

DRAM

4M x 4 DYNAMIC RAM EDO PAGE MODE

FEATURES

- Industry-standard x 4 pinouts and timing functions
- power supply : T2316405A 2.6V(±0.2V)
T2316407A 3.3V(±0.3V)
- All device pins are TTL- compatible.
- 2048-cycle refresh in 32 ms.
- Refresh modes: $\overline{\text{RAS}}$ only, $\overline{\text{CAS}}$ BEFORE $\overline{\text{RAS}}$ (CBR) and HIDDEN.
- Extended data-out (EDO) PAGE MODE access cycle.

GRNERAL DESCRIPTION

The T2316405A and T2316407A is a randomly accessed solid state memory containing 16,777,216 bits organized in a x 4 configuration. It offers Fast Page mode with Extended Data Output (EDO).

During READ or WRITE cycles, each of the 4 memory bits (1 bit per I/O) is uniquely addressed through the 22 address bits, which are entered 11 bits (A0-A10) at a time. $\overline{\text{RAS}}$ latches the first 11 bits and $\overline{\text{CAS}}$ latches the latter 11 bits.

A READ or WRITE cycle is selected with the $\overline{\text{WE}}$ input. A logic HIGH on $\overline{\text{WE}}$ dictates READ mode while a logic LOW on $\overline{\text{WE}}$ dictates WRITE mode. During a WRITE cycle, data-in is latched by the falling edge of $\overline{\text{WE}}$ or $\overline{\text{CAS}}$, whichever occurs last. When $\overline{\text{WE}}$ goes Low prior to $\overline{\text{CAS}}$ going LOW (EARLY WRITE cycle), the output pins remain open (High-Z) until the next $\overline{\text{CAS}}$ cycle.

A Late Write or Read-Modify-Write occurs. When $\overline{\text{WE}}$ falls after $\overline{\text{CAS}}$ was taken LOW (Late Write cycle). $\overline{\text{OE}}$ must be taken HIGH to disable the data-outputs prior to applying input data.

The four data inputs and four data outputs are routed through four pins using common I/O, and pin direction is controlled by $\overline{\text{WE}}$ and $\overline{\text{OE}}$.

Notes:

1. An initial pause of 200us is required after power-up followed by eight $\overline{\text{RAS}}$ refresh cycles ($\overline{\text{RAS}}$ only or CBR) before proper device operation is assured. The eight $\overline{\text{RAS}}$ cycle wake-ups should be repeated any time the t_{REF} refresh requirement is exceeded.
2. $V_{\text{IH}}(2.0\text{V})$ and $V_{\text{IL}}(0.8\text{V})$ are reference levels for measuring timing of input signals. Transition times are measured between $V_{\text{IH}}(2.0\text{V})$ and $V_{\text{IL}}(0.8\text{V})$.
3. In addition to meet the transition rate specification, all input signals must transit between V_{IH} and V_{IL} in a monotonic manner.
4. Assume that $t_{\text{RCD}} < t_{\text{RCD}}(\text{max})$. If t_{RCD} is greater than the maximum recommended value shown in this table, t_{RAC} will increase by the amount that t_{RCD} exceeds the value shown.
5. Assume that $t_{\text{RCD}} \geq t_{\text{RCD}}(\text{max})$.
6. Enables on-chip refresh and address counters.
7. Operation within the $t_{\text{RCD}}(\text{max})$ limit ensures that $t_{\text{RAC}}(\text{max})$ can be met. $t_{\text{RCD}}(\text{max})$ is specified as a reference point only; if t_{RCD} is greater than the specified $t_{\text{RCD}}(\text{max})$ limit, access time is controlled by t_{CAC} .
8. Operation within the t_{RAD} limit ensures that $t_{\text{RAC}}(\text{max})$ can be met. $t_{\text{RAD}}(\text{max})$ is specified as a reference point only; if t_{RAD} is greater than the specified $t_{\text{RAD}}(\text{max})$ limit, access time is controlled by t_{AA} .
9. Either t_{RCH} or t_{RRH} must be satisfied for a READ cycle.
10. $t_{\text{OFF1}}(\text{max})$ defines the time at which the output achieves the open circuit condition; it is not a reference to V_{OH} or V_{OL} .
11. t_{WCS} , t_{RWD} , t_{AWD} and t_{CWD} are restrictive operating parameters in LATE WRITE and READ-MODIFY-WRITE cycles only. If $t_{\text{WCS}} \geq t_{\text{WCS}}(\text{min})$, the cycle is an EARLY WRITE cycle and the data output will remain an open circuit throughout the entire cycle. If $t_{\text{RWD}} \geq t_{\text{RWD}}(\text{min})$, $t_{\text{AWD}} \geq t_{\text{AWD}}(\text{min})$ and $t_{\text{CWD}} \geq t_{\text{CWD}}(\text{min})$, the cycle is READ-WRITE and the data output will contain data read from the selected cell. If neither of the above conditions is met, the state of I/O (at access time and until $\overline{\text{CAS}}$ and $\overline{\text{RAS}}$ or $\overline{\text{OE}}$ go back to V_{IH}) is indeterminate. $\overline{\text{OE}}$ held high and $\overline{\text{WE}}$ taken low after $\overline{\text{CAS}}$ goes low result in a LATE WRITE ($\overline{\text{OE}}$ - controlled) cycle.
12. These parameters are referenced to $\overline{\text{CAS}}$ leading edge in EARLY WRITE cycles and $\overline{\text{WE}}$ leading edge in LATE WRITE or READ-MODIFY-WRITE cycles.
13. During a READ cycle, if $\overline{\text{OE}}$ is low then taken HIGH before $\overline{\text{CAS}}$ goes high, I/O goes open, if $\overline{\text{OE}}$ is tied permanently low, a LATE WRITE or READ-MODIFY-WRITE operation is not possible.
14. WRITE command is defined as $\overline{\text{WE}}$ going low.
15. LATE WRITE and READ-MODIFY-WRITE cycles must have both t_{OFF2} and t_{OEH} met ($\overline{\text{OE}}$ high during WRITE cycle) in order to ensure that the output buffers will be open during the WRITE cycles.
16. The I/Os open during READ cycles once t_{OFF1} or t_{OFF2} occur.

READ CYCLE

EARLY WRITE CYCLE

DON'T CARE
 UNDEFINED

Note: t_{OFF1} is referenced from the rising edge of $\overline{\text{RAS}}$ or $\overline{\text{CAS}}$, whichever occurs last.

READ WRITE CYCLE
(LATE WRITE and READ-MODIFY-WRITE CYCLES)

EDO-PAGE-MODE READ CYCLE

- Note:** 1. t_{OFF1} is referenced from the rising edge of $\overline{\text{RAS}}$ or $\overline{\text{CAS}}$, whichever occurs last.
2. t_{PC} can be measured from falling edge of $\overline{\text{CAS}}$ to falling edge of $\overline{\text{CAS}}$, or from rising edge of $\overline{\text{CAS}}$ to rising edge of $\overline{\text{CAS}}$. Both measurements must meet the t_{PC} specification.

EDO-PAGE-MODE EARLY-WRITE CYCLE

EDO-PAGE-MODE READ-WRITE CYCLE (LATE WRITE and READ-MODIFY-WRITE CYCLES)

Note: t_{PC} can be measured from falling edge to falling edge of $\overline{CAS}$, or from rising edge to rising edge of $\overline{CAS}$. Both measurements must meet the t_{PC} specification.

EDO-PAGE-MODE READ-EARLY-WRITE CYCLE (Pseudo READ-MODIFY-WRITE)

RAS ONLY REFRESH CYCLE
