3 | — | — | V |
| VOL | Output LOW voltage | | — | — | 0.4 | V |
| IOH | Output HIGH current | At specified VOH | -22 | — | — | mA |
| IOL | Output LOW current | At specified VOL | — | — | 22 | mA |

Caution Stresses greater than those listed in Table 14 may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

Table 18: Absolute Maximum Ratings

| Symbol | Parameter | Minimum | Maximum | Unit | Symbol |
|-------------------|-------------------------------------|---------|--------------|------|-------------------|
| VSUPPLY | Power supply voltage (all supplies) | -0.3 | 4.5 | V | VSUPPLY |
| ISUPPLY | Total power supply current | — | 200 | mA | ISUPPLY |
| IGND | Total ground current | — | 200 | mA | IGND |
| VIN | DC input voltage | -0.3 | VDD_IO + 0.3 | V | VIN |
| VOUT | DC output voltage | -0.3 | VDD_IO + 0.3 | V | VOUT |
| TSTG ¹ | Storage temperature | -40 | +150 | °C | TSTG ¹ |

- Notes:
1. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
 2. To keep dark current and shot noise artifacts from impacting image quality, keep operating temperature at a minimum.

Table 19: Operating Current Consumption in Parallel Output and Linear Mode

| Definition | Condition | Symbol | Min | Typ | Max | Unit |
|-------------------------------|----------------------------|---------|-----|-----|-----|------|
| Digital operating current | Streaming, 1280x960 45 fps | IDD1 | – | 63 | 90 | mA |
| I/O digital operating current | Streaming, 1280x960 45 fps | IDD_IO | – | 35 | 40 | mA |
| Analog operating current | Streaming, 1280x960 45 fps | IAA | – | 30 | 45 | mA |
| Pixel supply current | Streaming, 1280x960 45 fps | IAA_PIX | – | 10 | 15 | mA |
| PLL supply current | Streaming, 1280x960 45 fps | IDD_PLL | – | 7 | 15 | mA |
| Digital operating current | Streaming, 720p 60 fps | IDD1 | – | 63 | 90 | mA |
| I/O digital operating current | Streaming, 720p 60 fps | IDD_IO | – | 35 | 40 | mA |
| Analog operating current | Streaming, 720p 60 fps | IAA | – | 30 | 45 | mA |
| Pixel supply current | Streaming, 720p 60 fps | IAA_PIX | – | 10 | 15 | mA |
| PLL supply current | Streaming, 720p 60f ps | IDD_PLL | – | 7 | 15 | mA |

Notes: 1. Operating currents are measured at the following conditions:
 $V_{AA} = V_{AA_PIX} = V_{DD_IO} = V_{DD_PLL} = 2.8\text{ V}$
 $V_{DD} = 1.8\text{ V}$
 PLL Enabled and PIXCLK = 74.25 MHz
 $T_A = 25^\circ\text{C}$
 $C_{LOAD} = 10\text{ pF}$ Measured in dark

Table 20: Operating Current Consumption in Parallel Output and HDR Mode

| Definition | Condition | Symbol | Min | Typ | Max | Unit |
|-------------------------------|----------------------------|---------|-----|-----|-----|------|
| Digital operating current | Streaming, 1280x960 45 fps | IDD | – | 95 | 115 | mA |
| I/O digital operating current | Streaming, 1280x960 45 fps | IDD_IO | – | 35 | 40 | mA |
| Analog operating current | Streaming, 1280x960 45 fps | IAA | – | 65 | 75 | mA |
| Pixel supply current | Streaming, 1280x960 45 fps | IAA_PIX | – | 15 | 20 | mA |
| PLL supply current | Streaming, 1280x960 45 fps | IDD_PLL | – | 7 | 15 | mA |
| Digital operating current | Streaming, 720p 60 fps | IDD | – | 95 | 115 | mA |
| I/O digital operating current | Streaming, 720p 60 fps | IDD_IO | – | 35 | 40 | mA |
| Analog operating current | Streaming, 720p 60 fps | IAA | – | 61 | 75 | mA |
| Pixel supply current | Streaming, 720p 60 fps | IAA_PIX | – | 15 | 20 | mA |
| PLL supply current | Streaming, 720p 60 fps | IDD_PLL | – | 7 | 15 | mA |

Notes: 1. Operating currents are measured at the following conditions:
 $V_{AA} = V_{AA_PIX} = V_{DD_IO} = V_{DD_PLL} = 2.8\text{ V}$
 $V_{DD} = 1.8\text{ V}$
 PLL Enabled and PIXCLK = 74.25 MHz
 $T_A = 25^\circ\text{C}$
 $C_{LOAD} = 10\text{ pF}$ Measured in dark

Table 21: Operating Currents in HiSPi Output and Linear Mode

| Definition | Condition | Symbol | Min | Typ | Max | Unit |
|-------------------------------|---|----------------------|-----|-----|-----|------|
| Digital Operating Current | Streaming 1280x960 45 fps | I _{DD} | — | 95 | 115 | mA |
| I/O digital operating current | Streaming 1280x960 45 fps | I _{DD_IO} | — | 100 | 150 | μA |
| Analog operating current | Streaming 1280x960 45 fps | I _{AA} | — | 30 | 45 | mA |
| Pixel Supply Current | Streaming 1280x960 45 fps | I _{AA_PIX} | — | 10 | 15 | mA |
| PLL Supply Current | Streaming 1280x960 45 fps | I _{DD_PLL} | — | 7 | 15 | mA |
| SLVS Supply Current | Current LoVCM Mode Streaming 1280x960 45 fps | I _{DD_SLVS} | — | 8 | 15 | mA |
| | Current HiVCM Mode Streaming 1280x960 45 fps | | — | 16 | 25 | mA |
| Digital Operating Current | Streaming 720p 60 fps | I _{DD} | — | 95 | 115 | mA |
| I/O digital operating current | Streaming 720p 60 fps | I _{DD_IO} | — | 100 | 150 | μA |
| Analog operating current | Streaming 720p 60 fps | I _{AA} | — | 30 | 45 | mA |

| | Current HiVCM Mode Streaming 1280x960 60 fps | | — | 16 | 25 | mA |

- Notes: 1. Operating currents are measured at the following conditions:
V_{AA} = V_{AA_PIX} = V_{DD_IO} = V_{DD_PLL} = 2.8V
V_{DD} = 1.8V
V_{DD_SLVS} = 0.4V (LoVCM)
V_{DD_SLVS} = 1.8V (HiVCM)
PLL Enabled and PIXCLK = 74.25 Mhz
T_A = 25°C
Cload = 10pF Measured in dark

Table 22: Operating Current in HiSpi Output and HDR Mode

| Definition | Condition | Symbol | Min | Typ | Max | Unit |
|-------------------------------|---|----------------------|-----|-----|-----|------|
| Digital Operating Current | Streaming 1280x960 45 fps | I _{DD} | – | 115 | 130 | mA |
| I/O digital operating current | Streaming 1280x960 45 fps | I _{DD_IO} | – | 100 | 150 | μA |
| Analog operating current | Streaming 1280x960 45 fps | I _{AA} | – | 65 | 75 | mA |
| Pixel Supply Current | Streaming 1280x960 45 fps | I _{AA_PIX} | – | 15 | 20 | mA |
| PLL Supply Current | Streaming 1280x960 45 fps | I _{DD_PLL} | – | 7 | 15 | mA |
| SLVS Supply Current | Current LoVCM Mode Streaming 1280x960 45 fps | I _{DD_SLVS} | – | 8 | 15 | mA |
| | Current HiVCM Mode Streaming 1280x960 45 fps | | – | 16 | 25 | mA |
| Digital Operating Current | Streaming 720p 60 fps | I _{DD} | – | 115 | 130 | mA |
| I/O digital operating current | Streaming 720p 60 fps | I _{DD_IO} | – | 100 | 150 | μA |
| Analog operating current | Streaming 720p 60 fps | I _{AA} | – | 65 | 75 | mA |
| Pixel Supply Current | Streaming 720p 60 fps | I _{AA_PIX} | – | 15 | 20 | mA |
| PLL Supply Current | Streaming 720p 60 fps | I _{DD_PLL} | – | 7 | 15 | mA |
| SLVS Supply Current | Current LoVCM Mode Streaming 720p 60 fps | I _{DD_SLVS} | – | 8 | 15 | mA |
| | Current HiVCM Mode Streaming 1280x960 60fps | | – | 16 | 25 | mA |

Notes: 1. Operating currents are measured at the following conditions:

V_{AA} = V_{AA_PIX} = V_{DD_IO} = V_{DD_PLL} = 2.8 V
V_{DD} = 1.8 V
V_{DD_SLVS} = 0.4 V (LoVCM)
V_{DD_SLVS} = 1.8 V (HiVCM)
PLL Enabled and PIXCLK=74.25 MHz
T_A = 25°C
Cload = 10 pF Measured in dark

Table 23: Standby Current Consumption

| Definition | Condition | Symbol | Min | Typ | Max | Unit |
|--------------------------|----------------|--------|-----|------|------|------|
| Hard standby (clock off) | Analog, 2.8 V | — | — | 30 | 100 | μA |
| | Digital, 1.8 V | — | — | 85 | 2500 | μA |
| Hard standby (clock on) | Analog, 2.8 V | — | — | 30 | 100 | μA |
| | Digital, 1.8 V | — | — | 1.55 | 4 | mA |
| Soft standby (clock off) | Analog, 2.8 V | — | — | 85 | 100 | μA |
| | Digital, 1.8 V | — | — | 85 | 2500 | μA |
| Soft standby (clock on) | Analog, 2.8 V | — | — | 30 | 100 | μA |
| | Digital, 1.8 V | — | — | 1.55 | 4 | mA |

Notes: 1. Analog – VAA + VAA_PIX + VDD_PLL
2. Digital – VDD + VDD_IO

Figure 34: Power Supply Rejection Ratio

HiSPi Electrical Specifications

The HiSPi transmitter electrical specifications are listed at 700 MHz.

Table 24: Input Voltage and Current (HiSPi Power Supply 0.4 V)

Measurement Conditions: Max Freq 700 MHz

| Parameter | Symbol | Min | Typ | Max | Unit |
|--|------------------------|-----------------------------|-------------------------|-----------------------------|------|
| Supply current (PWRHiSPi) (driving 100Ω load) | I _{DD_SLVS} | – | 10 | 15 | A |
| HiSPi common mode voltage (driving 100Ω load) | V _{CM} | V _{DD_SLVS} x 0.45 | V _{DD_SLVS} /2 | V _{DD_SLVS} x 0.55 | V |
| HiSPi differential output voltage (driving 100Ω load) | V _{OD} | V _{DD_SLVS} x 0.36 | V _{DD_SLVS} /2 | V _{DD_SLVS} x 1.64 | V |
| Change in V _{CM} between logic 1 and 0 | ΔV _{CM} | | | 25 | mV |
| Change in V _{OD} between logic 1 and 0 | V _{OD} | | | 25 | mV |
| V _{OD} noise margin | NM | -30 | | 30 | |
| Difference in V _{CM} between any two channels | ΔV _{CM} | | | 50 | mV |
| Difference in V _{OD} between any two channels | ΔV _{OD} | | | 100 | mV |
| Common-mode AC voltage (pk) without V _{CM} cap termination | ΔV _{CM_ac} | | | 50 | mV |
| Common-mode AC voltage (pk) with V _{CM} cap termination | ΔV _{CM_ac} | | | 25 | mV |
| Max overshoot peak V _{OD} | V _{OD_ac} | | 1.2* V _{OD} | | V |
| Max overshoot V _{diff} pk-pk | V _{diff_pkpk} | | 2.4* V _{OD} | | V |
| Eye Height | V _{eye} | 0.5*V _{DD_SLVS} | | | |
| Single-ended output impedance | R _o | 35 | 50 | 70 | Ω |
| Output impedance mismatch | ΔR _o | | | 20 | % |

Table 25: Input Voltage and Current (HiSPi Power Supply 1.8 V)

Measurement Conditions: Max Freq 700 MHz

| Parameter | Symbol | Min | Typ | Max | Unit |
|---|-----------------------|------|-----|------|------|
| Supply current (PWRHiSPi) (driving 100Ω load) | I _{DD_HiVCM} | – | 15 | 25 | mA |
| HiSPi common mode voltage (driving 100Ω load) | V _{CM} | 0.76 | 0.9 | 1.07 | V |
| HiSPi differential output voltage (driving 100Ω load) | V _{OD} | 200 | 280 | 350 | V |
| Change in V _{CM} between logic 1 and 0 | Δ V _{CM} | | | | 25 |
| Change in V _{OD} between logic 1 and 0 | Δ V _{OD} | | | | 25 |
| V _{OD} noise margin | NM | -30 | | | 30 |
| Difference in V _{CM} between any two channels | Δ V _{CM} | | | | 50 |
| Difference in V _{OD} between any two channels | Δ V _{OD} | | | 100 | |
| Common-mode AC voltage (pk) without V _{CM} cap termination | ΔV _{CM_ac} | | | 50 | |
| Common-mode AC voltage (pk) with V _{CM} cap termination | ΔV _{CM_ac} | | | 30 | |

Table 25: Input Voltage and Current (HiSPi Power Supply 1.8 V)
Measurement Conditions: Max Freq 700 MHz

| Parameter | Symbol | Min | Typ | Max | Unit |
|---------------------------------------|------------------------|-----|-----|----------------------|------|
| Max overshoot peak V _{OD} | V _{OD_ac} | | | 1.2* V _{OD} | |
| Max overshoot V _{diff} pk-pk | V _{diff_pkpk} | | | 2.4* V _{OD} | V |
| Eye Height | V _{eye} | 320 | | | |
| Single-ended Output impedance | R _o | 40 | 70 | 100 | |
| Output impedance mismatch | ΔR _o | | | 20 | % |

Figure 35: Differential Output Voltage for Clock or Data Pairs

Table 26: Rise and Fall Times
Measurement Conditions: HiSPi Power Supply 0.4V or 1.8V, Max Freq 700 MHz

| Parameter | Symbol | Min | Typ | Max | Unit |
|-----------------------------------|------------------------|-------|---------|------|--------------------|
| Data Rate | 1/UI | 280 | — | 700 | Mb/s |
| Max setup time from transmitter | TxPRE | 0.3 | — | — | UI ¹ |
| Max hold time from transmitter | TxPost | 0.3 | — | — | UI |
| Clock jitter (RMS) | CLK _{JITTER} | — | 50 | — | ps |
| Rise time (20% - 80%) | RISE | — | 0.325UI | — | |
| Fall time (20% - 80%) | FALL | 150ps | 0.3 UI | — | |
| Clock duty | PLL_DUTY | 45 | 50 | 55 | % |
| Bitrate Period | t _{pw} | 1.43 | | 3.57 | ns ¹ |
| Eye Width | t _{eye} | 0.3 | | | UI ^{1, 2} |
| Data Total jitter (pk pk)@1e-9 | tt _{totaljit} | | | 0.2 | UI ^{1, 2} |
| Clock Period Jitter(RMS) | t _{ckjit} | | | 50 | ps ² |
| Clock cycle to cycle jitter (RMS) | t _{cyjit} | | | 100 | ps ² |
| Clock to Data Skew | t _{chskew} | -0.1 | | 0.1 | UI ^{1, 2} |
| PHY-to-PHY Skew | t _{PHYskew} | | | 2.1 | UI ^{1, 5} |

- Notes:
1. One UI is defined as the normalized mean time between one edge and the following edge of the clock.
 2. Taken from 0V crossing point w/ DLL off.
 3. Also defined with a maximum loading capacitance of 10pF on any pin. The loading capacitance may also need to be less for higher bitrates so the rise and fall times do not exceed the maximum 0.3UI.
 4. The absolute mean skew between the Clock lane and any Data Lane in the same PHY between any edges.
 5. The absolute mean skew between any Clock in one PHY and any Data lane in any other PHY between any edges.
 6. Differential skew is defined as the skew between complementary outputs. It is measured as the absolute time between the two complementary edges at mean V_{CM} point.

Figure 36: Eye Diagram for Clock and Data Signals

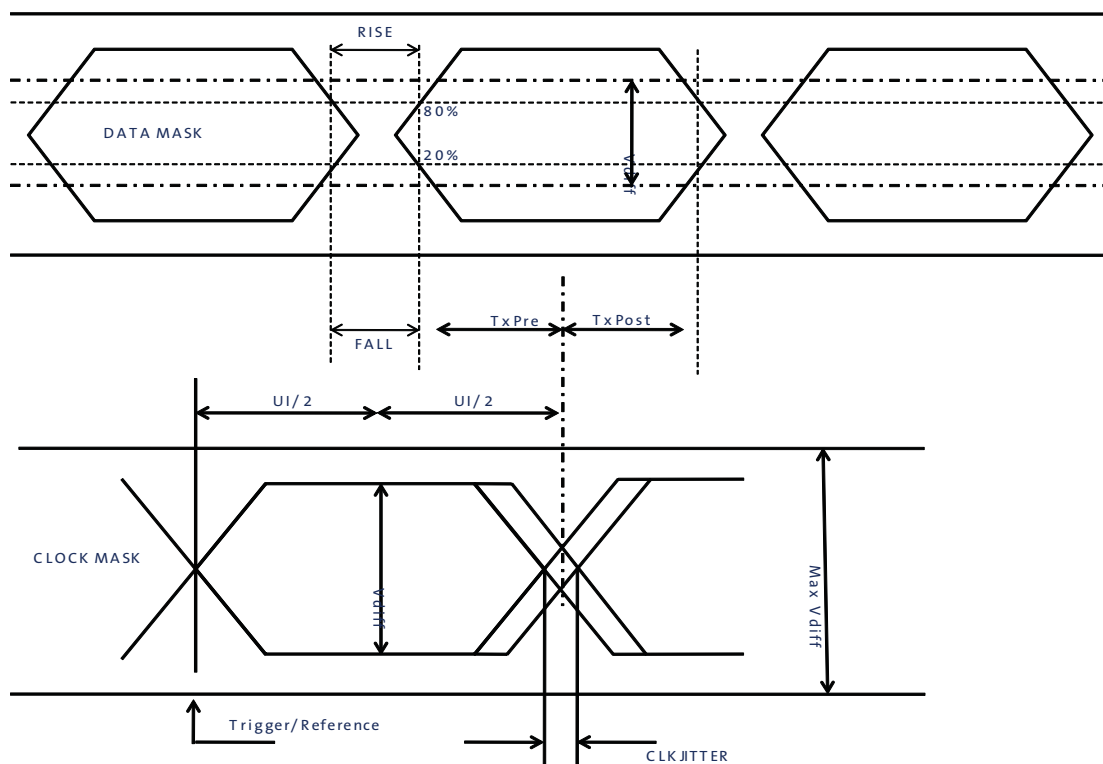

Figure 37: Skew Within the PHY and Output Channels

Power-On Reset and Standby Timing

Power-Up Sequence

The recommended power-up sequence for the MT9M024 is shown in Figure 29. The available power supplies (VDD_IO, VDD, VDD_SLVS, VDD_PLL, VAA, VAA_PIX) must have the separation specified below.

1. Turn on VDD_PLL power supply.
2. After 0–10 μ s, turn on VAA and VAA_PIX power supply.
3. After 0–10 μ s, turn on VDD_IO power supply.
4. After the last power supply is stable, enable EXTCLK.
5. Assert RESET_BAR for at least 1ms.
6. Wait 850000 EXTCLKs (for internal initialization into software standby).
7. Configure PLL, output, and image settings to desired values.
8. Wait 1ms for the PLL to lock.
9. Set streaming mode (R0x301A[2] = 1).

Figure 38: Power Up

Table 27: Power-Up Sequence

| Definition | Symbol | Minimum | Typical | Maximum | Unit |
|-------------------------------------|--------|----------------|-----------------|---------|---------|
| VDD_PLL to VAA/VAA_PIX ³ | t0 | 0 | 10 | — | μs |
| VAA/VAA_PIX to VDD_IO | t1 | 0 | 10 | — | μs |
| VDD_IO to VDD | t2 | 0 | 10 | — | μs |
| VDD to VDD_SLVS | t3 | 0 | 10 | — | μs |
| Xtal settle time | tx | — | 30 ¹ | — | ms |
| Hard Reset | t4 | 1 ² | — | — | ms |
| Internal Initialization | t5 | 850000 | — | — | EXTCLKS |
| PLL Lock Time | t6 | 1 | — | — | ms |

- Notes:
1. Xtal settling time is component-dependent, usually taking about 10 – 100 ms.
 2. Hard reset time is the minimum time required after power rails are settled. In a circuit where Hard reset is held down by RC circuit, then the RC time must include the all power rail settle time and Xtal settle time.
 3. It is critical that VDD_PLL is not powered up after the other power supplies. It must be powered before or at least at the same time as the others. If the case happens that VDD_PLL is powered after other supplies then sensor may have functionality issues and will experience high current draw on this supply.

Power-Down Sequence

The recommended power-down sequence for the MT9M024 is shown in Figure 30. The available power supplies (VDD_IO, VDD, VDD_SLVS, VDD_PLL, VAA, VAA_PIX) must have the separation specified below. Power may be removed from all supplies simultaneously, and a sudden loss of power on all rails does not cause damage or affect the lifetime of the device.

1. Disable streaming if output is active by setting standby R0x301A[2] = 0
2. The soft standby state is reached after the current row or frame, depending on configuration, has ended.
3. Turn off VDD_SLVS.
4. Turn off VDD.
5. Turn off VDD_IO
6. Turn off VAA/VAA_PIX.
7. Turn off VDD_PLL.

Figure 39: Power Down

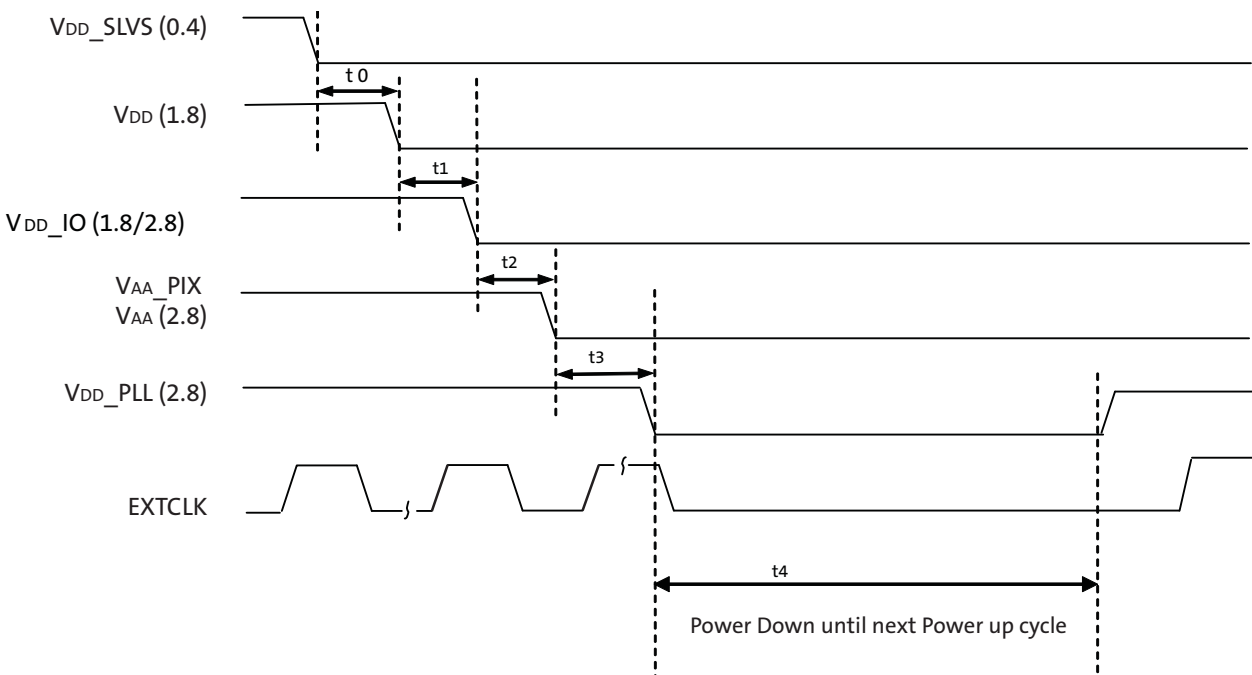

Table 28: Power-Down Sequence

| Definition | Symbol | Minimum | Typical | Maximum | Unit |
|-----------------------------|--------|---------|---------|---------|------|
| VDD_SLVS to VDD | t0 | 0 | — | — | μs |
| VDD to VDD_IO | t1 | 0 | — | — | μs |
| VDD_IO to VAA/VAA_PIX | t2 | 0 | — | — | μs |
| VAA/VAA_PIX to VDD_PLL | t3 | 0 | — | — | μs |
| PwrDn until Next PwrUp Time | t4 | 100 | — | — | ms |

Note: t4 is required between power down and next power up time; all decoupling caps from regulators must be completely discharged.

Package Dimensions

Figure 40: 63-Ball iBGA Package Outline Drawing

Note: All dimensions are in millimeters.

| NOTES | |
|-------|--|
| 1 | DIMENSIONS IN MM. DIMENSIONS IN () ARE FOR REFERENCE ONLY. |
| 2 | ENCAPSULANT: EPOXY LAMINATE. |
| 3 | SUBSTRATE MATERIAL: PLASTIC LAMINATE 0.5 THICKNESS. |
| 4 | LID MATERIAL: BOROSILICATE GLASS 0.4±0.04mm THICKNESS. |
| 5 | LEAD FINISH: GOLD PLATING, 0.5 MICRONS MINIMUM THICKNESS. |
| 6 | IMAGE SENSOR DIE: 0.2 THICKNESS. |
| 7 | MAXIMUM ROTATION OF OPTICAL AREA RELATIVE TO PACKAGE EDGES: 1°. MAXIMUM TILT OF OPTICAL AREA RELATIVE TO SUBSTRATE PLANE (A): 35 MICRONS MAXIMUM TILT OF COVER GLASS RELATIVE TO OPTICAL AREA PLANE (D): 50 MICRONS. |

Revision History

| | |
|---|----------|
| Rev. G | 4/15/15 |
| <ul style="list-style-type: none"> Updated “Ordering Information” on page 2 | |
| Rev. F | 3/27/15 |
| <ul style="list-style-type: none"> Converted to ON Semiconductor template Removed Confidential marking | |
| Rev. E | 10/22/13 |
| <ul style="list-style-type: none"> Updated temperature range in “General Description” on page 1 Updated Figure 2: “Typical Configuration: Serial Four-Lane HiSPi Interface,” on page 2 Updated Figure 3: “Typical Configuration: Parallel Pixel Data Interface,” on page 3 Updated “Pixel Array Structure” on page 7 Updated Figure 6: “Pixel Color Pattern Detail (Top Right Corner),” on page 8 Updated “Default Readout Order” on page 8 Added “Digital Gain Control” on page 9 Added “DLL Timing Adjustment” on page 13 Updated “Exposure” on page 16 Updated Equation 2 on page 16 Updated Table 8, “Real-Time Context-Switch Registers,” on page 21 Updated “PLL-Generated Master Clock” on page 22 Updated “Hard Standby” on page 24 Updated title of Figure 19: “Eight Pixels in Normal and Column Mirror Readout Modes,” on page 25 Added note at the end of “Embedded Data and Statistics” on page 29 Updated “Embedded Data” on page 30 Updated Figure 23: “Format of Embedded Statistics Output within a Frame,” on page 31 Updated “Column Triggering on Startup” on page 33 Updated “Column Correction Retriggering Due to Mode Change” on page 33 Updated “I/O Timing” on page 42 Updated Figure 33: “I/O Timing Diagram,” on page 43 Deleted Table 9, “I/O Timing Characteristics Added Table 11, “I/O Timing Characteristics (2.8V Vdd_IO)1,” on page 43 Added Table 12, “I/O Timing Characteristics (1.8V Vdd_IO)1,” on page 44 Added Table 13, “I/O Rise Slew Rate (2.8V Vdd_IO)1,” on page 44 Added Table 14, “I/O Fall Slew Rate (2.8V Vdd_IO)1,” on page 45 Added Table 15, “I/O Rise Slew Rate (1.8V Vdd_IO)1,” on page 45 Updated Table 20, “Operating Current Consumption in Parallel Output and HDR Mode,” on page 47 Added Figure 34: “Power Supply Rejection Ratio,” on page 50 Updated “Power-Up Sequence” on page 54 Updated Table 27, “Power-Up Sequence,” on page 55 | |
| Rev. D | 4/10/12 |
| <ul style="list-style-type: none"> Updated Table 1, “Pin Descriptions, 9 x 9 mm, 63-ball iBGA,” on page 5 Updated Figure 4: “9 x 9 mm 63-Ball IBGA Package,” on page 4 | |

- Updated “Hard Standby” on page 24
- Updated “Embedded Data and Statistics” on page 29
- Updated Table 11, “I/O Timing Characteristics (2.8V Vdd_IO),” on page 43
- Updated Table 24, “Input Voltage and Current (HiSPi Power Supply 0.4 V),” on page 51
- Updated Table 25, “Input Voltage and Current (HiSPi Power Supply 1.8 V),” on page 51
- Updated Table 26, “Rise and Fall Times,” on page 52
- Deleted old Table 20, “Channel, PHY, and Intra-PHY Skew

Rev. C3/29/11

- Updated Table 1, “Key Parameters,” on page 1
- Updated Table 2, “Available Part Numbers,” on page 1
- Updated “Exposure” on page 16
- Updated “HDR Specific Exposure Settings” on page 19
- Updated “Motion Compensation” on page 20
- Updated “PLL-Generated Master Clock” on page 22
- Table 8, “Real-Time Context-Switch Registers,” on page 21 Updated “Hard Standby” on page 24
- Updated Figure 19: “Eight Pixels in Normal and Column Mirror Readout Modes,” on page 25
- Updated Table 17, “DC Electrical Characteristics,” on page 46
- Updated notes for Table 19, “Operating Current Consumption in Parallel Output and Linear Mode ,” on page 47 and Table 20, “Operating Current Consumption in Parallel Output and HDR Mode,” on page 47
- Updated Table 22, “Operating Current in HiSPi Output and HDR Mode,” on page 49
- Updated Table 23, “Standby Current Consumption ,” on page 50
- Updated conditions for Table 26, “Rise and Fall Times,” on page 52 and Table 22, “Channel, PHY, and Intra-PHY Skew,” on page 45

Rev. B10/19/10

- Updated Table 1, “Key Parameters,” on page 1
- Updated Table 10, “Two-Wire Serial Bus Characteristics,” on page 41
- Updated storage temperature max in Table 18, “Absolute Maximum Ratings,” on page 46

Rev. A9/20/10

- Initial release

ON Semiconductor and the ON logo are registered trademarks of Semiconductor Components Industries, LLC (SCILLC) or its subsidiaries in the United States and/or other countries. SCILLC owns the rights to a number of patents, trademarks, copyrights, trade secrets, and other intellectual property. A listing of SCILLC's product/patent coverage may be accessed at www.onsemi.com/site/pdf/Patent-Marking.pdf. SCILLC reserves the right to make changes without further notice to any products herein. SCILLC makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does SCILLC assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. “Typical” parameters which may be provided in SCILLC data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including “Typicals” must be validated for each customer application by customer's technical experts. SCILLC does not convey any license under its patent rights nor the rights of others. SCILLC products are not designed, intended, or authorized for use as components in systems intended for surgical implant into the body, or other applications intended to support or sustain life, or for any other application in which the failure of the SCILLC product could create a situation where personal injury or death may occur. Should Buyer purchase or use SCILLC products for any such unintended or unauthorized application, Buyer shall indemnify and hold SCILLC and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that SCILLC was negligent regarding the design or manufacture of the part. SCILLC is an Equal Opportunity/Affirmative Action Employer. This literature is subject to all applicable copyright laws and is not for resale in any manner.
