

FEATURES

- 3.3V and 5V $\pm 10\%$ power supply options
- Guaranteed AC parameters over temperature:
 - $f_{MAX} = 800\text{MHz}$
 - $< 200\text{ps}$ differential propagation delay (D to Q_{FB})
 - $< 730\text{ps}$ differential propagation delay (D to Q_{HG})
 - $< 250\text{ps}$ t_r / t_f
- Low gain feedback path $Q_{FB} = +10\text{V/V}$
- Output enable
- V_{BB} reference output voltage
- Wide temperature range: -40°C to $+85^\circ\text{C}$
- Available in 10-pin (3x3mm) MSOP

DESCRIPTION

The SY100EL16VO is a differential receiver amplifier optimized for crystal oscillator applications. The device includes an additional low gain ($+10\text{V/V}$) output stage (Q_{FB}) ideal for feedback applications common in crystal oscillator gain blocks. The SY100EL16VO is fully differential, with a bandwidth $> 800\text{MHz}$ over temperature and voltage. For applications that require output disable control, an Enable pin ($/\text{EN}$) will force the differential output into a fixed logic state. The SY100EL16VO also includes a V_{BB} reference voltage for single-ended or AC-coupled applications.

The SY100EL16VO PECL logic is 100k ECL compatible. Operation is guaranteed over the -40°C to $+85^\circ\text{C}$ temperature range and 3.3V to 5V nominal supply voltage range.

PIN NAMES

Pin	Function
$Q_{FB}, /Q_{FB}$	Differential clock outputs for feedback path: Nominal DC gain +10.
D, /D	PECL, LVPECL, ECL, LVECL differential inputs: Internal 75k Ω pull-down resistor.
V_{BB}	$V_{CC} - 1.32\text{V}$ reference voltage for single-ended inputs: It provides the switching reference for the input differential amplifier. When unused, it can be left open. For single-ended PECL applications connect V_{BB} to /D input, and bypass with a 0.01 μF capacitor to V_{CC} .
$/\text{EN}$	Enable: PECL compatible input control with internal 75k Ω pull-down resistor. It controls the high-gain output (Q_{HG}). When HIGH, Q_{HG} is low and $/Q_{HG}$ is high. $/\text{EN}$ is synchronous so that the outputs will only be enabled/disabled when they are in the LOW state.
V_{EE}	Negative power supply: For ECL/LVECL operation, connect to negative supply. For PECL/ LVPECL operation, connect to GND.
$Q_{HG}, /Q_{HG}$	Differential high-gain outputs: Nominal DC gain is greater than +200.
V_{CC}	Positive power supply: For ECL/LVECL operation, connect to $V_{CC} = 0\text{V}$. For PECL/ LVPECL operation, connect to either 3.3V or 5.0V. Bypass with 0.1 μF // 0.01 μF low ESR capacitors.
