

## CMOS 8-BIT MICROCONTROLLER

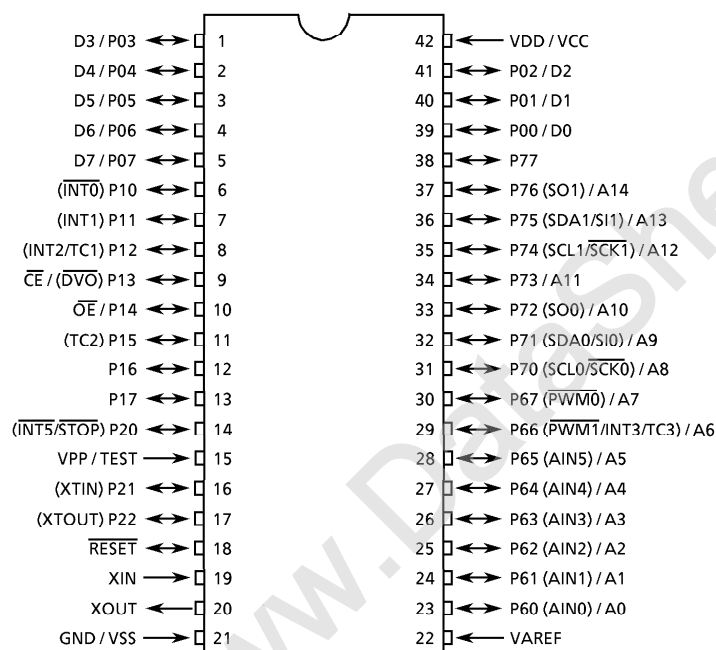

## TMP87PM43N

The 87PM43 is a One-Time PROM microcontroller with low-power 256K bits (a 32K bytes program memory) electrically programmable read only memory for the 87CK43/M43 system evaluation. The 87PM43 is pin compatible with the 87CK43/M43. The operations possible with the 87CK43/M43 can be performed by writing programs to PROM. The 87PM43 can write and verify in the same way as the TC57256AD using an adaptor socket BM1163 and an EPROM programmer.

Purchase of TOSHIBA I<sup>2</sup>C components conveys a license under the Philips I<sup>2</sup>C Patent Rights to use these components in an I<sup>2</sup>C system, provided that the system conforms to the I<sup>2</sup>C Standard Specification as defined by Philips.

## PIN FUNCTION

The 87PM43 has two modes: MCU and PROM.

## (1) MCU mode

In this mode, the 87PM43 is pin compatible with the 87CK43/M43 (fix the TEST pin at low level).

## (2) PROM mode

PIN NAME (PROM mode)	INPUT/OUTPUT	FUNCTIONS	PIN NAME (MCU mode)
A14 to A8	Input	PROM address inputs	P76 to P70
A7 to A0			P67 to P60
D7 to D0	I/O	PROM data input/outputs	P07 to P00
$\overline{CE}$	Input	Chip enable signal input (active low)	P13
$\overline{OE}$		Output enable signal input (active low)	P14
VPP	Power supply	+ 12.5 V / 5 V (Program supply voltage)	TEST
VCC		+ 5 V	VDD
GND		0 V	VSS
P11	I/O	PROM mode setting pin. Be fixed at high level.	
P21			
P77			
P12, P10		PROM mode setting pin. Be fixed at low level.	
P17 to P15			
P22, P20			
$\overline{RESET}$			
XIN	Input	Connect an 8 MHz oscillator to stabilize the internal state.	
XOUT	Output		
VAREF	Power supply	0 V (GND)	

## OPERATIONAL DESCRIPTION

The following explains the 87PM43 hardware configuration and operation. The configuration and functions of the 87PM43 are the same as those of the 87CK43/M43, except in that a one-time PROM is used instead of an on-chip mask ROM.

The 87PM43 is placed in the *single-clock* mode during reset. To use the dual-clock mode, the low-frequency oscillator should be turned on by executing [SET (SYSCR2). XTEN] instruction at the beginning of the program.

### 1. OPERATING MODE

The 87PM43 has two modes: MCU and PROM.

#### 1.1 MCU Mode

The MCU mode is activated by fixing the TEST / VPP pin at low level.

In the MCU mode, operation is the same as with the 87CK43/M43 (the TEST / VPP pin cannot be used open because it has no built-in pull-down resistance).

##### 1.1.1 Program Memory

The 87PM43 has a 32K bytes (addresses 8000<sub>H</sub> to FFFF<sub>H</sub> in the MCU mode, addresses 0000<sub>H</sub> to 7FFF<sub>H</sub> in the PROM mode) of program memory (OTP).

When the 87PM43 is used as a system evaluation of the 87CK43/M43, the data is written to the program storage area shown in Figure 1-1.

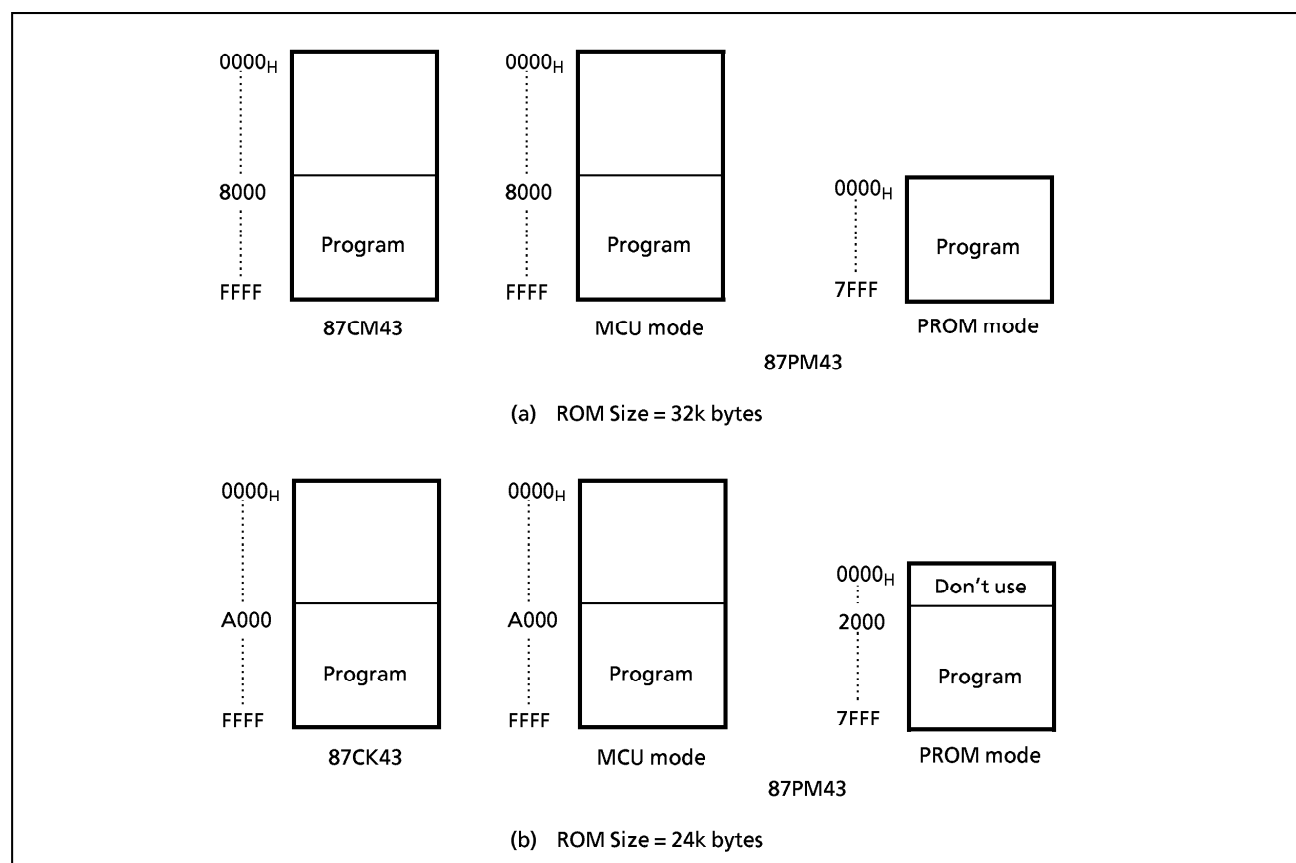

Figure 1-1. Program Memory Area

**Note :** Either write the data FF<sub>H</sub> to the unused area or set the PROM programmer to access only the program storage area.

### 1.1.2 Data Memory

The 87PM43 has an on-chip 1K bytes data memory (static RAM).

### 1.1.3 Input/Output Circuitry

#### (1) Control pins

The control pins of the 87PM43 are the same as those of the 87CK43/M43 except that the TEST pin has no built-in pull-down resistance.

Figure 1-2. TEST Pin

#### (2) I/O ports

The I/O circuitries of 87PM43 I/O ports are the same as the code A type I/O circuits of the 87CK43/M43.

## 1.2 PROM Mode

The PROM mode is activated by setting the TEST,  $\overline{\text{RESET}}$  pin and the ports P17 to P10, P22 to P20, and P77 as shown in Figure 1-3. The PROM mode is used to write and verify programs with a general-purpose PROM programmer. The high-speed programming mode can be used for program operation.

The 87PM43 is not supported an electric signature mode, so the ROM type must be set to TC57256AD.  
Set the adaptor socket switch to "N".

*Note : Please set the high-speed programing mode according to each manual of PROM programmer.*

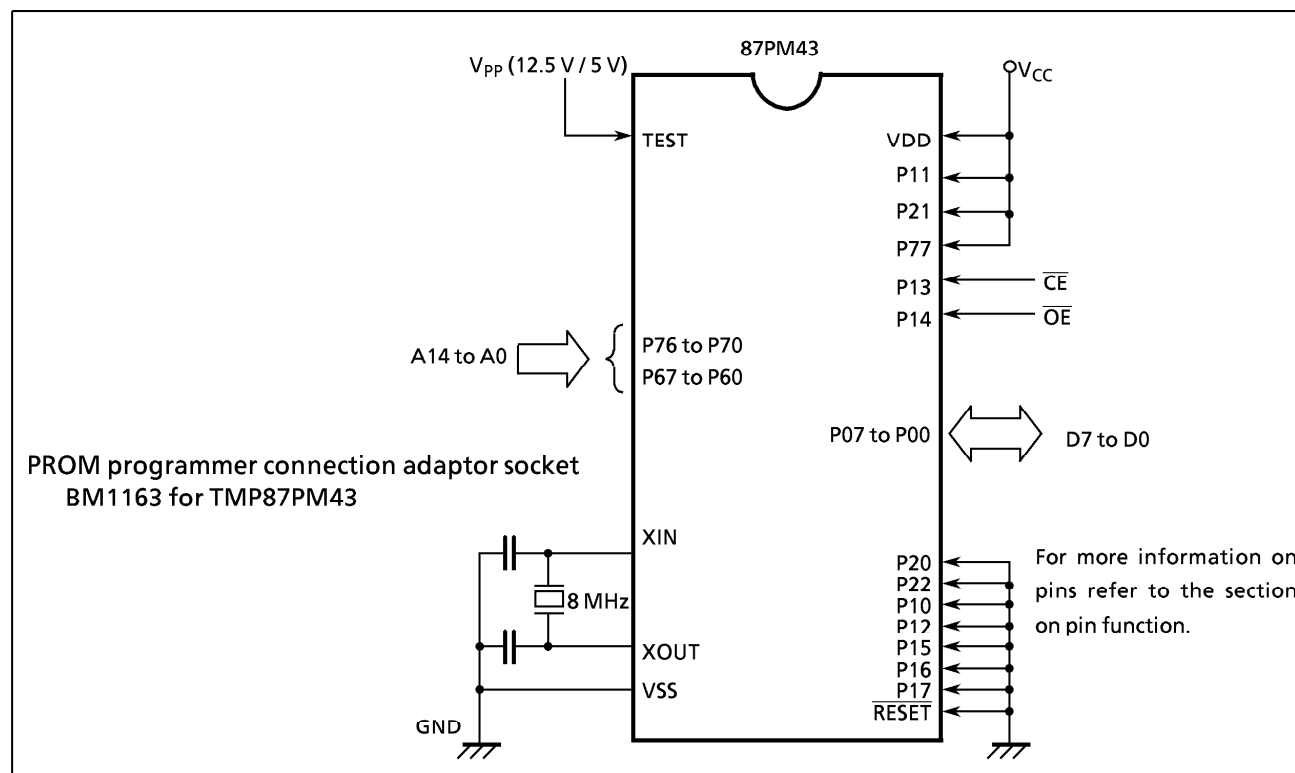

Figure 1-3. Setting for PROM Mode

### 1.2.1 Programming Flowchart (High-speed Programming Mode-I)

The high-speed programming mode is achieved by applying the program voltage (+ 12.5 V) to the VPP pin when  $V_{CC} = 6$  V. After the address and input data are stable, the data is programmed by applying a single 1ms program pulse to the  $\overline{CE}$  input. The programmed data is verified. If incorrect, another 1ms program pulse is applied and then the programmed data is verified. This process should be repeated (up to 25 times) until the program operates correctly. Programming for one address is ended by applying additional program pulse with width 3 times that needed for initial programming (number of programmed times  $\times$  1 ms). After that, change the address and input data, and program as before. When programming has been completed, the data in all addresses should be verified with  $V_{CC} = V_{pp} = 5$  V.

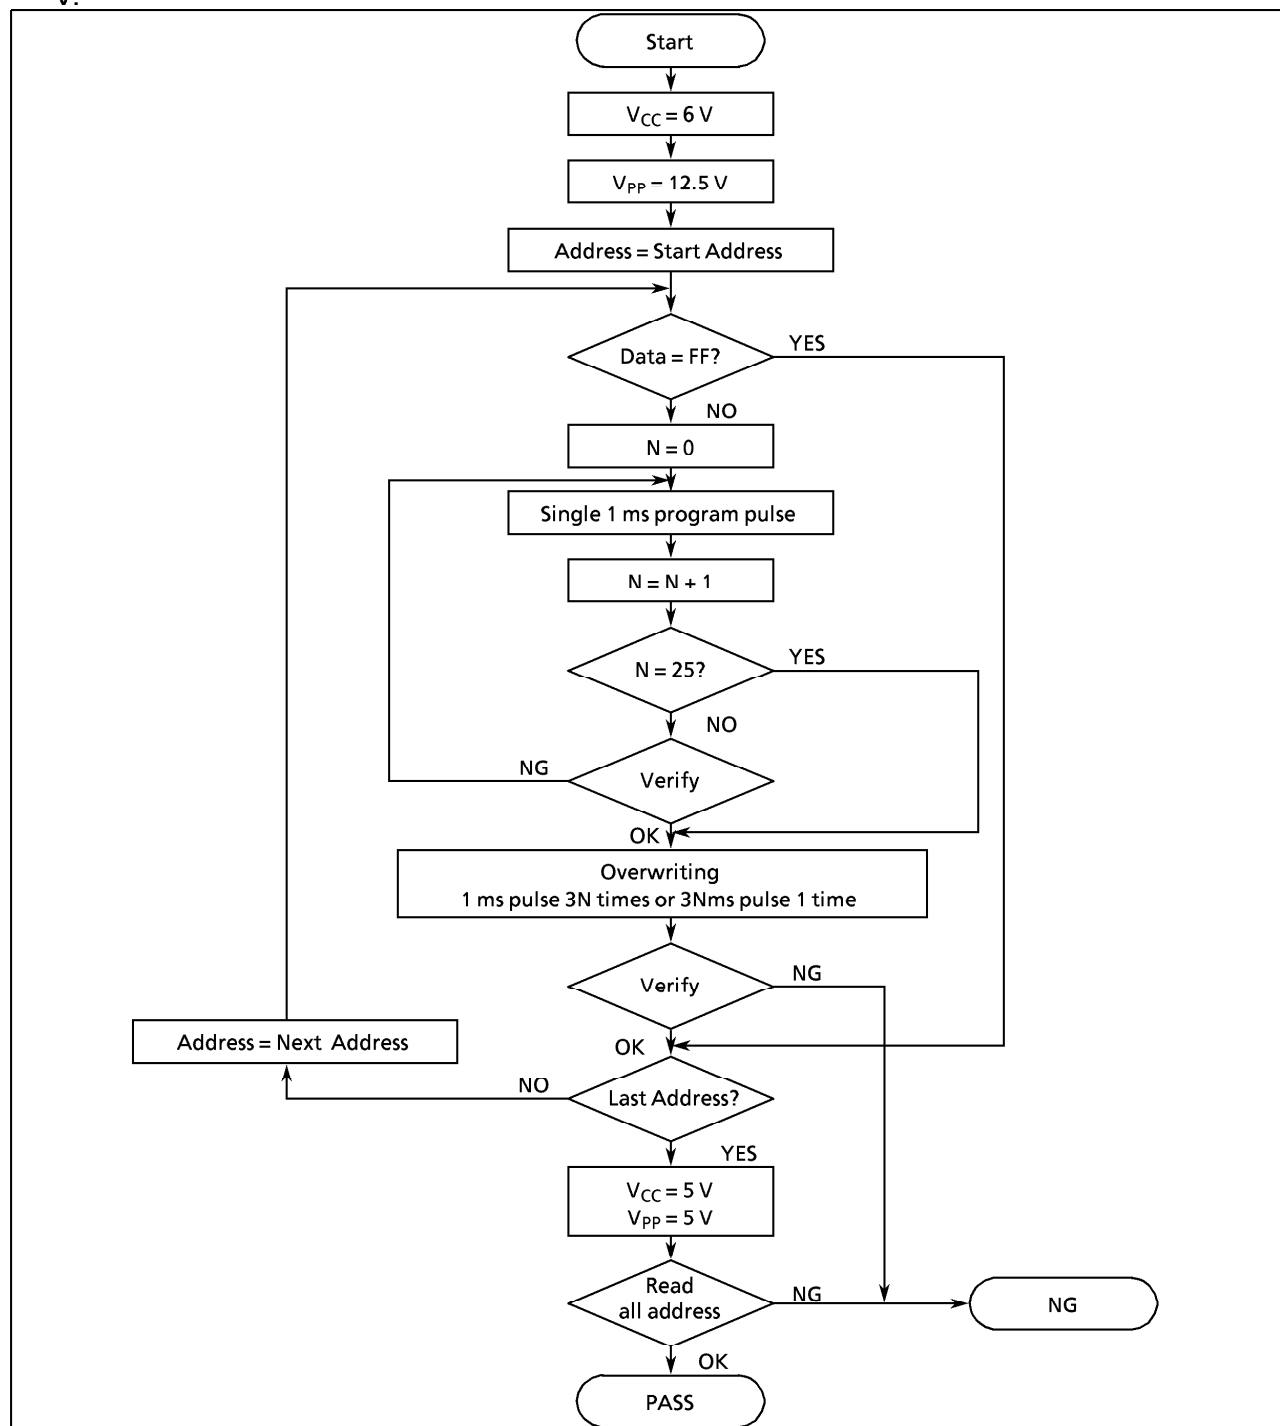

Figure 1-4. Flow chart of High-Speed Programming Mode - I

### 1.2.2 Programming Flowchart (High-speed Programming Mode-II)

The high-speed programming mode is achieved by applying the program voltage (+ 12.75 V) to the V<sub>pp</sub> pin when V<sub>cc</sub> = 6.25 V. After the address and input data are stable, the data is programmed by applying a single 0.1ms program pulse to the  $\overline{CE}$  input. The programmed data is verified. If incorrect, another 0.1ms program pulse is applied and then the programmed data is verified. This process should be repeated (up to 25 times) until the program operates correctly. After that, change the address and input data, and program as before. When programming has been completed, the data in all addresses should be verified with V<sub>cc</sub> = V<sub>pp</sub> = 5 V.

### 1.2.3 Writing Method for General-purpose PROM Program

(1) Adapters

BM1163 : TMP87PM43N

(2) Adapter setting

Switch (SW1) is set to side N.

Switch (SW2) is set to side PM70.

(3) PROM programmer specifying

i) PROM type is specified to TC57256AD.

Writing voltage: 12.5 V (high-speed program I mode)

12.75 V (high-speed program II mode)

ii) Data transfer (copy) (note 1)

In TMP87PM43, EPROM is within the addresses 0000 to 7FFFH. Data is required to be transferred (copied) to the addresses where it is possible to write. The program area in MCU mode and PROM mode is referred to "Program memory area" in Figure 1-1.

Ex. In the block transfer (copy) mode, executed as below.

ROM capacity of 24KB : transferred addresses A000 to FFFFH to addresses 2000 to 7FFFH

iii) Writing address is specified. (note 1)

Start address : 2000H

End address : 7FFFH

(4) Writing

Writing/Verifying is required to be executed in accordance with PROM programmer operating procedure.

*Note 1 : The specifying method is referred to the PROM programmer description. The data in unused area (TMP87CK43) must be specified to FF<sub>H</sub>.*

*Note 2 : When MCU is set to an adapter or the adapter is set to PROM programmer, a position of pin 1 must be adjusted. If the setting is reversed, MCU, the adapter and PROM program is damaged.*

*Note 3 : TMP87PM43 does not support the electric signature mode (hereinafter referred to as "signature"). If the signature is used in PROM program, a device is damaged due to applying 12 V  $\pm$  0.5 V to the address pin 9 (A9). The signature must not be used.*
