

# RYB050I 2.4GHz BlueTooth Module

## **Function description**

- \* Has a build-in 2.4GHz PCB antenna
- \* PIO control can be switched
- \* Has the standard HCI Port (UART or USB)
- \* The USB protocol is Full Speed USB1.1, and compliant with 2.0.
- \* This module can be used in the SMD.
- \* Bases at CSR BC417, Fully Qualified Bluetooth v2.0
- \* It is at the Bluetooth class 2 power level
- \*Has the function of adaptive frequency hopping.
- \* Low Cost

## **Application fields**

- \* Bluetooth Car Handsfree Device
- \* Bluetooth GPS
- \* Bluetooth PCMCIA , USB Dongle
- \* Bluetooth Data Transfer

## Software

\* CSR Standard

## **Ordering Information**

\* 50 pieces chips in an anti-static blister package

#### **Technical Specifications**

|   | Min. | Тур.  | Max.    | Unit | Note               |
|---|------|-------|---------|------|--------------------|
| Operating Voltage                                   | 3.1  | 3.3   | 4.2     | v    | VCC                |
| Current (in pairing)                                | 30   |       | 40      | mA   |                    |
| Current (communication)                             |      | 8     |         | mA   |                    |
| Operating Frequency                                 | 2.4  |       | 2.4835  | GHz  |                    |
| RF output power                                     | -6   | 2     | 4       | dBm  |                    |
| Step size of Power control                          | 2    |       | 8       | dB   |                    |
| Baud rate   | 4800 | 38400 | 1382400 | Hz   |                    |
| Freq. Offset  | -75  |       | 75      | KHz  |                    |
| Carrier Freq. drift ( Hopping on, drift rate/50uS ) | -20  |       | 20      | KHz  |                    |
| 1 slot packet                                       | -25  |       | 25      | KHz  |                    |
| 3 slot packet                                       | -40  |       | 40      | KHz  |                    |
| Average Freq. Deviations (Hopping off,              | 140  |       | 175     | KHz  |                    |
| modulation )  |      |       |         |      |                    |
| Freq. Deviation                                     | 115  |       |         | KHz  |                    |
| Ratio of Freq. Deviation                            | 0.8  |       |         |      |                    |
| Communication Distance                              |      |       | 10      | М    |                    |
| Receive Sensitivity @< 0.1% BER                     |      | -83   |         | dBm  | π <b>/</b> 4 DQPSK |
| Flash memory  |      | 8     |         | Mbit |                    |
| Dimensions  |      |       |         |      | 27mm×13mm 2mm      |
| Weight  |      |       |         | g    |                    |
| Operating Temperature                               | -40  |       | +85     | °C   |                    |

#### **PINs description**

| Pin | Name     | Input/Output                  | Description                                  |
|-----|----------|-------------------------------|--|
| 1   | UART_TX  | CMOS output, Tri-stable with  | UART Data output                             |
|     |          | weak internal pull-up         |  |
| 2   | UART_RX  | CMOS input with               | UART Data input                              |
|     |          | weak internal pull-down       |  |
| 3   | UART_CTS | CMOS input with weak internal | UART clear to send, active low               |
|     |          | pull-down                     |  |
| 4   | UART_RTS | CMOS output, tri-stable with  | UART request to send, active low             |
|     |          | weak internal pull-up         |  |
| 5   | PCM_CLK  | Bi-directional with weak      | Synchronous data clock                       |
|     |          | internal pull-down            |  |
| 6   | PCM_OUT  | CMOS output, tri-state, with  | Synchronous data output                      |
|     |          | weak internal pull-down       |  |
| 7   | PCM_IN   | CMOS input, with weak         | Synchronous data input                       |
|     |          | internal pull-down            |  |
| 8   | PCM_SYNC | Bi-directional with weak      | Synchronous data sync                        |
|     |          | internal pull-down            |  |
| 9   | AIO[0]   | Bi-Directional                | Programmable input/output line               |
| 10  | AIO[1]   | Bi-Directional                | Programmable input/output line               |
| 11  | RESETB   | CMOS Input with weak internal | Reset if low. Input debounced so must be     |
|     |          | pull-down                     | low for >5ms to cause a reset                |
| 12  | VCC      | Power supply                  |  |
| 13  | GND      | GROUND                        |  |
| 14  | 1V8      | VDD                           | Integrated 1.8V (+) supply                   |
|     |          |                               | with On-chip linear                          |
|     |          |                               | regulator output within                      |
|     |          |                               | 1.7-1.9V                                     |
| 15  | USB      | Bi-Directional                | USB data minus                               |
| 16  | SPI_CSB  | CMOS input with weak internal | Chip select for serial peripheral interface, |
|     |          | pull-up                       | active low                                   |
| 17  | SPI_MOSI | CMOS input with weak internal | Serial peripheral interface                  |
|     |          | pull-down                     | data input                                   |
| 18  | SPI_MISO | CMOS input with weak internal | Serial peripheral interface                  |
|     |          | pull-down                     | data Output                                  |
| 19  | SPI_CLK  | CMOS input with weak internal | Serial peripheral interface                  |
|     |          | pull-down                     | clock  |

| 20 | USB_+             | Bi-Directional                   | USB data plus                                 |
|----|-------------------|----------------------------------|---|
| 21 | GND               | GROUND                           |   |
| 22 | GND               | GROUND                           |   |
| 23 | PIO[0]/ RXEN      | Bi-directional with programmable | Programmable input/output line, control       |
|    |                   | strength internal pull-up/down   | output for LNA(if fitted)                     |
| 24 | PIO[1]/TXEN       | Bi-directional with programmable | Programmable input/output                     |
|    |                   | strength internal pull-up/down   | line, control output for PA(if fitted)        |
| 25 | PIO[2]            | Bi-directional with programmable | Programmable input/output                     |
|    |                   | strength internal pull-up/down   | line  |
| 26 | PIO[3]            | Bi-directional with programmable | Programmable input/output                     |
|    |                   | strength internal pull-up/down   | line  |
| 27 | PIO[4]/BT_Priorit | Bi-directional with programmable | Programmable input/output line or             |
|    | y/Ch_Clk          | strength internal pull-up/down   | optional BT_Priority/Ch_Clk output for        |
|    |                   |                                  | co-existence signalling                       |
| 28 | PIO[5]/BT_Active  | Bi-directional with programmable | Programmable input/output line or             |
|    |                   | strength internal pull-up/down   | optional BT_Active output for                 |
|    |                   |                                  | co-existence signalling                       |
| 29 | PIO[6]/WLAN_Act   | Bi-directional with programmable | Programmable input/output line or             |
|    | ive/Ch_Data       | strength internal pull-up/down   | optional WLAN_Active/Ch_Data input for        |
|    |                   |                                  | co-existence signalling                       |
| 30 | PIO[7]            | Bi-Directional                   | Programmable input/output                     |
|    |                   |                                  | line  |
| 31 | PIO[8]            | LED Output                       | LED, indicator of work mode. Has 3            |
|    |                   |                                  | modes:When the module is supplied             |
|    |                   |                                  | power and PIN34 is input high level,          |
|    |                   |                                  | PIN31 output 1Hz square wave to make          |
|    |                   |                                  | the LED flicker slowly. It indicates that the |
|    |                   |                                  | module is at the AT mode, and the baud        |
|    |                   |                                  | rate is 38400.                                |
|    |                   |                                  | When the module is supplied power and         |
|    |                   |                                  | PIN34 is input low level, PIN31 output 2Hz    |
|    |                   |                                  | square wave to make the LED flicker           |
|    |                   |                                  | quickly. It indicates the module is at the    |
|    |                   |                                  | pairable mode. If PIN34 is input high level,  |
|    |                   |                                  | then the module will enter to AT mode,        |
|    |                   |                                  | but the output of PIN31 is still 2Hz square   |
|    |                   |                                  | wave. After the pairing, PIN31 output 2Hz     |
|    |                   |                                  | square ware.                                  |

|    |         |                | Note: if PIN34 keep high level, all the      |
|----|---------|----------------|--|
|    |         |                | commands in the AT command set can be        |
|    |         |                | in application. Otherwise, if just excite    |
|    |         |                | PIN34 with high level but not keep, only     |
|    |         |                | some command can be used.                    |
| 32 | PIO[9]  | Output         | Before paired, it output low level. Once     |
|    |         |                | the pair is finished, it output high level.  |
| 33 | PIO[10] | Bi-Directional | Programmable input/output line               |
| 34 | PIO[11] | INPUT          | Mode switch input. If it is input low level, |
|    |         |                | the module is at paired or communication     |
|    |         |                | mode. If it's input high level, the module   |
|    |         |                | will enter to AT mode. Even though the       |
|    |         |                | module is at communication, the module       |
|    |         |                | can enter to the AT mode if PIN34 is input   |
|    |         |                | high level. Then it will go back to the      |
|    |         |                | communication mode if PIN34 is input         |
|    |         |                | low level again.                             |

27mm(L)\*13mm(W)\*2mm(H)

#### AT command

RYB050I embedded Bluetooth serial communication module has two work modes: order-response work mode and automatic connection work mode. And there are three work roles (Master, Slave and Loopback) at the automatic connection work mode.

When the module is at the **automatic connection work mode**, it will follow the default way set lastly to transmit the data automatically.

When the module is at the **order-response work mode**, user can send the AT command to the module to set the control parameters and sent control order. The work mode of module can be switched by controlling the module PIN (PIO[11]) input level.

Serial module PINs:

PIO[8] connects with LED. When the module is power on, LED will flicker. And the flicker style will indicate which work mode is in using since different mode has different flicker time interval.
 PIO[9] connects with LED. It indicates whether the connection is built or not. When the Bluetooth serial is paired, the LED will be turned on. It means the connection is built successfully.
 PIO[11] is the work mode switch. When this PIN port is input high level, the work mode will become order-response work mode. While this PIN port is input low level or suspended in air, the work mode will become automatic connection work mode.

4. The module can be reset if it is re-powered since there is a reset circuit at the module.

#### 1. How to get to the AT mode.

Way 1:

Step 1: Input low level to PIN34. Step 2: Supply power to the module. Step 3: Input high level to the PIN34. Then the module will enter to AT mode. The baud rate is as same as the communication time, such as 9600 etc.

Way 2: Step 1: Connect PIN34 to the power supply PIN. Step 2: Supply power to module (the PIN34 is also supplied with high level since the PIN34 is connected with power supply PIN). Then the module will enter to AT module. But at this time, the baud rate is 38400. In this way, user should change the baud rate at the AT mode, if they forget the communication baud rate.

How to get to the communication mode: Step 1: Input low level to PIN34. Step 2:Supply power to the module. Then the module will enter to communication mode. It can be used for pairing.

#### 2. How to set this module be the master role.

- Step 1: Input high level to PIO[11].
- Step 2: Supply power to the module. And the module will enter to the order-response work mode.
- Step 3: Set the parameters of the super terminal or the other serial tools

(baud rate:38400, data bit:8, stop bit:1, no parity bit, no Flow Control)

- Step 4: Sent the characters "AT+ROLE=1\r\n" through serial, then receive the characters "OK\r\n". Here, "\r\n" is the CRLF.
- Step 5: Input low level to PIO, and supply power to the module again. Then this module will become master role and search the other module (slave role) automatically to build the connection.

#### 3. Notes.

- (1) The command should end up with "\r\n". It means when you finish programming, you should add terminator ("ENTER" or "0x0D 0x0A") to the program.
- (2) The most common commands for the module are: AT+ROLE (set master slave), AT+CMODE( set address pairing), AT+PSWD (set password). If you want the master module has the function of remembering slave module, the most simply way is: First, set AT+CMODE=1. Make the master module pair with the slave module. Second, set AT+CMODE=0. Then the master module just can make pair with that specified slave module.
- (3) When PIN34 keeps high level, all commands can be used. Otherwise, only some of them can be used.

### **Detailed description of Command**

(AT command is case- sensitive, should end up with terminator ("enter" or "\r\n").)

## 1. Test

| Command | Response | Parameter |
|---------|----------|-----------|
| AT      | ОК       | None      |

#### 2. Reset

| Command  | Response | Parameter |
|----------|----------|-----------|
| AT+RESET | ОК       | None      |

#### 3. Get the soft version

| Command     | Response              | Parameter             |
|-------------|-----------------------|-----------------------|
| AT+VERSION? | +VERSION: <param/> OK | Param: Version number |

Example :

at+version?\r\n

+VERSION:2.0-20100601

ОК

#### 4. Restore default status

| Command | Response | Parameter |
|---------|----------|-----------|
| AT+ORGL | ОК       | None      |

The parameter of default status:

(1)  $\cdot$  Device type: 0

② · Inquire code: 0x009e8b33

3  $\cdot$  Module work mode: Slave Mode

4 · Connection mode: Connect to the Bluetooth device specified

5 · Serial parameter: Baud rate: 38400 bits/s; Stop bit: 1 bit; Parity bit: None.

ⓑ · Passkey: "1234"

1 · Device name: "H-C-2010-06-01"

#### 5. Get module Bluetooth address

| Command  | Response           | Parameter                |
|----------|--------------------|--------------------------|
| AT+ADDR? | +ADDR: <param/> OK | Param: Bluetooth address |

Bluetooth address will show as this way: NAP: UAP: LAP(Hexadecimal)

Example:

Module Bluetooth address: 12: 34: 56: ab: cd: ef

at+addr?\r\n

+ADDR:1234:56:abcdef

ОК

#### 6. Set/ inquire device's name

| Command           | Response           | Parameter                    |
|-------------------|--------------------|------------------------------|
| AT+NAME= <param/> | ОК                 |                              |
|                   | 1. +NAME: <param/> | Param: Bluetooth device name |
| AT+NAME?          | OKsuccess          |                              |
|                   | 2. FAILfailure     |                              |

Example:

AT+NAME=REYAX\r\n ---set the module device name: "REYAX"

ОК

ОК

at+name=TEST1\r\n ---set the module device name: "TEST1"

ОК

at+name= "TEST1"\r\n ---set module device name : "TEST1"

ОК

at+name?\r\n

+NAME: TEST1

7. Get the remote Bluetooth device's name

| Command                     | Response  | Parameter  |
|-----------------------------|---|--|
| AT+RNAME? <param1></param1> | <ol> <li>+NAME:<param2></param2></li> <li>OKsuccess</li> <li>FAILfailure</li> </ol> | Param1: Remote Bluetooth<br>device address<br>Param2: Remote Bluetooth<br>device address |

Bluetooth address will show as this way: NAP:UAP:LAP (Hexadecimal)

Example:

Bluetooth device address: 00:02:72: od: 22 : 24; device name: Bluetooth

```
at+rname? 0002,72,od2224\r\n
```

+RNAME:Bluetooth

ОК

8. Set/ inquire module role

| Command           | Response         | Parameter         |
|-------------------|------------------|-------------------|
| AT+ROLE= <param/> | ОК               | Param:            |
|                   |                  | 0 Slave role      |
| AT+ ROLE?         | + ROLE: <param/> | 1 Master role     |
|                   | ОК               | 2 Slave-Loop role |
|                   |                  | Default: 0        |

Role introduction:

Slave (slave role)----Passive connection;

Slave-Loop----Passive connection, receive the remote Bluetooth master device

data and send it back to the master device;

Master (master role)----Inquire the near SPP Bluetooth slave device, build

Connection with it positively, and build up the transparent data transmission

between master and slave device.

9. Set/inquire device type

| Command            | Response | Parameter          |
|--------------------|----------|--------------------|
| AT+CLASS= <param/> | ОК       | Param: device type |

| AT+ CLASS? | 1. + CLASS: <param/><br>OKsuccess<br>2. FAILfailure | Bluetooth device type is a 32-bit<br>parameter indicates the device<br>type and what type can be<br>supported.<br>Default: 0<br>More information is provided at<br>the appendix 1(device type |
|------------|---|---|
|            |   | introduction).  |

For inquiring the custom Bluetooth device from around Bluetooth devices quickly and effectively, user can set the module to be non-standard Bluetooth device type, such as 0x1f1f (Hexadecimal).

#### 10. Set/ inquire-Inquire access code

| Command           | Response       | Parameter                                     |
|-------------------|----------------|---|
| AT+IAC= <param/>  | 1. OKsuccess   | Param: Inquire access code                    |
| AT HAC- ST druinz | 2. FAILfailure | Default: 9e8b33                               |
| AT+ IAC2          | +IAC: <param/> | The more information is provided at the       |
|                   | ок             | appendix 2(Inquire access code introduction). |

Access code is set to be GIAC type (General Inquire Access Code:0x9e8b33), and used for seeking ( or being sought by ) all the Bluetooth devices around.

For inquiring (or being inquiring by) the custom Bluetooth device from around Bluetooth devices quickly and effectively, user can set the inquire access code to be the other type number (not GIAC nor LIAC), such as 9e8b3f.

Example: AT+IAC=9e8b3f\r\n OK AT+IAC?\r\n +IAC: 9e8b3f OK

11. Set/ inquire - Inquire access mode

| Command                             | Response       | Parameter                  |
|-------------------------------------|----------------|----------------------------|
| AT+INQM= <param/> ,                 | 1. OKsuccess   | Param: Inquire access mode |
| <param2>,<param3></param3></param2> | 2. FAILfailure | 0inquiry_mode_standard     |

|           |   | 1inquiry_mode_rssi                        |
|-----------|---|---|
|           |   | Param2: the maximum of Bluetooth devices  |
|           | +INQM: <param/> , <param2>,<param3></param3></param2> | response Param3:The maximum of limited    |
| AT+ INQM? | ОК  | inquiring time The range of limited time: |
|           |   | 1~48( Corresponding time:1.28s~61.44s)    |
|           |   | Default: 1, 1, 48                         |
|           |   |   |
|           |   |   |

### Example:

 AT+INQM=1,9,48\r\n
 ----Set Inquire access mode: 1) has RSSI signal intensity indicator, 2)

 stop inquiring once more than 9 devices response, 3) limited time is

 48\*I. 28=61.44s

 OK

AT+INQM\r\n +INQM:1, 9, 48 OK

### 12. Set/Inquire- passkey

| Command                                 | Response          | Parameter       |
|---|-------------------|-----------------|
| AT+PSWD= <param/>                       | ОК                | Param: passkey  |
| AT+ PSWD?                               | + PSWD : <param/> | Default: "1234" |
| ,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,, | ОК                |                 |

#### 13. Set/ Inquire- serial parameter

| Command                    | Response | Parameter                  |
|----------------------------|----------|----------------------------|
| AT+UART= <param/> ,<       | OK       | Param1: baud rate( bits/s) |
| Param2>, <param3></param3> | UK       | The value (Decimal) should |

| AT+ UART? | +<br>UART= <param/> , <para<br>m2&gt;,<param3><br/>OK</param3></para<br> | Param1: baud rate( bits/s)<br>The value (Decimal) should<br>be one of the following:<br>4800<br>9600<br>19200<br>38400<br>57600<br>115200<br>23400<br>460800<br>921600<br>1382400<br>Param2:stop bit:<br>01 bit<br>12 bits<br>Param3: parity bit<br>0None<br>1Odd parity |
|-----------|--|--|
|           |  | 0None<br>1Odd parity<br>2Even parity<br>Default: 9600, 0, 0  |

Example:

Set baud rate to be 115200, stop bit to be 2 bits, parity bit to be even parity.

AT+UART=115200,1,2,\r\n

ОК

AT+UART?

+UART:115200,1,2

#### 14. Set/ Inquire - connection mode

| Command            | Response                | Parameter                                 |
|--------------------|-------------------------|---|
| AT+CMODE= <param/> | ОК                      | Param:                                    |
|                    |                         | 0connect the module to the specified      |
|                    |                         | Bluetooth address.(Bluetooth address can  |
| AT+ CMODE?         |                         | be specified by the binding command)      |
|                    | + CMODE: <param/><br>OK | 1connect the module to any address        |
|                    |                         | (The specifying address has no effect for |
|                    |                         | this mode.)                               |
|                    |                         | 2Slave-Loop                               |
|                    |                         | Default connection mode: 0                |
|                    |                         |   |

#### 15. Set/Inquire - bind Bluetooth address

Bluetooth address will show as this way: NAP: UAP:LAP(Hexadecimal)

| Command           | Response         | Parameter              |
|-------------------|------------------|------------------------|
| AT+BIND= <param/> | ОК               | ParamBluetooth address |
| AT+ BIND?         | + BIND: <param/> | needed to be bind      |
|                   |                  | Default address:       |
|                   | ŬK.              | 00:00:00:00:00:00      |

Bluetooth address will show as this way: NAP:UAP:LAP(Hexadecimal)

This command is effective only when the module wants to connect to the specified Bluetooth address.

Example:

The module is at connection mode which connects to specified Bluetooth address, and the

specified address is 12:34:56:ab:cd:ef.

Command and the response show as follow:

AT+BIND=1234, 56, abcdef\r\n

ОК

AT+BIND?\r\n

+BIND:1234:56:abcdef

16. Set/Inquire - drive indication of LED and connection status

| Command                      | Response                    | Parameter                                   |
|------------------------------|-----------------------------|---|
| AT+POLAR= <param1>,</param1> | OK                          | Param1:The value is                         |
| <param1></param1>            |                             | 0PI08 outputs low level and turn on LED     |
|                              |                             | 1PI08 outputs high level and turn on LED    |
|                              |                             | Param2:The value is                         |
|                              | + POLAR= <param1>,</param1> | 0PI09 output low level, indicate successful |
| ATT BIND:                    | <param1></param1>           | connection                                  |
|                              | ОК                          | 1PI09 output high level, and                |
|                              |                             | indicate successful connection              |
|                              |                             | Default: 1, 1                               |
|                              |                             |   |

Bluetooth module definition: The output of PI0[8] drives indication of LED work mode; the output of PI0[9] indicates the connection status.

Example:

PI0[8] outputs low level and turn on LED, PI09 outputs high level and indicates successful connection.

Command and response show as follow:

AT+POLAR=0, 1\r\n OK AT+POLAR?\r\n +POLAR=0, 1

ОК

17. Set PIO single port output

| Command                                     | Response | Parameter  |
|---|----------|--|
| AT+PIO= <param1>,<param2></param2></param1> | ОК       | Param1: PIO port number(Decimal)<br>Param2: PIO port status<br>0low level<br>1high level |

Bluetooth module provides the user with the ports ( $PI0[0] \sim PI0[7]$  and PI0[10])which can extern another input and output ports.

Example:

1. PI0[10] port outputs high level

AT+PI0=10, 1\r\n OK 2. PI0[10] port outpust low level AT+PI0=10, 0\r\n OK

18. Set PIO multiple port output

| Command  | Response | Parameter                  |
|--|----------|----------------------------|
| AT+MPIO- <params< td=""><td rowspan="2">ОК</td><td>Param: Mask combination of</td></params<> | ОК       | Param: Mask combination of |
|  |          | PIO ports number (Decimal) |

Bluetooth module provides the ports (PI00 $^{
m PI07}$  and PI010) which can extern another input and

output ports to the user.

(1) Mask of PIO port number = (1<<port number)

```
(2) Mask combination of PIO ports number= (PIO port number mask 1|PIO port number mask
```

2|.....)

Example :

```
PI0[2] port number mask=(1<<2) =0x004
```

PI0[10] port number mask =(1<<10)=0x400

Mask combination of PI02 and PI010 port number=(0x004|0x400)=0x404

Example:

1. PI010 and PI02 ports output high level

AT+MPI0=404\r\n

ОК

2. PIO4 port output high level

AT+PI0=004\r\n

ОК

3. PI0[10] port output high level

AT+PI0=400\r\n

ОК

4. All ports output low level

AT+MPI0=0\r\n

#### 19. Inquire PIO port input

| Command        | Response                     | Parameter       |
|----------------|------------------------------|-----------------|
| AT+MPIO?<br>OK | ParamPIO port value (16bits) |                 |
|                |                              | Param[0]=PI00   |
|                | +MPIO: <param/>              | Param[1]=PI01   |
|                | OV                           | Param[2]=PI02   |
|                | OK                           |                 |
|                |                              | Param[10]=PI010 |
|                |                              | Param[11]=PI011 |

Bluetooth module provides the user with the ports ( $PI0[0] \sim PI0[7]$  and PI0[10])which can extern another input and output ports.

#### 20. Set/ Inquire page scan and inquire scan parameter

| Command                                 | Response                             | Parameter                       |
|---|--------------------------------------|---------------------------------|
|   | ОК                                   | Param1:time interval of         |
|   | +IPSCAN:                             | inquiring                       |
| AT+IPSCAN= <param1>,</param1>           | <param1>,<param2>,</param2></param1> | Param2: duration in inquiring   |
| <param2>,</param2>                      | <param3>,<param4></param4></param3>  | Param3: time interval of paging |
| <param3>,<param4>AT+I</param4></param3> | ОК                                   | Param4: duration in paging      |
| PSCAN?                                  |                                      | The above parameters are        |
|   |                                      | decimal.                        |
|   |                                      | Default:1024,512,1024,512       |

Example:

at+ipscan=1234,500,1200,250\r\n OK at+ipscan? +IPSCAN:1234,500,1200,250

#### 21. Set/ Inquire—SHIFF energy parameter

| Command                             | Response  | Parameter                         |
|-------------------------------------|---|-----------------------------------|
| AT+SNIFF= <param1></param1>         |   | Param1: maximum time              |
| , <param2>,</param2>                | ОК  | Param2: minimum time              |
| <param3>,<param4></param4></param3> |   | Param3: test time                 |
|                                     | +SNIFF:   | Param4: limited time              |
| AT+IPSCAN?                          | <param1>,<param2>,<par< td=""><td>The above parameters are decimal.</td></par<></param2></param1> | The above parameters are decimal. |
|                                     | am3>, <param4></param4>   | Default : 0,0,0,0                 |

#### 22. Set/ Inquire safe and encryption mode

| Command  | Response                                    | Parameter                             |
|--|---|---------------------------------------|
| AT+SENM= <param< td=""><td>1. OKsuccess</td><td>Param: the value of safe mode:</td></param<> | 1. OKsuccess                                | Param: the value of safe mode:        |
| >, <param2>,</param2>  | 2. FAILfailure                              | 0sec_mode0+off                        |
|  |   | 1sec_mode1+non_secure                 |
|  |   | 2sec_mode2_service                    |
| +S   | +SENM: <param/> , <param2>,<br/>OK</param2> | 3sec_mode3_link                       |
|  |   | 4sec_mode_unknown                     |
|  |   | Param2: the value of encryption mode: |
|  |   | 0hci_enc_mode_off                     |
|  | 1hci_enc_mode_pt_to_pt                      |                                       |
|  |   | 2hci_enc_mode_pt_to_pt_and_bcast      |
|  |   | Default: 0,0                          |

#### 23. Delete authenticated device in the Bluetooth pair list

| Command            | Response | Parameter                       |
|--------------------|----------|---------------------------------|
| AT+PMSAD= <param/> | ОК       | Param: Bluetooth device address |

Example:

Delete the device ( address: 12:34:56:ab:cd:ef ) in the blue pair list

at+rmsad=1234,56,abcdef\r\n

OK ---- successful deletion

Or

at+rmsad=1234,56,abcdef\r\n

FAIL ----There is no the Bluetooth device whose address is 12:34:56:ab:cd:ef in the pair list.

#### 24. Delete all authenticated devices in the pair list

| Command  | Response | Parameter |
|----------|----------|-----------|
| AT+RMAAD | ОК       | None      |

Example:

Move all devices away from the pair list.

at+rmaad\r\n

ОК

#### 25. Seek the authenticated device in the Bluetooth pair list

| Command           | Response                       | Parameter                       |
|-------------------|--------------------------------|---------------------------------|
| AT+FSAD= <param/> | 1. OKsuccess<br>2. FAILfailure | Param: Bluetooth device address |

Example:

Seek the authenticated device (address: 12:34:56:ab:cd:ef) in the pair list

at+fsad=1234,56,abcdef\r\n

OK ----the Bluetooth device whose address is 12:34:56:ab:cd:ef is found.

at+fsad=1234,56,abcde0\r\n

FAIL ----There is no the Bluetooth device whose address is 12:34:56:ab:cd:e0 in the pair list.

#### 26. Get the authenticated device count from the pair list

| Command  | Response        | Parameter                         |
|----------|-----------------|-----------------------------------|
| AT+ADCN? | +ADCN: <param/> | Param: Authenticated Device Count |
|          | ОК              |                                   |

Example:

at+adcn?

+ADCN:0 ----There is no authenticated device in the pair list.

ОК

#### 27. Get the Bluetooth address of Most Recently Used Authenticated Device

| Command  | Response          | Parameter                               |
|----------|-------------------|---|
|          | + MRAD : <param/> | Param: the Bluetooth address of         |
| AT+MRAD? | ОК                | Most Recently Used Authenticated Device |

Example:

at+mrad?

+MRAD:0:0:0 ---- There is no device that has been used recently.

#### 28. Get the work status of Bluetooth module

| Command   | Response          | Parameter                       |
|-----------|-------------------|---------------------------------|
|           |                   | Param: work status of module    |
|           |                   | Return value:                   |
|           |                   | "INITIALIZED"initialized status |
|           | + STATE: <param/> | "READY" ready status            |
| AT+STATE? |                   | "PAIRABLE"pairable status       |
|           | ОК                | "PAIRED"paired status           |
|           |                   | "INQUIRING"inquiring status     |
|           |                   | "CONNECTING"connecting status   |
|           |                   | "CONNECTED"connected status     |
|           |                   | "DISCONNECTED"disconnected      |
|           |                   | status                          |
|           |                   | "NUKNOW"unknown status          |
| Example:  | 1                 | I                               |

at+state?

+STATE:INITIALIZED -----initialized status

ОК

29. Initialize the SPP profile lib

| Command          | Response       | Parameter |
|------------------|----------------|-----------|
| AT+INIT 1.<br>2. | 1. OKsuccess   | None      |
|                  | 2. FAILfailure |           |

#### 30. Inquire Bluetooth device

| Command | Response   | Parameter                     |
|---------|--|-------------------------------|
| AT+INQ  | +INQ: <param1>,<param2>,<param3>,</param3></param2></param1> | Param1: Bluetooth address     |
|         |  | Param2: device type           |
|         | ОК   | Param3: RSSI signal intensity |

```
Example 1:
at+init\r\n
               ---- Initialize the SPP profile lib( can't repeat initialization)
ОК
at+iac=9e8b33\r\n
                       ----Inquire Bluetooth device has an access code
ОК
at+class=0\r\n
                  ----Inquire the Bluetooth device type
at+inqm=1,9,48\r\n
                        ----Inquire mode: 1) has the RSSI signal intensity indication, 2)stop
                           inquiring if more than 9 Bluetooth devices response, 3)limited time
                           in inquiring is 48*1.28=61.44s.
At+inq\r\n
               ----inquire the Bluetooth device around

| 17                      | SPP lib has been repeated initialization.            |
| 18                      | Invalid inquire mode                                 |
| 19                      | Too long inquire time                                |
| 1A                      | No Bluetooth address                                 |
| 18                      | Invalid safe mode                                    |
| 1C                      | Invalid encryption mode                              |

#### Appendix 2: The introduction of devices

The Class of Device/Service(CoD) is a 32 bits number that of 3 field specifies the service supported by the device. Another field specifies the minor device class, which describes the device type in more detail

The Class of Device /Service (CoD) field has a variable format. The format is indicated using the 'within the CoD .The length of the Format Type field is variable and ends with two bits different from'11'.The version field starts at the least significant bit of the CoD and may extend upwards. In the 'format#1' of the CoD (format Type field=00), 11 bits are assigned as a bit –mask (multiple bits can be set) each bit corresponding to a high level generic category of service class. Currently 7 categories are defined. These are primarily of a' public service' nature. The remaining 11 bits are used for indicating device type category and other device-specific characteristics. Any reserved but otherwise unassigned bits, such as in the Major Service Class field, should be to 0.

Figure 1.2: The Class of Device/Service field (format type). Please note the krder in which the octets are sent on the air and stored in memory. Bit number 0 is sent first on the air .

#### 2. MAJOR DEVICE CLASSES

The Major Class segment is the highest level of granularity for defining a Bluetooth Device. The main function of a device is used for determining the major Class grouping. There are 32 different possible major classes. The assignment of this Major Class field is defined in Table1.3. 12111098 Major Device Class

#### 3. THE MINOR DEVICE CLASS FIELD

The' Minor Device Class field' (bits 7 to 2 in the CoD ), are to be interpreted only in the context of the Major Device Class (but interpreted of the Service Class field). Thus the meaning of the bits may change, depending on the value of the ' Major Device Class field'. When the Minor Device Class field indicates a device class , then the primary decvice class should be reported, e. g. a cellular phone that can work as a cordless handset should

- X X X X X All other values reserved

[Ret #4: Only to be used with a Gaming/Toy device that makes audio/video capabilities available via

Bluetooth]

TABLE 1.8: SUB DEVICES FOR THE 'AUDIO/VIOEO'MAJOR CLASS

8. MINOR DEVICE CLASS FIELD – PERIPHERAL MAJOR CLASS

**Minor Device Class** 

7 6 bit no of CoD

- 0 1 Keyboard
- 10 Pointing device
- 1 1 Combo keyboard /pointing device
- X X X All other values reserved

TABLE1.9: THE PERIPHERAL MAJOR CLASS KEYBOARD/POINTING DEVICE

FIELD

Bits 6 and 7 independently specify mouse, keyboard or combo mouse/keyboard devices.

These may be combined with the lower bits in a multifunctional device.

Minor Device Class

- 5 4 3 2 bit no of CoD
- 0000 Uncategorized device
- 0 0 0 1 Gamepd
- 0011 Remote control
- 0 1 0 0 Sensing device
- 0 1 0 1 Digitizer tablet
- X X X X All other values reserved
- TABLE1.10: RESERVED SUB-FIELD FOR THE DEVICE TYPE

9. MINOR DEVICE CLASS FIELD - IMAGING MAJOR CLASS

Minor Device Class

7 6 5 4 bit no of CoD

- X X X 1 Display
- X X 1 X Camera
- X 1 X X Scanner

1 X X X Printer

X X X X All other values reserved

TABLE 1.11: THE TMAGING MAJOR CLASS BITS 7 TO 7

Bits 4 to 7 independently specify bi splay, camera, scanner or printer. These may be

combined in a multifunctional device.

**Minor Device Class** 

3 2 bit no of CoD

0 0 Uncategorized, default

X X All other values reserved

TABLE 1. 12: THE IMAGING MAJOR CLASS BITS 2 AND 3

Bits 2 and 3 are reserved

#### Appendix 3: (The Inquiry Access Codes)

The General-and Device-Specific Inquiry Access Codes (DIACs) The Inquiry Access Code is the first level of filtering when finding Bluetooth devices. The main purpose of defining multiple IACs is to limit the number of responses that are received when scanning devices within range.

- 0. 0x9E8B33 ---- General/Unlimited Inquiry Access Code(GIAC)
- 1. 0x9E8B00 ---- Limited Dedicated Inquiry Access Code(LIAC)
- 2. 0x9E8B01  $\,\sim\,$  0x9E8B32 RESERVED FOR FUTURE USE
- 3. 0x9E8B34  $\,\sim\,$  0x9E8B3F RESERVED FOR FUTURE USE

The Limited Inquiry Access Code(LIAC) is only intended to be used for limited time periods in scenarios where both sides have been explicitly caused to enter this state, usually by user action. For further explanation of the use of the LIAC, please refer to the Generic Access Profile.

In contrast it is allowed to be continuously scanning for the General Inquiry Access Code (GIAC) and respond whenever inquired.
