## Power Factor Controller IC

### DESCRIPTION

SP6562A is an active transition-mode (TM) power factor correction (PFC) controller for AC-DC switching mode power supply applications.

SP6562A features an internal start-up timer for standalone applications, a one quadrant multiplier with THD optimizer for near unity power factor, zero current detector (ZCD) to ensure TM operation, a current sensing comparator with built-in leading-edge blanking, and a totem pole output ideally suited for driving a power MOSFET.

SP6562A offers great protection coverage including system over-voltage protection (OVP) to eliminate runaway output voltage due to load removal, VCC under voltage lockout (UVLO), multiplier output clamping that limit maximum peak switch current, and gate drive output clamping for external power MOSFET protection. with added system open loop protection feature, shuts down system when the feedback loop is open.

### FEATURES

- Transition Mode (TM) Operation
- Low Total Harmonic Distortion(THD)
- Precise Adjustable Output Over-Voltage Protection
- Open-Feedback Protection and Disable Function
- Zero Current Detector
- Internal Start up timer
- Under-Voltage Lockout with 2.5V Hysteresis
- Low Start-up (30 $\mu$ A)
- Low (2.2mA) quiescent current
- 1.4% internal reference voltage
- -600/+800mA totem pole gate driver with active pull-down during UVLO and voltage clamp
- SOP-8 Package

### APPLICATIONS

- AC/DC Switching Power Adaptor
- PC Power Supply
- LCD TV Power Supply
- Electronic Ballast

### PIN DESCRIPTION

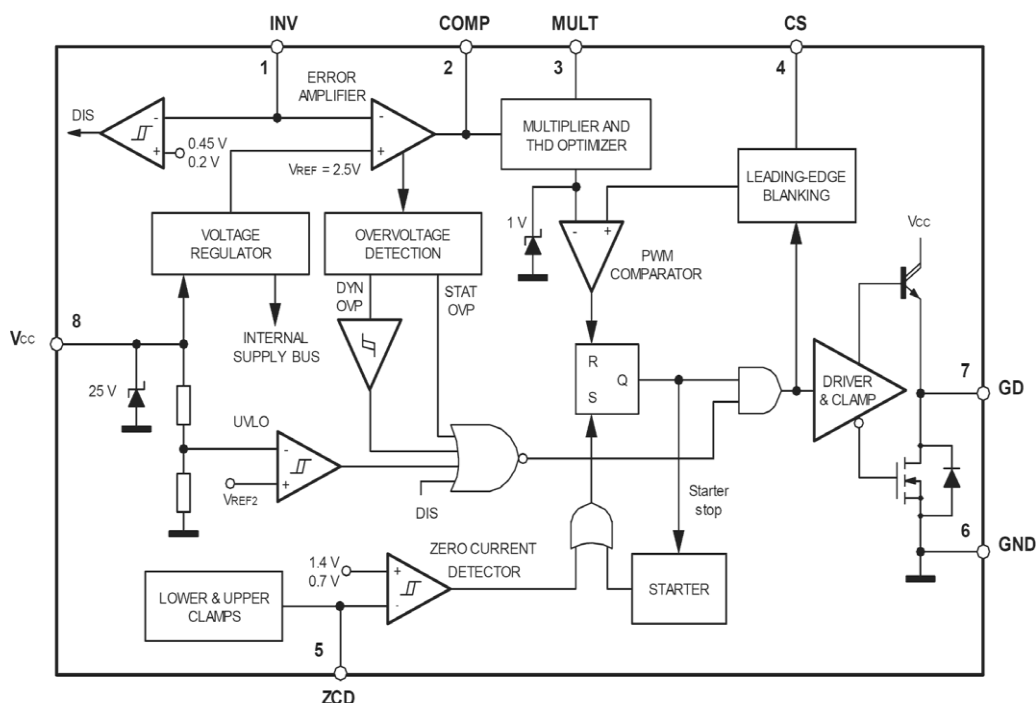

Pin	Symbol	Description
1	INV	Inverting input of the error amplifier. The information on the output voltage of the PFC pre-regulator is fed into this pin through a resistor divider. The pin doubles as an ON/OFF control input.
2	COMP	Output of the error amplifier. A compensation network is placed between this pin and INV to achieve stability of the voltage control loop and ensure high power factor and low THD.
3	MULT	Main input to the multiplier. This pin is connected to the rectified mains voltage via a resistor divider and provides the sinusoidal reference to the current loop.
4	CS	Input to the PWM comparator. The current flowing in the MOSFET is sensed through a resistor, the resulting voltage is applied to this pin and compared with an internal sinusoidal-shaped reference, generated by the multiplier, to determine MOSFET's turn-off. The pin is equipped with 200 ns leading-edge blanking for improved noise immunity.
5	ZCD	Boost inductor's demagnetization sensing input for transition-mode operation. A negative-going edge triggers MOSFET's turn-on.
6	GND	Ground. Current return for both the signal part of the IC and the gate driver.
7	GD	Gate driver output. The totem pole output stage is able to drive power MOSFET's and IGBT's with a peak current of 600 mA source and 800 mA sink. The high-level voltage of this pin is clamped at about 12V to avoid excessive gate voltages in case the pin is supplied with a high Vcc.
8	Vcc	Supply Voltage of both the signal part of the IC and the gate driver. The supply voltage upper limit is extended to 22V min. to provide more headroom for supply voltage changes.
