

**Typical Applications**

- Broadband Gain Blocks
- Final PA for Low-Power Applications
- IF or RF Buffer Amplifiers
- Driver Stage for Power Amplifiers
- Oscillator Loop Amplifiers

**Product Description**

The RF2322 is a general purpose, low-cost silicon amplifier designed for operation from a 3V supply. The circuit configuration with resistive feedback allows for broadband cascadable amplification. Capacitive compensation extends the bandwidth of the amplifier and input stage design optimizes noise figure. The device is unconditionally stable and internally matched to 50Ω. The only external components required for specified performance are bypass and DC blocking capacitors (as shown in application schematic). The RF2322 is available in a very small industry-standard SOT-23 5-lead surface mount package, enabling compact designs which conserve board space.

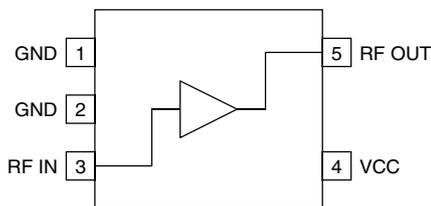

**Optimum Technology Matching® Applied**

- Si BJT
- GaAs HBT
- GaAs MESFET
- Si Bi-CMOS
- SiGe HBT
- Si CMOS

**Package Style: SOT-23-5**

**Features**

- DC to >2000MHz Operation
- 2.7V to 3.3V Single Supply
- +3dBm Output IP3
- 19dB Gain at 900MHz
- 12dB Gain at 1900MHz
- High Isolation (38dB at 900MHz)

Pin	Function	Description	Interface Schematic
1	GND	Ground connection. Keep traces physically short and connect immediately to ground plane for best performance.	
2	GND	Same as pin 1.	
3	RF IN	RF input pin. This pin is not internally DC blocked and thus requires an external blocking capacitor suitable for the frequency of operation. The input impedance of this pin is internally matched to 50Ω using resistive feedback.	
4	VCC	Supply connection. This pin should be bypassed with a suitable capacitor(s).	
5	RF OUT	RF output and bias pin. The output impedance of this pin is internally matched to 50Ω using resistive feedback. Because DC biasing is present on this pin, a DC blocking capacitor should be used in most applications (see application schematic).	See pin 3 schematic.
