

Product Overview

The NSi814x devices are high reliability quad-channel digital isolators. The NSi814x device is safety certified by UL1577 support several insulation withstand voltages (3.75kV_{rms}, 5kV_{rms}), while providing high electromagnetic immunity and low emissions at low power consumption. The data rate of the NSi814x is up to 150Mbps, and the common-mode transient immunity (CMTI) is up to 150kV/us. The NSi814x device provides digital channel direction configuration and the default output level configuration when the input power is lost. Wide supply voltage of the NSi814x device support to connect with most digital interface directly, easy to do the level shift. High system level EMC performance enhance reliability and stability of use. AEC-Q100 (Grade 1) option is provided for all devices.

Key Features

- Up to 5000V_{rms} Insulation voltage
- Date rate: DC to 150Mbps
- Power supply voltage: 2.5V to 5.5V
- AEC-Q100 Grade 1 available for all devices
- High CMTI: 150kV/us
- Chip level ESD: HBM: $\pm 6\text{kV}$
- High system level EMC performance:
Enhanced system level ESD, EFT, Surge immunity
- Default output high level or low level option
- Isolation barrier life: >60 years
- Low power consumption: 1.5mA/ch (1 Mbps)
- Low propagation delay: <15ns
- Operation temperature: -40°C~125°C
- RoHS-compliant packages:
SOP16 narrow body
SOW16 wide body

Safety Regulatory Approvals

- UL recognition: up to 5000V_{rms} for 1 minute per UL1577
- CQC certification per GB4943.1-2011
- CSA component notice 5A
- DIN VDE V 0884-11:2017-01

Applications

- Industrial automation system
- Isolated SPI, RS232, RS485
- General-purpose multichannel isolation
- Motor control

Note A :The input pulse is supplied by a generator having the following characteristics: PRR \leqslant 50 kHz, 50% duty cycle, $t_r \leqslant 3$ ns, $t_f \leqslant 3$ ns, $Z_0 = 50 \Omega$. At the input, a 50- Ω resistor is required to terminate the Input Generator signal. It is not needed in actual application.

NoteB : $C_L = 15 \text{ pF}$ and includes instrumentation and fixture capacitance within $\pm 20\%$.

4. Function Description

The NSi814x is a Quad-channel digital isolator based on a capacitive isolation barrier technique. The digital signal is modulated with RF carrier generated by the internal oscillator at the Transmitter side. Then it is transferred through the capacitive isolation barrier and demodulated at the Receiver side.

The NSi814x devices are high reliability quad-channel digital isolator with AEC-Q100 qualified. The NSi814x device is safety certified by UL1577 support several insulation withstand voltages ($3.75\text{ kV}_{\text{rms}}$, 5 kV_{rms}), while providing high electromagnetic immunity and low emissions at low power consumption. The data rate of the NSi814x is up to 150Mbps, and the common-mode transient immunity (CMTI) is up to 150kV/us. The NSi814x device provides digital channel direction configuration and the default output level configuration when the input power is lost. Wide supply voltage of the NSi814x device support to connect with most digital interface directly, easy to do the level shift. High system level EMC performance enhance reliability and stability of use.

The NSi814x has a default output status when VDDIN is unready and VDDOUT is ready as shown in Table 4.1, which helps for diagnosis when power is missing at the transmitter side. The output B follows the same status with the input A within 60us after powering up.

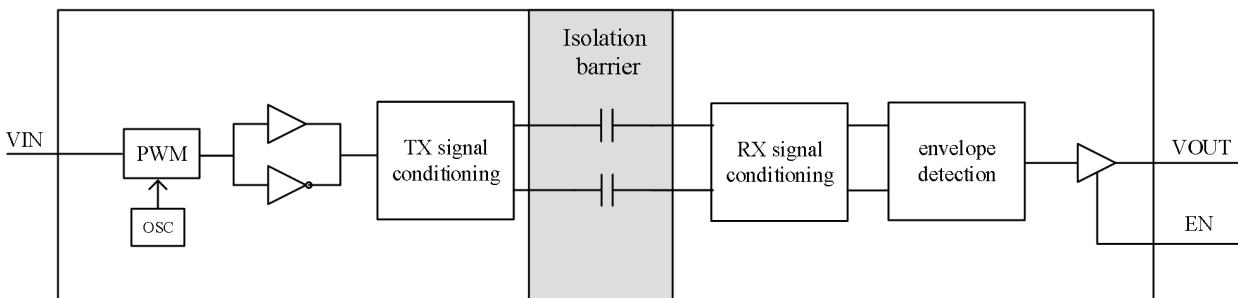

Figure 4.1 Simplified Channel Diagram

Table 4.1 Output status vs. power status

Input	EN_x	VDD1 status	VDD2 status	Output	Comment
H	H or NC	Ready	Ready	H	Normal operation.
L	H or NC	Ready	Ready	L	
X	L	Ready	Ready	Z	Output Disabled, the output is high impedance
X	H or NC	Unready	Ready	L H	The output follows the same status with the input within 60us after input side VDD1 is powered on.
X	L	Unready	Ready	Z	Output Disabled, the output is high impedance
X	X	Ready	Unready	X	The output follows the same status with the input within 60us after output side VDD2 is powered on.

5. Application Note

5.1. PCB Layout

The NSi814x requires a $0.1 \mu\text{F}$ bypass capacitor between VDD1 and GND1, VDD2 and GND2. The capacitor should be placed as close as possible to the package. Figure 5.1 show the recommended schematic diagram, Figure 5.2 to Figure 5.3 show the recommended PCB layout, make sure the space under the chip should keep free from planes, traces, pads and via. To enhance the robustness of a design, the user may also include resistors (50–300 Ω) in series with the inputs and outputs if the system is excessively noisy. The series resistors also improve the system reliability such as latch-up immunity.

The typical output impedance of an isolator driver channel is approximately 50Ω , $\pm 40\%$. When driving loads where transmission line effects will be a factor, output pins should be appropriately terminated with controlled impedance PCB traces.

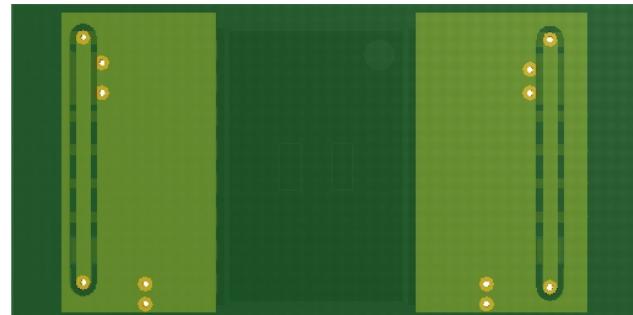

Figure 5.3 Recommended PCB Layout — Bottom Layer

5.2. High Speed Performance

Figure 5.4 shows the eye diagram of NSi814x at 200Mbps data rate output. The result shows a typical measurement on the NSi814x with 350ps p-p jitter.

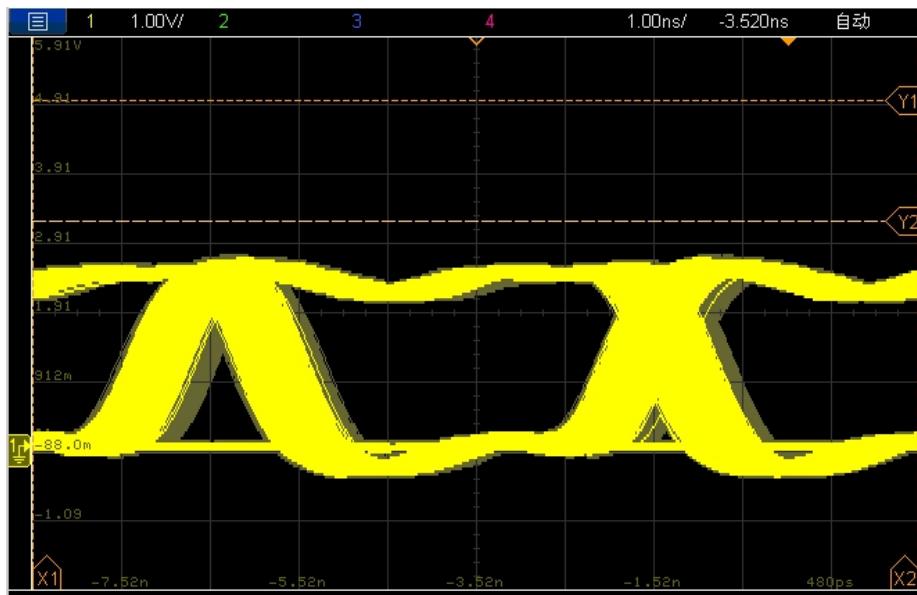

Figure5.4 NSi814x Eye Diagram

5.3. Typical Supply Current Equations

The typical supply current of NSi814x can be calculated using below equations. I_{DD1} and I_{DD2} are typical supply currents measured in mA, f is data rate measured in Mbps, C_L is the capacitive load measured in pF

NSi8140:

$$I_{DD1} = 0.19 * a_1 + 1.45 * b_1 + 0.82 * c_1$$

$$I_{DD2} = 1.36 + VDD1 * f * C_L * c_1 * 10^{-9}$$

When a_1 is the channel number of low input at side 1, b_1 is the channel number of high input at side 1, c_1 is the channel number of switch signal input at side 1.

NSi8141:

$$I_{DD1} = 0.87 + 1.26 * b_1 + 0.63 * c_1 + VDD1 * f * C_L * c_2 * 10^{-9}$$

$$I_{DD2} = 0.87 + 1.26 * b_2 + 0.63 * c_2 + VDD1 * f * C_L * c_1 * 10^{-9}$$

When b_1 is the channel number of high input at side 1, c_1 is the channel number of switch signal input at side 1, b_2 is the channel number of high input at side 2, c_2 is the channel number of switch signal input at side 2.

NSi8142:

$$I_{DD1} = 0.87 + 1.26 * b_1 + 0.63 * c_1 + VDD1 * f * C_L * c_2 * 10^{-9}$$

$$I_{DD2} = 0.87 + 1.26 * b_2 + 0.63 * c_2 + VDD1 * f * C_L * c_1 * 10^{-9}$$

When b_1 is the channel number of high input at side 1, c_1 is the channel number of switch signal input at side 1, b_2 is the channel number of high input at side 2, c_2 is the channel number of switch signal input at side 2.
