FEATURES

- **1.** ROM: 1K x 14 bits OTP or 512 x 14 bits TTPTM (Two Time Programmable ROM)
- 2. RAM: 48 x 8 bits
- 3. STACK: 5 Levels
- 4. I/O port: One Bit-programmable I/O port (Max. 6 pins)
- 5. Timer/Counter: One 8-bit timer/counter with divided by 1~256 pre-scale option
- 6. PWM: One 8-bit PWM0 with prescale/period-adjustment function
- 7. 10-bit ADC with 5 channels input
- 8. 4-channel Touch Key (TM57PT16/PT16B only)
 - H/W auto scan (ATK), threshold adjustable for each key
 - Interrupt / Wake-up CPU while key pressed
 - Internal built-in reference capacitor (TM57PT16B only)

9. Watchdog Timer

• Clocked by built-in RC oscillator with 4 adjustable Reset/Interrupt Time

(176 ms/88 ms/44 ms/22 ms, @5V; 224 ms/112 ms/56 ms/28 ms, @3V)

• Watchdog timer can be disabled/enabled in STOP mode

10. Reset

- Power On Reset
- Watchdog Reset
- Low Voltage Reset
- External pin Reset

11. System Clock Mode

- Internal RC: 4/8 MHz.
 - When the IRC is 8 MHz, the LVR can only be set to 3.1V (cannot use 2.2V).

12. 2-Level Low Voltage Reset: 2.2V/3.1V (Can be disabled)

| LVR Freq | 2.2V | 3.1V | Disable |
|-------------|--------------|--------------|-------------------------|
| 4 MHz | \checkmark | \mathbf{V} | N |
| 8 MHz | X | \checkmark | $\mathbf{\overline{A}}$ |

13. Operation Voltage: Low Voltage Reset Level to 5.5V

- Fsys = 4 MHz, 1.9V ~ 5.5V
- Fsys = 8 MHz, 2.3V ~ 5.5V

14. I/O Port

- CMOS Output
- Pseudo-Open-Drain or Open-Drain Output
- Schmitt Trigger Input with/without pull-up resistor

15. Instruction set: 36 Instructions

16. Interrupt

- Two External Interrupt pins:
 - One pin is falling edge triggered
 - One pin is rising or falling edge triggered
- TM0, Wake-up Timer, Auto Touch Key (TM57PT16/PT16B only) Interrupt

17. PA1~PA4 individual pin low level wake up

18. Power Saving Operation Modes

- Normal Mode: Internal RC keeps CPU running
- STOP Mode: All Clocks stop
- IDLE Mode: Internal RC and CPU stop, WKT or Auto Touch Key (TM57PT16/PT16B only) keep running

19. Support 5-wire program

20. Package Types:

- SOT23-6
- DIP-8 (300mil)
- SOP-8 (150mil)
- MSOP-8 (118mil)

21. Supported EV Board on ICE

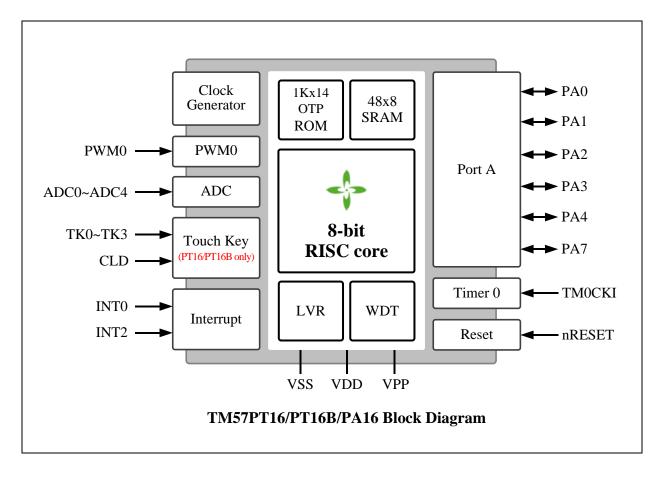

EV Board: EV8201

22. Comparison Table:

| | EV8201 | TM57PT16 | TM57PT16B |
|----------------|-----------------|-----------------|--------------------------------------|
| EV Board | - | EV8201 | EV8201 |
| Touch Key | 4-channel | 4-channel | 4-channel + Internal Reference |
| АТК | 4-channel | 4-channel | 4-channel (Must set TKCHS2=0) |
| SFR Difference | TKTMR (F14.6~4) | TKTMR (F14.6~4) | TKTMR (F14.6~5) TKCHS2 (F14.4) |

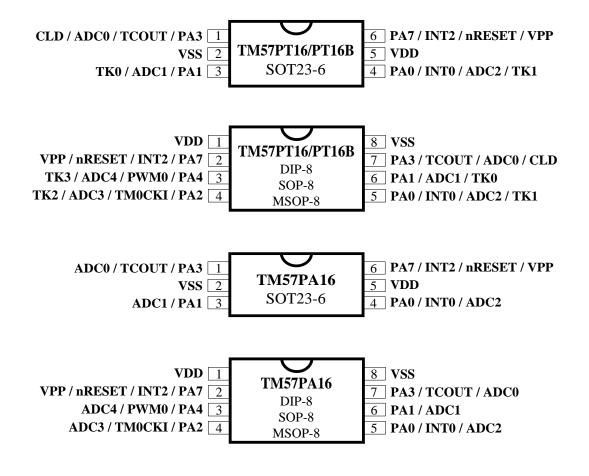

BLOCK DIAGRAM

PIN ASSIGNMENT

PIN DESCRIPTION

| Name | In/Out | Pin Description |
|------------|--------|---|
| PA0–PA1 | I/O | Bit-programmable I/O port for Schmitt-trigger input, CMOS push-pull output or "pseudo-open-drain" output. Pull-up resistors are assignable by software. |
| PA2–PA4 | I/O | Bit-programmable I/O port for Schmitt-trigger input, CMOS push-pull output or open-drain output. Pull-up resistors are assignable by software. |
| PA7 | I/O | Bit-programmable I/O port for Schmitt-trigger input or open-drain output. Pull-up resistors are assignable by software. |
| nRESET | Ι | External active low reset |
| TCOUT | 0 | Instruction cycle clock output. The instruction clock frequency is system clock frequency divided by two (Fsys/2) |
| VDD, VSS | Р | Power Voltage input pin and ground |
| VPP | Ι | PROM programming high voltage input |
| INT0, INT2 | Ι | External interrupt input |
| TM0CKI | Ι | Timer0's input in counter mode |
| NC | - | Not connected |
| PWM0 | 0 | PWM0 output |
| TK0–TK3 | Ι | Touch key input (TM57PT16/PT16B only) |
| CLD | Ι | Touch key capacitor input (TM57PT16/PT16B only) |
| ADC0-ADC4 | Ι | ADC channel input |

O.D. = Open Drain

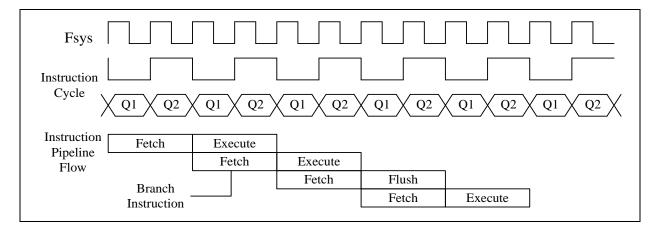

FUNCTIONAL DESCRIPTION

1. CPU Core

1.1 Clock Scheme and Instruction Cycle

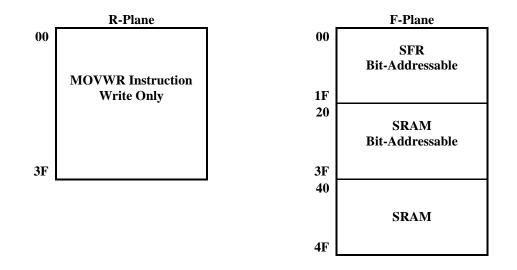

The system clock is internally divided by two to generate Q1 state and Q2 state for each instruction cycle. The Programming Counter (PC) is updated at Q1 and the instruction is fetched from program ROM and latched into the instruction register in Q2. It is then decoded and executed during the following Q1-Q2 cycle. Branch instructions take two cycles since the fetch instruction is 'flushed' from the pipeline, while the new instruction is being fetched and then executed.

1.2 Addressing Mode

There are two Data Memory Planes in CPU, R-Plane and F-Plane. The registers in R-Plane are writeonly. The "MOVWR" instruction copies the W-register's content to R-Plane registers by direct addressing mode. The lower locations of F-Plane are reserved for the SFR. Above the SFR is General Purpose Data Memory, implemented as static RAM. F-Plane can be addressed directly or indirectly. Indirect Addressing is made by INDF register. The INDF register is not a physical register. Addressing INDF actually addresses the register whose address is contained in the FSR register (FSR is a pointer). The first half of F-Plane is bit-addressable, while the second half of F-Plane is not bit-addressable.

MOVLW AAH ; Move immediate AAH into W register **MOVWR** 05H ; Move W value into R-Plane location 05H \bigcirc Example: Write immediate data into F-Plane register MOVLW ; Move immediate 55H into W register 55H MOVWF ; Move W value into F-Plane location 20H 20H ♦ Example: Move F-Plane location 20H data into W register MOVFW 20H ; To get a content of F-Plane location 20H to W ♦ Example: Clear SRAM Bank0 data by indirect addressing mode ; W = 20H (SRAM start address) MOVLW 20H ; Set start address of user SRAM into FSR register MOVWF FSR LOOP: MOVLW 00H MOVFW INDF · Clear user SRAM data

| IVIO V F VV | INDF | , Clear user SKAIVI uata |
|-------------|-----------|--|
| INCF | FSR, 1 | ; Increment the FSR for next address |
| MOVLW | 50H | ; $W = 50H$ (SRAM end address) |
| XORWF | FSR, 0 | ; Check the FSR is end address of user SRAM? |
| BTFSS | STATUS, Z | ; Check the Z flag |
| GOTO | LOOP | ; If $Z = 0$, goto LOOP label |
| | | ; If $Z = 1$, exit LOOP |

Example: Write immediate data into R-Plane register

1.3 Programming Counter (PC) and Stack

The Programming Counter is 10-bit wide capable of addressing a 1K x 14 OTP ROM. As a program instruction is executed, the PC will contain the address of the next program instruction to be executed. The PC value is normally increased by one except the followings. The Reset Vector (000h) and the Interrupt Vector (001h) are provided for PC initialization and Interrupt. For CALL/GOTO instructions, PC loads 10 bits address from instruction word. For RET/RETI/RETLW instructions, PC retrieves its content from the top level STACK. For the other instructions updating PC [7:0], the PC [9:8] keeps unchanged. The STACK is 10-bit wide and 5-level in depth. The CALL instruction and hardware interrupt will push STACK level in order. While the RET/RETI/RETLW instruction pops the STACK level in order.

1.4 ALU and Working (W) Register

The ALU is 8-bit wide and capable of addition, subtraction, shift and logical operations. In two-operand instructions, typically one operand is the W register, which is an 8-bit non-addressable register used for ALU operations. The other operand is either a file register or an immediate constant. In single operand instructions, the operand is either W register or a file register. Depending on the instruction executed, the ALU may affect the values of Carry (C), Digit Carry (DC), and Zero (Z) Flags in the STATUS register. The C and DC flags operate as a /Borrow and /Digit Borrow, respectively, in subtraction.

Note: /Borrow represents inverted of Borrow register.

/Digit Borrow represents inverted of Digit Borrow register.

DS-TM57PT16_PT16B_PA16_E

1.5 STATUS Register

This register contains the arithmetic status of ALU and the reset status. The STATUS register can be the destination for any instruction, as with any other register. If the STATUS register is the destination for an instruction that affects the Z, DC or C bits, then the write to these three bits is disabled. These bits are set or cleared according to the device logic. It is recommended, therefore, that only BCF, BSF and MOVWF instructions are used to alter the STATUS register because these instructions do not affect those bits.

| STATUS | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 | |
|-------------|--|--|-----------|-----------------|---|----------------------------------|-------|-------|--|
| Reset Value | - | - | - | 0 | 0 | 0 | 0 | 0 | |
| R/W | _ | - | _ | R | R | R/W | R/W | R/W | |
| Bit | | | | Desci | ription | | | | |
| 7~5 | Not Used | | | | | | | | |
| 4 | 0: after P | TO : Time Out Flag 0: after Power On Reset, LVR Reset, or CLRWDT/SLEEP instruction 1: WDT time out occurs | | | | | | | |
| 3 | PD: STOP Flag 0: after Power On Reset, LVR Reset, or CLRWDT instruction 1: after SLEEP instruction | | | | | | | | |
| 2 | 0: the res | Z: Zero Flag0: the result of a logic operation is not zero1: the result of a logic operation is zero | | | | | | | |
| | DC: Decimal Carry Flag or Decimal /Borrow Flag | | | | | | | | |
| | | ADD in | struction | | SUB instruction | | | | |
| 1 | 0: no carry | | | | 0: a borrow from the low nibble bits of the | | | | |
| | 1: a carry from the low nibble bits of the result occurs1: | | | | | It result occurs 1: no borrow | | | |
| | C: Carry Flag or /Borrow Flag | | | | | | | | |
| 0 | | ADD in | struction | SUB instruction | | | | | |
| , v | 0: no carry0: a borrow occurs from the MSB1: a carry occurs from the MSB1: no borrow | | | | | | | | |

♦ Example: Write immediate data into STATUS register

| MOVLW | 00H | |
|-------|--------|-------------------------|
| MOVWF | STATUS | ; Clear STATUS register |

♦ Example: Bit addressing set and clear STATUS register

| BSF | STATUS, 0 | ; Set C = 1 |
|-----|-----------|-----------------|
| BCF | STATUS, 0 | ; Clear $C = 0$ |

♦ Example: Determine the C flag by BTFSS instruction

| BTFSS | STATUS, 0 | ; Check the C flag |
|-------|-----------|-----------------------------------|
| GOTO | LABEL_1 | ; If $C = 0$, goto LABEL_1 label |
| GOTO | LABEL_2 | ; If $C = 1$, goto LABEL_2 label |

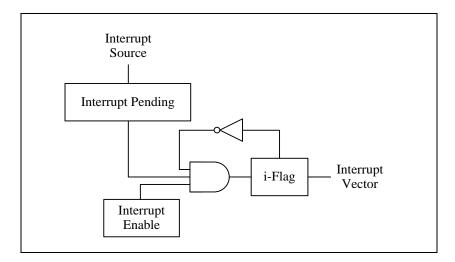

DS-TM57PT16_PT16B_PA16_E

1.6 Interrupt

The TM57PA16 has 1 level, 1 vector and 4 interrupt sources. TM57PT16/PT16B has 1 level, 1 vector and 5 interrupt sources. Each interrupt source has its own enable control bit. An interrupt event will set its individual pending flag; no matter its interrupt enable control bit is 0 or 1. Because TM57PT16/PT16B/PA16 has only 1 vector, there is not an interrupt priority register. The interrupt priority is determined by F/W.

If the corresponding interrupt enable bit has been set (INTIE), it would trigger CPU to service the interrupt. CPU accepts interrupt in the end of current executed instruction cycle. In the mean while, A "CALL 001" instruction is inserted to CPU, and i-flag is set to prevent recursive interrupt nesting.

The i-flag is cleared in the instruction after the "RETI" instruction. That is, at least one instruction in main program is executed before service the pending interrupt. The interrupt event is level triggered. F/W must clear the interrupt event register while serving the interrupt routine.

 \bigcirc Example: Setup INT0 (PA0) interrupt request with rising edge trigger

| • • I • • • | ORG | 000H | ; Reset Vector |

R0B.4 INT0EDG: INT0 (PA0) trigger edge select

0: INT0 (PA0) pin falling edge to trigger interrupt event

1: INTO (PA0) pin rising edge to trigger interrupt event

F09.4 **TM0IF:** Timer0 interrupt event pending flag This bit is set by H/W while Timer0 overflows, write 0 to this bit will clear this flag

F09.2 **INT2IF:** INT2 (PA7) pin falling interrupt pending flag This bit is set by H/W at INT2 pin's falling edge, write 0 to this bit will clear this flag

2. Chip Operation Mode

2.1 Reset

The TM57PT16/PT16B/PA16 can be RESET in four ways.

- Power-On-Reset
- Low Voltage Reset (LVR)
- External Pin Reset (PA7)
- Watchdog Reset (WDT)

After Power-On-Reset, all system and peripheral control registers are then set to their default hardware Reset values. The clock source, LVR level and chip operation mode are selected by the SYSCFG register value. The Low Voltage Reset features static reset when supply voltage is below a threshold level. There are two threshold levels can be selected. The LVR's operation mode is defined by the SYSCFG register.

There are two voltage selections for the LVR threshold level, one is higher level which is suitable for application with V_{DD} is more than 3.3V, while another one is suitable for application with V_{DD} is less than 3.3V. See the following LVR Selection Table; user must also consider the lowest operating voltage of operating frequency.

LVR Selection Table:

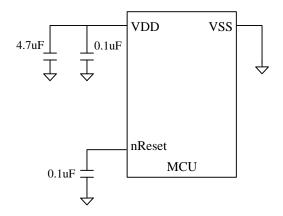

| LVR Threshold Level | Consider the operating voltage to choose LVR |
|---------------------|--|
| LVR3.1 | $5.5V > V_{DD} > 3.3V$ |
| LVR2.2 | V _{DD} is wide voltage range |

The External Pin Reset and Watchdog Reset can be disabled or enabled by the SYSCFG register. These two resets also set all the control registers to their default reset value. The TO/PD flag is not affected by these resets.

2.2 External Reset Circuit

External reset pin is low level active. The system is running when reset pin is high level voltage input. The reset pin receives the low voltage and the system is reset. The external reset can reset the system during power on duration, and good external reset circuit can protect the system to avoid working at unusual power condition.

2.3 System Configuration Register (SYSCFG)

The System Configuration Register (SYSCFG) is located at ROM address 3FCh. The SYSCFG determines the option for initial condition of MCU. It is written by PROM Writer only. User can select clock source, LVR threshold voltage and chip operation mode by SYSCFG register. The default value of SYSCFG is 3FFFh. The 13th bit of SYSCFG is code protection selection bit. If this bit is 0, the data in PROM will be protected, when user reads PROM.

| Bit | | 13~0 | | | | |
|---------------|---------------------|---|--|--|--|--|
| Default Value | | 11111111111 | | | | |
| Bit | | Description | | | | |
| 13 | PROTECT: 0 | Code protection selection | | | | |
| | 0 | Enable | | | | |

| 5 | | 8 MHz, 1: IRC=4 MHz is 8 MHz, the LVR can only be set to 3.1V or disable (can't use 2.2V). | | | | |
| 4-0 | Reserved | | | | | |

DS-TM57PT16_PT16B_PA16_E

2.4 PROM Re-use ROM

The PROM of this device is 1K words. For some F/W program, the program size could be less than 512 words. To fully utilize the PROM, the device allows users to reuse the PROM. This feature is named as Two Time Programmable (TTP) ROM. While the first half of PROM is occupied by a useless program code and the second half of the PROM remains blank, users can re-write the PROM with the updated program code into the second half of the PROM. In the Re-use mode, the Reset Vector and Interrupt Vector are re-allocated at the beginning of the PROM's second half by the Assembly Compiler. Users simply choose the "REUSE" option in the ICE tool interface, and then the Compiler will move the object code to proper location. That is, the user's program still has reset vector at address 000h, but the compiled object code has reset vector at 200h. In the SYSCFG, if PROTECT is enabled and not Re-use, the Code protection area is first half of PROM. This allows the Writer tool to write then verify the Code during the Re-use Code programming. After the Re-use Code being written into the PROM's second half, user should write "REUSE" control bit to "0". In the mean while, the Code protection area becomes the whole PROM except the Reserved Area.

| | PROM, REUSE=1 | | PROM, REUSE=0 | | | | |
|-----|---------------------|---------|---------------|---------------------|---------|--|--|

2.5 Power Down Mode

The Power Down mode includes STOP mode and IDLE mode. It is activated by SLEEP instruction.

STOP Mode:

When WKTIE (F08.3) is cleared, all blocks will be turned off and the TM57PT16/PT16B/PA16 will enter the "STOP Mode" after executing the SLEEP instruction. During the STOP mode, the system clock and peripherals stop to minimize power consumption. The STOP mode can be terminated by Reset, or enabled External Pins Interrupt or PA1-4 pins low level wake up.

IDLE Mode:

When WKTIE (F08.3) is set, the TM57PT16/PT16B/PA16 will enter the "IDLE Mode" after executing the SLEEP instruction. TM57PT16/PT16B has another way to enter the IDLE mode by setting TKAUTO (F15.2) before executing the SLEEP instruction. During the IDLE mode, the system clock and peripherals stops to minimize power consumption, but WKT/WDT and auto touch key (TM57PT16/PT16B only) can still run. The IDLE mode can be terminated by Reset, or enabled Interrupts (External pins, WKT and ATK interrupts) or PA1-4 pins low level wake up. (More details for Touch Key setting is in chapter 3.5)

3. Peripheral Functional Block

3.1 Watchdog (WDT) / Wakeup (WKT) Timer

The WDT and WKT share the same internal RC Timer. The overflow period of WDT/WKT can be selected from 22 ms to 224 ms. The WDT/WKT is cleared by the CLRWDT instruction. If the Watchdog Reset is enabled (SYSCFG[6], WDTE=1), the WDT generates the chip reset signal, otherwise, the WKT only generates overflow time out interrupt. The WDT/WKT works in normal mode and IDLE mode. User can further choose to enable or disable the WDT/WKT by "WKTIE" (F08.3) to enter IDLE or STOP mode. If WKTIE is cleared (no matter WDTE is 1 or 0), the internal RC Timer stops for power saving. In other words, user keeps the WDT/WKT alive in IDLE Mode by setting WKTIE to "1". If the WDTE is set and WKTIE is cleared, WDT/WKT timer will be cleared and stopped for power saving in STOP mode. If the WDTE and WKTIE are set, WDT/WKT timer keeps counting in IDLE/normal mode. Refer to the following table and figure.

If the user program needs the MCU totally shut down for power conservation in STOP mode, the below setting of control bits should be followed.

3.2 Timer0: 8-bit Timer/Counter with Pre-scale (PSC)

The Timer0 is an 8-bit wide register of F-Plane. It can be read or written as any other register of F-Plane. Besides, Timer0 increases itself periodically and automatically rolls over based on the pre-scaled clock source, which can be the instruction cycle or TM0CKI (PA2) rising/falling input. The Timer0's increasing rate is determined by the TM0PSC[3:0] (R02.3~0) bits in R-Plane. The Timer0 can generate interrupt flag TM0IF (F09.4) when it rolls over. It generates Timer0 interrupt if the TM0IE (F08.4) bit is set.

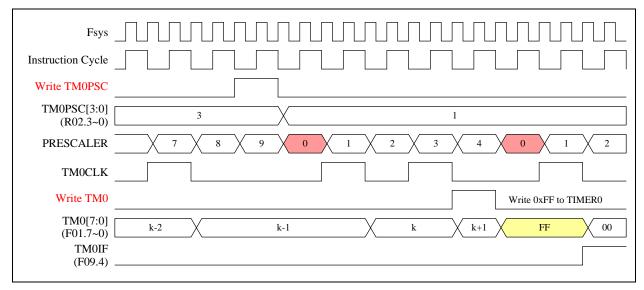

Timer0 Block Diagram

Timer Mode:

When the Timer0 prescaler (TM0PSC) is written, the internal 8-bit prescaler will be cleared to 0 to make the counting period correct at the first Timer0 count. TM0CLK is the internal signal that causes the Timer0 to increase by 1 at the end of TM0CLK. TM0WR is also the internal signal that indicates the Timer0 is directly written by instruction; meanwhile, the internal 8-bit prescaler will be cleared. When Timer0 counts from FFh to 00h, TM0IF (Timer0 Interrupt Flag) will be set to 1 and generate interrupt if TM0IE (Timer0 Interrupt Enable) is set. The following timing diagram describes the Timer0 works in pure Timer mode.

Timer0 works in Timer mode (TM0CKS = 0)

The equation of Timer0 interrupt timer value is as following:

Timer0 interrupt frequency = Instruction cycle time / TM0PSC / 256

 \bigcirc Example: Setup Timer0 work in Timer mode, Fsys = IRC Clock = 4MHz

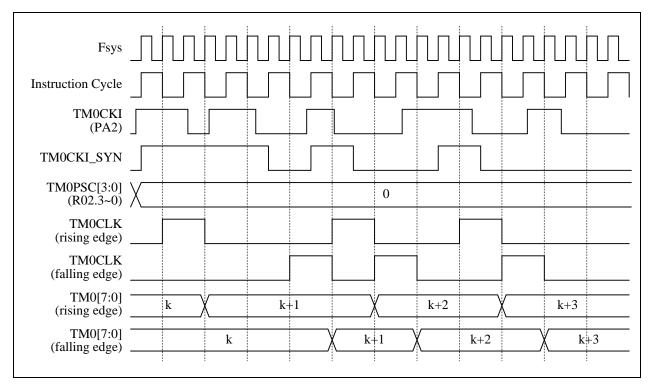

| ; Setup Tim | ner0 clock sou | rce and divider | |
|----------------|----------------|-------------------------|---|
| | MOVLW | 00x 00101 B | ; TM0CKS = 0, Timer0 clock is instruction cycle |
| | MOVWR | TMOCTL | ; TM0PSC = $0101b$, divided by 32 |

| | MOVLW | 111 <u>0</u> 1111B | |
| | MOVWF | INTIF | ; Clear Timer0 request interrupt flag |
| | BSF | TM0IE | ; Enable Timer0 interrupt function |
| ; Setup Tim | ner0 | | |
| - | CLRF | TM0 | ; Clear Timer0 content |
| T : 0 1 | 1 | | |
| Timer0 clo | ck source is F | sys/2 = 4 MHz / 2 = 2 N | /Hz, Timer0 divided by 32 |

Timer0 interrupt frequency = 2 MHz / 32 / 256 = 244.14 Hz

Counter Mode:

If TM0CKS is set, then Timer0 counter source clock is from TM0CKI (PA2) pin. TM0CKI signal is synchronized by instruction cycle that means the high/low time durations of TM0CKI must be longer than one instruction cycle time to guarantee each TM0CKI's change will be detected correctly by the synchronizer. The following timing diagram describes the Timer0 works in Counter mode.

Timer0 works in Counter mode (TM0CKS = 1) for TM0CKI

♦ Example: Setup Timer0 works in Counter mode

| ; Setup Timer0 clock s MOVLW MOVWR | 00 <u>110000</u> B | ; TM0EDG = 1, counting edge is falling edge ; TM0CKS = 1, Timer0 clock is TM0CKI (PA2) ; TM0PSC = 0000b, divided by 1 |

3.3 PWM0: 8-bit PWM

The chip has a built-in 8-bit PWM generator. The source clock comes from Fsys divided by 1, 2, 4, and 8 according to PWM0PSC (R11.1~0). The PWM0 duty cycle can be changed with writing to PWM0D (F12.7~0).

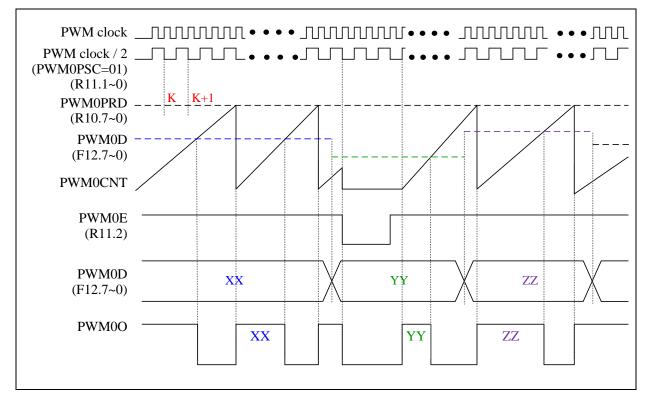

The PWM0 will be output to PA4 if PWM0E (R11.2) is set. With I/O mode setting, the PWM0 output can be set as CMOS push-pull or open-drain output mode. When PAE[4] (R05.4) is set, the output is CMOS push-pull output mode, otherwise is open-drain output mode. Figure shows the block diagram of PWM0.

PWM0 Block Diagram

Figure shows the PWM0 waveforms. When PWM0E bit is cleared or PWM0D equals to zero, the PWM0 output is cleared to '0' no matter what its current status is. Once the PWM0E bit is set and PWM0D is not zero, the PWM0 output is set to '1' to begin a new PWM cycle. PWM0 output will be '0' when PWM0CNT is greater than or equals to PWM0D. PWM0CNT keeps counting up when equals to PWM0PRD (R10.7~0), the PWM0 output is set to '1' again.

PWM0 Block Diagram

 \bigcirc Example: PWM0 output and PWM0 clock is divided by 2, Fsys = 4 MHz

| - | 10 period and MOVLW | l duty FFH | |
|-------------|------------------------|--------------------|--|
| | MOVWR | PWM0PRD | ; Set PWM0 period = $FFH + 1 = 256$ |
| | MOVLW | 80H | |
| | MOVWF | PWM0D | ; Set PWM0 duty $= 80H = 128$ |
| ; Setup PWN | 40 prescaler a | and output enable | |
| | MOVLW | 00000 <u>101</u> B | ; $PWM0E = 1$, $PWM0$ output to PA4 pin |
| | MOVWR | PWMCTL | ; $PWMOPSC = 01b$, divided by 2 |
| | | | - |

PWM0 output duty = PWM0D / (PWM0PRD + 1) = 128 / (255 + 1) = 1 / 2

PWM clock = Fsys = 4 MHz, PWM clock divided by 2

PWM0 output frequency = 4 MHz / 2 / (255 + 1) = 7812.5 Hz

3.4 Analog-to-Digital Converter

The 10-bit ADC (Analog to Digital Converter) consists of a 5-channel analog input multiplexer, control register, clock generator, 10-bit successive approximation register, and output data register. To use the ADC, user needs to set ADCPSC (F1F.5~4) to choose a proper ADC clock frequency, which must be less than 2 MHz. User then launches the ADC conversion by setting the ADCST (F1F.3) control bit. After end of conversion, H/W automatic clears the ADCST (F1F.3) bit. User can poll this bit to know the conversion status. The PAIE (R14.4~0) control registers are used for ADC pin configuration, user can write the corresponding bit to "0" when the pin is used as an ADC input. The setting can disable the pin logical input path to save power consumption.

ADC Block Diagram

3.5 Touch Key (TM57PT16/PT16B only)

Only TM57PT16/PT16B supported the Touch Key function. The Touch Key offers an easy, simple and reliable method to implement finger touch detection. For most applications, it only requires an external capacitor component on CLD pin. The device support 4 channels touch key detection with S/W manual mode and H/W auto (ATK) mode. Only one mode can be active at a time.

With I/O mode setting, The PAIE (R14.4~0) control registers are used for touch key pin configuration, user can write the corresponding bit to "0" when the pin is used as touch key input. The setting can disable the pin logical input path to save power consumption.

Touch Key Block Diagram

S/W Manual Mode Touch Key Detection

All touch key (TK0~TK3) can be used for S/W mode, it can be select by TKCHS (F14.1~0) bits. To start the S/W mode, TKAUTO (F15.2) and TKPD (F14.7) have to be cleared. After setting the TKSOC (F14.3) bit, the touch key starts conversion. The TKSOC bit can be automatically cleared while end of conversion. However, if the system clock is too slow, H/W might lose the auto clear TKSOC capability. "TKEOC=0" means conversion is in process, while "TKEOC=1" means the conversion is finish. After TKEOC's rising edge, user must wait at least 10 us for next conversion. The touch key counting values is stored into the 10 bits touch key data count "TKDH (F16.1~0), TKDL (F17.7~0)". If TKOVF (F16.2) is set, it means the conversion transaction exceeds period time. Reduce/Increase TKTMR (TM57PT16: F14.6~4; TM57PT16B: F14.6~5), can reduce/increase touch key data count to adapt the system board circumstances.

In TM57PT16B, The Touch Key unit has an internal built-in reference capacitor to simulate the Key behavior. Set {TKCHS2(F14.4), TKCHS}=111B and start the Touch Key can get the TKDATA of this reference capacitor. Since the internal capacitor never affected by water or mobile phone, it is useful for comparing the environment background noise.

H/W Auto Mode Touch Key (ATK) Detection

TK0~TK3 are all eligible for H/W auto mode by setting TKSCNUM (F15.1~0). This function can work in normal/IDLE mode and save the S/W effort as well as minimize the chip current consumption. To use this function, TKAUTO has to be set. The WKT will generate an overflow flag after WKT time out to trigger the touch key H/W auto mode starting. That can enable H/W control the touch key module fully. H/W then automatically detects the TK0~TK3's touch key data count at every 22 ms or 224 ms rate by WKTPSC (R0B.1~0). If those keys' data count are less than each pre-set compare thresholds ATKCMP0 (F1C.2~0, F18.7~0), ATKCMP1 (F1C.6~4, F19.7~0), ATKCMP2 (F1D.2~0, F1A.7~0) or ATKCMP3 (F1D.6~4, F1B.7~0), H/W will record the compare result in the ATKDT (F16.7~4). If ATKDT bits are not equal to "0", H/W will also generate interrupt flag ATKIF (F9.5) after touch key module ends conversion. It generates auto touch key interrupt and wake up CPU if the ATKIE (F8.5) bit is set. User can switch the touch key module to S/W manual mode after the touch key interrupt and identify/confirm the Key touch event. About I/O setting, the ATK will control the TK channel's PAPUN and PAIE automatically when this channel is being scanned. To use ATK in TM57PT16B, the TKCHS2 has to be cleared. Otherwise the wrong channel will be scanned. It will cause the function is invalid.

 \bigcirc Example: S/W Mode, Touch key channel = TK1 (PA0).

3.6 System Clock Oscillator

System clock can only be operated in internal RC mode. The on chip oscillator generates 4/8 MHz system clock. When the IRC is 8 MHz, the LVR can only be set to 3.1V (cannot use 2.2V). In this mode, PCB Layout may have strong effect on the stability of Internal Clock Oscillator. Since power noise degrades the performance of Internal Clock Oscillator, placing power supply bypass capacitors 1 uF and 0.1 uF very close to VDD/VSS pins improves the stability of clock and the overall system.

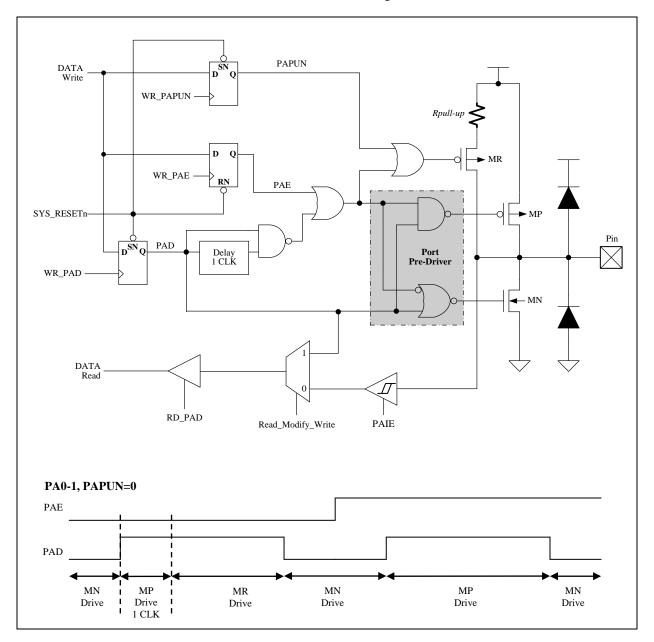

Internal RC Mode

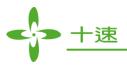

4. I/O Port

4.1 PA0-1

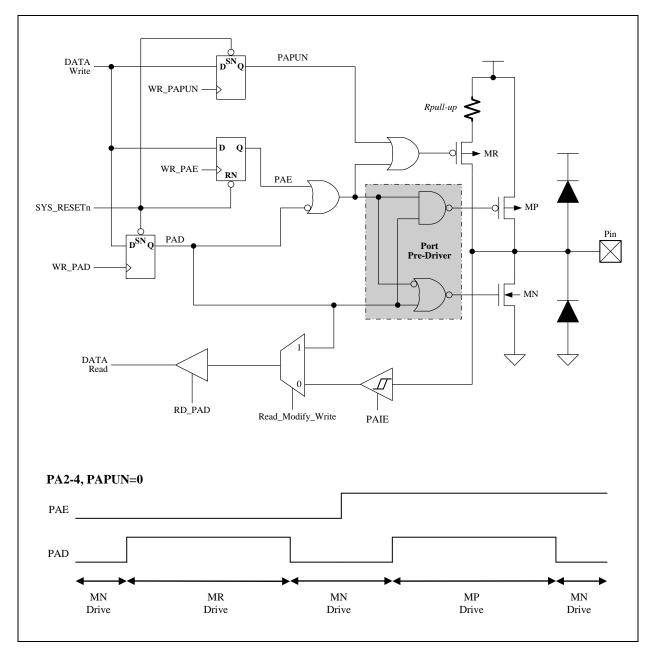

These pins can be used as Schmitt-trigger input, CMOS push-pull output or "pseudo-open-drain" output. The pull-up resistor is assignable to each pin by S/W setting. To use the pin in Schmitt-trigger input mode, S/W needs to set the PAE=0 and PAD=1. To use the pin in pseudo-open-drain mode, S/W sets the PAE=0.The benefit of pseudo-open-drain structure is that the output rise time can be much faster than pure open-drain structure. S/W sets PAE=1 to use the pin in CMOS push-pull output mode. Reading the pin data (PAD) has different meaning. In "Read-Modify-Write" instruction, CPU actually reads the output data register. In the others instructions, CPU reads the pin state. The so-called "Read-Modify-Write" instruction includes BSF, BCF and all instructions using F-Plane as destination.

4.2 PA2-4

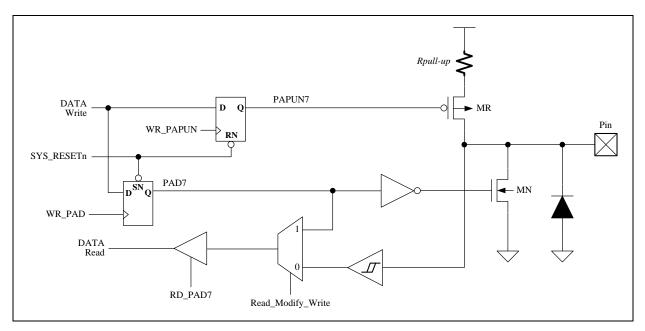

These pins are almost the same as PA0-1, except they do not support pseudo-open-drain mode. They can be used in pure open-drain mode, instead.

4.3 PA7

PA7 can be used in Schmitt-trigger input or pure open-drain output. The pull-up resistor connected to this pin default, and can be disabled by S/W.

INSTRUCTION SET

Each instruction is a 14-bit word divided into an Op Code, which specifies the instruction type, and one or more operands, which further specify the operation of the instruction. The instructions can be categorized as byte-oriented, bit-oriented and literal operations list in the following table.

For byte-oriented instructions, "f" or "r" represents the address designator and "d" represents the destination designator. The address designator is used to specify which address in Program memory is used by the instruction. The destination designator specifies where the result of the operation is placed. If "d" is "0", the result is placed in the W register. If "d" is "1", the result is placed in the address specified in the instruction.

For bit-oriented instructions, "b" represents a bit field designator, which selects the number of the bit affected by the operation, while "f" represents the address designator. For literal operations, "k" represents the literal or constant value.

| Field / Legend | Description | | | |
|----------------|---|--|--|--|
| f | F-Plane Register File Address | | | |
| r | R-Plane Register File Address | | | |
| b | Bit address | | | |
| k | Literal. Constant data or label | | | |
| d | Destination selection field. 0 : Working register 1 : Register file | | | |
| W | Working Register | | | |
| Z | Zero Flag | | | |
| С | Carry Flag | | | |
| DC | Decimal Carry Flag | | | |
| PC | Program Counter | | | |
| TOS | Top Of Stack | | | |
| GIE | Global Interrupt Enable Flag (i-Flag) | | | |
| [] | Option Field | | | |
| () | Contents | | | |

| XORLW | k | 01 1111 kkkk kkkk | 1 | Z | XOR Literal "k" with W |

| ADDLW | Add Literal "k" and W | |
|-----------------|--------------------------------|--|
| Syntax | ADDLW k | |
| Operands | k : 00h ~ FFh | |
| Operation | $(W) \leftarrow (W) + k$ | |
| Status Affected | C, DC, Z | |
| OP-Code | 01 1100 kkkk kkkk | |
| Description | The contents of the W register | are added to the eight-bit literal 'k' and the result is |
| | placed in the W register. | |
| Cycle | 1 | |
| Example | ADDLW 0x15 | $\mathbf{B}:\mathbf{W}=0\mathbf{x}10$ |
| | | A: W = 0x25 |

| ADDWF | Add W and "f" | |
|-----------------|--------------------------------------|--|
| Syntax | ADDWF f [,d] | |
| Operands | f : 00h ~ 7Fh, d : 0, 1 | |
| Operation | $(destination) \leftarrow (W) + (f)$ | |
| Status Affected | C, DC, Z | |
| OP-Code | 00 0111 dfff ffff | |
| Description | Add the contents of the W | / register with register 'f'. If 'd' is 0, the result is stored in |
| • | the W register. If 'd' is 1, t | the result is stored back in register 'f'. |
| Cycle | 1 | - |
| Example | ADDWF FSR, 0 | B: W = 0x17, FSR = 0xC2 |
| - | | A: W = 0xD9, FSR = 0xC2 |

| ANDLW | Logical AND Litera | l ''k'' with W |
|-----------------|--|---|
| Syntax | ANDLW k | |
| Operands | k : 00h ~ FFh | |
| Operation | $(W) \leftarrow (W) AND k$ | |
| Status Affected | Z | |
| OP-Code | 01 1011 kkkk kkkk | |
| Description | The contents of W register placed in the W register. | er are AND'ed with the eight-bit literal 'k'. The result is |
| Cycle | 1 | |
| Example | ANDLW 0x5F | $\mathbf{B}: \mathbf{W} = 0\mathbf{x}\mathbf{A}3$ |
| - | | $\mathbf{A}:\mathbf{W}=0\mathbf{x}03$ |

| ANDWF | AND W with "f" | |
|-----------------|------------------------------------|---|
| Syntax | ANDWF f [,d] | |
| Operands | f : 00h ~ 7Fh, d : 0, 1 | |
| Operation | (destination) \leftarrow (W) ANI | D (f) |
| Status Affected | Z | |
| OP-Code | 00 0101 dfff ffff | |
| Description | AND the W register wi | th register 'f'. If 'd' is 0, the result is stored in the W |
| - | register. If 'd' is 1, the res | ult is stored back in register 'f'. |
| Cycle | 1 | |
| Example | ANDWF FSR, 1 | B: W = 0x17, FSR = 0xC2 |
| - | | A: W = 0x17, FSR = 0x02 |

| Clear "b" bit of "f" | |
|-------------------------------------|--|
| BCF f [,b] | |
| f : 00h ~ 3Fh, b : 0 ~ 7 | |
| $(f.b) \leftarrow 0$ | |
| - | |
| 01 000b bbff ffff | |
| Bit 'b' in register 'f' is cleared. | |
| 1 | |
| BCF FLAG_REG, 7 | $B : FLAG_REG = 0xC7$ |
| | $A: FLAG_REG = 0x47$ |
| | |
| | BCF f [,b] f: 00h ~ 3Fh, b: 0 ~ 7 (f.b) \leftarrow 0 - 01 000b bbff ffff Bit 'b' in register 'f' is cleared. 1 |

| BSF | Set "b" bit of "f" | | |
|-----------------|---------------------------------|---|--|
| Syntax | BSF f[,b] | | |
| Operands | f : 00h ~ 3Fh, b : 0 ~ 7 | | |
| Operation | $(f.b) \leftarrow 1$ | | |
| Status Affected | - | | |
| OP-Code | 01 001b bbff ffff | | |
| Description | Bit 'b' in register 'f' is set. | | |
| Cycle | 1 | | |
| Example | BSF FLAG_REG, 7 | $B : FLAG_REG = 0x0A$ $A : FLAG_REG = 0x8A$ | |

| Test "b" bit of "f", skip if clear(0) | |
|--|--|
| BTFSC f [,b] | |
| f : 00h ~ 3Fh, b : 0 ~ 7 | |
| Skip next instruction if $(f.b) = 0$ | |
| - | |
| 01 010b bbff ffff | |
| If bit 'b' in register 'f' is 1, then the next instruction is executed. If bit 'b' in register | |
| 'f' is 0, then the next instruction is discarded, and a NOP is executed instead, | |
| making this a 2nd cycle instruction. | |
| 1 or 2 | |
| LABEL1 BTFSC FLAG, 1 $B: PC = LABEL1$ | |
| TRUE GOTO SUB1 $A: if FLAG.1 = 0, PC = FALSE$ | |
| FALSE if $FLAG.1 = 1$, $PC = TRUE$ | |
| | |

| BTFSS | Test "b" bit of "f", skip | if set(1) |
|-----------------|--|-----------------------------------|
| Syntax | BTFSS f [,b] | |
| Operands | f : 00h ~ 3Fh, b : 0 ~ 7 | |
| Operation | Skip next instruction if $(f.b) = 1$ | |
| Status Affected | - | |
| OP-Code | 01 011b bbff ffff | |
| Description | If bit 'b' in register 'f' is 0, then the next instruction is executed. If bit 'b' in register | |
| - | 'f' is 1, then the next instruction is discarded, and a NOP is executed instead, | |
| | making this a 2nd cycle instruction. | |
| Cycle | 1 or 2 | |
| Example | LABEL1 BTFSS FLAG, 1 | B : PC = LABEL1 |
| | TRUE GOTO SUB1 | A : if $FLAG.1 = 0$, $PC = TRUE$ |
| | FALSE | if $FLAG.1 = 1$, $PC = FALSE$ |

| CALL | Call subroutine "k" |
|-----------------|--|
| Syntax | CALL k |
| Operands | k : 000h ~ FFFh |
| Operation | Operation: TOS \leftarrow (PC) + 1, PC.11 \sim 0 \leftarrow k |
| Status Affected | - |
| OP-Code | 10 kkkk kkkk |
| Description | Call Subroutine. First, return address (PC+1) is pushed onto the stack. The 12-bit immediate address is loaded into PC bits <11:0>. CALL is a two-cycle instruction. |
| Cycle | 2 |
| Example | LABEL1 CALL SUB1 B : PC = LABEL1 A : PC = SUB1, TOS = LABEL1 + 1 |

| CLRF | Clear "f" | |
|-----------------|--|-------------------------------|
| Syntax | CLRF f | |
| Operands | f : 00h ~ 7Fh | |
| Operation | (f) \leftarrow 00h, Z \leftarrow 1 | |
| Status Affected | Z | |
| OP-Code | 00 0001 1fff ffff | |
| Description | The contents of register 'f' are cleared and the Z bit is set. | |
| Cycle | 1 | |
| Example | CLRF FLAG_REG | $B : FLAG_REG = 0x5A$ |
| | | A : FLAG_REG = $0x00$, Z = 1 |

| CLRW | Clear W | |
|-----------------|--------------------------------------|--------------------|
| Syntax | CLRW | |
| Operands | - | |
| Operation | $(W) \leftarrow 00h, Z \leftarrow 1$ | |
| Status Affected | Z | |
| OP-Code | 00 0001 0100 0000 | |
| Description | W register is cleared a | and Z bit is set. |
| Cycle | 1 | |
| Example | CLRW | B: W = 0x5A |
| - | | A: W = 0x00, Z = 1 |

| CLRWDT | Clear Watchdog | Гimer |
|-----------------|---|--------------------------|
| Syntax | CLRWDT | |
| Operands | - | |
| Operation | WDT/WKT Timer $\leftarrow 00h$ | |
| Status Affected | TO, PD | |
| OP-Code | 00 0000 0000 0100 | |
| Description | CLRWDT instruction clears the Watchdog/Wakeup Timer | |
| Cycle | 1 | |
| Example | CLRWDT | B: WDT counter = ? |
| 1. | | A : WDT counter = $0x00$ |

| COMF | Complement "f" | |
|-----------------|--|--------------------------|
| Syntax | COMF f [,d] | |
| Operands | f : 00h ~ 7Fh, d : 0, 1 | |
| Operation | (destination) \leftarrow (\overline{f}) | |
| Status Affected | Ž | |
| OP-Code | 00 1001 dfff ffff | |
| Description | The contents of register 'f' are complemented. If 'd' is 0, the result is stored in W. | |
| | If 'd' is 1, the result is stored back in register 'f'. | |
| Cycle | 1 | - |
| Example | COMF REG1, 0 | B: REG1 = 0x13 |
| | | A: REG1 = 0x13, W = 0xEC |

| DECF | Decrement "f" | | |
|-----------------|--|------------------------------------|--|
| Syntax | DECF f [,d] | | |
| Operands | f : 00h ~ 7Fh, d : 0, 1 | | |
| Operation | $(destination) \leftarrow (f) - 1$ | (destination) \leftarrow (f) - 1 | |
| Status Affected | Z | | |
| OP-Code | 00 0011 dfff ffff | | |
| Description | Decrement register 'f'. If 'd' is 0, the result is stored in the W register. If 'd' is 1, the result is stored back in register 'f'. | | |
| Cycle | 1 | | |
| Example | DECF CNT, 1 | B : CNT = $0x01$, Z = 0 | |
| - | | A : CNT = 0x00, Z = 1 | |

| DECFSZ | Decrement "f", Skip if 0 |
|-----------------|---|
| Syntax | DECFSZ f [,d] |
| Operands | f : 00h ~ 7Fh, d : 0, 1 |
| Operation | (destination) \leftarrow (f) - 1, skip next instruction if result is 0 |
| Status Affected | - |
| OP-Code | 00 1011 dfff ffff |
| Description | The contents of register 'f' are decremented. If 'd' is 0, the result is placed in the W register. If 'd' is 1, the result is placed back in register 'f'. If the result is 1, the next instruction is executed. If the result is 0, then a NOP is executed instead, making it a 2 cycle instruction. |
| Cycle | 1 or 2 |
| Example | LABEL1 DECFSZ CNT, 1 $B: PC = LABEL1$ |
| | GOTO LOOP CONTINUE $A : CNT = CNT - 1$ if $CNT = 0$, $PC = CONTINUE$ if $CNT \neq 0$, $PC = LABEL1 + 1$ |

| GOTO | Unconditional Branch | |
|-----------------|---|-----------------|
| Syntax | GOTO k | |
| Operands | k : 000h ~ FFFh | |
| Operation | PC.11~0 \leftarrow k | |
| Status Affected | - | |
| OP-Code | 11 kkkk kkkk | |
| Description | GOTO is an unconditional branch. The 12-bit immediate value is loaded into PC | |
| - | bits <11:0>. GOTO is a two-cycle instruction. | |
| Cycle | 2 | - |
| Example | LABEL1 GOTO SUB1 | B : PC = LABEL1 |
| - | | A : PC = SUB1 |

| INCF | Increment "f" | |
|-----------------|--|---|
| Syntax | INCF f [,d] | |
| Operands | f : 00h ~ 7Fh | |
| Operation | $(destination) \leftarrow (f) + 1$ | |
| Status Affected | Z | |
| OP-Code | 00 1010 dfff ffff | |
| Description | The contents of register 'f' are incremented. If 'd' is 0, the result is placed in the V register. If 'd' is 1, the result is placed back in register 'f'. | V |
| Cycle | 1 | |
| Example | INCF CNT, 1 $B: CNT = 0xFF, Z = 0$ | |
| - | A : $CNT = 0x00, Z = 1$ | |
| INCFSZ | Increment ''f'', Skip if 0 | |
| | | _ |
| Syntax | INCFSZ f [,d] | |
| Operands | f: 00h ~ 7Fh, d: 0, 1 | |
| Operation | (destination) \leftarrow (f) + 1, skip next instruction if result is 0 | |
| Status Affected | - | |
| OP-Code | 00 1111 dfff ffff | |
| Description | The contents of register 'f' are incremented. If 'd' is 0, the result is placed in the V register. If 'd' is 1, the result is placed back in register 'f'. If the result is 1, the next instruction is executed. If the result is 0, a NOP is executed instead, making it a cycle instruction. | t |
| Cycle | 1 or 2 | |
| Example | LABEL1INCFSZCNT, 1 GOTO $B : PC = LABEL1$ $A : CNT = CNT + 1$ if $CNT = 0$, $PC = CONTINUE$ CONTINUEif $CNT = 0$, $PC = CONTINUE$ if $CNT \neq 0$, $PC = LABEL1 + 1$ | |

| IORLW | Inclusive OR Liter | al with W |
|-----------------|---|--|
| Syntax | IORLW k | |
| Operands | k : 00h ~ FFh | |
| Operation | $(W) \leftarrow (W) OR k$ | |
| Status Affected | Z | |
| OP-Code | 01 1010 kkkk kkkk | |
| Description | The contents of the W r placed in the W register | register are OR'ed with the eight-bit literal 'k'. The result is |
| Cycle | 1 | |
| Example | IORLW 0x35 | B: W = 0x9A A: W = 0xBF, Z = 0 |

| IORWF | Inclusive OR W with | "f" |
|-----------------|---|--|
| Syntax | IORWF f [,d] | |
| Operands | f : 00h ~ 7Fh, d : 0, 1 | |
| Operation | (destination) \leftarrow (W) OR k | |
| Status Affected | Z | |
| OP-Code | 00 0100 dfff ffff | |
| Description | Inclusive OR the W register with register 'f'. If 'd' is 0, the result is placed in the | |
| I | 6 | ult is placed back in register 'f'. |
| Cycle | 1 | 1 0 |
| Example | IORWF RESULT, 0 | B : RESULT = $0x13$, W = $0x91$ |
| 1 | | A : RESULT = $0x13$, W = $0x93$, Z = 0 |

| MOVFW | Move "f" to W | |
|-----------------|---|-------------------------|
| Syntax | MOVFW f | |
| Operands | f : 00h ~ 7Fh | |
| Operation | $(W) \leftarrow (f)$ | |
| Status Affected | - | |
| OP-Code | 00 1000 Offf ffff | |
| Description | The contents of register 'f' are moved to W register. | |
| Cycle | 1 | - |
| Example | MOVFW FSR | B : FSR = 0xC2, W = ? |
| - | | A: FSR = 0xC2, W = 0xC2 |

| MOVLW | Move Literal to W | |
|-----------------|-----------------------------------|--|
| Syntax | MOVLW k | |
| Operands | k : 00h ~ FFh | |
| Operation | $(W) \leftarrow k$ | |
| Status Affected | - | |
| OP-Code | 01 1001 kkkk kkkk | |
| Description | The eight-bit literal 'k' is 0's. | s loaded into W register. The don't cares will assemble as |
| Cycle | 1 | |
| Example | MOVLW 0x5A | $\mathbf{B}:\mathbf{W}=?$ |
| | | A: W = 0x5A |

| MOVWF | Move W to "f" | |
|-----------------|--|--------------------------|
| Syntax | MOVWF f | |
| Operands | f : 00h ~ 7Fh | |
| Operation | $(f) \leftarrow (W)$ | |
| Status Affected | - | |
| OP-Code | 00 0000 1fff ffff | |
| Description | Move data from W register to register 'f'. | |
| Cycle | 1 | |
| Example | MOVWF REG1 | B: REG1 = 0xFF, W = 0x4F |
| - | | A: REG1 = 0x4F, W = 0x4F |

| MOVWR | Move W to "r" | |
|-----------------|--------------------------|--|
| Syntax | MOVWR r | |
| Operands | r : 00h ~ 3Fh | |
| Operation | $(r) \leftarrow (W)$ | |
| Status Affected | - | |
| OP-Code | 00 0000 00rr rrrr | |
| Description | Move data from W registe | r to register 'r'. |
| Cycle | 1 | - |
| Example | MOVWR REG1 | B : REG1 = 0xFF, W = 0x4F A : REG1 = 0x4F, W = 0x4F |

| NOP | No Operation | | |
|-----------------|--|--|--|
| Syntax | NOP | | |
| Operands | - | | |
| Operation | No Operation | | |
| Status Affected | - | | |
| OP-Code | 00 0000 0000 | | |
| Description | No Operation | | |
| Cycle | 1 | | |
| Example | NOP - | | |
| RET | Return from Subroutine | | |
| Syntax | RET | | |
| Operands | | | |
| Operation | $PC \leftarrow TOS$ | | |
| Status Affected | 16 ~ 105 | | |
| | - | | |
| OP-Code | 00 0000 0100 0000 Determ from submitting. The stack is DODed and the tag of the stack (TOS) is | | |
| Description | Return from subroutine. The stack is POPed and the top of the stack (TOS) is loaded into the program counter. This is a two-cycle instruction. | | |
| Cycle | 2 | | |
| Example | RET $A : PC = TOS$ | | |
| RETI | Return from Interrupt | | |
| Syntax | RETI | | |
| Operands | - | | |
| Operation | $PC \leftarrow TOS, GIE \leftarrow 1$ | | |
| Status Affected | - | | |
| OP-Code | - 00 0000 0110 0000 | | |
| Description | Return from Interrupt. Stack is POPed and Top-of-Stack (TOS) is loaded in to the PC. Interrupts are enabled. This is a two-cycle instruction. | | |
| Cycle | 2 | | |
| Example | RETI $A : PC = TOS, GIE = 1$ | | |
| RETLW | Return with Literal in W | | |
| | | | |
| Syntax | RETLW k | | |
| Operands | k: 00h ~ FFh | | |
| Operation | $PC \leftarrow TOS, (W) \leftarrow k$ | | |
| Status Affected | - | | |
| OP-Code | 01 1000 kkkk kkkk | | |
| Description | The W register is loaded with the eight-bit literal 'k'. The program counter is loaded from the top of the stack (the return address). This is a two-cycle instruction | | |
| Coult | instruction. | | |
| Cycle | $2 \qquad \qquad \mathbf{P} \cdot \mathbf{W} = 0.07$ | | |
| Example | CALL TABLE $B: W = 0x07$ | | |
| | A: W = value of k8 | | |
| | TABLE ADDWF PCL, 1 | | |
| | RETLW k1 | | |
| | RETLW k2 | | |
| | : RETLW kn | | |
| | ALILW KI | | |

| RLF | Rotate Left "f" throu | igh Carry |
|-----------------|-------------------------|--|
| Syntax | RLF f [,d] | |
| Operands | f : 00h ~ 7Fh, d : 0, 1 | |
| Operation | C Reg | gister f |
| Status Affected | C | |
| OP-Code | 00 1101 dfff ffff | |
| Description | e | are rotated one bit to the left through the Carry Flag. If in the W register. If 'd' is 1, the result is stored back in |
| Cycle | 1 | |
| Example | RLF REG1, 0 | B : REG1 = 1110 0110, C = 0 |
| | | A : REG1 = 1110 0110 |
| | | $W = 1100 \ 1100, C = 1$ |

| RRF | Rotate Right "f" through Carry |
|-----------------|--|
| Syntax | RRF f [,d] |
| Operands | f : 00h ~ 7Fh, d : 0, 1 |
| Operation | C Register f |
| Status Affected | С |
| OP-Code | 00 1100 dfff ffff |
| Description | The contents of register 'f' are rotated one bit to the right through the Carry Flag. If 'd' is 0, the result is placed in the W register. If 'd' is 1, the result is placed back in register 'f'. |
| Cycle | 1 |
| Example | RRF REG1, 0 B : REG1 = 1110 0110, C = 0 |
| - | A : REG1 = 1110 0110 |
| | $W = 0111\ 0011, C = 0$ |

| SLEEP | Go into standby mode, Clock oscillation stops |
|-----------------|---|
| Syntax | SLEEP |
| Operands | - |
| Operation | - |
| Status Affected | TO, PD |
| OP-Code | 00 0000 0000 0011 |
| Description | Go into STOP mode with the oscillator stops. |
| Cycle | 1 |
| Example | SLEEP - |

| SUBWF | Subtract W from "f" | |
|-----------------|--|--|
| Syntax | SUBWF f [,d] | |
| Operands | f : 00h ~ 7Fh, d : 0, 1 | |
| Operation | $(destination) \leftarrow (f) - (W)$ | |
| Status Affected | C, DC, Z | |
| OP-Code | 00 0010 dfff ffff | |
| Description | Subtract (2's complement method) W register from register 'f'. If 'd' is 0, the result | |
| | is stored in the W register. I | f 'd' is 1, the result is stored back in register 'f'. |
| Cycle | 1 | |
| Example | SUBWF REG1, 1 | B : REG1 = $0x03$, W = $0x02$, C = ?, Z = ? |
| | | A : REG1 = $0x01$, W = $0x02$, C = 1, Z = 0 |
| | SUDWE DEC1 1 | $\mathbf{D} \cdot \mathbf{D} = \mathbf{C} + $ |
| | SUBWF REG1, 1 | B : REG1 = $0x02$, W = $0x02$, C = $?$, Z = $?$ |
| | | A : REG1 = $0x00$, W = $0x02$, C = 1, Z = 1 |
| | SUBWF REG1, 1 | B : REG1 = $0x01$, W = $0x02$, C = ?, Z = ? |
| | | A : REG1 = 0xFF, W = 0x02, C = 0, Z = 0 |

| SWAPF | Swap Nibbles in ''f' | • |
|-----------------|--|---|
| Syntax | SWAPF f [,d] | |
| Operands | f : 00h ~ 7Fh, d : 0, 1 | |
| Operation | (destination, $7 \sim 4$) \leftarrow (f. $3 \sim$ | -0), (destination.3~0) \leftarrow (f.7~4) |
| Status Affected | - | |
| OP-Code | 00 1110 dfff ffff | |
| Description | | bles of register 'f' are exchanged. If 'd' is 0, the result is ' is 1, the result is placed in register 'f'. |
| Cycle | 1 | |
| Example | SWAPF REG, 0 | B : REG1 = 0xA5 A : REG1 = 0xA5, W = 0x5A |

| TESTZ | Test if "f" is zero | |
|-----------------|-----------------------------------|-----------------------------|
| Syntax | TESTZ f | |
| Operands | f : 00h ~ 7Fh | |
| Operation | Set Z flag if (f) is 0 | |
| Status Affected | Z | |
| OP-Code | 00 1000 1fff ffff | |
| Description | If the content of register 'f' is | s 0, Zero flag is set to 1. |
| Cycle | 1 | |
| Example | TESTZ REG1 | B : REG1 = 0, Z = ? |
| | | A : $REG1 = 0, Z = 1$ |
| | | |

| XORLW | Exclusive OR Litera | l with W |
|-----------------|--|--|
| Syntax | XORLW k | |
| Operands | k : 00h ~ FFh | |
| Operation | $(W) \leftarrow (W) XOR k$ | |
| Status Affected | Z | |
| OP-Code | 01 1111 kkkk kkkk | |
| Description | The contents of the W register is placed in the W register | gister are XOR'ed with the eight-bit literal 'k'. The result |
| Cycle | 1 | |
| Example | XORLW 0xAF | $\mathbf{B}: \mathbf{W} = 0\mathbf{x}\mathbf{B}5$ |
| - | | A: W = 0x1A |

| XORWF | Exclusive OR W wit | h ''f'' |
|-----------------|------------------------------------|--|
| Syntax | XORWF f [,d] | |
| Operands | f : 00h ~ 7Fh, d : 0, 1 | |
| Operation | (destination) \leftarrow (W) XOR | L (f) |
| Status Affected | Z | |
| OP-Code | 00 0110 dfff ffff | |
| Description | | s of the W register with register 'f'. If 'd' is 0, the result is f 'd' is 1, the result is stored back in register 'f'. |
| Cycle | 1 | |
| Example | XORWF REG, 1 | B : REG = $0xAF$, W = $0xB5$ A : REG = $0x1A$, W = $0xB5$ |

ELECTRICAL CHARACTERISTICS

1. Absolute Maximum Ratings $(T_A = 25 \degree C)$

| Parameter | Rating | Unit |
|---------------------------------|----------------------------------|------|
| Supply voltage | V_{SS} - 0.3 to V_{SS} + 6.5 | |
| Input voltage | V_{SS} - 0.3 to $V_{DD}+0.3$ | V |
| Output voltage | V_{SS} - 0.3 to V_{DD} + 0.3 | |
| Output current high per 1 PIN | - 25 | |
| Output current high per all PIN | - 80 | |
| Output current low per 1 PIN | + 30 | — mA |
| Output current low per all PIN | + 150 | |
| Maximum operating voltage | 5.5 | V |
| Operating temperature | - 40 to + 85 | °C |
| Storage temperature | - 65 to + 150 | °C |

| Parameter | Sym | | Min | Тур | Max | Unit | |
