# Optically Coupled Triac Drivers

## Type OPI3009, OPI3010, OPI3011, OPI3012

### Features

- For 120 VAC operation
- 2500 VDC minimum electrical isolation
- Low LED trigger current to latch output
- UL recognized File No. E58730

### Description

The OPI3009, OPI3010, OPI3011, and OPI3012 each consist of a gallium arsenide or gallium aluminum arsenide infrared emitting diode and a monolithic integrated circuit containing a photodiode and a bidirectional switch, mounted in a standard plastic six pin dual-in-line package. This series is intended to interface electronic controls with power triacs to control resistive and inductive loads as in motors, solenoids, and appliances.

### Absolute Maximum Ratings ( $T_A = 25^\circ\text{C}$ unless otherwise noted)

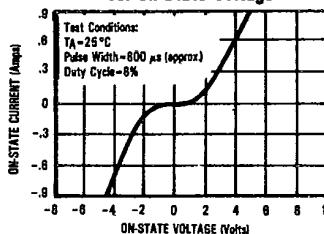

|                                                                                                         |       |                                 |

### Notes:

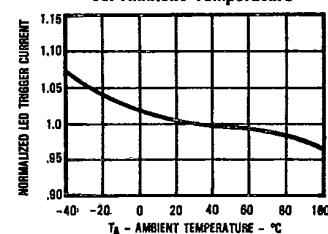

- (1) Measured with input diode leads shorted together and output leads shorted together.
- (2) RMA flux is recommended. Duration can be extended to 10 sec. max. when flow soldering.
- (3) Derate 7.27 mW/ $^\circ\text{C}$  above 25°C.
- (4) Derate 1.82 mW/ $^\circ\text{C}$  above 25°C.
- (5) Derate 6.38 mW/ $^\circ\text{C}$  above 25°C.

## Typical Performance Curves

Static  $dV/dt$  Test CircuitCommutating  $dV/dt$  Test Circuit

- The relay provides a high speed repeated pulse to the D.U.T.
- 10X probes are used to allow high speeds.
- The worst case condition for static  $dV/dt$  is established by triggering the D.U.T. with a normal input (LED) current, then removing this current. The variable  $R_{TEST}$  allows the  $dV/dt$  to be increased until the D.U.T. continues to trigger in response to the applied voltage pulse, even after the LED current has been removed. The  $dV/dt$  is then decreased until the D.U.T. stops triggering.  $\tau_{RC}$  is measured at this point and recorded.

- 10X probes are used to allow high speeds.
- Frequency is increased until the triac stays "on" after being triggered by pushbutton. Frequency is then decreased until triac turns "off."  $t_p$  is measured at this point and recorded.
- Commutating  $dV/dt = 36/t_p$ .
