

Product Description

Sirenza Microdevices' NGA-586 is a high performance InGaP/ GaAs Heterojunction Bipolar Transistor MMIC Amplifier. A Darlington configuration designed with InGaP process technology provides broadband performance up to 5.5 GHz with excellent thermal performance. The heterojunction increases breakdown voltage and minimizes leakage current between junctions. Cancellation of emitter junction non-linearities results in higher suppression of intermodulation products. At 850 Mhz and 80mA , the NGA-586 typically provides +39.6 dBm output IP3, 19.8 dB of gain, and +18.9 dBm of 1dB compressed power using a single positive voltage supply. Only 2 DC-blocking capacitors, a bias resistor and an optional RF choke are required for operation.

Absolute Maximum Ratings

Parameter	Absolute Limit
Max. Device Current (I_D)	120 mA
Max. Device Voltage (V_D)	6 V
Max. RF Input Power	+15 dBm
Max. Junction Temp. (T_J)	+150°C

Operation of this device beyond any one of these limits may cause permanent damage. For reliable continuous operation, the device voltage and current must not exceed the maximum operating values specified in the table on page one.

Bias Conditions should also satisfy the following expression:
 $I_D V_D < (T_J - T_L) / R_{TH}$

OIP₃ vs. Frequency
 $V_D = 4.9\text{ V}$, $I_D = 80\text{ mA}$

 $V_D = 4.9\text{ V}$, $I_D = 80\text{ mA}$

* Note: In the applications circuit on page 4, R_{BIAS} compensates for voltage and current variation over temperature.

Basic Application Circuit

Part Identification Marking

The part will be marked with an "N5" designator on the top surface of the package.

Caution: ESD sensitive

Appropriate precautions in handling, packaging and testing devices must be observed.

Supply Voltage(V _S)	7.5 V	8 V	10 V	12 V
R _{BIAS}	33 Ω	39 Ω	62 Ω	91 Ω

Note: R_{BIAS} provides DC bias stability over temperature.

Mounting Instructions

1. Use a large ground pad area under device pins 2 and 4 with many plated through-holes as shown.
2. We recommend 1 or 2 ounce copper. Measurements for this data sheet were made on a 31 mil thick FR-4 board with 1 ounce copper on both sides.

Pin #	Function	Description
1	RF IN	RF input pin. This pin requires the use of an external DC blocking capacitor chosen for the frequency of operation.
2, 4	GND	Connection to ground. Use via holes for best performance to reduce lead inductance as close to ground leads as possible.
3	RF OUT/BIAS	RF output and bias pin. DC voltage is present on this pin, therefore a DC blocking capacitor is necessary for proper operation.
