Detailed Explanation

Display On/Off

Code	R/W	D/I	DB7.....DB0							DB0
	0	0	0	0	1	1	1	1	1	D
	MSB					LSB				

The display data appears when D is 1 and disappears when D is 0. Though the data is not on the screen with D=0, it remains in the display data RAM. Therefore, you can make it appear by changing D=0 into D=1.

Display Start Line

	R/W	D/I	DB7.....DB0						
Code	0	0	1	1	A	A	A	A	A
	MSB						LSB		

Z address AAAAAA (binary) of the display data RAM is set in the display start line register and displayed at the top of the screen. Figure 1 shows examples of display (1/64 duty cycle) when the start line=0-3. When the display duty cycle is 1/64 or more (ex. 1/32, 1/24 etc.), the data of total line number of LCD screen, from the line specified by display start line instruction, is displayed.

See figure 1.

Set page (X address)

	R/W	D/I	DB7.....DB0						
Code	0	0	1	0	1	1	1	A	A
	MSB						LSB		

X address AAA (binary) of the display data RAM is set in the X address register. After that, writing or reading to or from MPU is executed in this specified page until the next page is set. See figure 2.

Set Y Address

	R/W	D/I	DB7.....DB0						
Code	0	0	0	1	A	A	A	A	A
	MSB						LSB		

Y address AAAAAA (binary) of the display data RAM is set in the Y address Counter. After that, Y address counter is increased by 1 every time the data is written or read to or from MPU.

Status Read

	R/W	D/I	DB7.....DB0						
Code	1	0	BUSY	0	ON/OFF	REST	0	0	0
	MSB						LS		

- Busy

When busy is 1, the LSI is executing internal operations. No instructions are accepted while busy is 1,

so you should make sure that busy is 0 before writing the next instruction.

• ON/OFF

Shows the liquid crystal display conditions: on condition or off condition.

When on/off is 1, the display is in off condition.

When on/off is 0, the display is in on condition.

• RESET

RESET=1 shows that the system is being initialized. In this condition, no instructions except status read can be accepted.

RESET=0 shows that initializing has finished and the system is in the usual operation condition.

Write Display Data

	R/W	D/I	DB7.....DB0						
Code	0	1	D	D	D	D	D	D	D
	MSB				LSB				

Write 8-bit data DDDDDDDD (binary) into the display data RAM. Then Y address is increased by 1 automatically.

Read Display Data

	R/W	D/I	DB7.....DB0						
Code	1	1	D	D	D	D	D	D	D
	MSB				LSB				

Reads out 8-bit data DDDDDDDD (binary) from the display data RAM. Then Y address is increased by 1 automatically.

One dummy read is necessary right after the address setting. For details, refer to the explanation of output register in “Function of Each Block”.
