

Product Overview

The NSREF30xx is a family of low power, low dropout, precision bandgap references. These designs are available in 3-pin SOT23 package. The NSREF30xx's small size and low power consumption makes them ideal for use in battery-powered systems where there can be wide variations in supply voltage and a need to minimize power dissipation. The NSREF30xx does not require an output compensation capacitor, yet is stable with capacitive loads and can sink or source up to ± 10 mA of output current. Unloaded, the NSREF30xx can operate on supplies down to 1 mV above the output voltage. All models are specified over the temperature range of -40°C to +125°C.

Key Features

- Excellent Specified Drift Performance:
35 ppm/°C (Maximum) from -40°C to +125°C
- Output Noise (0.1 to 10Hz): 22uVpp of NSREF3025
- High Output Current: ± 10 mA
- High Accuracy: 0.2% Maximum
- Do Not Require a Load Capacitor to Be Stable
- Low Dropout: 1mV

Applications

- Data Acquisition Systems
- Medical Equipment
- Hand-Held Test Equipment

1. Pin Configuration and Functions

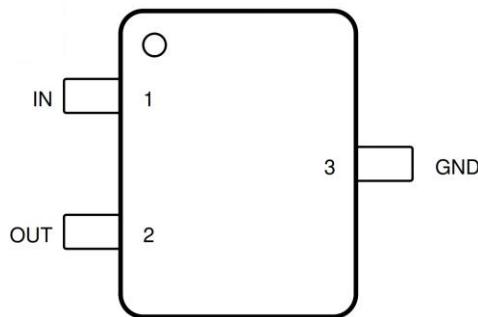

Figure 1.1 NSREF30xx SOT23-3L Package Top View

Table 1.1 NSREF30xx Pin Configuration and Description

PIN No.	Symbol	Function
1	IN	Input supply voltage
2	OUT	Reference output voltage
3	GND	Ground

2. Absolute Maximum Ratings

Parameters	Symbol	Min	Typ	Max	Unit
Input supply voltage	V _{IN}			6.5	V
Storage temperature	T _{stg}	-65		150	°C
Ambient temperature	T _A	-40		125	°C
Junction temperature	T _J	-40		150	°C

3. ESD Ratings

	Ratings	Value	Unit
Electrostatic discharge	Human-body model (HBM), per AEC-Q100-002-RevE ● All pins	±8000	V
	Charged-device model (CDM), per AEC-Q100-011-RevD ● All pins	±2000	V

4. Recommended Operating Conditions

Parameters	Symbol	Min	Typ	Max	Unit	Comments
Input voltage	V _{IN}	1.8		5.5	V	NSREF3012 Only
		V _{OUT} + 0.05		5.5		Except NSREF3012
Load current	I _{LOAD}	-10		10	mA	
Operating temperature	T _A	-40		125	°C	

5. Thermal Information

Parameters	Symbol	SOT23-3L	Unit
Junction-to-ambient thermal resistance	θ _{JA}	298	°C/W
Junction-to-case(top) thermal resistance	θ _{JC (top)}	97	°C/W
Junction-to-board thermal resistance	θ _{JB}	72	°C/W

6. Electrical Characteristics

$T_A = 25^\circ\text{C}$, $V_{IN} = 5\text{V}$ and $I_{LAOD} = 0\text{mA}$ (Unless otherwise noted)¹

Parameters	Symbol	Condition	Min	Typ	Max	Unit
NSREF3012 (1.25V)						
Output voltage	V_{OUT}		1.2475	1.25	1.2525	V
Quiescent current	I_Q		135	165		uA
		$T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$		170		
Output voltage noise	$e_{n,p-p}$	$f = 0.1\text{Hz}$ to 10Hz		9		μV_{pp}
Line regulation		$1.8 \leq V_{IN} \leq 5.5\text{V}$		30	90	ppm/V
Turn-on settling time		to 0.1% with $C_L = 0$		100		us
NSREF3020 (2.048V)						
Output voltage	V_{OUT}		2.044	2.048	2.052	V
Quiescent current	I_Q		140	165		uA
		$T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$		170		
Output voltage noise	$e_{n,p-p}$	$f = 0.1\text{Hz}$ to 10Hz		20		μV_{pp}
Line regulation		$V_{OUT} + 0.05\text{V} \leq V_{IN} \leq 5.5\text{V}$		25	85	ppm/V
Turn-on settling time		to 0.1% with $C_L = 0$		250		us
NSREF3025 (2.5V)						
Output voltage	V_{OUT}		2.495	2.5	2.505	V
Quiescent current	I_Q		140	165		uA
		$T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$		170		
Output voltage noise	$e_{n,p-p}$	$f = 0.1\text{Hz}$ to 10Hz		22		μV_{pp}
Line regulation		$V_{OUT} + 0.05\text{V} \leq V_{IN} \leq 5.5\text{V}$		15	85	ppm/V
Turn-on settling time		to 0.1% with $C_L = 0$		380		us
NSREF3030 (3.0V)						
Output voltage	V_{OUT}		2.994	3	3.006	V
Quiescent current	I_Q		145	170		uA
		$T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$		175		
Output voltage noise	$e_{n,p-p}$	$f = 0.1\text{Hz}$ to 10Hz		28		μV_{pp}
Line regulation		$V_{OUT} + 0.05\text{V} \leq V_{IN} \leq 5.5\text{V}$		15	90	ppm/V
Turn-on settling time		to 0.1% with $C_L = 0\mu\text{F}$		450		us

Electrical Characteristics(continued)

$T_A = 25^\circ\text{C}$, $V_{IN} = 5\text{V}$ and $I_{LOAD} = 0\text{mA}$ (Unless otherwise noted)¹

Parameters	Symbol	Condition	Min	Typ	Max	Unit
NSREF3033 (3.3V)						
Output voltage	V_{OUT}		3.294	3.3	3.306	V
Quiescent current	I_Q		145	170		uA
		$T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$		175		
Output voltage noise	$e_{n,p-p}$	$f = 0.1\text{Hz}$ to 10Hz		31		μV_{pp}
Line regulation		$V_{OUT} +0.05\text{V} \leq V_{IN} \leq 5.5\text{V}$	25	100		ppm/V
Turn-on settling time		To 0.1% with $C_L = 0$		550		us
NSREF3040 (4.096V)						
Output voltage	V_{OUT}		4.088	4.096	4.104	V
Quiescent current	I_Q		145	175		uA
		$T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$		175		
Output voltage noise	$e_{n,p-p}$	$f = 0.1\text{Hz}$ to 10Hz		33		μV_{pp}
Line regulation		$V_{OUT} +0.05\text{V} \leq V_{IN} \leq 5.5\text{V}$	50	150		ppm/V
Turn-on settling time		To 0.1% with $C_L = 0$		680		us
NSREF30xx (NSREF3012, NSREF3020, NSREF3025, NSREF3030, NSREF3033, NSREF3040)						
Input supply voltage	V_{IN}	NSREF3012	1.8	5.5		V
		Except NSREF3012	$V_{OUT} +0.05$	5.5		
Temperature drift ²	$d_{V_{OUT}}/d_T$	$T_A = -40^\circ\text{C}$ to 125°C	10	35		ppm/ $^\circ\text{C}$
Thermal hysteresis		First cycle, T_A cycled from 25°C to 125°C to -40°C to 25°C		100		ppm
Load regulation	$\Delta V_{O(\Delta I_L)}$	$I_L = 0\text{mA}$ to 10mA , $V_{IN} = V_{OUT} + 0.25\text{V}$ ³	5	10		$\mu\text{V}/\text{mA}$
		$I_L = -10\text{mA}$ to 0mA , $V_{IN} = V_{OUT} + 0.1\text{V}$ ³	25	50		
Output current	I_{LOAD}	Guaranteed by Load Regulation	-10	+10		mA
Dropout voltage	$V_{IN} - V_{OUT}$			1		mV
Short-circuit current	I_{SC}	Sourcing		40		mA
		Sinking		55		
Long-term stability		0 to 1000h at 35°C		100		ppm
		0 to 2000h at 35°C		130		ppm

¹NSREF30xx series are 100% production tested at $T_A = +25^\circ\text{C}$ and are guaranteed by characterization for $T_A = T_{MIN}$ to T_{MAX} as specified.

²Box Method used to determine temperature drift.

³Minimum supply voltage for the NSREF3012 is 1.8 V.

8. Application Information

8.1. Temperature Coefficient

The temperature coefficient is defined as the change in output voltage over temperature. The temperature coefficient is calculated using the box method in which a box is formed by the minimum and maximum values for the nominal output voltage over the operating temperature range. NSREF30xx series have a low maximum temperature coefficient of 35 ppm/ $^{\circ}\text{C}$ from -40°C to $+125^{\circ}\text{C}$.

$$\text{Temperature Coefficient} = \left(\frac{(V_{\text{OUT_MAX}} - V_{\text{OUT_MIN}})}{V_{\text{OUT_NOMINAL}} \times \text{Temperature Range}} \right) \times 10^6$$

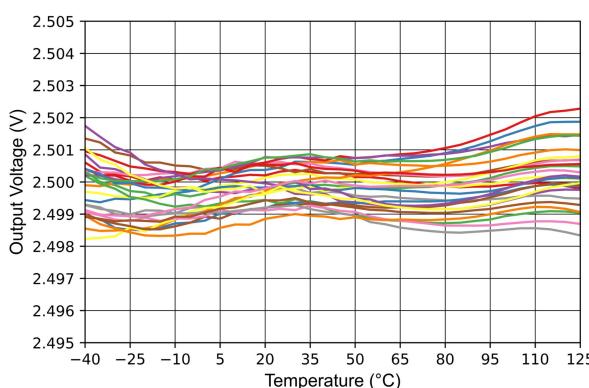

Figure 8.1 Output Voltage vs Temperature

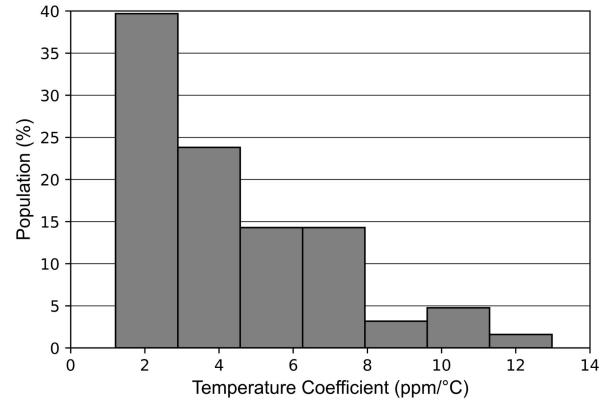

Figure 8.2 Temperature Drift Histogram

The box method specifies limits for the temperature error but does not specify the exact shape and slope of the devices under test. Due to temperature curvature correction to achieve low-temperature drift, the temperature drift is expected to be non-linear. Use for the box method.

8.2. Long-Term Stability

The long-term stability value is tested in a setup that reflects standard PCB board manufacturing practices. The boards are made of standard FR4 material and the board does not have special cuts or grooves around the devices to relieve the mechanical stress of the PCB. The devices and boards in this test do not undergo high temperature burn in post-soldering prior to testing. These conditions replicate real-world system performance and common manufacturing techniques. During the long-term stability testing, the devices under test are maintained at $T_A=35^{\circ}\text{C}$ in an ultra-stable oil bath, their outputs were scanned regularly and measured with an 8.5 digit DVM.

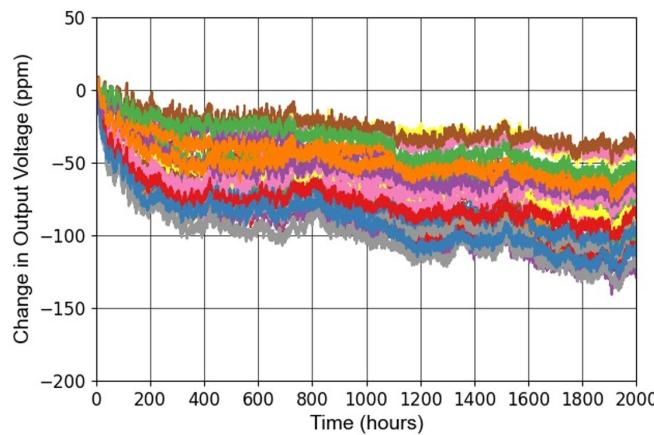

Figure 8.3 Long Term Drift 0 to 2000 hours

Figure 8.3 shows that the typical drift value for the NSREF30xx series is 130 ppm from 0 to 2000 hours. It is important to understand that long-term stability is not ensured by design and that the value is typical. The first 250 hours account most drift, Thus, the early life drift is the dominant contributor, whereas the drift after 250 hours is significantly lower.

8.3. Noise Performance

Flicker noise, also known as 1/f noise, is a low-frequency noise that affects the device output voltage which can affect precision measurements in a data acquisition system. This noise increases proportionally with output voltage and operating temperature. NSREF30xx series peak-to-peak flicker noise is measured with a 2-pole high-pass filter at 0.1Hz and 2-pole low-pass filter at 10Hz, and the test time is 10 seconds. Due to the statistical nature of noise, repeating noise measurements will yield larger and smaller peak values in a given measurement interval. By repeating the measurement for 2000 intervals, each 10 seconds long, it is shown that there are time intervals during which the noise is higher than in a typical single interval, as predicted by statistical theory. For the 1000 interval test, a typical unit will exhibit noise that is less than the typical value listed in the Electrical Characteristics table in more than 80% of all units.

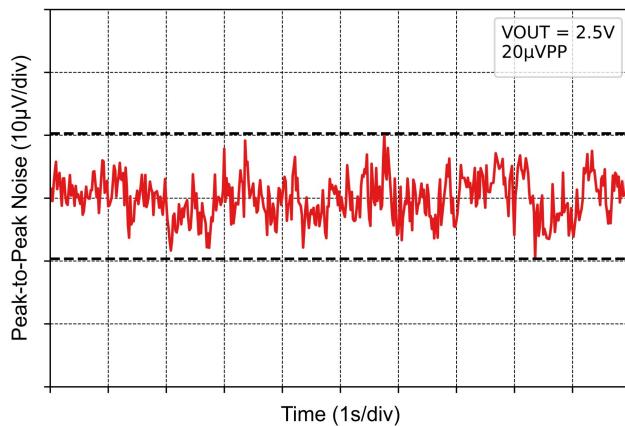

Figure 8.4 0.1Hz to 10Hz Voltage Noise

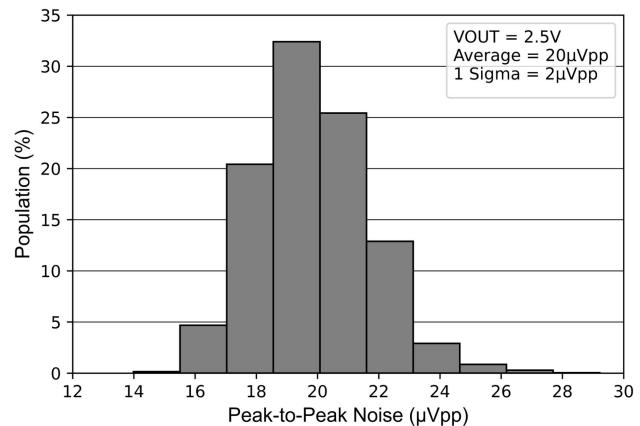

Figure 8.5 0.1Hz to 10Hz Noise Histogram

8.4. Typical Voltage Reference Connection

8.4.1. Input Capacitors

The NSREF30xx series require a 1 μ F or larger input capacitor located close to IN pin to improve transient response in applications where the supply voltage may fluctuate. Connect an additional 0.1 μ F capacitor in parallel to reduce high frequency supply noise.

8.4.2. Load Capacitors

The NSREF30xx series does not require any output capacitance for frequency stability, an additional 1 μ F to 10 μ F electrolytic or ceramic capacitor can be added to improve transient performance in response to sudden changes in load current, however, doing so increases the turn-on time of the device.

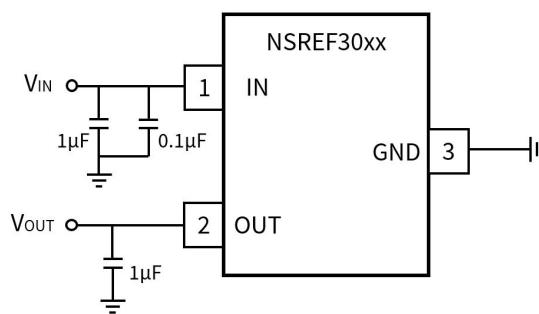

Figure 8.6 The NSREF30xx Typical Application Circuit

8.5. Layout Guidelines

- Connect low-ESR, 0.1- μ F ceramic bypass capacitors at IN of the NSREF30xx.
- Connect low-ESR, 1-uF to 10-uF capacitor at OUT of the NSREF30xx.
- Decouple other active devices in the system per the device specifications.
- Using a solid ground plane helps distribute heat and reduces electromagnetic interference (EMI) noise pickup.
- Place the external components as close to the device as possible. This configuration prevents parasitic errors from occurring.
