

FEATURES

- Access Times of 150, 200, 250 and 350ns
- Single 5V±10% Power Supply
- Fast Byte Write (200μs or 1 ms)
- Low Power CMOS:
 - 60 mA Active Current
 - 150 μA Standby Current
- Fast Write Cycle Time - DATA Polling
- CMOS & TTL Compatible Inputs and Outputs
- Endurance:
 - 10,000 Write Cycles
 - 100,000 Write Cycles (optional)
- Data Retention: 10 Years
- Available in the following package:
 - 24-Pin 600 mil Ceramic DIP
 - 32-Pin Ceramic LCC (450x550 mils)

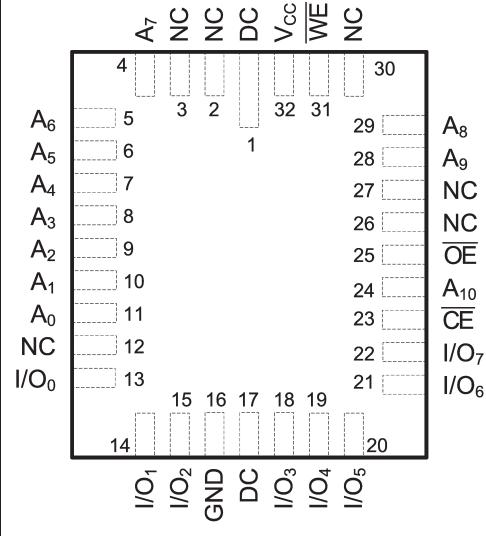

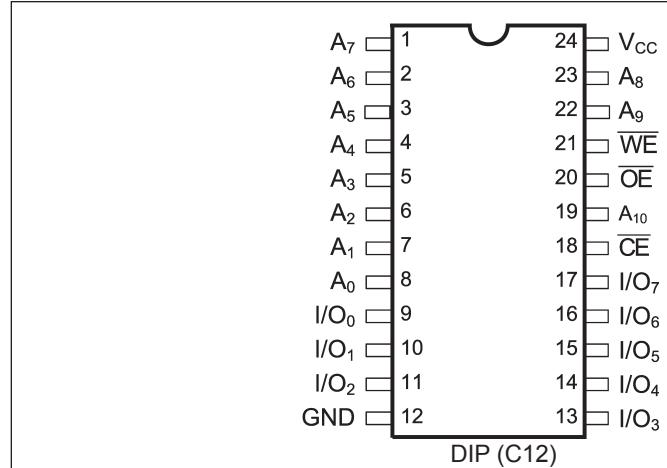

DESCRIPTION

The PYA28C16 is a 5 Volt 2Kx8 EEPROM. The PYA28C16 is a 16K memory organized as 2,048 words by 8 bits. Data Retention is 10 Years. The device is available in a 24-Pin 600 mil wide Ceramic DIP and 32-Pin LCC.

PIN CONFIGURATIONS

OPERATION

READ

Read operations are initiated by both \overline{OE} and \overline{CE} LOW. The read operation is terminated by either \overline{CE} or \overline{OE} returning HIGH. This two line control architecture eliminates bus contention in a system environment. The data bus will be in a high impedance state when either \overline{OE} or \overline{CE} is HIGH.

BYTE WRITE

Write operations are initiated when both \overline{CE} and \overline{WE} are LOW and \overline{OE} is HIGH. The PYA28C16 supports both a \overline{CE} and \overline{WE} controlled write cycle. That is, the address is latched by the falling edge of either \overline{CE} or \overline{WE} , whichever occurs last. Similarly, the data is latched internally by the rising edge of either \overline{CE} or \overline{WE} , whichever occurs first. A byte write operation, once initiated, will automatically continue to completion.

CHIP CLEAR

The contents of the entire memory of the PYA28C16 may be set to the high state by the CHIP CLEAR operation. By setting \overline{CE} low and \overline{OE} to 12 volts, the chip is cleared when a 10 msec low pulse is applied to \overline{WE} .

DEVICE IDENTIFICATION

An extra 32 bytes of EEPROM memory are available to the user for device identification. By raising A_9 to $12 \pm 0.5V$ and using address locations 7E0H to 7FFH the additional bytes may be written to or read from in the same manner as the regular memory array.

DATA POLLING

The PYA28C16 features DATA Polling as a method to indicate to the host system that the byte write cycle has completed. DATA Polling allows a simple bit test operation to determine the status of the PYA28C16, eliminating additional interrupts or external hardware. During the internal programming cycle, any attempt to read the last byte written will produce the complement of that data on I/O₇ (i.e., write data=0xxx xxxx, read data=1xxx xxxx). Once the programming cycle is complete, I/O₇ will reflect true data.

Notes:

- Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to MAXIMUM rating conditions for extended periods may affect reliability.
- Extended temperature operation guaranteed with 400 linear feet per minute of air flow.
- Transient inputs with V_{IL} and I_{IL} not more negative than -3.0V and -100mA, respectively, are permissible for pulse widths up to 20ns.
- This parameter is sampled and not 100% tested.
