

High Frequency Quasi-Resonant Flyback Converter With GaN Integrated

1 Descriptions

SC3057 is a high frequency, quasi-resonant flyback PWM converter with 650V GaN integrated (QR/DCM), which can achieve high efficiency and reliability. The converter with x-cap discharge function built-in high voltage start-up circuit through HV pin. Therefore, extremely low standby power consumption and super-fast start-up time can be obtained by HV pin.

SC3057 provides an adaptive switching frequency foldback to achieve higher efficiency in the whole loading range. It operates in QR and DCM with valley switching for high efficiency. And at no load, the IC will operate in burst mode to reduce power consumption.

SC3057 provides functions of low start-up current, fast start-up, low standby power consumption. The burst mode with extremely low operation current (350uA) can significantly reduce standby power consumption to meet the efficiency regulations.

The converter integrates a segment power supply circuit for VDD power supply, which is especially suitable for applications with wide output voltage range.

SC3057 offers comprehensive protections to prevent the circuit from damage under abnormal conditions.

Furthermore, the features of frequency jittering and smart driving function can minimize the noise and improve EMI performance.

2 Features

- Integrated 650V GaN
- Integrated high-voltage startup circuit with brown
 in/out detection
- With x-cap discharge function.
- Internal Soft Start
- Integrated segment power supply circuit for extrawide output range
- Ultra-low operation current @Burst mode/Fault Mode
- Up to 175KHz Switching Frequency
- Frequency Jitter for EMI improvement
- Valley switching operation @QR/DCM
- Burst Mode @ Light Load & No Load
- Internal over temperature protection
- Comprehensive Protection
 - VDD over voltage protection
 - VDD under voltage lock out
 - Cycle by cycle current limiting
 - > Two level over current protection
 - Output over voltage protection
 - Output short protection
 - Over Load protection
- QFN6*8 package available

3 Applications

- USB-PD and QC Chargers
- AC-DC adapters for Portable Devices

Fig. 2 Top view

TERMINAL						
SC3057	NAME	I/O	DESCRIPTION			
1,4,7,13, 14,24,25,31	GND	PWR	Power Ground.			
2	ZCD	I	Output voltage sense. The ZCD voltage is used to detect resonant valleys for quasi-resonant switching. This pin detects the output voltage information and diode current discharge time based on the auxiliary winding voltage.			
3	CSS	I	The controller current sense for peak-current-mode control.			
5,6,8,9	CS	0	Internal GaN FET source terminal. This pin connects to a current-sense resistor to sense the GaN current.			
10,11,12	NC		No connection. These pins are recommended to be connected to GND to increase heat dissipation.			
20,21,22	NC		No connection. In order to increase the safety distance, the pads of these pins in the layout are not recommended.			
26	ОТР	0	External OTP pin. This pin is typically connected to an NTC resistor.			
29	NC		No connection.			
15,16,17, 18,19	VD	PWR	Internal GaN FET drain terminal.			
23	HV	PWR	Connected to the line via resistors and diodes for startup and x-cap discharge, this pin allows the brown in/out detection as well.			
27	SW	PWR	Segment power supply circuit control.			
28	VDD	PWR	Power Supply.			
30	FB	I	Secondary side voltage feedback input pin. Connect to an opto-coupler directly.

7 Specifications

7.1 Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted) ⁽¹⁾

Item	Description	Min.	Тур.	Max.	UNIT
	HV to GND			700	V
	VD, max to GND			650	V
Voltage range at terminals ⁽²⁾	VD, transient to GND			750	V
	VDD、SW to GND	-0.3		44	V
	Other Pins to GND	-0.3	\geq	6.5	V
TJ	Operating Junction temperature range	-40	$\langle \rangle$	150	°C
T _{stg}	Storage temperature range	-65		150	°C

(1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) All voltage values are with respect to network ground terminal.

7.2 Thermal Information

THERMAL RESISTA	NCE ⁽¹⁾	QFN6*8 (6.0mmx8.0mm)	UNIT
θ _{JA}	Junction to ambient thermal resistance	60	°C/W
θ _{JC}	Junction to case resistance	3.2	°C/W

(1) Measured on JESD51-7, 2-layer PCB.

7.3 Handling Ratings

PARAMETER	DEFINITION	MIN	МАХ	UNIT
ESD ⁽¹⁾	Human body model (HBM) ESD stress voltage ⁽²⁾ (HV pin)	-1	+1	kV
	Human body model (HBM) ESD stress voltage ⁽²⁾ (All pins except HV)	-2	+2	kV
	Charged device model (CDM) ESD stress voltage (3)	-1	+1	kV

(1) Electrostatic discharge (ESD) to measure device sensitivity and immunity to damage caused by assembly line electrostatic discharges into the device.

(2) Level listed above is the passing level per ANSI, ESDA, and JEDEC JS-001. JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(3) Level listed above is the passing level per EIA-JEDEC JESD22-C101. JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

SC3057 PRELIMINARY DATASHEET

SOUTHCHIP CONFIDENTIAL SUBJECT TO CHANGE

8 Functional Block Diagram

9 Feature Description

SC3057 is designed for USB-PD solutions, together with PD converter, such as SC21xx series. It integrates GaN FET, so that the high efficiency and power density can be achieved. SC3057 provides an adaptive switching frequency fold-back to achieve higher efficiency in the whole loading range.

The converter integrates a segment power supply circuit for VDD, which is especially suitable for applications with a wide output voltage range, saving power consumption and greatly reducing peripheral devices. The built-in high voltage start-up circuit can achieve short start-up time, and extremely low standby power.

It operates in DCM or QR mode in full load range. The controller operates in green mode with valley switching for high efficiency when the valley counter is below 7. And at no load, the IC will operate in Burst mode to reduce power consumption.

9.1 Start-up

After AC power on, the VDD will be charged by HV pin with 1mA current until VDD voltage higher than 0.5V. After VDD voltage rise above 0.5V, the charging current rise to I_{HV_VDD2} until VDDon.

The maximum start-up time can be estimated by the following equation:

$$T_{\text{START-UP}} = \frac{C_{\text{VDD}*}0.5\text{V}}{\text{IHV}_{\text{VDD1}}} + \frac{C_{\text{VDD}*}(\text{VDDon} - 0.5)\text{V}}{\text{IHV}_{\text{VDD2}}}$$

SC3057 PRELIMINARY DATASHEET

SOUTHCHIP CONFIDENTIAL SUBJECT TO CHANGE

Where, C_{VDD} is VDD cap, VDDon is VDD on threshold voltage.

9.2 VDD UVLO

A hysteresis of UVLO (Under Voltage Lock Out) comparator is implemented in SC3057. The turn-on and turn-off thresholds are fixed at V_{DDON} and V_{DDOFF} respectively. This hysteresis ensures that the VDD capacitor can be small enough during start-up. A large hysteresis is essential to ensure the IC works properly during the start-up period, even for a small VDD capacitor.

9.3 VDD Holding Mode

After the system starts, the VDD capacitor can be charged by the auxiliary winding. There are some operation condition changes (load changes, output voltage adjustment, burst mode), may lead the primary side DRV stop working when the output value is higher than the set value. Furthermore, the VDD voltage will be lower than VDDOFF and the system will stop. To avoid this situation, a VDD holding circuitry is designed, which starts working when VDD drops below V_{DDHOLDL} and stops working when VDD rises above V_{DDHOLDH}. The working process is shown in fig.4.

9.4 Segment Power Supply Circuit for VDD Power Supply

In some applications with a wide output voltage range, especially for chargers that need to support PPS, the output voltage range is 3.3V ~ 21V. In order to meet the power supply of the SSR converter, additional circuits need

to be added, such as LDO or additional auxiliary windings of transformer. This increases the power consumption and cost of system. The SC3057 integrates a segment power supply circuit, which can guarantee the power supply of VDD under the low output voltage of auxiliary winding. Only a surface-mount inductor is added. The working process of the circuit is shown in fig.5.

Fig. 5 The Segment Power Supply Circuit

9.5 Brown IN/OUT Detection and X-Cap Discharge

Fig. 6 Brown In/Out detection

The Brown IN/OUT function is implemented through HV pin. When HV pin voltage rises above V_{HVBIN} , the IC starts working, and it stops working when HV pin voltage

SC3057 PRELIMINARY DATASHEET

SOUTHCHIP CONFIDENTIAL SUBJECT TO CHANGE

decreases below V_{HVBOUT} . When HV voltage drops below V_{HVBOUT} , a brown-out timer is enabled. The converter is disabled if HV voltage doesn't exceed V_{HVBOUT} before brown-out timer expires.

SC3057 integrates X-cap discharge function. When detected the voltage on HV pin drops and no rising edge detected after T_{XDET} , it is considered that the AC power is disconnected, and then the X-cap discharge function is enabled. The HV pin generates a source current of 5mA to discharge the X-Cap until the voltage drops to a very low level.

9.6 Operation Mode

SC3057 provides an adaptive switching frequency foldback to achieve higher efficiency in the whole loading range. It operates in DCM or QR mode under full load range. The maximum frequency is 175kHz.

At heavy load or full load, SC3057 probably operates in QR Mode with high switching frequency. When the load current decreases, it will operate in green mode (DCM) with valley switching for high efficiency. When in QR or green mode, the switching valley ranges from 1st valley to the 7th valley as load current decreases. The SC3057 won't detect the valley voltage anymore if the valley numbers are more than 7. And at no load, the IC will operate in Burst mode to reduce power consumption. In this condition, switching loss of MOSFET is the main power dissipation. The DRV will be disabled immediately if V_{FB} drops below V_{FBBSTL}. When V_{FB} rises up to V_{FBBSTH}, the DRV starts to pulse again.

9.7 GaN Device

SC3057 integrates GaN FET and its driver. The built-in line compensation resistor is help to achieve a constant power limit over different line voltage. In this way, the peripheral components can be greatly simplified, and the reliability is greatly improved.

Fig. 7 current sense

9.8 Valley Switching

ZCD pin can detect the freewheel information on the secondary side. In QR mode, when the voltage of ZCD turns to a negative value, it means that after a quarter of the resonant period, the primary MOS can be turned on, and valley opening helps to improve efficiency and improve EMI performance. The best valley opening can be achieved by appropriately adjusting T_{DZCD}, T_{DPG} and T_{DDRV}, where T_{DPG} is an internal fixed delay. T_{DZCD} can be adjusted by connecting a small capacitor in parallel with R_{ZCDDWON}. The recommended value is 11pF.

Fig. 8 Valley Switching

9.9 Auto-Recovery after Failure

SC3057 has complex protection functions, such as VDD over voltage protection, VDD under voltage lock out, two level over current protection, output over voltage protection, output short protection, over Load protection, brown IN/Out protection, line voltage over voltage protection. Unless

SC3057 PRELIMINARY DATASHEET

SOUTHCHIP CONFIDENTIAL SUBJECT TO CHANGE

otherwise specified, these protections are auto-recovery. After the protection is triggered, the system enters the protection mode, and the VDD power consumption is reduced. After the T_{DFAULT} delay, the VDD sink current increases until V_{DDOFF} , and VDD starts the restart process. The detailed process is as follows.

9.10 VDD OVP

When the VDD voltage is higher than the V_{DDOVP} and lasts for a period longer than T_{VDDOVP} , a sink current of I_{VDDOVP} is enabled and DRV will be shut down. The VDD OVP function is an auto-recovery protection.

9.11 Over Current Protection

Two levels of overcurrent protection are integrated. One is cycle-by-cycle current limiting for overload protection. V_{CSSSCP} is the fast protection for the case of secondary rectifier shorted. The over current protection and its shielding time are shown in fig.11.

Fig. 11 LEB of OCP

9.12 Adaptive Over Load Protection

An adaptive over load protection is implemented in the SC3057. When the voltage of VFB is higher than V_{FBOLP} and lasts for a period of time T_{FBOLP} , overload protection will be triggered. In particular, when the voltage of VFB is higher than V_{FBOLP} , and the peak voltage of ZCD pin is lower than V_{ZCDH} , the delay of T_{FBOLP} will be shortened. In

SC3057 PRELIMINARY DATASHEET

SOUTHCHIP CONFIDENTIAL SUBJECT TO CHANGE

the Fig.12, when V_{ZCD} is lower than V_{ZCDH} , the coefficient K is less than 1. The adaptive OLP can reduce the power loss when secondary side is shorted.

Fig. 12 Adaptive Over Load Protection

9.13 On-Chip OTP

An internal OTP circuit is embedded inside to provide the worst-case protection for SC3057. When the chip temperature rises higher than the OTP_H , the converter will be disabled and works in the failure mode until the chip is cooled down below the hysteresis OTP_{HYS} .
