### **Assembly Notes**

- 1. Carefully clean the PC board, base plate, and package leads with alcohol. Allow it to dry fully.
- To improve the thermal and RF performance, Qorvo recommends attaching a heat sink to the bottom
  of the package and apply either a thermal compound (Arctic Silver 5 recommended) or a .004 inch
  (maximum thickness) Indium shim between the heat sink and the package. Refer to the applications
  note <u>Application of Arctic Silver 5 Thermal Compound and Indium Shims for Qorvo CP-style Packaged
  Components</u> for more information.
- 3. The component leads should be manually soldered. Apply a low residue solder alloy meeting J-STD-001 (ROL0, ROL1 or equivalent) with a liquidus temperature below 220 °C to each pin of the TGM2635-CP. The use of low residue/no-clean flux (ROL0, ROL1) is recommended. The package lead temperature should not exceed 260 deg C. Each solder connection should be completed within 2 to 5 seconds. Adding flux during hand soldering of the component leads with localized spot cleaning is acceptable. Soldering irons meeting the requirements of J-STD-001, Appendix A are acceptable.
- 4. The leads should be soldered in a staggered or star pattern from side to side, and never solder two adjacent leads. This allows the heat to dissipate on each lead, and not cause the adjacent leads to become de-soldered and damaged or displaced.

- 5. The packaged part should not be subjected to conventional SMT automated solder reflow processes.
- 6. (The following is for information only. There are many variables in a second level assembly that Qorvo does not control, so Qorvo does not recommend an absolute torque value.) Use screws to attach the component to the heat sink. A suggested final torque value is 16 in-oz. for a 0-80 screw. Start with screws finger tight, then torque to 8 in-oz., then torque to final value. Use the following tightening pattern:

ESD-Charged Device Model (CDM)	Class C3	ANSI / ESDA / JEDEC JS-002	ESD-Sensitive Device
MSL-Moisture Sensitivity Level	N/A		

#### Solderability

The component leads should be manually soldered, and the package cannot be subjected to conventional reflow processes. The use of no-clean solder to avoid washing after soldering is recommended.
