

CMOS PROGRAMMABLE LOW POWER OPERATIONAL AMPLIFIERS
Description

The TLC271 operational amplifier combines a wide range of input offset voltage grades with low offset voltage drift and high input impedance. In addition, the TLC271 offers a bias-select mode that allows the user to select the best combination of power dissipation and AC performance for a particular application.

Using the bias-select option, these devices can be programmed to fit a wide range of applications. Three offset voltage grades are available, ranging from the low-cost TLC271 (10mV) to the TLC271B (2mV) low-offset version. The devices are offered in both commercial and industrial operating temperature ranges.

The extremely high input impedance and low bias currents, in conjunction with good common-mode and supply voltage rejection make these devices an excellent choice for high performance designs.

The devices also feature low-voltage single-supply operation with a common-mode input voltage range which includes the negative rail.

Features

- Wide range of supply voltages over specified temperature range:
0°C to 70°C . . . 3 V to 16 V
-40°C to 85°C . . . 4 V to 16 V
- Single-Supply Operation
- Common-Mode Input Voltage Range
- Extends Below the Negative Rail
- Low Noise:
20 nV/√Hz Typical @ f = 1kHz
(High-Bias Mode)
- Output Voltage Range Includes Negative Rail
- High Input Impedance
- ESD-Protection Circuitry
- Designed-In Latch-Up Immunity
- **Totally Lead-Free & Fully RoHS Compliant (Notes 1 & 2)**
- **Halogen and Antimony Free. "Green" Device (Note 3)**

- Notes:
1. No purposely added lead. Fully EU Directive 2002/95/EC (RoHS) & 2011/65/EU (RoHS 2) compliant.
 2. See http://www.diodes.com/quality/lead_free.html for more information about Diodes Incorporated's definitions of Halogen- and Antimony-free, "Green" and Lead-free.
 3. Halogen- and Antimony-free "Green" products are defined as those which contain <900ppm bromine, <900ppm chlorine (<1500ppm total Br + Cl) and <1000ppm antimony compounds.

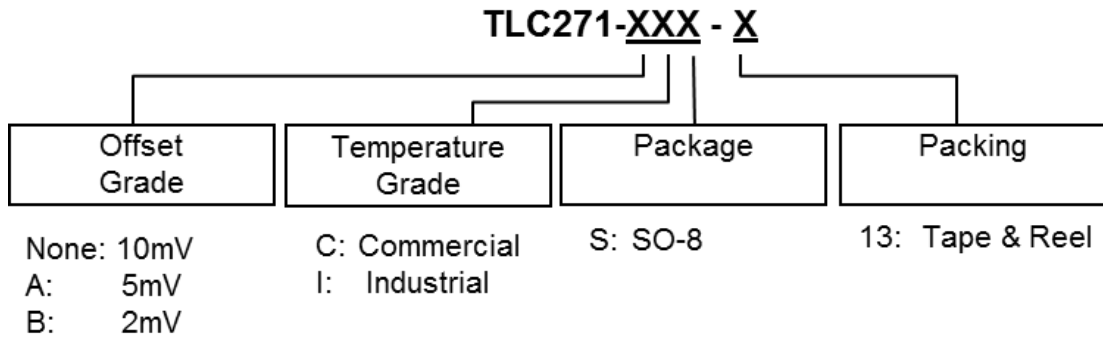

Pin Assignments

Applications

With the programmability options of the TLC271, a designer can choose a very low current option allowing for extended battery life or choose a higher current option for more performance. It is possible to switch performance modes as the application demands change.

The TLC271 is well suited for many consumer audio, industrial and other low power applications.

- Audio
Microphone Preamplifier
Filtering – Equalizers
Signal Amplification
- Industrial
Power Supply
Instrumentation
Metering
- Medical
Portable Meters and Measurement
Instrumentation

Ordering Information

Device	Package Code	Offset Voltage	Operating Temperature Range	Packaging (Note 4)	13" Tape and Reel	
					Quantity	Part Number Suffix
TLC271CS-13	S	10mV	0 to 70°C	SO-8	2500/Tape & Reel	-13
TLC271ACS-13	S	5mV	0 to 70°C	SO-8	2500/Tape & Reel	-13
TLC271BCS-13	S	2mV	0 to 70°C	SO-8	2500/Tape & Reel	-13

TLC271BIS-13	S	2mV	-40 to 85°C	SO-8	2500/Tape & Reel	-13

Note: 4. Pad layout as shown on Diodes Inc. suggested pad layout document AP02001, which can be found on our website at <http://www.diodes.com/datasheets/ap02001.pdf>.

Pin Descriptions

Pin Name	Pin number	Description
OFFSET N1	1	Offset Control Inverting Input
IN-	2	Inverting Input
IN+	3	Non-Inverting Input
GND	4	Ground
OFFSET N2	5	Offset Control Non-Inverting Input
OUT	6	Output
V _{DD}	7	Supply
BIAS SELECT	8	Bias Mode Select

Absolute Maximum Ratings (Notes 5, 6, 7, 8, 9)

Symbol	Parameter		Rating	Unit
V_{DD}	Supply Voltage (Note 6)		18	V
V_{ID}	Differential Input Voltage (Note 7)		$\pm V_{DD}$	V
V_{IN}	Input Voltage Range (either input)		-0.3 to V_{DD}	V
I_{IN}	Input Current		± 5	mA
I_o	Output Current		± 30	mA
	Output Short-Circuit to GND (Note 8)		Continuous	—
P_D	Power Dissipation (Note 9)		1065	mW
T_A	Operating Temperature Range	C Grade	0 to +70	°C
		I Grade	-40 to +85	
T_J	Operating Junction Temperature		150	°C
T_{ST}	Storage Temperature Range		-65 to +150	°C
ESD HBM	Human Body Model ESD Protection (1.5k Ω in series with 100pF)		1.5	kV

- Notes:
- Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only; functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
 - All voltage values, except differential voltages, are with respect to ground.
 - Differential input voltages are at $IN+$ with respect to $IN-$.
 - The output may be shorted to either supply. Temperature and/or supply voltages must be limited to ensure that the maximum dissipation rating is not exceeded.
 - For operating at high temperatures, the TLC271 must be derated 8.5mW/°C to zero based on a +150°C maximum junction temperature and a thermal resistance of +117 °C/W when the device is soldered to a printed circuit board, operating in a still air ambient.

Recommended Operating Conditions

Symbol	Parameter		C grade		I grade		Unit
			Min	Max	Min	Max	
V_{DD}	Supply Voltage		3	16	4	16	V

Application Information

Bias select feature

The TLC271 offers a bias-select feature that allows the user to select any one of three bias levels depending on the level of performance desired. The trade-off between bias levels relates to ac performance and power dissipation as below.

Typical values $T_A = +25^\circ\text{C}$, $V_{DD} = 5\text{V}$		Mode			Units
		High bias $R_L = 10\text{k}\Omega$	Medium bias $R_L = 100\text{k}\Omega$	Low bias $R_L = 1\text{M}\Omega$	
P_D	Power Dissipation	3.4	0.5	0.05	mW
SR	Slew Rate	3.6	0.4	0.03	V/ μs
V_n	Equivalent Input Noise Voltage at $f=1\text{kHz}$	20	25	28	nV/ $\sqrt{\text{Hz}}$
B_1	Unity Gain Bandwidth	1.7	0.5	0.09	MHz
ϕ_m	Phase Margin	46°	40°	34°	—
A_{VD}	Large Signal Differential Voltage Amplification	23	170	480	V/mV

Bias selection

Bias selection is achieved by connecting the bias select pin to one of three voltage levels (see below). For medium-bias applications, it is recommended that the bias select pin be connected to the midpoint between the supply rails. This procedure is simple in split-supply applications, since this point is ground.

In single-supply applications, the medium-bias mode necessitates using a voltage divider as indicated below. The use of large-value resistors in the voltage divider reduces the current drain of the divider from the supply line. However, large-value resistors used in conjunction with a large-value capacitor require significant time to charge the supply to the midpoint after the supply is switched on. A voltage other than the midpoint can be used if it is within the voltages specified table.

Bias Mode	Bias Select Voltage (Single Supply)
Low	V_{DD}
Medium	1 V to $V_{DD} - 1\text{ V}$
High	GND

Figure 91

High-Bias Mode

In high-bias mode, the TLC271 series features low offset voltage drift, high input impedance and low noise. Speed in this mode approaches that of BiFET devices but at only a fraction of the power dissipation. Unity-gain bandwidth is typically greater than 1 MHz.

Medium-Bias Mode

The TLC271 in medium-bias mode features low offset voltage drift, high input impedance and low noise. Speed in this mode is similar to general-purpose bipolar devices, but power dissipation is only a fraction of that consumed by bipolar devices.

Low-Bias Mode

In low-bias mode, the TLC271 features low offset voltage drift, high input impedance, extremely low power consumption and high differential voltage gain.

Application Information (cont.)

Parameter measurement circuits

Because the TLC271 is optimized for single-supply operation, circuit configurations used for the various tests can present some difficulties since the input signal must be offset from ground. This issue can be avoided by testing the device with split supplies and the output load tied to the negative rail. Example circuits are shown below.

Figure 92 Measurement circuit with either single or split supply

Fig 93 Noise measurement with single or split supply

Figure 94 Gain of 100 with single or split supply

Application Notes

Offset Voltage Nulling Circuit

The TLC271 offers external input offset null control. Nulling of the input off set voltage may be achieved by adjusting a 100-k Ω potentiometer connected between the offset null terminals with the wiper connected as shown in Figure 95. The amount of nulling range varies with the bias selection. In the high-bias mode, the nulling range allows the maximum offset voltage specified to be trimmed to zero. In low-bias and medium-bias modes, total nulling may not be possible.

Figure 95 Offset Nulling Circuits

Input Bias Current – Error Protection

The TLC271 has an extremely high input impedance. To use the inputs as a high impedance node, for example, greater than 100K, or to accurately measure bias current, it will be necessary to place a guard ring around the input pins and drive this ring to a potential equivalent to the common mode input voltage. In many cases this common mode potential may exist as a part of the feedback circuit and can be obtained from one of the appropriate nodes. In the case for the SO8 package, pin 4 is connected to ground or Vdd-. Input pins 2 and 3 are normally well above the voltage on pin 4 so a large potential voltage on the order of several volts is likely between pins 3 and 4. To prevent interference with a 1 pA bias current the board resistance would need to be in the order of gigaohms to have a minimum impact. The goal is to have the common mode potential on the guard ring, therefore reducing the stray voltage near the input pins to millivolts in normal applications. Any solder flux residue, excess moisture, humidity or board contamination will be detrimental to using the device in a high impedance input mode.

LIFE SUPPORT

Diodes Incorporated products are specifically not authorized for use as critical components in life support devices or systems without the express written approval of the Chief Executive Officer of Diodes Incorporated. As used herein:

A. Life support devices or systems are devices or systems which:

1. are intended to implant into the body, or
2. support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in significant injury to the user.

B. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or to affect its safety or effectiveness.

Customers represent that they have all necessary expertise in the safety and regulatory ramifications of their life support devices or systems, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of Diodes Incorporated products in such safety-critical, life support devices or systems, notwithstanding any devices- or systems-related information or support that may be provided by Diodes Incorporated. Further, Customers must fully indemnify Diodes Incorporated and its representatives against any damages arising out of the use of Diodes Incorporated products in such safety-critical, life support devices or systems.
