Active Area

- Note (4) The specified power are the sum of LCD panel electronics input power and the inverter input power. Test conditions are as follows.
 - (a) Vcc = 3.3 V, $Ta = 25 \pm 2 \,^{\circ}\text{C}$, $f_v = 60 \,\text{Hz}$,
 - (b) The pattern used is a black and white 32 x 36 checkerboard, slide #100 from the VESA file "Flat Panel Display Monitor Setup Patterns", FPDMSU.ppt.
 - (c) Luminance: 60 nits.
 - (d) The inverter used is provided from Sumida.

Note (5) The parameters of LVDS signals are defined as the following figures.

Note (1) Lamp current is measured by utilizing a high frequency current meter as shown below:

- Note (2) The voltage that must be larger than Vs should be applied to the lamp for more than 1 second after startup. Otherwise, the lamp may not be turned on normally.
- Note (3) The lamp frequency may generate interference with horizontal synchronous frequency from the display, and this may cause line flow on the display. In order to avoid interference, the lamp frequency should be detached from the horizontal synchronous frequency and its harmonics as far as possible.
- Note (4) P_{BL} = Inverter input power

Inverter input power is measured at 8th step(the max brightness step) @Vin=12V

- Note (5) The lifetime of lamp is defined as the time when it continues to operate under the conditions at Ta = 25 ± 2 °C and I_L = $6.0 \text{ mA}_{\text{RMS}}$ until one of the following events occurs:
 - (a) When the brightness becomes or lower than 50% of its original value.
 - (b) When the effective ignition length becomes or lower than 80% of its original value. (Effective ignition length is defined as an area that the brightness is less than 70% compared to the center point.)
- Note (6) The waveform of the voltage output of inverter must be area-symmetric and the design of the inverter must have specifications for the modularized lamp. The performance of the Backlight, such as lifetime or brightness, is greatly influenced by the characteristics of the DC-AC inverter for the lamp. All the parameters of an inverter should be carefully designed to avoid generating too much current leakage from high voltage output of the inverter. When designing or ordering the inverter please make sure that a poor lighting caused by the mismatch of the Backlight and the inverter (miss-lighting, flicker, etc.) never occurs. If the above situation is confirmed, the module should be operated in the same manners when it is installed in your instrument.

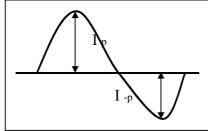

Requirements for a system inverter design, which is intended to have a better display performance, a better power efficiency and a more reliable lamp. It shall help increase the lamp lifetime and reduce its

leakage current.

- a. The asymmetry rate of the inverter waveform should be 10% below;
- b. The distortion rate of the waveform should be within $\sqrt{2} \pm 10\%$;
- c. The ideal sine wave form shall be symmetric in positive and negative polarities.

Input Voltage

The operating input voltage of inverter shall be defined.

The inverter shall ignite the CCFL lamp at minimum input voltage at any environment conditions.

On/Off control

Enable: At "ON" condition (FPBACK=Hi), enable the inverter.

Disable: At "OFF" condition (FPBACK=Lo), disable the inverter.

Quiescent current

At the inverter "OFF" condition, input quiescent should be less than 0.1mA.

Open lamp voltage

The inverter start-up output voltage will be above "Vopen" for "Ts" minimum at any condition under specify until lamp to be ignited. The inverter should be shutdown if lamp ignition was failed in "Ts" maximum. The inverter shall be capable of withstanding the output connections open without component over-stress / fire / smoke /arc.

Burst mode frequency

The burst mode frequency should be in specification in any environment condition and electrical condition.

Brightness control

SM-BUS values for panel luminance are to be included in the on LCD board EEDID ROM chip table. The supplier will measure panel luminance in a system and define the SMBUS values for each of the 8 required luminance levels. The panel luminance, for which SMBUS values will be provided in the EEDID from byte # 113(hex #71), to byte # 120, (hex # 78), is show in the table below. The inverter supplier should provide these appropriate values to CMO.

Step Count	Step 1	Step 2	Step3	Step 4	Step 5	Step 6	Step 7	Step 8
Address	Byte	Byte	Byte	Byte	Byte	Byte	Byte	Byte

Luminance (nits)	10	17	24	30	60	100	160	220

Output ripple ratio

Ripple ratio = 2 * (Ipeak - Ivalley) / (Ipeak + Ivalley) * 100%

The Ripple ratio should be less than 5% and ripple frequency should be less than 200 Hz.

Power up Overshoot & Undershoot

Overshoot & Undershoot at power up should not exceed the following limits.

Vin	Output current	lo (dl)	Settling time
VIII	lo(rms)	Overshoot/Undershoot	(dT)
0→Vin(min.)	lo(max.)	150% / 50%	5 ms max.

0→Vin(max.)	lo(max.)	150% / 50%	5 ms max.
U→VIII(IIIax.)	lo(min.)	130 /0 / 30 /0	J IIIS IIIAX.

dl=(lo-lmin.)/lo dl=lmax.-lo or

Output connections short protection

The inverter shall be capable of withstanding the output connections short without damage or over-stress. And the inverter maximum input power shall be limited within 1W.

6.4.3 Mechanical Drawing

6.4.4 Other Information

- Safety
 - The inverter shall meet the requirement of "Limited current circuits" in paragraphs 2.4.1 in IEC60950. There is no fire/smoke while simulating the component of the inverter open/short test.
 - The Inverter AND panel must be UL certified with CB certificate and LCC (Limited Current Circuit) test and test reports from UL. Inverter panel combo must pass Dell Safety requirements.
- EMI

The inverter must meet the radiated limitation requirement of CISPR22 class B, FCC-B and VCCI level II with 6dB margin minimum while the inverter operating in the complete system.

- **Environment Regulation**
 - Follow the RoHS requirement.
 - Fill in CMO's official document << Environmentally Conscious Products Questionnaire for Suppliers of Materials, Parts, and Products>> and turn in to CMO before CMO's specification approval process.
- Dell's other requirements
 - 1. The inverter must not emit any audible noise.

	Vertical Active Display Period	TVD	800	800	800	TH	
	Vertical Active Blanking Period	TVB	1360	1440	1600	TH	
	Horizontal Total Time	TH	1280	1280	1280	Tc	
	Horizontal Active Display Period	THD	-	71	80	Tc

INPUT SIGNAL TIMING DIAGRAM

7.2 POWER ON/OFF SEQUENCE

Timing Specifications:

$$0.5 \le t1 \le 10 \text{ ms}$$

$$0 \le t2 \le 50 \text{ ms}$$

$$0\ \le t3\ \le\ 50\ ms$$

 $t4 \ge 500 \text{ ms}$

 $t5 \ge 200 \text{ ms}$

 $t6 \ge 200 \text{ ms}$

- Note (1) Please follow the power on/off sequence described above. Otherwise, the LCD module might be damaged.
- Note (2) Please avoid floating state of interface signal at invalid period. When the interface signal is invalid, be sure to pull down the power supply of LCD Vcc to 0 V.
- Note (3) The Backlight inverter power must be turned on after the power supply for the logic and the interface signal is valid. The Backlight inverter power must be turned off before the power supply for the logic and the interface signal is invalid.
- Note (4) Sometimes some slight noise shows when LCD is turned off (even backlight is already off). To avoid this phenomenon, we suggest that the Vcc falling time is better to follow $5 \le t7 \le 300$ ms.

		θ _Y -		30	-	-		

Definition of Viewing Angle (θx , θy): Note (1)

Note (2) Definition of Contrast Ratio (CR):

The contrast ratio can be calculated by the following expression.

Contrast Ratio (CR) = L63 / L0

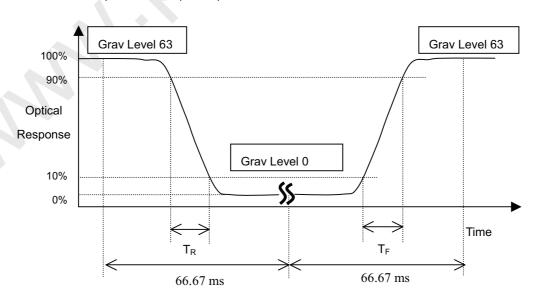

L63: Luminance of gray level 63

L 0: Luminance of gray level 0

CR = CR(5)

CR (X) is corresponding to the Contrast Ratio of the point X at Figure in Note (6).

Note (3) Definition of Response Time (T_R, T_F):

26 / 35

Note (4) Definition of Average Luminance of White (L_{AVE}):

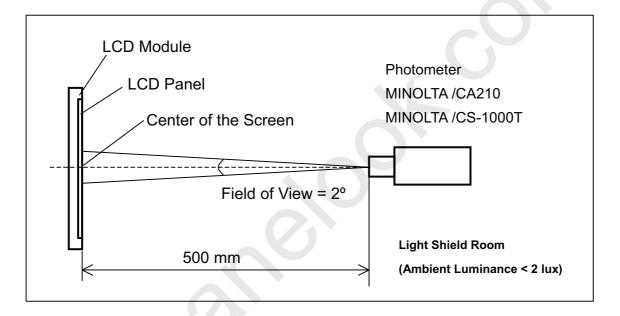

Measure the luminance of gray level 63 at 5 points

$$L_{AVE} = [L (5)+L (10)+L (11)+L (12)+L (13)] / 5$$

L (x) is corresponding to the luminance of the point X at Figure in Note (6).

Note (5) Measurement Setup:

The LCD module should be stabilized at given temperature for 15 minutes to avoid abrupt temperature change during measuring. In order to stabilize the luminance, the measurement should be executed after lighting Backlight for 15 minutes in a windless room.

Note (6) Definition of White Variation (δW_{5p} , δW_{13p}):

Measure the luminance of gray level 63 at 5, 13 points

 δW_{5p} ={1-{ Minimum [L (5)+ L (10)+ L (11)+ L (12)+ L (13)] / Maximum [L (5)+ L (10)+ L (11)+ L (12)+ L (13)] / Maximum [L (5)+ L (10)+ L (11)+ L (12)+ L (13)] L (13)]}} *100%

 $\delta W_{13p} = \{1-\{ Minimum [L (1) \sim L (13)] / Maximum [L (1) \sim L (13)] \} *100\%$

: Test Point X=1 to 13

Note (7) Definition of Color Gamut (C.G):

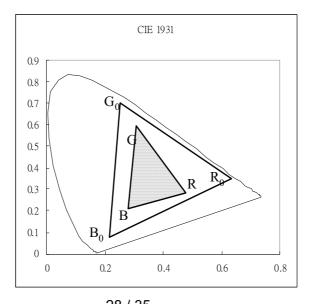

C.G= $R G B / R_0 G_0 B_0,*100\%$

R₀, G₀, B₀: color coordinates of red, green, and blue defined by NTSC, respectively.

R, G, B: color coordinates of module on 63 gray levels of red, green, and blue, respectively.

 $R_0 \; G_0 \; B_0$: area of triangle defined by $R_0, \; G_0, \; B_0$

R G B: area of triangle defined by R, G, B

9 PRECAUTIONS

9.1 HANDLING PRECAUTIONS

- (1) The module should be assembled into the system firmly by using every mounting hole. Be careful not to twist or bend the module.
- (2) While assembling or installing modules, it can only be in the clean area. The dust and oil may cause electrical short or damage the polarizer.
- (3) Use fingerstalls or soft gloves in order to keep display clean during the incoming inspection and assembly process.
- (4) Do not press or scratch the surface harder than a HB pencil lead on the panel because the polarizer is very soft and easily scratched.
- (5) If the surface of the polarizer is dirty, please clean it by some absorbent cotton or soft cloth. Do not use Ketone type materials (ex. Acetone), Ethyl alcohol, Toluene, Ethyl acid or Methyl chloride. It might permanently damage the polarizer due to chemical reaction.
- (6) Wipe off water droplets or oil immediately. Staining and discoloration may occur if they left on panel for a long time.
- (7) If the liquid crystal material leaks from the panel, it should be kept away from the eyes or mouth. In case of contacting with hands, legs or clothes, it must be washed away thoroughly with soap.
- (8) Protect the module from static electricity, it may cause damage to the C-MOS Gate Array IC.
- (9) Do not disassemble the module.
- (10) Do not pull or fold the lamp wire.
- (11) Pins of I/F connector should not be touched directly with bare hands.

9.2 STORAGE PRECAUTIONS

- (1) High temperature or humidity may reduce the performance of module. Please store LCD module within the specified storage conditions.
- (2) It is dangerous that moisture come into or contacted the LCD module, because the moisture may damage LCD module when it is operating.
- (3) It may reduce the display quality if the ambient temperature is lower than 10 °C. For example, the response time will become slowly, and the starting voltage of lamp will be higher than the room temperature.

9.3 OPERATION PRECAUTIONS

- (1) Do not pull the I/F connector in or out while the module is operating.
- (2) Always follow the correct power on/off sequence when LCD module is connecting and operating. This can prevent the CMOS LSI chips from damage during latch-up.
- (3) The startup voltage of Backlight is approximately 1000 Volts. It may cause electrical shock while assembling with inverter. Do not disassemble the module or insert anything into the Backlight unit.
