

± 1.5 °C High Precision Ultra-low Current Analog Temperature Sensor

Datasheet (EN) 1.2

Product Overview

The NST235 is a high precision CMOS analog output temperature sensor. The device offers a maximum accuracy of $\pm 0.5^\circ\text{C}$ at 25°C and a maximum of $\pm 2.5^\circ\text{C}$ over the full temperature range. The device is specified at the full temperature range of -40°C to 150°C and the power supply operating range is 2.3V to 5.5V.

The NST235 device provides a positive slope output of $10.0\text{mV}/^\circ\text{C}$ over -40°C to 100°C . It is highly linear and does not require complex calculations or lookup tables to derive temperature.

The NST235 is a low power device, and the typical operating current is $20\mu\text{A}$. Therefore, self-heating is negligible. The NST235 is available in SC70(5) and SOT-23(3) package, making it suitable for on-board and off-line applications in the industrial, and consumer markets applications in the IoT.

Applications

- Smartphones
- Portable Medical Instruments
- Notebook Computers
- Industrial Internet of Things (IoT)
- Power Supply Modules
- Power-system Monitors
- Thermal Protection
- Environmental Monitoring and HVAC
- Disk Drives

Device Information

Part Number	Package	Body Size
NST235	SC70(5)	2.00mm × 1.25mm
	SOT-23(3)	2.92mm × 1.30mm

Functional Block Diagrams

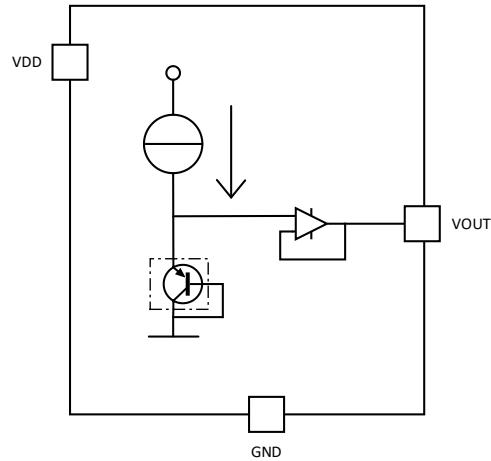

Figure 1 NST235 Functional Block Diagram

Key Features

- High Accuracy Over -40°C to 150°C Temperature Range
 - $0^\circ\text{C} \sim 70^\circ\text{C}: \pm 0.5^\circ\text{C}$ (Typical)
 - $0^\circ\text{C} \sim 70^\circ\text{C}: \pm 1.5^\circ\text{C}$ (Maximum)
 - $-40^\circ\text{C} \sim 150^\circ\text{C}: \pm 2.5^\circ\text{C}$ (Maximum)
- Operating Voltage Range: 2.3V to 5.5V
- Average Sensor Gain: $10\text{mV}/^\circ\text{C}$
- Output Impedance: 1Ω (Typical)
- Operating Current: $20\mu\text{A}$ (Typical)
- Push-Pull Output Current Drain: $500\mu\text{A}$ (Maximum)
- Predictable Curvature Error
- Output Short Protection
- Suitable for Remote Applications
- Package: SOT-23(3) and SC70(5)

3.3 Feature Description

3.3.1 NST235 Transfer Function

The NST235 device is linear. However, the output voltage will shift a little when the temperature is greater than 100°C. In order to achieve the highest accuracy performance of the device, we use piecewise linear function to describe the conversion relationship between temperature and output voltage. In the whole working temperature range, the conversion relationship of NST235 is shown in [Table 3.2](#). The parameters of the piecewise linear function used in the three temperature ranges are shown in [Table 3.1](#), and the output voltage is calculated by [Equation 3-1](#):

$$V_0 = T_C \times (T_A - T_I) + V_{OF} \quad (3-1)$$

Where, V_0 is the output voltage at a given temperature.

T_A is the ambient temperature in °C.

T_I is the temperature inflection point for a piecewise segment in °C.

T_C is the temperature coefficient or gain of NST235.

V_{OF} is the voltage offset of NST235.

Therefore, in a certain output voltage range (V_R), given the output voltage value, the corresponding T_A can be calculated using [Equation 3-2](#). For accuracy insensitive applications, the parameters in the first row of Table 3.1 can be used directly.

$$T_A = \frac{(V_0 - V_{OF})}{T_C} + T_I \quad (3-2)$$

Table 3.1 NST235 Piecewise Linear Function Summary

T_A (°C)	V_R (mV)	T_I (°C)	T_C (mV/°C)	V_{OF} (mV)
-40 to 100	< 1500	0	10	500
100 to 125	1500 to 1752.5	100	10.1	1500
125 to 150	> 1752.5	125	10.6	1752.5

3.3.2 Application Curve

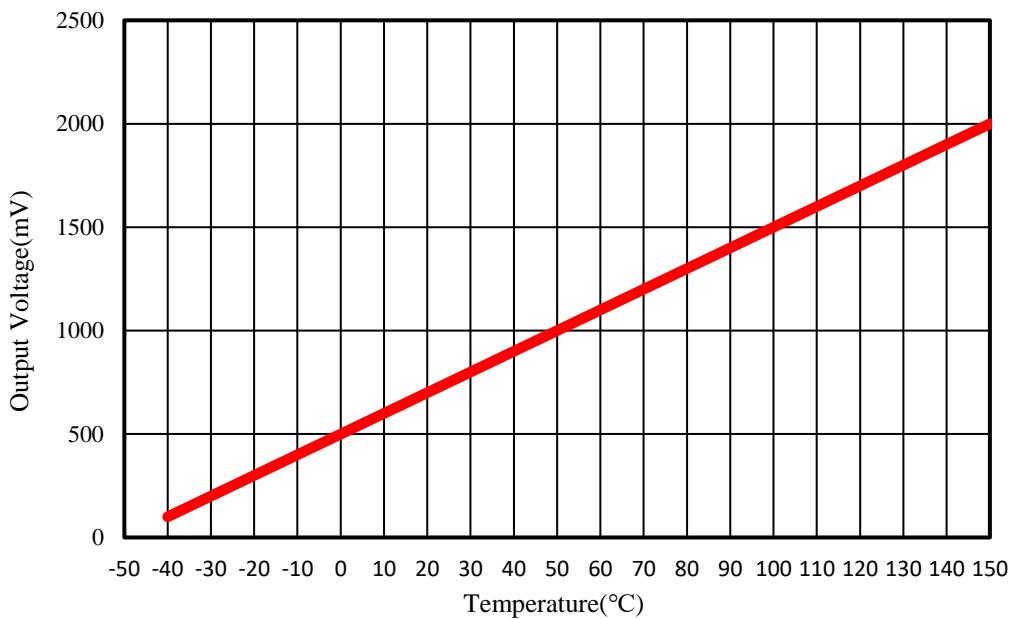

Figure 3.2 Output Voltage vs Temperature

4 Application Information

4.1 Capacitive Loads

As shown in the structure diagram, the output stage of NST235 is an amplifier. Generally, the output of the amplifier directly connected to the capacitive load is unstable. However, NST235 uses a special design, which makes it have 1000pF capacitive load capacity as shown in the [Figure 4.1](#). If a larger capacitor is connected to filter the noise, an isolation resistance should be added between the output of NST235 and the capacitor as shown in the [Table 4.1](#).

When the equipment is in an extremely noisy environment, it may be necessary to add an RC low-pass filter network to the output of NST235, such as a 1μF capacitor and a 800Ω series resistor. This low-pass filter will improve the thermal response time of NST235 and has the function of filtering high-frequency noise as shown in the [Figure 4.2](#).

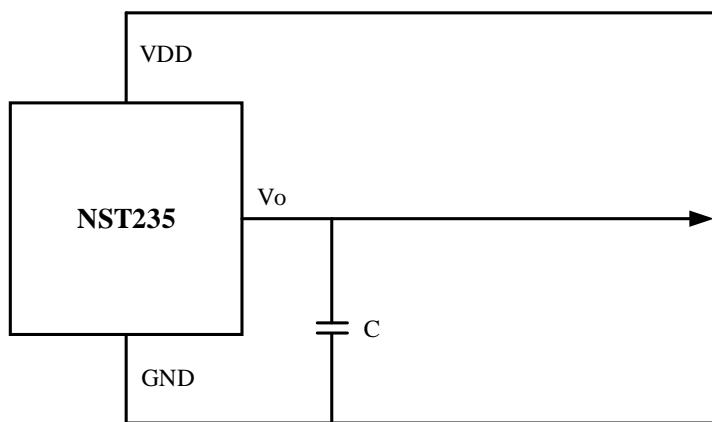

Figure 4.1 NST235 No Decoupling Required for Capacitive Loads Less Than 1000pF

Table 4.1 Capacitive Loading Isolation

C (μF)	Minimum R(Ω)
1	800
0.1 to 0.999	1500
0.01 to 0.099	3000

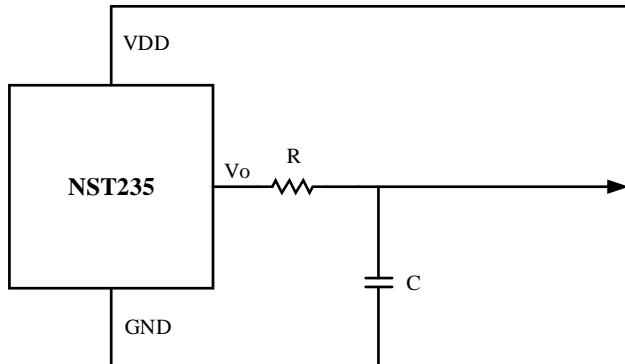

Figure 4.2 NST235 with RC Filter

4.2 Typical Application

As shown in [Figure 4.3](#), the NST235 has an extremely low supply current and a wide supply range, therefore, it can be easily driven by a battery. In order to reduce the noise in the output voltage, it is recommended to add a $0.1\mu\text{F}$ capacitor between the power and the ground.

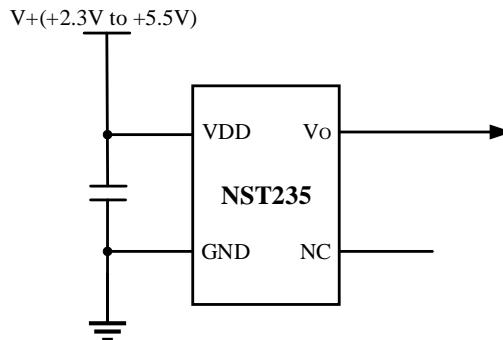

Figure 4.3 Typical Connections of the NST235

4.3 System Examples

4.3.1 Conserving Power Dissipation with Shutdown

Although NST235 has extremely low power consumption, for power-sensitive applications it can simply be shutdown by driving its supply pin with the output of a logic gate as shown in [Figure 4.4](#).

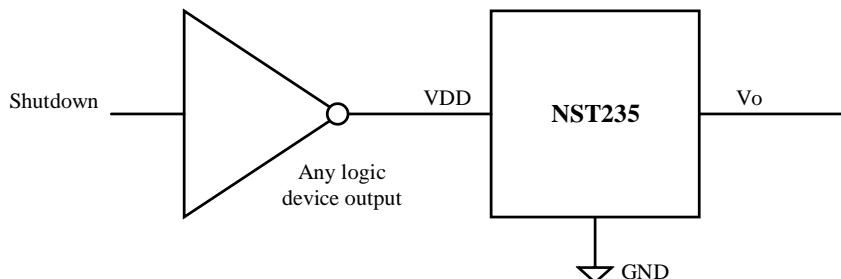

Figure 4.4 Conserving Power Dissipation with Shutdown

4.3.2 Analog-to-Digital Converter Input Stage

The input structure of most CMOS ADCs is sample and hold structure. When ADC charges the sampling capacitor, it needs to draw instantaneous current from the signal source (such as NST235 temperature sensor and many operational amplifiers). By adding RC filter to the output stage of NST235, this requirement can be met. At this time, the instantaneous current is provided by the output capacitor. This ADC is shown as an example only, in [Figure 4.5](#).

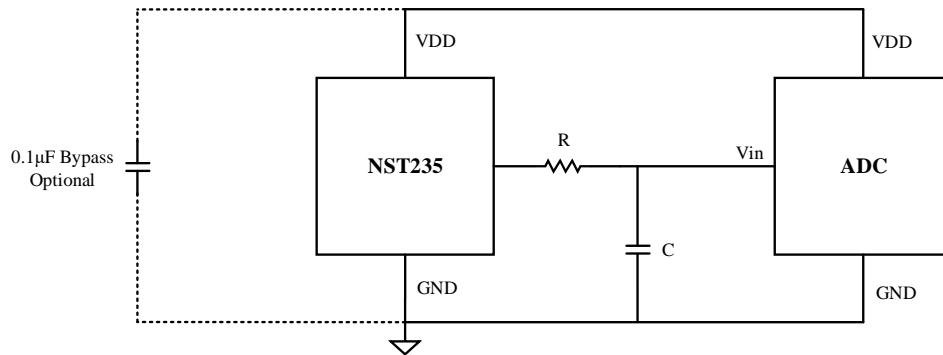

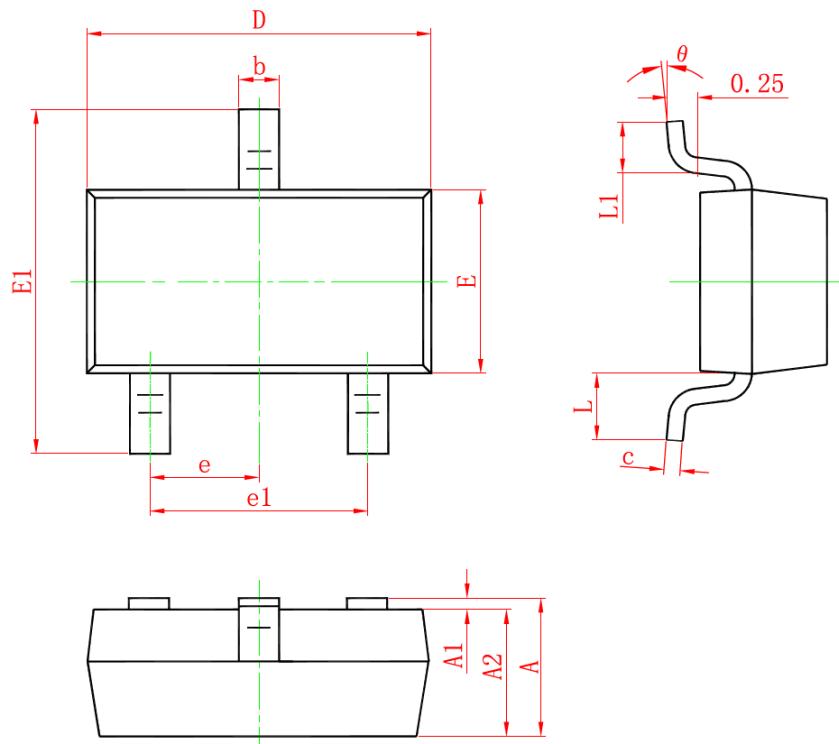

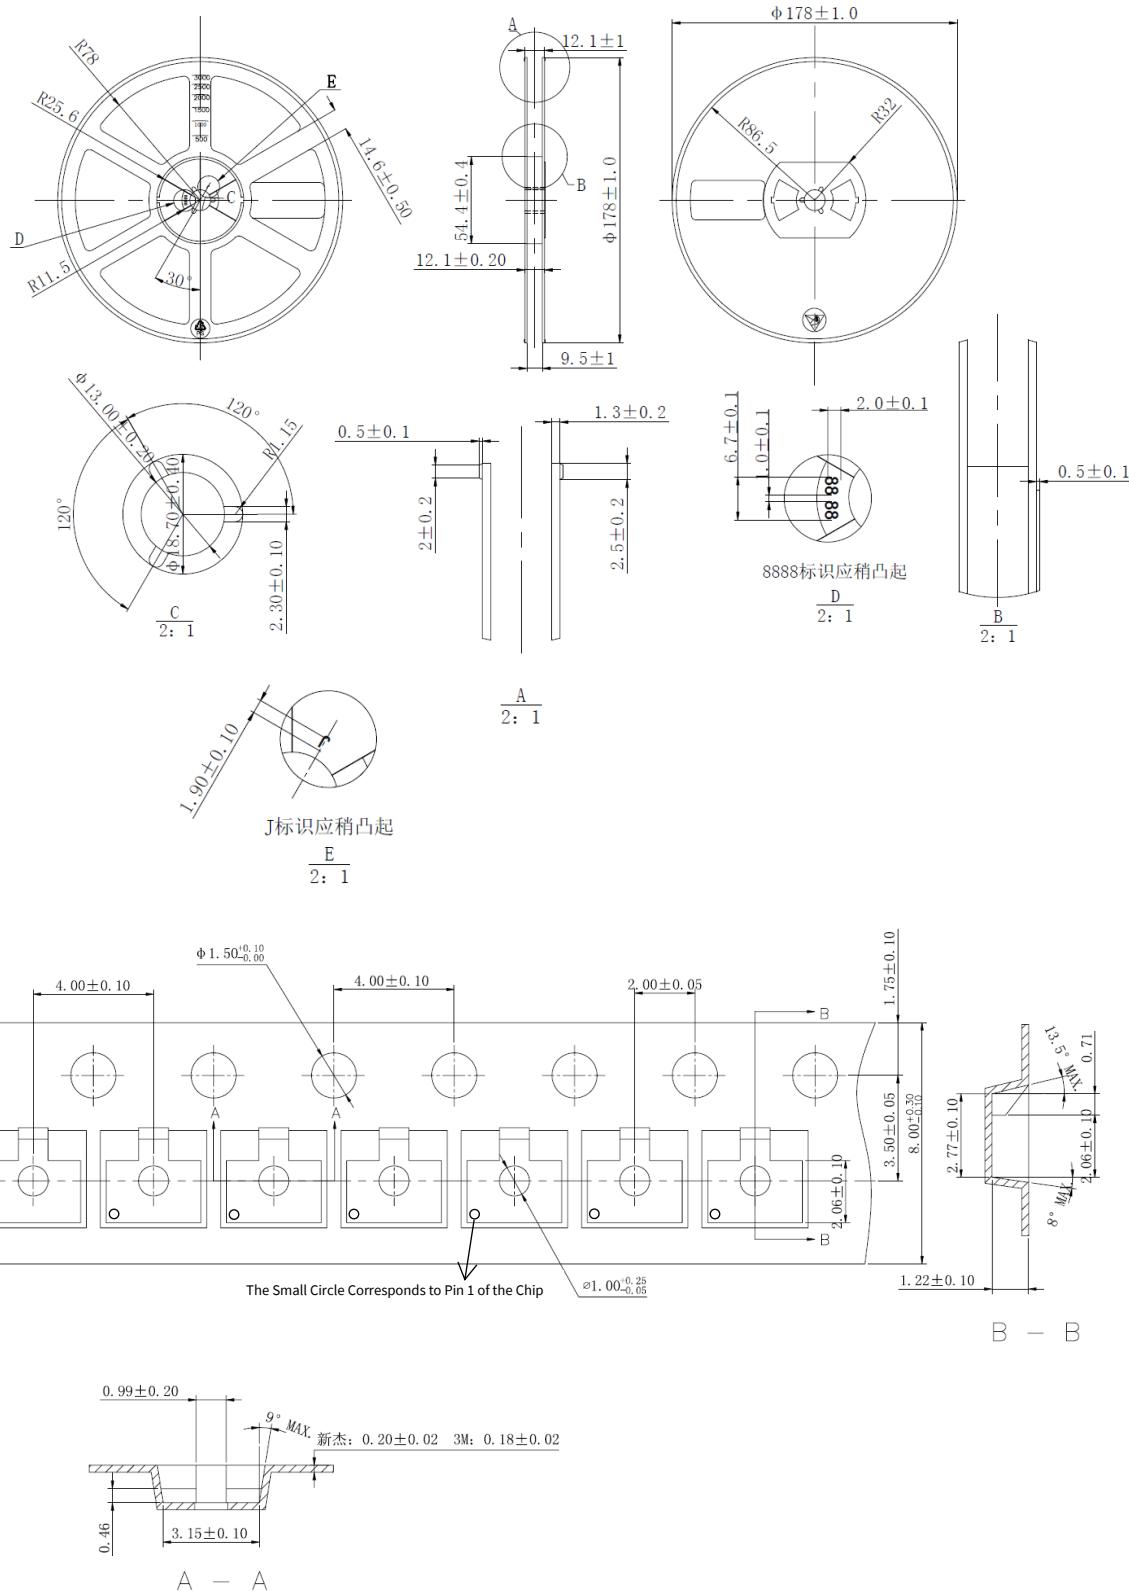

Figure 4.5 Suggested Connection to a Sampling Analog to Digital Converter Input Stage
