### ■ Standard Connection

D1 : This device is necessary to protect the element from damage when reverse voltage may be applied to the regulator in case of input short-circuiting.

C<sub>ref</sub> : This device is necessary when it is required to enhance the ripple rejection or to delay the output start-up time\*. Otherwise, it is not necessary.

(Care must be taken since C<sub>ref</sub> may raise the gain, facilitating oscillation.)

\* The output start-up time proportional to C<sub>ref</sub> X R<sub>2</sub>.

C<sub>IN</sub>, C<sub>O</sub> : Be sure to mount the devices C<sub>IN</sub> and C<sub>O</sub> as close to the device terminal as possible so as to prevent oscillation.

The standard specification of C<sub>IN</sub>=0.33μF, C<sub>O</sub>=47μF, respectively. However, adjust them as necessary after checking.

R<sub>1</sub>, R<sub>2</sub> : These devices are necessary to set the output voltage. The output voltage V<sub>O</sub> is given by the following formula:

$$V_O = V_{ref} \times (1 + R_2/R_1)$$

(V<sub>ref</sub> is 1.25V TYP)

The standard value of R<sub>1</sub> is 2Ω. But value up to 10kΩ.
