## ■ TEST CIRCUIT

\*4: 1.8V <  $V_O$  ≤ 2.6V version:  $C_O$  = 1.0µF (Ceramic)  
 $V_O$  ≤ 1.8V version:  $C_O$  = 2.2µF (Ceramic)

## ■ TYPICAL APPLICATION

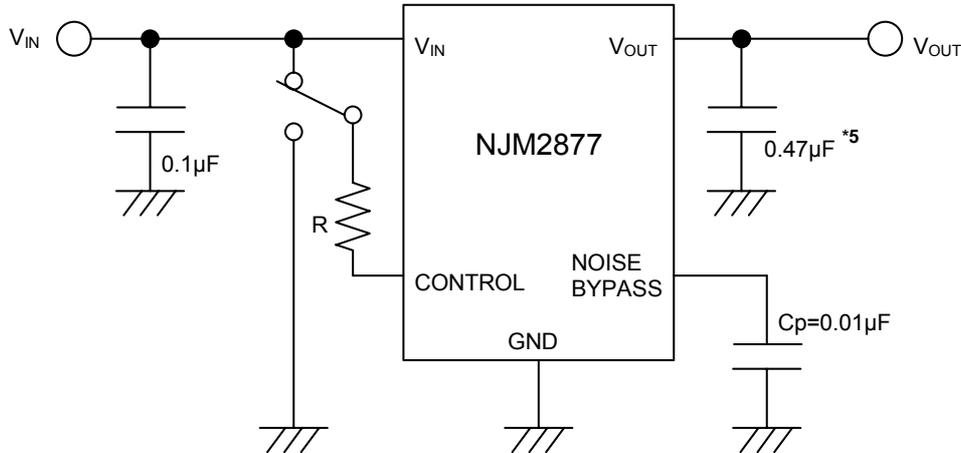

① In the case where ON/OFF Control is not required:

\*5: 1.8V <  $V_O$  ≤ 2.6V version:  $C_O$  = 1.0µF  
 $V_O$  ≤ 1.8V version:  $C_O$  = 2.2µF

Connect control terminal to  $V_{IN}$  terminal

② In use of ON/OFF CONTROL:

\*5 : 1.8V <  $V_o$  ≤ 2.6V version :  $C_o = 1.0\mu\text{F}$   
 $V_o \leq 1.8\text{V}$  version :  $C_o = 2.2\mu\text{F}$

State of control terminal:

- "H" → output is enabled.
- "L" or "open" → output is disabled.

**\*Noise bypass Capacitance  $C_p$**

Noise bypass capacitance  $C_p$  reduces noise generated by band-gap reference circuit. Noise level and ripple rejection will be improved when larger  $C_p$  is used. Use of smaller  $C_p$  value may cause oscillation. Use the  $C_p$  value of  $0.01\mu\text{F}$  greater to avoid the problem.

**\*Input Capacitance  $C_{IN}$**

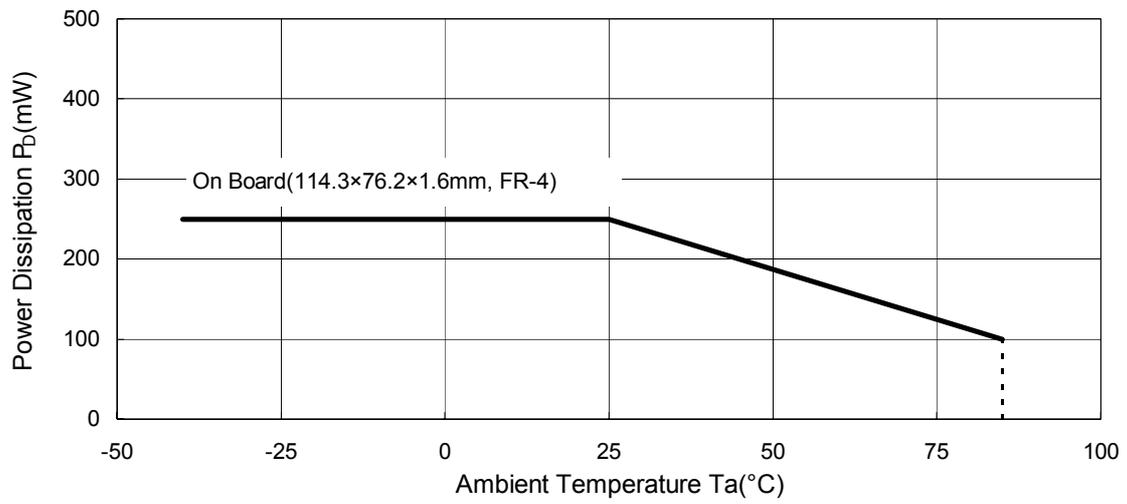

Input Capacitance  $C_{IN}$  is required to prevent oscillation and reduce power supply ripple for applications with high power supply impedance or a long power supply line. Use the  $C_{IN}$  value of  $0.1\mu\text{F}$  greater to avoid the problem.  $C_{IN}$  should connect between GND and  $V_{IN}$  as short as possible.

**\*In the case of using a resistance "R" between  $V_{IN}$  and control.**

The current flow into the control terminal while the IC is ON state ( $I_{CONT}$ ) can be reduced when a pull up resistance "R" is inserted between  $V_{IN}$  and the control terminal. The minimum control voltage for ON state ( $V_{CONT(ON)}$ ) is increased due to the voltage drop caused by  $I_{CONT}$  and the resistance "R". The  $I_{CONT}$  is temperature dependence as shown in the "Control Current vs. Temperature" characteristics. Therefore, the resistance "R" should be carefully selected to ensure the control voltage exceeds the  $V_{CONT(ON)}$  over the required temperature range.
