

TC55257BPL/BFL/BSPL/BFTL/BTRL-85L/10L(LV)

SILICON GATE CMOS

32,768 WORD x 8 BIT STATIC RAM

Description

The TC55257BPL is a 262,144 bit CMOS static random access memory organized as 32,768 words by 8 bits and operated from a single 5V power supply. Advanced circuit techniques provide both high speed and low power features with an operating current of 5mA/MHz (typ.) and a minimum cycle time of 85ns.

When \overline{CE} is a logical high, the device is placed in a low power standby mode in which the standby current is 2 μ A at room temperature. The TC55257BPL has two control inputs. Chip enable (\overline{CE}) allows for device selection and data retention control, while an output enable input (\overline{OE}) provides fast memory access. The TC55257BPL is suitable for use in microprocessor systems where high speed, low power, and battery backup are required.

The TC55257BPL is offered in a standard dual-in-line 28-pin plastic package (0.6/0.3 inch width), a small outline plastic package, and a thin small outline plastic package (forward type, reverse type).

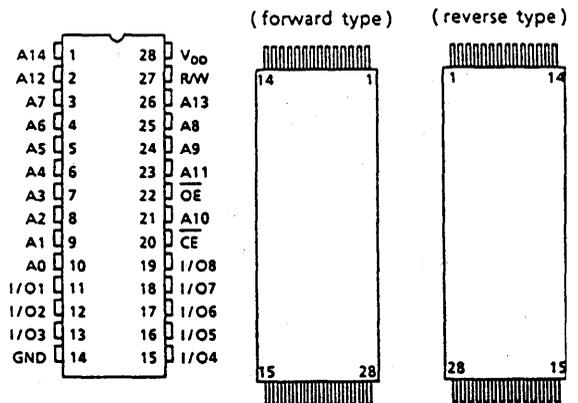

Features

- Low power dissipation: 27.5mW/MHz (typ.)
- Standby current: 2 μ A (max.) at Ta = 25°C
- Single 5V power supply
- Access time (max.)

Read Cycle ⁽¹⁾

Write Cycle 1 ⁽⁴⁾ (R/W Controlled Write)

Write Cycle 2⁽⁴⁾ (\overline{CE} Controlled Write)

Notes:

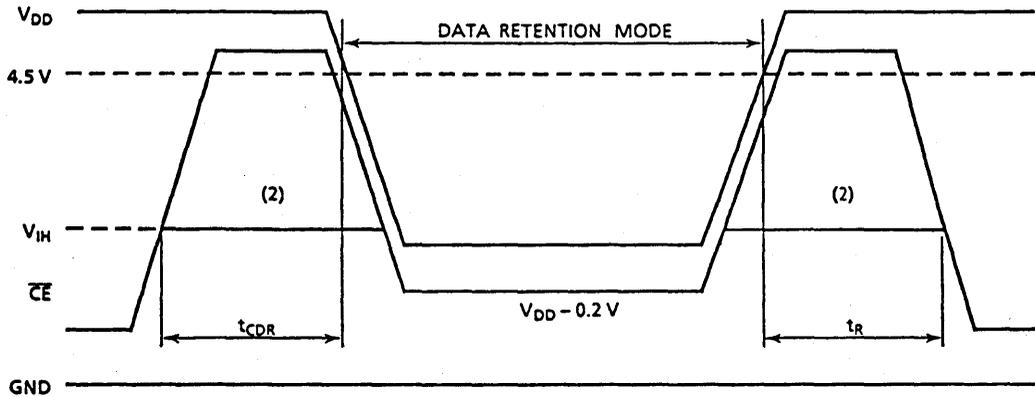

1. R/W is high for read cycles.
2. If the \overline{CE} low transition occurs coincident with or after the R/W low transition, outputs remain in a high impedance state.
3. If the \overline{CE} high transition occurs coincident with or prior to the R/W high transition, outputs remain in a high impedance state.
4. If \overline{OE} is high during a write cycle, the outputs are in a high impedance state during this period.
