1 INTRODUCTION

The ST1624 is a mutual capacitive sensing controller for small size projected capacitive touch screen. It is a RISC microcontroller with capacitor charge, capacitor sensing, slave I2C interface, general purpose I/O and embedded non-volatile memory.

Internal program and cooperating digital circuit convert finger / capacitor stylus physical touching into button pressing message or multiple coordination information for application. The maximum fingers identification ability is up to five.

The ST1624 uses low profile QFN package and support ITO electrode on glass or film substrate. Hence, slim and small touch panel module is realizable.

And more, low electromagnetic interference of ST1624 makes it suitable for modern touch screen application which contain a vivid and high density display, like smart phone, portable navigation device and touch-enabled media player, etc..

3 SYSTEM MANAGEMENT

3.1 Power Down

In power down mode, all of the clocks of ST1624 are stopped. The way to exit power down mode is by a hardware reset or I2C.

3.2 Reset

Master can reset ST1624 through $\overline{\text{RESET}}$ pin. $\overline{\text{RESET}}$ pin is low active and needs hold low for 1us to take effect.

4 DIGITAL INTERFACE

4.1 I2C Slave Interface

ST1624 equipped with I2C provides two wires, serial data (SDA) and serial clock (SCL), to carry transferring information at up to 400 kbit/s(Fast mode). ST1624 plays the slave role in I2C transfer. Both SDA and SCL are bidirectional lines, connected to IOVDD via pull-up resistors. All transactions begin with a START (S) and can be terminated by a STOP (P). 7-bits address follows START to recognize device. Each byte is 8-bits length and followed by an acknowledge bit. A HIGH to LOW transition on the SDA line while SCL is HIGH defines a START condition. A LOW to HIGH transition on the SDA line while SCL is HIGH defines a STOP condition. The data on the SDA line must be stable during the HIGH period of the clock. The HIGH or LOW state of the data line can only change when the clock signal on the SCL line is LOW.
