## Error correction for technical datasheet of Universal Asynchronous Receiver-Transmitter

Thank you for using Toshiba microcontrollers.

We have found the mistakes about occurring transmission interrupt timing of the Universal Asynchronous Receiver-Transmitter (UART and FUART) and the Universal Asynchronous Receiver-Transmitter Circuit with 50% duty mode (UART) in our technical datasheet and reference manual. We will inform you about the mistakes in this document.

We apologize for any inconvenience, but we ask that you review the content.

If you have any questions, please contact our sales representative.

## 2. Details

The timing of occurring transmission interrupt is shown as below.

There is the mistake in the timing of occurring transmission interrupt when the transmission FIFO is not used only, and it will be corrected as below. There is no mistake in the transmission interrupt timing when using the transmission FIFO.

### 2.1. When the transmission FIFO is unused

Transmission interrupt occurs when a transmission data moves from the transmission buffer (the 1st level of transmission FIFO) to transmission shift register. (When the transmission buffer becomes empty.)

#### 2.1.1. The timing of occurring transmission interrupt

The transmission interrupt when the transmission FIFO is not used occurs when the transmission buffer becomes empty because it notifies the timing of writing to the transmission buffer for the next data. The transmission interrupt is automatically cleared when the next data is written to the transmission buffer. Therefore, it is not necessary to clear the transmission interrupt by software when continuously transmitting data (set UARTxICR<TXIC> to "1").

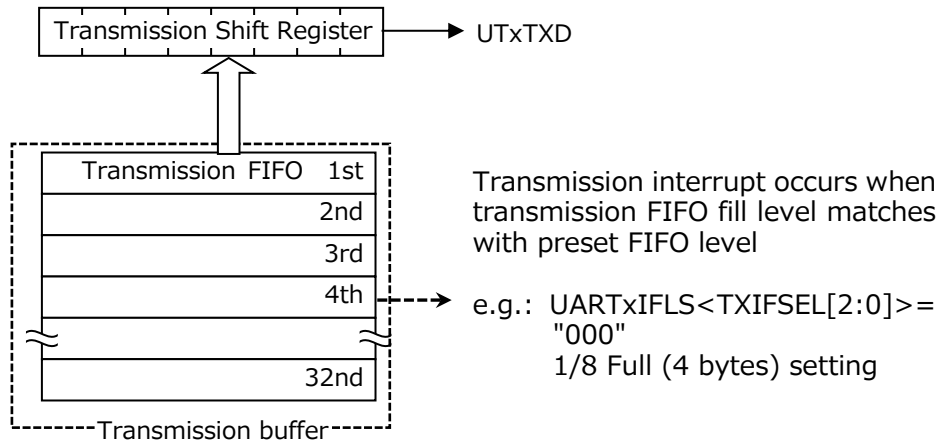

When the transmission is terminated, the final transmission data is transferred to the shift register, and the final transmission interrupt occurs when the transmission buffer becomes empty. If the next data is not written to the transmission buffer, the transmission interrupt can be intentionally cleared by executing clear by software in the interrupt handler (set UARTxICR<TXIC> to "1").

If you execute the transmission interrupt clear by software during data transmission (set UARTxICR<TXIC> to "1"), the transmission interrupt does not occur if you write the data to the transmission buffer at the same time as the STOP bit is generated. In order to generate the transmission interrupt reliably, do not clear the transmission interrupt by software, write data to the transmission buffer during data transmission, or write the data to the transmission buffer while transmission is stopped (when UARTxFR<BUSY>= "0").

When transmitting data continuously, it is recommended to transfer the data by using the transmission FIFO in the next section.

## 2.2. When transmission FIFO is used

Transmission interrupt occurs when transmission FIFO level matches with preset FIFO level which is specified by  $\text{UARTxIFLS} < \text{TXIFSEL}[2:0] >$ .

### 2.2.1. The timing of occurring transmission interrupt

When using the transmission FIFO, the transmission interrupt occurs when transmission FIFO level matches with preset FIFO level.

For example, in case of  $\text{UARTxIFLS} < \text{TXIFSEL}[2:0] > = \text{'000'}$  (1/8 full 4 bytes setting), the transmission interrupt occurs when the transmission FIFO level matches with 4th level.

The transmission interrupt is cleared when data whose FIFO level is above the specified FIFO level is stored in the transmission FIFO and occurs again when the specified FIFO level is reached.

## 3. Description

The description about occurring transmission interrupt is different from each product. The chapter number of placement for each product are shown as below.

There is the mistake in the timing of occurring transmission interrupt when the transmission FIFO is not used only, and it will be corrected as below. There is no mistake in the transmission interrupt timing when using the transmission FIFO.

The details of revised description for the mistake will be explained in "4. Revised description" below, and the revised description is all target products in common.

### Type B(2)

#### Original description (Red box)

Interrupt source	Interrupt generation timing
Overrun error generation	After a stop bit is received when FIFO is full.
Break error interrupt	After a stop bit is received.
Parity error generation	After a parity data is received.
Framing error generation	After bit data that generates frame over is received.
Reception timeout interrupt	After data is received in receive FIFO, then 511 clocks of Baud16 has elapsed.
Transmission interrupt	When the FIFO is unused: After the transmission is enabled, when a START bit and STOP bit in the first byte of the transmission data are sent, a transmit interrupt occurs. In the second byte and the following byte, a transmit interrupt occurs only when a STOP bit is sent. (In this case, each interrupt is cleared after the transmit data is written.)
	When the FIFO is used: When a STOP bit is sent (after the MSB data is transmitted), if the amount of data in the FIFO is the same level as the specified level of FIFO, a transmit interrupt occurs.
Reception interrupt	When the FIFO is unused: A receive interrupt occurs when the FUART receives a STOP bit.
	When the FIFO is used: A receive interrupt occurs when the FUART receives a STOP bit included in the data that fills the FIFO to the specified level.

Parity error generation	After a parity data is received.
Framing error generation	After Bit data that generates frame over is received.
Reception timeout interrupt	After data is received in receive FIFO, then 511 clocks of the transfer clock have elapsed.
Transmission interrupt	<div>1 byte hold register (FIFO is unused): After transmission has been enabled. For the first Byte, when START bit starts to transmit and when STOP bit starts to transmit. For the second Byte or later, when STOP bit starts to transmit (after each interrupt has been generated and the interrupt is cleared by each data write).</div> <div>FIFO is enabled: When the data count in FIFO becomes a set level at the start of STOP bit transmission (after MSB data is transmitted).</div>
Reception interrupt	<div>1 byte hold register (FIFO is unused): After STOP bit is received.</div> <div>FIFO is enabled: After STOP bit is received when the data count in FIFO becomes a set level.</div>

## 3.5. Description Type C

### 3.5.1. Applicable products and chapter of the description.

Product name	Chapter of the description
TMPM46BF10FG	19.4.6.2

#### Type C

Original description (Red box)

Interrupt source	Interrupt generation timing
Overrun error generation	After a stop bit is received when FIFO is full.
Break error interrupt	After a stop bit is received.
Parity error generation	After a parity data is received.
Framing error generation	After bit data that generates frame over is received.
Reception timeout interrupt	After data is received in receive FIFO, then 511 clocks of Baud16 has elapsed.
Transmission interrupt	After MSB of last data is transmitted.
Reception interrupt	After a stop bit is received.

## 4. Revised description

The description of the transmission interrupt occurrence timing differs depending on the products, but the correct description is as follows in common.

### 4.1. The timing of occurring transmission interrupt

The transmission interrupt when the transmission FIFO is not used occurs when the transmission buffer becomes empty because it notifies the timing of writing to the transmission buffer for the next data. The transmission interrupt is automatically cleared when the next data is written to the transmission buffer. Therefore, it is not necessary to clear the transmission interrupt by software when continuously transmitting data (set UARTxICR<TXIC> to "1").

When the transmission is terminated, the final transmission data is transferred to the shift register, and the final transmission interrupt occurs when the transmission buffer becomes empty. If the next data is not written to the transmission buffer, the transmission interrupt can be intentionally cleared by executing clear by software in the interrupt handler (set UARTxICR<TXIC> to "1").

If you execute the transmission interrupt clear by software during data transmission (set UARTxICR <TXIC> to "1"), the transmission interrupt does not occur if you write the data to the transmission buffer at the same time as the STOP bit is generated. In order to generate the transmission interrupt reliably, do not clear the transmission interrupt by software, write data to the transmission buffer during data transmission, or write the data to the transmission buffer while UART transmission is stopped (when UARTxFR<BUSY> = "0").

Make sure to read read this chapter before using the product.

## 1 Serial bus interface

There are restrictions on the use of I2C bus mode when the multi-master function is used.

### 1.1 Description

When the multi-master function is used in I2C bus mode, if these masters start the communications simultaneously, the following phenomena may occur:

1. Communications may be locked up.
2. SCL pulse widths shorten; therefore these pulses may not satisfy I2C Specifications.

### 1.2 Condition

These phenomena occur only when the multi-master function is used in I2C bus mode. If a single master is used, these phenomena do not occur.

### 1.3 Workaround

There is no workaround for these phenomena. Perform recovery process by software.

### 1.4 How to Recover from These Phenomena

Perform recovery process by software.

By using a timer, add timeout process to check whether communication is in a lock-up state.

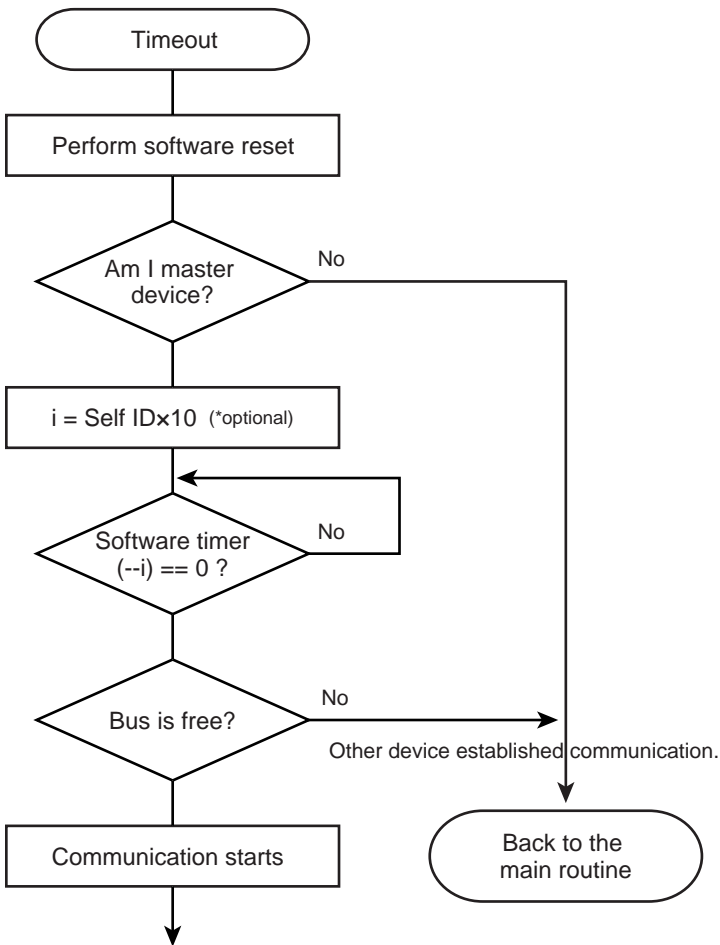

#### An example of recovery process:

1. Start a timer count synchronously with start of the transmission.
2. If a serial interface interrupt (INTSBIx) does not occur in a certain period, the MCU determines the timeout.
3. If the MCU determines the timeout, communications may be locked up. Perform software reset on the serial bus interface circuit. This circuit is initialized to release communication from the lock up state.
4. Resend transmission data.

Mostly, Process 1 to 4 are enough to recovery; however if the multiple products are connected to the same bus line, add a delay time between each product's recovery process before Process 4 (resending data) is performed. This delay makes a time difference between each master; therefore bus collision can be avoided when the data is sent again.

---

Example: Recovery process after a timeout is detected.

## 2 Transitions to Low-power Consumption Mode and Generating a Non-maskable Interrupt

This chapter describes the precautions at which non-maskable interrupt (NMI) occurs when the MCU enters low-power consumption mode.

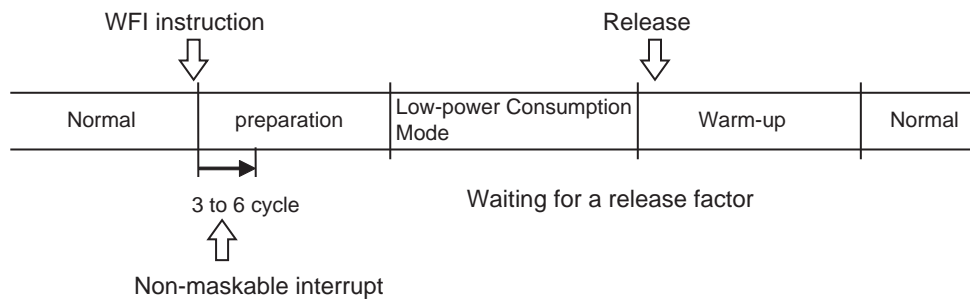

- STOP1
- STOP2

### 2.1 Description

When the WFI instruction is executed to enter the above-mentioned low-power consumption mode, if a non-maskable interrupt (NMI) occurs, the MCU may enter low-power consumption mode without the process for releasing low-power consumption mode.

Note 1: An NMI notice and flag setting to the CPU are normal; therefore the NMI process after low-power consumption mode is released can be performed.

Note 2: When the MCU has entered low-power consumption mode, factors other than an NMI are accepted; however an NMI may not be accepted.

### 2.2 Conditions

- The WFI instruction is executed to enter low-power consumption mode.
- A non-maskable interrupt occurs after WFI instruction execution and within 3 to 6 cycles.

### 2.3 Workaround

Do not use a non-maskable interrupt as a release factor for the above-mentioned low-power consumption modes.

To avoid generating a non-maskable interrupt, the following settings should be specified before the MCU enters the above-mentioned low-power consumption mode.

- NMI pin: This input pin must be fixed to "High".
- Watchdog timer: Stop the watchdog timer or set the reset function.
- Voltage detection circuit: Stop the voltage detection circuit or set the reset function.

### 3 Restrictions on the Use of the DMA function

There are restrictions on the use of the DMA function.

#### 3.1 Description

When the synchronous serial interface (SSP) or the asynchronous serial communication circuit (UART) is used to transmit data or receive data, the following problems may occur:

- At transmission : A part of communication data may be lost (the FIFO buffer may overflow).
- At reception : Unnecessary data may be transferred (the FIFO buffer may underflow).

#### 3.2 Conditions

The table below lists the peripheral functions that are connectable at DMA transfer. When the SSP <ch4 to 9> or UART <ch10 to 13> are used, if single-transfer is enabled (the connection channel of DMAxChnlUse-burstSet is set to "0"), the problem may occur.

o: Connectable peripheral circuit    -: Not supported

## 3.3 Explanation

### • At transmission

Under the following circumstance, one additional DMA request may occur compared with the number of unused data space of the FIFO of the SSP or UART. Therefore, DMA transfer is executed even if the FIFO is full and the FIFO overflow occurs.

- The number of data of the FIFO becomes lower than the watermark level while the DMA is transferring data to the FIFO.

### • At reception

Under the following circumstance, one additional DMA request may occur compared with the number of stored data. Therefore, invalid data is transferred from the FIFO of the SSP or UART and the FIFO underflow occurs.

- The number of data of the FIFO becomes higher than the watermark level while the DMA is transferring data from the FIFO of the SSP or UART.

Note: Watermark level:

SSP Fixed to 4

UART Full level of UARTxIFLS<RXIFSEL[2:0]> or <TXIFSEL[2:0]>

### Example of relationship between the condition of the FIFO and the watermark level (SSP transmission)

### 3.4 Workaround

When the DMA function is used, set "1" to the corresponding channel of DMAxChnlUseburstSet (single-transfer is prohibited).

However, there are several conditions and restrictions.

Note: These conditions and restrictions vary depending on transmission or reception.

#### 3.4.1 Transmission

When single-transfer is prohibited, arbitration setting is subject to a constraint. According to the number of transfers, select the appropriate method below:

- a. When the number of transfers is a multiple of the watermark level of the FIFO.

Set the arbitration rates to the watermark level of the FIFO. After the number of specified transfers is complete, arbitration for the priorities between the peripheral functions that are connected to the DMA controller unit is issued. Therefore, the DMA transfer can be performed at high-speed.

Set the number of arbitration rates <R\_power> for the control data to the watermark level of the FIFO.

- b. When the number of transfers is not a multiple of the watermark level of the FIFO.

Set the arbitration rates to "after one transfer". This setting can be used in every case. After each transfer is complete, arbitration for the priorities between the peripheral functions that are connected to the DMA controller unit is issued. Therefore, the DMA transfer is performed at slower speed than the case of (a).

Specify "0000" as the arbitration rate setting <R\_power> for the control data.

#### 3.4.2 Reception

Disable or Enable single-transfer according to the number of transfers of control data <n\_minus\_1>.

- a. When the number of transfers is a multiple of the watermark level.

This setting can be used when the number of transfers is a multiple of the watermark level. For example, the watermark level is n, "n &tilde;integer number " can be set as the number of transfers.

Set "1" (disable the single-transfer) to the corresponding channel of DMAxChnlUseburstSet.

Set the number of arbitration rates <R\_power> for the control data to the watermark level of the FIFO.

- b. When the number of transfers is less than the watermark level.

This setting can be used when the number of transfers is less than the watermark level.

Set "0" (enable the single-transfer) to the corresponding channel of DMAxChnlUseburstSet.

Specify "0000" as the arbitration rate <R\_power> for the control data.

---

c. When the number of transfers is other than the above.

This setting can be used when the number of transfers is set to over the watermark level and the setting is not a multiple of the watermark level.

Use "Peripheral scatter-gather" as the transfer mode and combine the two tasks at DMA transfer.

For example, in the case of the number of transfers =  $(n \times \text{watermark}) + m$

Set Task A to the same as (a).

Disable single-transfer. Set the number of arbitration rates  $\langle R\_power \rangle$  for the control data to the watermark level of the FIFO. Set "watermark level  $\times n$ " as the number of transfers.

Set Task B to the same as (b).

Enable single-transfer. Set "0000" to  $\langle R\_power \rangle$ . Set "m" as the number of transfers.

#### Example of setting

The peripheral circuit that performs DMA transfer.		SSO(reception)	
The number of DMA transfers to be set		15 times	
Watermark level		4 (Fixed to 4 for SSP communication)	
The DMA register setting		DMAxChnlUseburstSet<ch4>=1 : Disable single-transfer	
Channel control data setting (Alternative data)	Task A Use the same setting as (a).	<n_minus_1>=0x00B	The number of transfers $4 \times 3 = 12$ times
		<R_power>=0011	Arbitration is issued after four transfers are complete.
		<next_useburst>=0	Enables Task B to perform single-transfer
		<cycle_ctrl>=111	Peripheral scatter-gather mode
	Task B Use the same setting as (b).	<n_minus_1>=0x002	The number of transfers $15 - 12 = 3$ times
		<R_power>=0000	Arbitration is issued after one transfer is complete.
		<cycle_ctrl>=001	The transfer ends in basic mode.

## Introduction: Notes on the description of SFR (Special Function Register) under this specification

An SFR (Special Function Register) is a control register for peripheral circuits (IP).

The SFR addresses of IPs are described in the chapter on memory map, and the details of SFR are given in the chapter of each IP.

Definition of SFR used in this specification is in accordance with the following rules.

- a. SFR table of each IP as an example
  - SFR tables in each chapter of IP provides register names, addresses and brief descriptions.
  - All registers have a 32-bit unique address and the addresses of the registers are defined as follows, with some exceptions: "Base address + (Unique) address"

Base Address = 0x0000\_0000

Register name		Address(Base+)
Control register	SAMCR	0x0004
		0x000C

Note: **SAMCR register address is 32 bits wide from the address 0x0000\_0004 (Base Address(0x00000000) + unique address (0x0004)).**

Note: **The register shown above is an example for explanation purpose and not for demonstration purpose. This register does not exist in this microcontroller.**

- b. SFR(register)
  - Each register basically consists of a 32-bit register (some exceptions).
  - The description of each register provides bits, bit symbols, types, initial values after reset and functions.

### 1.2.2 SAMCR(Control register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	MODE	
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	MODE		TDATA					
After reset	0	0	0	1	0	0	0	0

Bit	Bit Symbol	Type	Function
31-10	-	R	"0" can be read.
9-7	MODE[2:0]	R/W	Operation mode settings 000 : Sample mode 0 001 : Sample mode 1 010 : Sample mode 2 011 : Sample mode 3 The settings other than those above: Reserved
6-0	TDATA[6:0]	W	Transmitted data

Note: The Type is divided into three as shown below.

R / W	READ WRITE
R	READ
W	WRITE

#### c. Data descriptopn

Meanings of symbols used in the SFR description are as shown below.

- x:channel numbers/ports
- n,m:bit numbers

#### d. Register descriptoption

Registers are described as shown below.

- Register name <Bit Symbol>  
Exmaple: SAMCR<MODE>="000" or SAMCR<MODE[2:0]>="000"  
<MODE[2:0]> indicates bit 2 to bit 0 in bit symbol mode (3bit width).
- Register name [Bit]  
Example: SAMCR[9:7]="000"  
It indicates bit 9 to bit 7 of the register SAMCR (32 bit width).

# CMOS 32-Bit Microcontroller

## TMPM368FDXBG

The TMPM368FDXBG is a 32-bit RISC microprocessor with an ARM Cortex™-M3 microprocessor core.

Product Name	ROM (FLASH)	RAM	Package
TMPM368FDXBG	512 Kbyte	128 Kbyte	TFBGA109

The outlines and features are as follows:

### 1.1 Features

1. ARM Cortex-M3 microprocessor core
  - a. Improved code efficiency has been realized through the use of Thumb®-2 instruction.
    - New 16-bit Thumb instructions for improved program flow
    - New 32-bit Thumb instructions for improved performance
    - New Thumb mixed 16-/32-bit instruction set can produce faster, more efficient code.
  - b. Both high performance and low power consumption have been achieved.
    - High performance
    - A 32-bit multiplication ( $32 \times 32 = 32$  bit) can be executed with one clock.
    - Division takes between 2 and 12 cycles depending on dividend and divisor
    - Low power consumption
    - Optimized design using a low power consumption library
    - Standby function that stops the operation of the micro controller core
  - c. High-speed interrupt response suitable for real-time control
    - An interruptible long instruction.
    - Stack push automatically handled by hardware.
2. High-speed programming & low power consumption using Toshiba NANO FLASH™ technology
  - High-speed programming has an effect on mass production stage and developing device
  - Low power consumption design
3. On-chip program memory and data memory
  - On-chip FlashROM : 512K bytes
  - On-chip RAM : 128K bytes
4.  $\mu$ DMA controller ( $\mu$ DMAC) : 32 channels / 2 units  
Transfer object : On-chip memory, on-chip I/O and external memory
5. 16-bit timer (TMRB) : 8 channels
  - 16-bit interval timer mode

- 16-bit event counter mode
  - 16-bit PPG output (4-phase synchronous output supported)
  - Input capture function
6. Real-time clock (RTC) : 1 channel
- Clock (hour, minute and second)
  - Calender (Month, week, date and leap year)
  - Operable regardless of operational modes (NORMAL/IDLE/STOP1/STOP2)
7. Watch-dog timer (WDT) : 1 channel
- Watchdog timer (WDT) generates a reset or a non-maskable interrupt (NMI).
8. General-purpose serial interface (SIO/UART) : 4 channels
- Either UART mode or synchronous mode can be selected (4byte FIFO equipped)
9. Serial bus interface (I2C/SIO) : 3 channels
- Either I2C bus mode or synchronous mode can be selected.
10. Synchronous serial interface (SSP) : 3 channels
- Supports SPI/SSI/Microwire formats
- Channel 0/1 : 10MHz (Master), 3.3MHz (Slave) (@ fsys=80MHz)
- Channel 2 : 20MHz (Master), 6.6MHz (Slave) (@ fsys=80MHz)
11. UART : 2 channels
- Either 8-wired UART or IrDA 1.0 mode can be selected.
12. 12-bit AD converter (ADC) : 8 channels/ 2 units
- Start by an internal timer trigger
  - Fixed channel/scan mode
  - Single/repeat mode
  - AD monitoring 2ch
  - Conversion speed 1.0  $\mu$ s (@fsys = 80 MHz in normal mode)
  - High-speed conversion using interleave mode (conversion speed max. 0.5 $\mu$ s)
13. 10-bit DA converter (DAC) : 2 channels
- VREFH cutting function (Power down mode)
  - Output current : 1mA
  - Settling time : 1 $\mu$ s
  - Signal generation function
14. USB2.0 full-speed device : 1 channel
- Conforms to Universal Serial Bus Specification Rev2.0
  - End point : 8 channels
  - Control/Bulk/Interrupt/Isochronous mode
  - Full-speed 12Mbps (Low speed is not available.)

15. USB2.0 full-speed host : 1 channel
  - Conforms to Universal Serial Bus Specification Rev2.0
  - Conforms to OpenHCI for Release 1.0a
  - Control/Bulk/Interrupt/Isochronous mode
  - Full-speed 12Mbps (Low speed is not available.)
16. CAN2.0 : 1 channel
  - Supports Version 2.0B Active
  - 32 mailboxes
  - Maximum transfer rate : 1Mbps
17. Remote control signal preprocessor (RMC) : 1 channel
  - Can receive up to 72 bits data at a time
  - Noise canceller
  - Reader code detection
18. Multi-purpose timer (MPT) : 4 channels
  - Motor control (PMD : 1 channel)
  - IGBT control
  - 16-bit timer
19. Encoder input function (ENC) : 1 channel
  - Support incremental type encoder
20. LVD/POR function : 1 unit
21. Oscillation Frequency Detection (OFD) : 1 unit
22. External bus interface (EBIF) : 1 unit
  - Supports multiplex bus : 8-bit/16-bit width
  - Chip select/wait controller : 4 channels
23. Interrupt source
  - Internal: 99 factors. The order of precedence can be set over 7 levels (except the watchdog timer interrupt).
  - External: 14 factors. The order of precedence can be set over 7 levels.
24. Non maskable interrupt (NMI)
  - NMI is generated by Watchdog timer, LVD and  $\overline{\text{NMI}}$  pin.
25. Input/ output ports
  - Input/output 59 pins (One 5V tolerant input included), output: 1 pin
26. Low power consumption mode
  - IDLE, STOP1, STOP2
  - IDLE : CPU stops
  - STOP1/STOP2 : All circuits stop except RTC and remote control signal preprocessor

(In STOP2 mode, partial circuit is shut-down.)

27. Clock generator

- On-chip PLL (switchable multiplier among 3-, 4-, 5-, 6-, 8- and 10-fold)
- Clock gear function : The high-speed clock can be divided into 1/1, 1/2, 1/4, 1/8 or 1/16.

28. Endian

Little endian

29. Debug interface

JTAG/SWD/SWV/TRACE (DATA 4 bits)

30. JTAG interface

Support boundary scan

31. Maximum operating frequency

80MHz (External oscillator@8MHz/10MHz/16MHz or internal oscillator@10MHz)

32. Operating voltage range

2.7V to 3.6V (When USB is not used)

3.0V to 3.45V (When USB is used)

33. Temperature range

- -40 to 85 degrees (except during Flash writing/erasing)
- 0 to 70 degrees (during Flash writing/erasing)

34. Package

TFBGA109 (9mm x 9mm, 0.65mm pitch)

## 1.2 Block Diagram

## 1.4 Pin names and Functions

The following table shows the input/output pin names and functions of TMPM368FDXBG.

### 1.4.1 Sorted by Port name

Table 1-1 Pin Names and Functions (1/8)

Type	Pin No.	Pin Name	Input/ Output	Function
Function/ Debug	B5	PA0 TDO/SWV DTR5	Input/Output Output Output	Input port Debug pin Modem control (DTR)
Function/ Debug	A6	PA1 TMS/SWDIO DSR5	Input/Output Input./Output Input	Input/Output port Debug pin Modem status (DSR)
Function/ Debug	B6	PA2 TCK/SWCLK RIN5	Input/Output Input Input	Input/Output port Debug pin Modem status (RIN)
Function/ Debug	C7	PA3 TDI DCD5 INT3	Input/Output Input Input Input	Input/Output port Debug pin Modem status (DCD) External interrupt pin
Function/ Debug	B7	PA4 TRST RTS5	Input/Output Input Output	Input/Output port Debug pin Modem control( $\overline{\text{RTS}}$ )
Function/ Debug	A7	PA5 TRACECLK RXD5 IRIN5	Input/Output Output Input Input	Input/Output port Debug pin UART receive pin IrDA1.0 receive pin
Function/ Debug	A8	PA6 TRACEDATA0 TXD5 IROUT5	Input/Output Output Output Output	Input/Output port Debug pin UART transmit pin IrDA1.0 transmit pin
Function/ Debug	B8	PA7 TRACEDATA1 $\overline{\text{CTS5}}$ SCLK3 $\overline{\text{CTS3}}$ TB7OUT	Input/Output Output Input Input/Output Input Output	Input/Output port Debug pin Handshake pin SIO clock pin Handshake pin Timer B output pin
Function/ Debug	C8	PB0 TRACEDATA2 TXD3	Input/Output Output Output	Input/Output port Debug pin SIO transmit pin
Function/ Debug	C9	PB1 TRACEDATA3 RXD3	Input/Output Output Input	Input/Output port Debug pin SIO receive pin

Table 1-1 Pin Names and Functions (2/8)

Type	Pin No.	Pin Name	Input/ Output	Function
Function	K7	PB2 WR SP2CLK MTOUT03 MTTB3OUT	Input/Output Output Input/Output Output Output	Input/Output port Write strobe pin SSP clock pin Multi-purpose timer (IGBT mode) output pin Multi-purpose timer (timer mode) output pin
Function	K8	PB3 RD SP2DO MTOUT13 MTTB3IN	Input/Output Output Output Output Input	Input/Output port Read strobe pin SSP data output pin Multi-purpose timer (IGBT mode) output pin Multi-purpose timer (timer mode) input pin
Function	L8	PB4 CS0 SP2DI GEMG3 INT7	Input/Output Output Input Input Input	Input/Output port Chip select pin Output SSP data input pin Multi-purpose timer read strobe pin (IGBT mode) abnormal status detection input External interrupt pin
Function	L9	PB5 ALE SP2FSS MT3IN INT1	Input/Output Output Input/Output Input Input	Input/Output port Address latch enable pin SSP frame/slave selection pin Multi-purpose timer (IGBT mode) input pin External interrupt pin
Function/ Control	K9	PB6 BELL SCOUT TB3OUT BOOT	Output Output Output Output Input	Output port Byte enable pin Internal clock output pin Timer B output pin Boot mode pin (This port is used for single boot mode. Refer to "Flash" for more detail.)
Function	H1	PE0 A16 INT4 TB0IN	Input/Output Output Input Input	Input/Output port (This port is used for single boot mode. Refer to "Flash" for more detail.) Address bus External interrupt pin Inputting the timer B capture trigger
Function	H2	PE1 RXD0 A17 INT5 TB1IN	Input/Output Input Output Input Input	Input/Output port (This port is used for single boot mode. Refer to "Flash" for more detail.) SIO receive pin Address bus External interrupt pin Inputting the timer B capture trigger
Function	H3	PE2 TXD0 A18 TB1OUT	Input/Output Output Output Output	Input/Output port (This port is used for single boot mode. Refer to "Flash" for more detail.) SIO transmit pin Address bus Timer B output
Function	J3	PE3 SCLK0 A19 CTS0 TB0OUT	Input/Output Input/Output Output Input Output	Input/Output port (This port is used for single boot mode. Refer to "Flash" for more detail.) SIO clock pin Address bus Handshake pin Timer B output pin

Table 1-1 Pin Names and Functions (3/8)

Type	Pin No.	Pin Name	Input/ Output	Function
Function	J2	PE4 SCLK1 A20 CTS1 TB2OUT	Input/Output Input/Output Output Input Output	Input/Output port SIO clock pin Address bus Handshake pin Timer B output pin
Function	J1	PE5 TXD1 A21	Input/Output Output Output	Input/Output port (This port is used for single boot mode. Refer to "Flash" for more detail.) SIO transmit pin Address bus
Function	K1	PE6 RXD1 A22	Input/Output Input Output	Input/Output port SIO receive pin Address bus
Function	K2	PE7 A23 INT6 TB2IN	Input/Output Output Input Input	Input/Output port Address bus External interrupt pin Inputting the timer B capture trigger
Function	L1	PF0 AD0 CTS4	Input/Output Input/Output Input	Input/Output port Address data bus pin Handshake pin

Function	C1	PI0 AINA0 INT9	Input/Output Input Input	Input/Output port Analog input External interrupt pin
Function	D1	PI1 AINA1 INTA	Input/Output Input Input	Input/Output port Analog input External interrupt pin
Function	D2	PI2 AINA2 INTB	Input/Output Input Input	Input/Output port Analog input External interrupt pin
Function	D3	PI3 AINA3 INTC $\overline{DMAREQ}$	Input/Output Input Input Input	Input/Output port Analog input External interrupt pin DMA request pin
Function	A3	PI4 AINB0	Input/Output Input	Input/Output port Analog input
Function	B3	PI5 AINB1	Input/Output Input	Input/Output port Analog input
Function	A2	PI6 AINB2	Input/Output Input	Input/Output port Analog input
Function	A1	PI7 AINB3	Input/Output Input	Input/Output port Analog input
Function	A12	PK0 USBDPON (INTD)	Input/Output Input (Input)	Input/Output port (5V tolerant input) (note) USB power-on detection (USB device) (External interrupt pin)
Function	B11	PK1 $\overline{USBOC}$ SP0FSS INT8 TB6OUT	Input/Output Output Input/Output Input Output	Input/Output port USB over current SSP frame/slave selection pin External interrupt pin Timer B output pin

Table 1-1 Pin Names and Functions (6/8)

Type	Pin No.	Pin Name	Input/ Output	Function
Function	C10	PK2 USB_ECLK SP0DI SIO/SDA0	Input/Output Input Input Input/Output	Input/Output port USB clock input SSP data input pin SIO mode transmit pin, I2C mode transmit/receive pin
Function	D10	PK3 USBHPON SP0DO SIO/SCL0	Input/Output Output Output Input/Output	Input/Output port USB power-on output (host) SSP data output pin SIO mode receive pin, I2C mode clock pin
Function	E10	PK4 RXIN SP0CLK SCK0	Input/Output Input Input/Output Input/Output	Input/Output port Remote control input pin SSP clock pin SIO mode clock pin
Function	A11	PL0 INT2 MT1IN ADTRGA	Input/Output Input Input Input	Input/Output port External interrupt pin Multi-purpose timer (IGBT mode) input pin External activation pin for AD converter
Function	A10	PL1 GEMG1 DATRG RXD2	Input/Output Input Input Input	Input/Output port Multi-purpose timer (IGBT mode) abnormal status detection input External activation pin for DA converter SIO receive pin
Function	B10	PL2 MTOUT11 MTTB1IN TXD2	Input/Output Output Input Output	Input/Output port Multi-purpose timer (IGBT mode) output pin Multi-purpose timer (timer mode) input pin SIO transmit pin
Function	B9	PL3 MTOUT01 MTTB1OUT SCLK2 CTS2	Input/Output Output Output Input/Output Input	Input/Output port Multi-purpose timer (IGBT mode) output pin Multi-purpose timer (timer mode) output pin SIO clock pin Handshake pin
Function	C6	NMI	Input	Non-maskable interrupt
Function	E12	USB-HDM	Input/Output	USB data minus (Host) (Note) Pulled-down USB-HDM when USB host is not used.
Function	D12	USB-HDP	Input/Output	USB data plus (Host) (Note) Pulled-down USB-HDP when USB host is not used.
Function	H12	USB-DDM	Input/Output	USB data minus (Device) (Note) Pulled-down USB-DDM when USB device is not used.
Function	G12	USB-DDP	Input/Output	USB data plus (Device) (Note) Pulled-down USB-DDP when USB device is not used.
Function	F1	DA0	Output	DA converter analog output pin
Function	F2	DA1	Output	DA converter analog output pin
Clock	K12	X1	Input	Connect to a high-speed oscillator

Table 1-1 Pin Names and Functions (7/8)

Type	Pin No.	Pin Name	Input/ Output	Function
Clock	L12	X2	Output	Connect to a high-speed oscillator
Clock	M12	XT1	Input	Connect to a Low-speed oscillator
Clock	M11	XT2	Output	Connect to a Low-speed oscillator
Control	C4	MODE	Input	Mode pin (note) MODE must be connected to GND.
Function	C5	$\overline{\text{RESET}}$	Input	Reset input pin
Control	D4	BSC	-	JTAG Boundary scan control pin (Note) BSC must be connected to GND if boundary scan is not used.
TEST	F3	FTEST3	-	TEST pin (note) TEST pin must be left OPEN.
PS	E3	AVDD3_DA	-	Supplying the DA converter with a power supply. (note) AVDD3_DA must be connected to power supply even if DA converter is not used.
PS	G1	AVSS_DA	-	Supplying the DA converter GND pin (note) AVSS_DA must be connected to GND even if DA converter is not used.
PS	C2	AVDD3A	-	Supplying the AD converter with a power supply. (note) AVDD3A must be connected to power supply even if AD converter is not used.
PS	B4	AVDD3B	-	Supplying the AD converter with a power supply. (note) AVDD3B must be connected to power supply even if AD converter is not used.
PS	C3	AVSSA	-	AD converter GND pin (note) AVSSA must be connected to GND even if the AD converter is not used.
PS	A4	AVSSB	-	AD converter GND pin (note) AVSSB must be connected to GND even if the AD converter is not used.
PS	E2	VREFHA	-	Supplying the AD converter with a reference power supply. (note) VREFHB must be connected to power supply even if AD converter is not used.
PS	B2	VREFHB	-	Supplying the AD converter with a reference power supply. (note) VREFHB must be connected to power supply even if AD converter is not used.
PS	E1	VREFLA	-	Supplying the AD converter with a reference power supply. (note) VREFLA must be connected to power supply even if AD converter is not used.
PS	B1	VREFLB	-	Supplying the AD converter with a reference power supply. (note) VREFLB must be connected to power supply even if AD converter is not used.
PS	A9	DVDD3A	-	Power supply pin
PS	G3	DVDD3A	-	Power supply pin
PS	L11	DVDD3A	-	Power supply pin
PS	M4	DVDD3A	-	Power supply pin
PS	M9	DVDD3A	-	Power supply pin
PS	F12	DVDD3B	-	Power supply pin

Table 1-1 Pin Names and Functions (8/8)

Type	Pin No.	Pin Name	Input/ Output	Function
PS	A5	DVSSA	-	GND pin
PS	B12	DVSSA	-	GND pin
PS	G2	DVSSA	-	GND pin
PS	K11	DVSSA	-	GND pin
PS	M3	DVSSA	-	GND pin
PS	M8	DVSSA	-	GND pin
PS	M10	DVSSA	-	GND pin
PS	C12	DVSSB	-	GND pin
PS	C11	DVSSB	-	GND pin
PS	D11	DVSSB	-	GND pin
PS	F10	DVSSB	-	GND pin
PS	E11	DVSSB	-	GND pin
PS	F11	DVSSB	-	Power supply pin
PS	G11	DVSSB	-	Power supply pin
PS	H11	DVSSB	-	Power supply pin
PS	J11	DVSSB	-	Power supply pin
PS	J12	DVSSB	-	Power supply pin
PS	L10	RVDD3	-	Power supply pin

Note: Only when input is enabled, these pins tolerate 5V inputs. Note that these pins cannot be pulled up over the power supply voltage when using as open-drain output.

## 1.5 Power Supplies and Power Supplied Pins

Table 1-2 Power supplies and power supplied pins

Power supply	Voltage range	Pin No.	Power supplied pin
DVDD3A	2.7V to 3.6V 3.0 to 3.45V (when USB is used.)	A9 G3 L11 M4 M9	PA0-7, PB0-6, PE0-7, PF0-7, PG0-7, PH0-3, PK0-4, PL0-3, X1, X2, XT1, XT2, $\overline{\text{RESET}}$ , $\overline{\text{NMI}}$ , MODE BSC
DVSSA	0V	A5 B12 G2 K11 M3 M8 M10	
DVDD3B	2.7V to 3.6V 3.0 to 3.45V (when USB is used.)	F12	USB-DDM, USB-DDP USB-HDM, USB-HDP
DVSSB	0V	C12 C11 D11 F10 E11 F11 G11 H11 J11 J12	
AVDD3A	2.7V to 3.6V 3.0 to 3.45V (when USB is used.)	C2	PI0-3
AVSSA	0V	C3	
AVDD3B	2.7V to 3.6V 3.0 to 3.45V (when USB is used.)	B4	PI4-PI7
AVSSB	0V	A4	
AVDD3_DA	2.7V to 3.6V 3.0 to 3.45V (when USB is used.)	E3	DA0 DA1
AVSS_DA	0V	G1	
RVDD3	2.7V to 3.6V 3.0 to 3.45V (when USB is used.)	L10	-

## 2. Processor Core

The TX03 series has a high-performance 32-bit processor core (the ARM Cortex-M3 processor core). For information on the operations of this processor core, please refer to the "Cortex-M3 Technical Reference Manual" issued by ARM Limited. This chapter describes the functions unique to the TX03 series that are not explained in that document.

### 2.1 Information on the processor core

The following table shows the revision of the processor core in the TPM368FDXB.

Refer to the detailed information about the CPU core and architecture, refer to the ARM manual "Cortex-M series processors" in the following URL:

<http://infocenter.arm.com/help/index.jsp>

Product Name	Core Revision
TPM368FDXB	r2p1

### 2.2 Configurable Options

The Cortex-M3 core has optional blocks. The optional blocks of the revision r2p1 are ETM™ and MPU. The following table shows the configurable options in the TPM368FDXB.

Feature	Configure option
FPB	Two literal comparators Six instruction comparators
DWT	Four comparators
ITM	Present
MPU	Absent
ETM	Present
AHB-AP	Present
AHB Trace Macrocell Interface	Absent
TPIU	Present
WIC	Absent
Debug Port	JTAG / Serial wire
Bit Band	Present
constant AHB control	Absent

## 2.3 Exceptions/ Interruptions

Exceptions and interruptions are described in the following section.

### 2.3.1 Number of Interrupt Inputs

The number of interrupt inputs can optionally be defined from 1 to 240 in the Cortex-M3 core.

TMPM368FDXBG has 113 interrupt inputs. The number of interrupt inputs is reflected in <INTLINESNUM[4:0]> bit of NVIC register. In this product, if read <INTLINESNUM[4:0]> bit, 0x00 is read out.

### 2.3.2 Number of Priority Level Interrupt Bits

The Cortex-M3 core can optionally configure the number of priority level interrupt bits from 3 bits to 8 bits.

TMPM368FDXBG has 3 priority level interrupt bits. The number of priority level interrupt bits is used for assigning a priority level in the interrupt priority registers and system handler priority registers.

### 2.3.3 SysTick

The Cortex-M3 core has a SysTick timer which can generate SysTick exception.

For the detail of SysTick exception, refer to the section of "SysTick" in the exception and the register of SysTick in the NVIC register.

### 2.3.4 SYSRESETREQ

The Cortex-M3 core outputs SYSRESETREQ signal when <SYSRESETREQ> bit of Application Interrupt and Reset Control Register are set.

TMPM368FDXBG provides the same operation when SYSRESETREQ signal are output.

### 2.3.5 LOCKUP

When irreparable exception generates, the Cortex-M3 core outputs LOCKUP signal to show a serious error included in software.

TMPM368FDXBG does not use this signal. To return from LOCKUP status, it is necessary to use non-maskable interrupt (NMI) or reset.

### 2.3.6 Auxiliary Fault Status register

The Cortex-M3 core provides auxiliary fault status registers to supply additional system fault information to software.

However, TMPM368FDXBG is not defined this function. If auxiliary fault status register is read, always "0x0000\_0000" is read out.

## 2.4 Events

The Cortex-M3 core has event output signals and event input signals. An event output signal is output by SEV instruction execution. If an event is input, the core returns from low-power consumption mode caused by WFE instruction.

TMPM368FDXBG does not use event output signals and event input signals. Please do not use SEV instruction and WFE instruction.

## 2.5 Power Management

The Cortex-M3 core provides power management system which uses SLEEPING signal and SLEEPDEEP signal. SLEEPDEEP signals are output when <SLEEPDEEP> bit of System Control Register is set.

These signals are output in the following circumstances:

- Wait-For-Interrupt (WFI) instruction execution

- Wait-For-Event (WFE) instruction execution

- the timing when interrupt-service-routine (ISR) exit in case that <SLEEPONEXIT> bit of System Control Register is set.

TMPM368FDXBG does not use SLEEPDEEP signal so that <SLEEPDEEP> bit must not be set. And also event signal is not used so that please do not use WFE instruction.

For detail of power management, refer to the Chapter "Clock/Mode control."

## 2.6 Exclusive access

In Cortex-M3 core, the DCode bus system supports exclusive access. However TMPM368FDXBG does not use this function.

## 3. Memory Map

### 3.1 Memory Map

The memory maps for TMPM368FDXBG are based on the ARM Cortex-M3 processor core memory map. The internal ROM, internal RAM and special function registers (SFR) of TMPM368FDXBG are mapped to the Code, SRAM and peripheral regions of the Cortex-M3 respectively. The special function register (SFR) means the control registers of all input/output ports and peripheral functions. The SRAM and SFR areas are all included in the bit-band region.

The CPU register area is the processor core's internal register region.

For more information on each region, see the "Cortex-M3 Technical Reference Manual".

Note that access to regions indicated as "Fault" causes a memory fault if memory faults are enabled, or causes a hard fault if memory faults are disabled. Also, do not access the vendor-specific region.

Single chip mode

Single boot mode

## 3.2 Bus Matrix

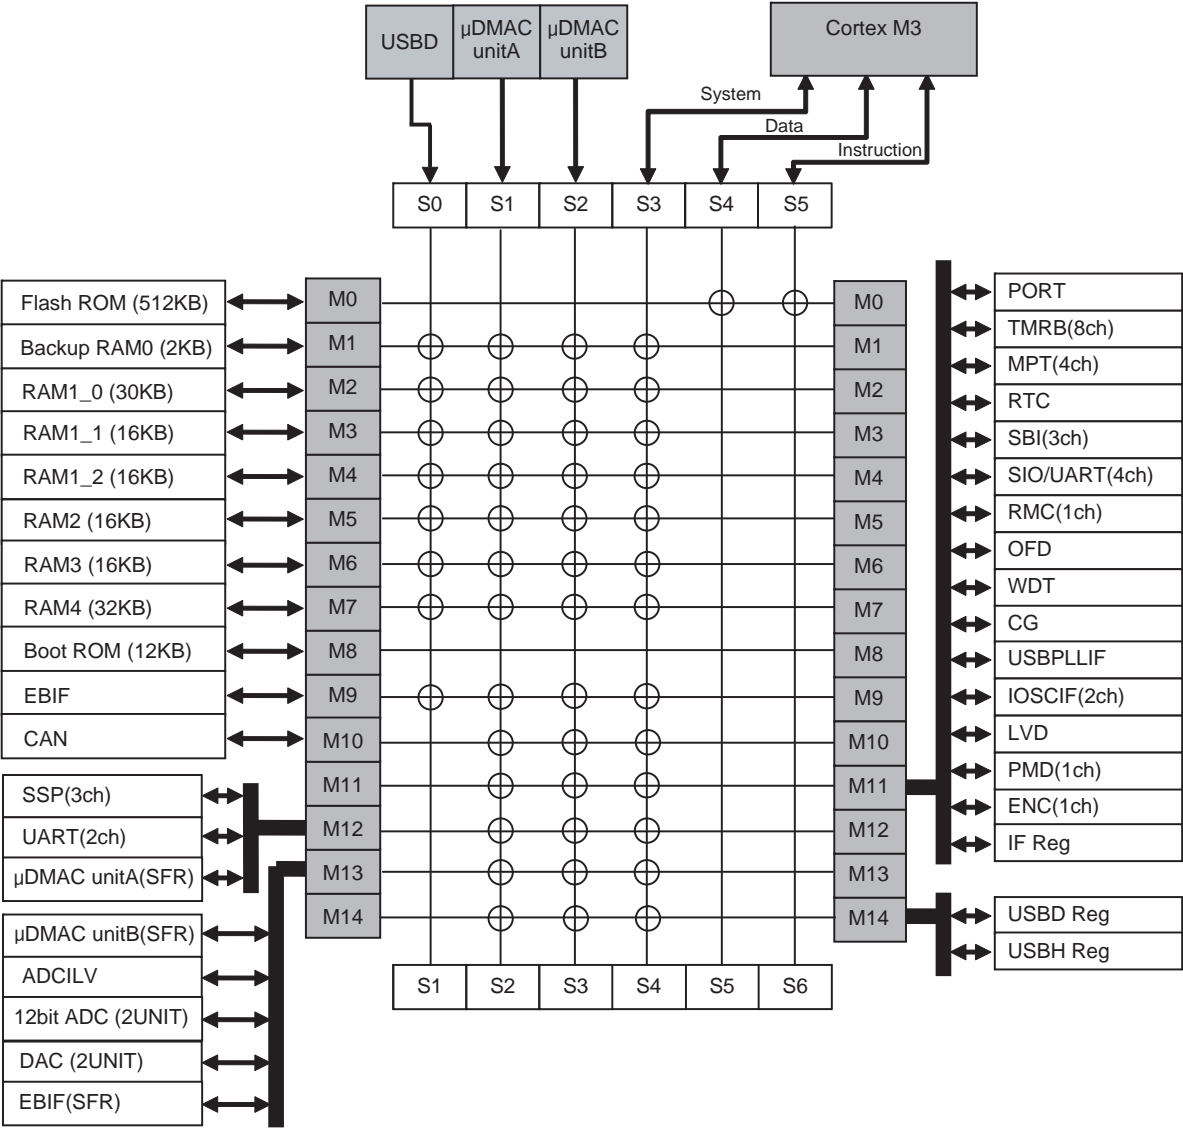

This MCU contains three bus masters such as a CPU core, a  $\mu$ DMA controller and a USB D controller .

Bus masters connect to slave ports (S0 to S5) of Bus Matrix. In the bus matrix, master ports (M0 to M14) connect to peripheral functions via connections described as (o) in the following figure.

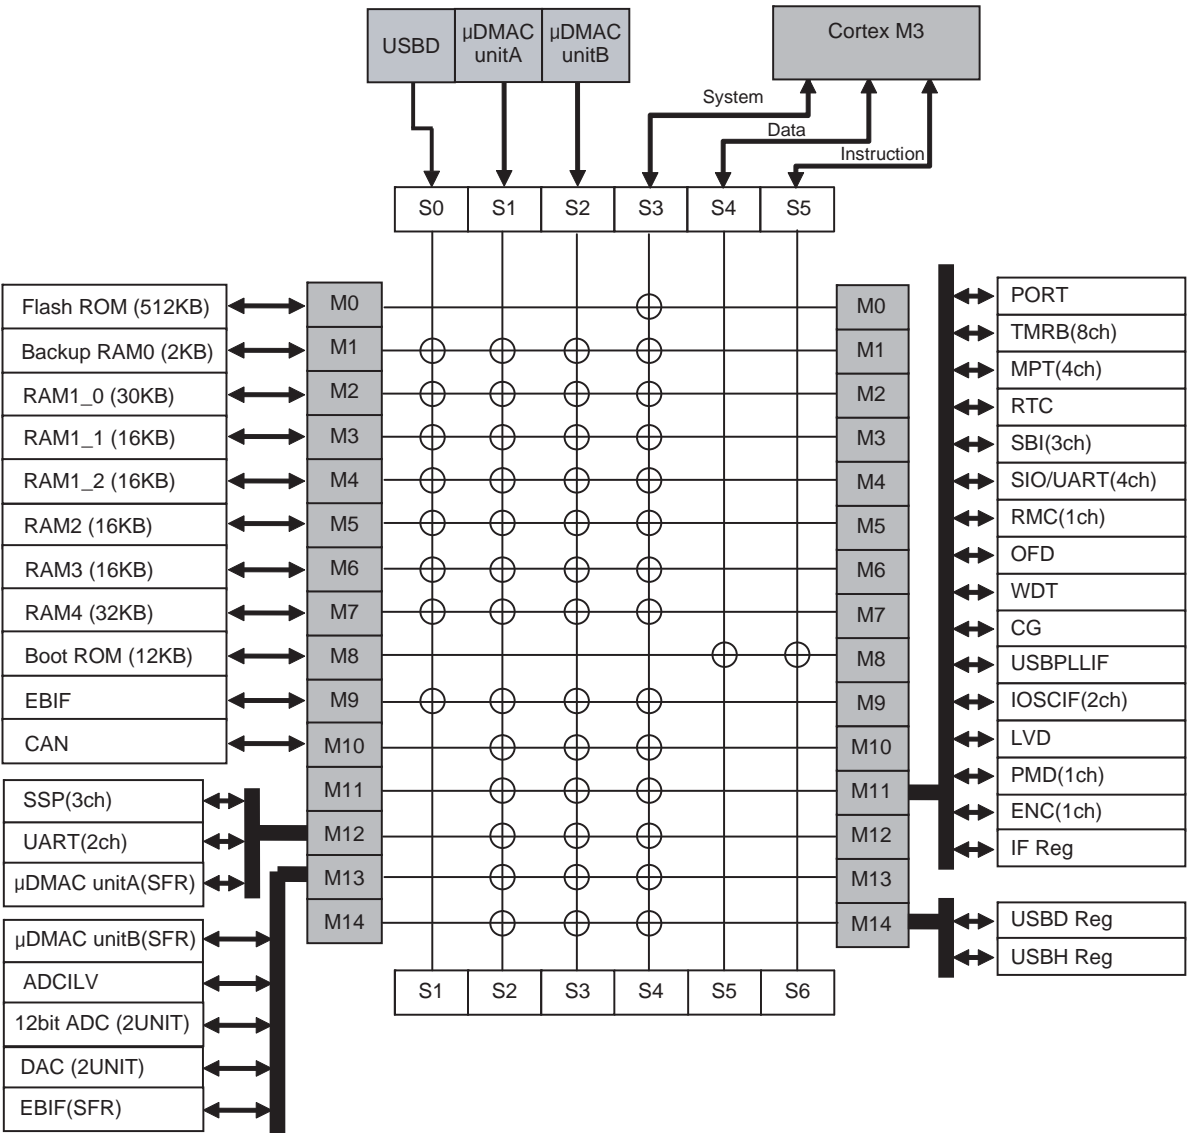

While multiple slaves are connected on the same bus master line in the Bus Matrix, if multiple slave accesses are generated at the same time, a priority is given to access from a master with the smallest slave number.

3.2.1 Structure

3.2.1.1 Single chip mode

3.2.1.2 Single boot mode

### 3.2.2 Connection table

#### 3.2.2.1 Code area / SRAM area

## 4. Internal High-speed Oscillation Adjustment Function (TRMOSC)

TPPM368FDXBG has the internal high-speed oscillation adjustment function.

Note: This adjustment function is not applicable to the reference clock for OFD.

## 4.1 Register Description

### 4.1.1 Register List

The control registers and its addresses are as follows:

Base Address = 0x400F\_3200

Register name		Address(Base+)
Protect register	TRMOSCPRO	0x0000
Enable register	TRMOSCEN	0x0004
Initial trimming value monitoring register	TRMOSCINIT	0x0008
Trimming value setting register	TRMOSCSET	0x000C

#### 4.1.2 TRMOSCPRO (Protect register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-

bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	-	-	TRIMEN
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-1	-	R	Read as "0".
0	TRIMEN	R/W	Trimming control 0 : Disable 1 : Enable  When "1" is set, a trimming value of the internal oscillator is switched to a value read from TRIMOSCINIT to a value set in TRMOSCSET.

## 4.1.4 TRMOSCINIT (Initial trimming value monitoring register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	TRIMINITC					
After reset	0	0	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	TRIMINITF			
After reset	0	0	0	0	Undefined	Undefined	Undefined	Undefined

Bit	Bit Symbol	Type	Function
31-14	-	R	Read as "0".
13-8	TRIMINITC	R	Initial coarse trimming value Reads an initial coarse trimming value before shipping.
7-4	-	R	Read as "0".
3-0	TRIMINITF	R	Initial delicate trimming value Reads an initial delicate trimming value before shipping.

Note: For details about the specific setting and adjustment value of coarse trimming and delicate trimming, refer to Section "4.2.2 Adjustment range".

## 4.1.5 TRMOSCSET (Trimming value setting register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	TRIMSETC					
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	TRIMSETF			
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-14	-	R	Read as "0".
13-8	TRIMSETC	RW	Coarse trimming value setting Sets a coarse trimming value.
7-4	-	R	Read as "0".
3-0	TRIMSETF	RW	Delicate trimming value setting Sets a delicate trimming value.

Note: For details about the specific setting and adjustment value of coarse trimming and delicate trimming, refer to Section "4.2.2 Adjustment range".

## 4.2 Operational Description

### 4.2.1 Adjustment

Oscillation is adjusted using coarse trimming values and delicate trimming values.

The value setting before shipping can be checked with TRMOSCINIT<TRIMINITC> or <TRIMINITF>.

When the value changing, set a new value to TRMOSCSET<TRIMSETC> or <TRIMSETF>. By setting "1" to TRMOSCEN<TRIMEN>, a setting value of the internal oscillator will be changed.

Note: After reset, writing to TRMOSCSET and TRMOSCEN is prohibited. When writing to these bits, TRMOSCPRO<PROTECT> must be set to "0xC1".

### 4.2.2 Adjustment range

In the coarse trimming, -57.6% to +55.8% adjustment by 1.8%-step is feasible. In the delicate trimming, -2.4% to +2.1% adjustment by 0.3%-step is feasible. Table 4-1 and Table 4-2 show a adjustment range.

Note: Each step value is assumed based on the typical condition. In the coarse trimming, it has  $\pm 0.2\%$  margin of error. In the delicate trimming, it has  $\pm 0.1\%$  margin of error.

Table 4-1 Adjustment range of coarse trimming

Coarse trimming	
<TRIMSETC>	Frequency change (typ.)
011111	+55.8%
.	.
000001	+1.8%
000000	$\pm 0\%$
111111	-1.8%
111110	-3.6%
.	.
100000	-57.6%

Table 4-2 Adjustment range delicate trimming

Delicate trimming	
<TRIMSETF>	Frequency change (typ.)
0111	+2.1%
.	.
0001	+0.3%
0000	$\pm 0$
1111	-0.3%
1110	-0.6%
.	.
1000	-2.4%

### 4.2.3 Example of Internal High-speed Oscillation by using 16-bit timer/event counter (TMRB)

The internal oscillation adjustment function uses the pulse width measurement function of 16-bit timer/event counter (TMRB).

#### 4.2.3.1 The way of input a pulse into TBxIN pin

First, choose an internal oscillator as a prescaler clock  $\phi T0$  of TMRB.

Second, input a pulse from TBxIN. Third, capture an up-counter value at the rising edge of the pulse using the capture function.

Finally, determine the adjustment value using a difference between a frequency of TBxIN calculated with capture value and the actual frequency.

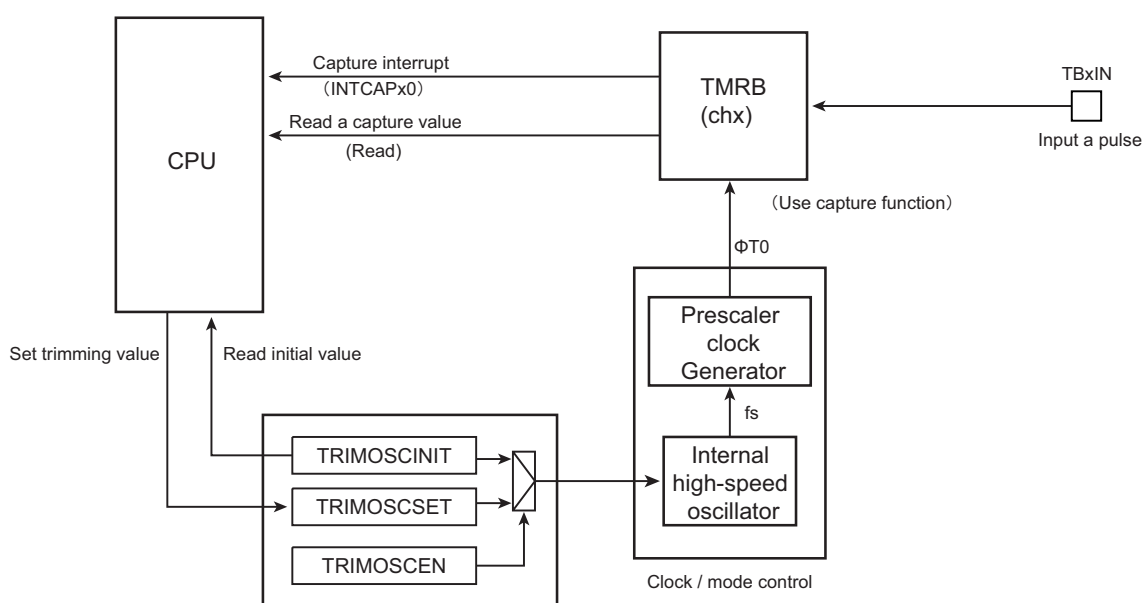

Figure 4-1 The way of input a pulse into TBxIN pin

#### 4.2.3.2 The way of input fs into TB5IN

In TMPM368FDXBG, fs is input into TB5IN. A pulse is made by TMRB ch5 which uses fs.

TB5OUT of TMRB ch5 is connected with TMRB ch6 and ch7 internally.

Choose an internal oscillator as a prescaler clock  $\phi T0$  of TMRB ch6 or ch7.

Capture an up-counter value at the rising edge of the TB5OUT using the capture function.

Determine the adjustment value using a difference between a frequency of TBxIN calculated with capture value and the actual frequency.

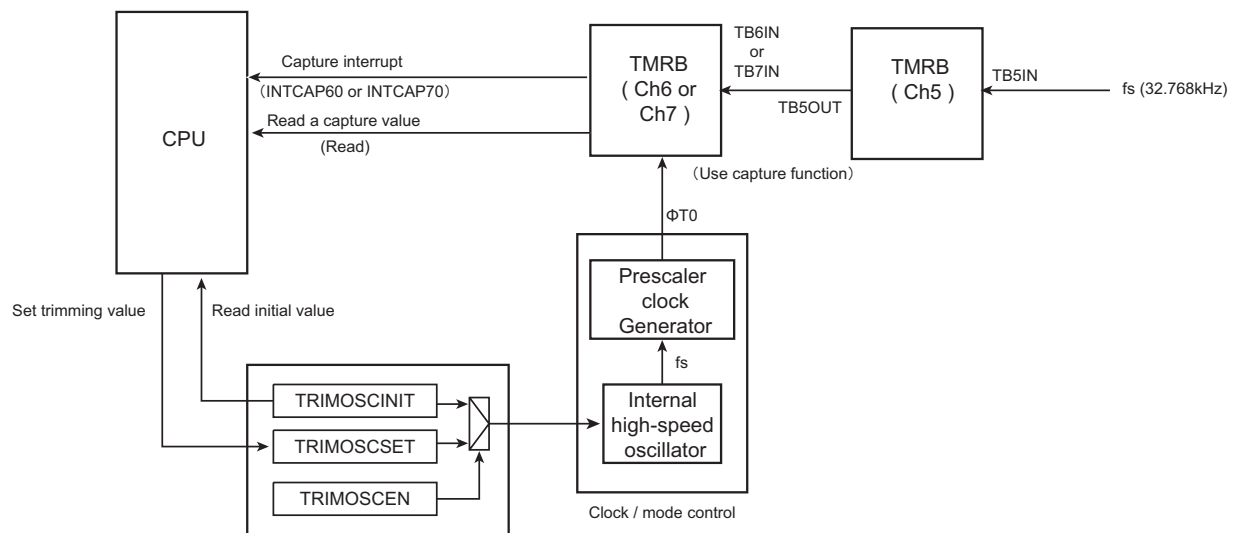

Figure 4-2 The way of input fs into TB5IN

## 5. Clock/Mode control

### 5.1 Outline

The clock/mode control block enables to select clock gear, prescaler clock and warm-up of the PLL clock multiplication circuit and oscillator.

There is also the low power consumption mode which can reduce power consumption by mode transitions.

This chapter describes how to control clock operating modes and mode transitions.

## 5.2 Registers

### 5.2.1 Register List

The following table shows the Clock/Mode control related registers and addresses.

Base Address = 0x400F_3000		
Register name		Address (Base+)
System control register	CGSYSCR	0x0000
Oscillation control register	CGOSCCR	0x0004
Standby control register	CGSTBYCR	0x0008
PLL selection register	CGPLLSEL	0x000C
Reserved	-	0x0010
Reserved	-	0x0014
Reserved	-	0x0015
Clock stop register for peripheral	CGCKSTP	0x0018
Reserved	-	0x001C
Reserved	-	0x0038
Protect register	CGPROTECT	0x003C

Note: Access to the "Reserved" area is prohibited.

## 5.2.2 CGSYSCR (System control register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	FCSTOP	-	-	SCOSEL	
After reset	0	0	0	0	0	0	0	1
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	FPSEL	-	PRCK		
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	GEAR		
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-21	-	R	Read as "0".
20	FCSTOP	R/W	ADC clock 0: Active 1: Stop Enables to stop providing ADC clock. ADC clock is provided after reset. Confirming that ADC is stopped or finished in advance is required when setting "1"(stop). Enables to confirm that ADC is stopped or finished.
19-18	-	R	Read as "0".
17-16	SCOSEL[1:0]	R/W	SCOUT out 00: fs 01: fsys/2 10: fsys 11: φT0 Enables to output the specified clock from SCOUT pin.
15-14	-	R	Read as "0".
13	-	R/W	Write "0"
12	FPSEL	-	fperiph source clock 0: fgear 1: fc Specifies the source clock to fperiph. Selecting fc fixes fperiph regardless of the clock gear mode.
11	-	R	Read as "0".
10-8	PRCK[2:0]	R/W	Prescaler clock 000: fperiph    100: fperiph/16 001: fperiph/2    101: fperiph/32 010: fperiph/4    110: Reserved 011: fperiph/8    111: Reserved Specifies the prescaler clock to peripheral circuit.
7-3	-	R	Read as "0".
2-0	GEAR[2:0]	R/W	High-speed clock (fc) gear 000: fc    100: fc/2 001: Reserved    101: fc/4 010: Reserved    110: fc/8 011: Reserved    111: fc/16

## 5.2.3 CGOSCCR (Oscillation control register)

	31	30	29	28	27	26	25	24
bit symbol	WUPT							
After reset	1	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	WUPT				WUPSEL2	EHOSCSEL	OSCSEL	XEN2

Bit	Bit Symbol	Type	Function
31-20	WUPT[11:0]	R/W	Warm-up counter setup value. Setup the 16-bit timer for warm-up timer of upper 12-bits counter value.
19	WUPSEL2	R/W	High-speed warm-up clock. 0: internal ( $f_{IHOSC}$ ) 1: external ( $f_{EHOSC}$ ) Selects warm-up counter by high-speed oscillator. The warm-up counter is counted up by the selected clock.
18	EHOSCSEL	R/W	External oscillator. 0: input external clock 1: external oscillator
17	OSCSEL	R/W	High-speed oscillator 0: internal high-speed oscillator 1: external high-speed oscillator
16	XEN2	R/W	Internal high-speed oscillator operation (for SYS) 0: Stop 1: Oscillation
15-14	WUPTL[1:0]	R/W	Warm-up counter setup value. Setup the 16-bit timer for warm-up timer of lower 2-bits counter value, This is used for low-speed clock.
13-12	-	R/W	Write "0".
11	-	R	Read as "0".
10	XEN3	R/W	Internal high-speed oscillator operation (for OFD) 0: Stop 1: Oscillation
9	XTEN	R/W	External low-speed oscillator operation 0: Stop 1: Oscillation
8	XEN1	R/W	External high-speed oscillator operation 0: Stop 1: Oscillation
7-4	-	R/W	Write "0011"
3	WUPSEL1	R/W	Select warm-up counter 0: High-speed 1: Low-speed
2	PLLON	R/W	PLL (multiplying circuit) operation (note 3) 0: Stop 1: Oscillation

Bit	Bit Symbol	Type	Function
1	WUEF	R	Status of warm-up timer (WUP) 0: WUP finish 1: WUP active Enables to monitor the status of the warm-up timer.
0	WUEON	W	Operation of warm-up timer (WUP) 0: don't care 1: warm-up timer start Enables to start the warm-up timer. Read as "0".

Note 1: Refer to 5.6.9.1 about the Warm-up setup.

Note 2: When selecting external oscillator (input external clock), select <OSCSEL> after setting <EHOSCSEL>. (Do not select simultaneously)

Note 3: Refer to "5.3.5 Clock Multiplication Circuit (PLL)" about setting PLL.

Note 4: Returning from the STOP1/STOP2 mode, related bits <WUPSEL2>, <OSCSEL>, <XEN3>, <XEN2>, <XEN1>, <PLLON> of the register CGOSCCR and CGPLLSEL<PLLSEL> are initialized because of internal high-speed oscillator starts up.

Note 5: When using internal high-speed oscillator (IHOSC), do not use it as system clock which high accuracy assurance is required.

## 5.2.4 CGSTBYCR (Standby control register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0

16	DRVE	R/W	Pin status in STOP1 mode. 0: Inactive in STOP1 mode 1: Active in STOP1 mode
15-3	-	R	Read as "0".
2-0	STBY[2:0]	R/W	Low power consumption mode 000: Reserved 001: STOP1 010: Reserved 011: IDLE 100: Reserved 101: STOP2 110: Reserved 111: Reserved

Note: Access to the "Reserved" area is prohibited.

## 5.2.5 CGPLLSEL (PLL Selection Register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	PLLSET							
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	PLLSET							PLLSEL
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-16	-	R	Read as "0".
15-1	PLLSET[14:0]	R/W	PLL multiplying value (Do not use except below) 0x5917 : Input clock 8MHz, output clock 48MHz (6 multiplying) 0x59A6 : Input clock 8MHz, output clock 80MHz (10 multiplying) 0x729E : Input clock 10MHz, output clock 80MHz (8 multiplying) 0x5A0F : Input clock 12MHz, output clock 48MHz (4 multiplying) 0x6296 : Input clock 12MHz, output clock 72MHz (6 multiplying) 0x720B : Input clock 16MHz, output clock 48MHz (3 multiplying) 0x3A92 : Input clock 16MHz, output clock 80MHz (5 multiplying)
0	PLLSEL	R/W	Use of PLL 0: $f_{osc}$ use 1: $f_{PLL}$ use Specifies use or disuse of the clock multiplied by the PLL. " $f_{osc}$ (internal high-speed oscillator)" is automatically set after reset. Resetting is required when using the PLL.

Note 1: Select PLL multiplying value which is shown in Table 5-2.

Note 2: Refer to "5.3.5 Clock Multiplication Circuit (PLL)" about setting PLL.

Note 3: Returning from the STOP1/STOP2 mode, related bits <PLLSEL>, CGOSCCR<WUPSEL2>, <OSCSEL>, <XEN2>, <XEN1>, and <PLLON> are initialized because of internal high-speed oscillator starts up.

## 5.2.6 CGCKSTP (Clock stop register for peripheral)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	CANSTP	USBHSTP	USBDSTP
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-4	-	R	Read as "0".
3	-	R/W	Write "1".
2	CANSTP	R/W	CAN clock control 0 : operation 1 : clock stop Enable / disable CAN clock
1	USBHSTP	R/W	USBH clock control 0 : operation 1 : clock stop Enable / disable USBH clock
0	USBDSTP	R/W	USBD clock control 0 : operation 1 : clock stop Enable / disable USBD clock

Note: After reset, CAN, USBH and USBD clock are operated. Set register to "1" after confirming stop of a circuit operation.

## 5.2.7 CGPROTECT (Protect register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	CGPROTECT							
After reset	1	1	0	0	0	0	0	1

Bit	Bit Symbol	Type	Function
31-6	-	R	Read as "0".
7-0	CGPROTECT	R/W	Register protection control 0xC1 : Register write enable Except 0xC1 : Register write disable Initial value is "0xC1" as writing enable to each register and when writing except "0xC1", each register except CGPROTECT register can not be written.

## 5.3 Clock control

### 5.3.1 Clock Type

Each clock is defined as follows:

fosc	: Clock generated by internal oscillator. Clock input from the X1 and X2 pins.
f <sub>PLL</sub>	: Clock multiplied by PLL.
fc	: Clock specified by CGPLLSEL<PLLSEL> (High-speed clock)
fgear	: Clock specified by CGSYSCR<GEAR[2:0]> (Gear Clock)
fsys	: Clock specified by CGCKSEL (System clock)
fperiph	: Clock specified by CGSYSCR<FPSEL[2:0]>
φT0	: Clock specified by CGSYSCR<PRCK[2:0]> (Prescaler clock)

The gear clock fgear and the prescaler clock φT0 are dividable as follows.

Gear clock	: fc, fc/2, fc/4, fc/8, fc/16
Prescaler clock	: fperiph, fperiph/2, fperiph/4, fperiph/8, fperiph/16, fperiph/32

### 5.3.2 Initial Values after Reset

Reset operation initializes the clock configuration as follows.

Internal high-speed oscillator	: oscillating
External high-speed oscillator	: stop
PLL (phase locked loop circuit)	: stop
Gear clock	: fc (no frequency dividing)
Internal high-speed oscillator for OFD	: stop

Reset operation causes all the clock configurations to be the same as fosc.

fc = fosc  
fsys = fosc  
φT0 = fosc

### 5.3.4 Warm-up function

The warm-up function secures the stability time for the oscillator of fs and the PLL with the warm-up timer when releasing STOP1 and STOP2. Refer to "5.6.8 Warm-up" for a detail.

How to configure the warm-up function.

1. Specify the count up clock

Specify the count up clock for the warm-up counter in the CGOSCCR<WUPSEL2>.

2. Specify the warm-up counter value

The warm-up time can be selected by setting the CGOSCCR<WUPT[11:0]><WUPTL[1:0]>. The value can be calculated by following formula with round lower 4 bit off, set to the bit of <WUPT[11:0]> for high-speed oscillation and set to the bit of <WUPT[11:0]><WUPTL[1:0]> for low-speed oscillation.

Warm-up time equation and setup example are shown below.

$$\text{number of warm-up cycle} = \frac{\text{warm-up time to set}}{\text{input frequency cycle (s)}}$$

<example> When using high-speed oscillator 8MHz, and set warm-up time 5ms.

$$\frac{\text{warm-up time to set}}{\text{input frequency cycle (s)}} = \frac{5\text{ms}}{1/8\text{MHz}} = 40000 \text{ cycle} = 0x9C40$$

Round lower 4 bit off, set 0x9C4 to CGOSCCR<WUPT[11:0]>

3. confirm the start and completion of warm-up

The CGOSCCR<WUEON><WUEF> is used to confirm the start and completion of warm-up through software (instruction). When CGOSCCR<WUEON> is set to "1", the warm-up start a count up. The completion of warm-up can be confirmed with CGOSCCR<WUEF>.

Note 1: Setting warm-up count value to CGOSCCR<WUPT[11:0]> and <WUPTL[1:0]>, wait until this value is reflected, then transit to the low power consumption mode by executing a command "WFI"

Note 2: The warm-up timer operates according to the oscillation clock, and it may contain errors if there is any fluctuation in the oscillation frequency. Therefore, the warm-up time should be taken as approximate time.

The example of warm-up function setup.

Table 5-1 The example of warm-up setting (When an internal high-speed oscillator is selected)

	CGOSCCR<WUODR[11:0]> = "0x9C4"	: Specify the warm-up time
	Read CGOSCCR<WUODR[11:0]>	: Confirm warm-up time reflecting Repeat until reading "0x9C4"
	CGOSCCR<XEN2> = "1"	: Internal high-speed oscillator(IHOSC) enable
	CGOSCCR<WUEON> = "1"	: Start the warm-up timer (WUP)
	CGOSCCR<WUEF> read	: Wait until the state becomes "0" (warm-up is finished)

Note 1: The warm-up function is not necessary when using stable external clock.

Note 2: The warm-up timer operates according to the oscillation clock, and it may contain errors if there is any fluctuation in the oscillation frequency. Therefore, the warm-up time should be taken as approximate time.

Note 3: Setting warm-up count value to CGOSCCR<WUPT[11:0]><WUPTL[1:0]>, wait until this value is reflected, then transit to standby mode by executing a command "WFI".

Note 4: Returning from the STOP1/STOP2 mode, related bits <WUPSEL2>, <OSCSEL>, <XEN3>, <XEN2>, <XEN1>, <PLLON> of the register CGOSCCR and CGPLLSEL<PLLSEL> are initialized because of internal high-speed oscillator starts up.

### 5.3.5 Clock Multiplication Circuit (PLL)

This circuit outputs the  $f_{PLL}$  clock (80MHz max.) that is multiplied by 3, 4, 5, 6, 8 or 10 of the high-speed oscillator output clock ( $f_{osc}$  : 8MHz to 16MHz). As a result, the input frequency to oscillator can be low frequency, and the internal clock be made high-speed.

#### 5.3.5.1 How to configure the PLL function

The PLL is disabled after reset.

To enable the PLL, set CGPLLSEL<PLLSET> to multiplying value. And set <PLLON> to "1" after 100 $\mu$ s for initialize time of PLL. After 100 $\mu$ s for lock-up time elapses, set CGPLLSEL<PLLSEL> to "1",  $f_{PLL}$  which is multiplied by 3,4,5,6,8 or 10 from  $f_{osc}$  is used.

The PLL requires a certain amount of time to be stabilized, which should be secured using the warm-up function or other methods.

A Multiplying value can be selected from 3, 4, 5, 6, 8, or 10. The preset value of <PLLSET> is as follows.

Multiplying	External clock input [MHz]	<PLLSET>
6	8	0x5917
10	8	0x59A6
8	10	0x729E
4	12	0x5ADF
6	12	0x6296
3	16	0x720B
5	16	0x3A92

#### 5.3.5.2 Change PLL multiplying

When number of multiplication is changed, firstly set "0" to CGPLLSEL<PLLSEL>. Secondly read CGPLLSEL<PLLSEL> to check the setting in which multiplication clock is not used (CGPLLSEL<PLLSEL>="0"). Thirdly, set "0" to <PLLON> to stop PLL.

Modify CGPLLSEL<PLLSEL> to multiplying value. And set <PLLON> to "1" after 100 $\mu$ s for initialize time of PLL. After 100 $\mu$ s for lock-up time elapses, set CGPLLSEL<PLLSEL> to "1".

### 5.3.5.3 The sequence of PLL setting

The sequence of PLL setting is shown below.

The sequence of PLL setting

Note: Internal high-speed oscillator and voltage supply need to be stable.

#### 5.3.5.4 Change PLL multiplying sequence

The sequence of PLL multiplying setting is shown below.

### 5.3.6 System clock

The internal high-speed oscillation clock and the external high-speed oscillation clocks which are an oscillator connecting or an inputting clock can be used as a source clock of the system clock.

Source clock		Frequency	Using PLL
Internal high-speed oscillation (IHOSC)		10MHz Note) (Target)	Not use, 3, 4, 5, 6, 8 or 10 multiplying
External high-speed oscillation	Oscillator (EHOSC)	8 to 16MHz	
	Input clock (EHCLKIN)	8 to 16MHz	

Note: The frequency of an internal high-speed oscillator must be adjusted by the internal high-speed oscillation adjustment function in order to keep  $f_c$  equal or less than 80MHz when PLL is used.

The system clock can be divided by CGSYSCR<GEAR>. Although the setting can be changed while operating, the actual switching takes place after a slight delay.

Table 5-2 shows the example of the operation frequency by the setting of PLL and the clock gear.

Table 5-2 System clock (Unit : MHz, "-" : Reserved)

External oscillator (MHz)	External clock input (MHz)	PLL multi- plying	Max. oper- ation freq. ( $f_c$ ) (MHz)	USB PLL (48MHz) multiplying	ADC Max. operation freq. ( $f_c/2$ ) (MHz)	Clock gear (CG) PLL = ON					Clock gear (CG) PLL = OFF				
						1/1	1/2	1/4	1/8	1/16	1/1	1/2	1/4	1/8	1/16
8	8	10	80	6	40	80	40	20	10	5	8	4	2	1	-
8	8	6	48	6	24	48	24	12	6	3	8	4	2	1	-
10	10	8	80	-	40	80	40	20	10	5	10	5	2.5	1.25	-
12	12	6	72	4	36	72	36	18	9	4.5	12	6	3	1.5	-
12	12	4	48	4	24	48	24	12	6	3	12	6	3	1.5	-
16	16	5	80	3	40	80	40	20	10	5	16	8	4	2	1
16	16	3	48	3	24	48	24	12	6	3	16	8	4	2	1

↑ initial value after reset

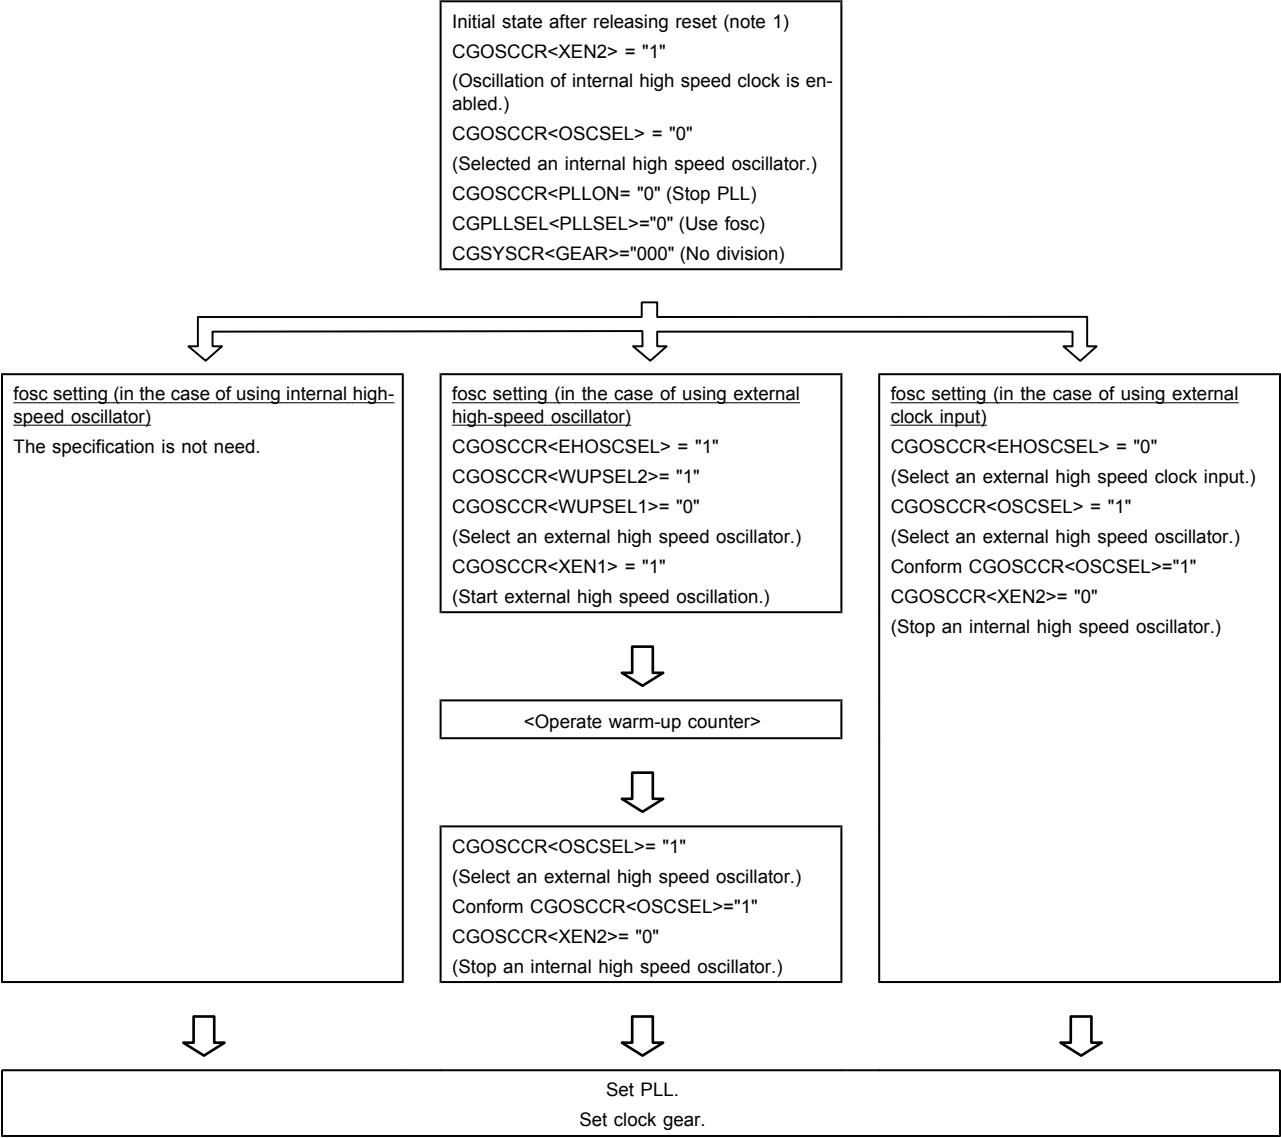

Note 1: The maximum operation frequency of an AD converter is 40 MHz. It is the value set to  $f_c/2$  by setup of ADCLK<ADCLK[2:0]>.

Note 2: Do not use 1/16 when SysTick is used.

5.3.6.1 The sequence of System clock setting

The system clock is selected by CGOSCCR. After setting CGOSCCR, the PLL is set by CGPLLSEL and CGOSCCR and the clock gear is set by CGSYSCR.

The sequence of PLL setting

### 5.3.7 Prescaler Clock Control

Peripheral I/O has a prescaler for dividing a clock. As the clock  $\phi T0$  to be input to each prescaler, the "fperiph" clock specified in the CGSYSCR<FPSEL> can be divided according to the setting in the CGSYSCR<PRCK[2:0]>. After the controller is reset, fperiph/1 is selected as  $\phi T0$ .

Note: To use the clock gear, ensure that you make the time setting such that prescaler output  $\phi Tn$  from each peripheral function is slower than fsys ( $\phi Tn < fsys$ ). Do not switch the clock gear while the timer counter or other peripheral function is operating.

### 5.3.8 System Clock Pin Output Function

TMPM368FDXBG enables to output the system clock from a pin. The SCOUT pin can output low speed clock fs and the system clock fsys and fsys/2, and the prescaler input clock for peripheral I/O  $\phi T0$ .

Note 1: The phase difference (AC timing) between the system clock output by the SCOUT and the internal clock is not guaranteed.

Note 2: When fsys is output from SCOUT pin, SCOUT pin outputs the unexpected waveform just after changing clock gear. In the case of influencing to system by the unexpected waveform, the output of SCOUT pin should be disabled when changing the clock gear.

When port is used as SCOUT, refer to "Input/Output ports".

Table 5-3 shows the pin status in each mode when the SCOUT pin is set to the SCOUT output.

Table 5-3 SCOUT Output Status in Each Mode

SCOUT selection CGSYSCR	Mode	Low power consumption mode	
	NORMAL	IDLE	STOP1/STOP2(Note)
<SCOSEL[1:0]> = "00"	Output the fs clock		
<SCOSEL[1:0]> = "01"	Output the fsys/2 clock		Fixed to "0" or "1".
<SCOSEL[1:0]> = "10"	Output the fsys clock		
<SCOSEL[1:0]> = "11"	Output the $\phi T0$ clock		

Note: When you change to the STOP2 mode, please set "1" as CGSTBYCR<PTKEEP> first and hold the state of a port.

## 5.4 Modes and Mode Transitions

### 5.4.1 Operation Mode Transitions

The IDLE and STOP1 modes can be used as the low power consumption mode that enables to reduce power consumption by halting processor core and some peripheral circuits operation.

And TMPM368FDXBG has STOP2 mode that enables to reduce power consumption significantly by halting main voltage supply, retaining some peripheral circuits operations.

Figure 5-2 shows a mode transition diagram.

For a detail of sleep-on-exit, refer to "Cortex-M3 Technical Reference Manual."

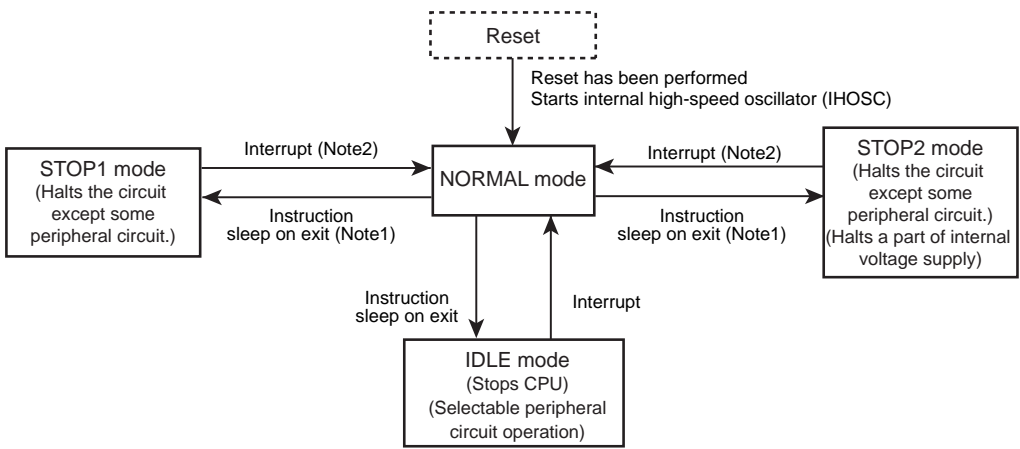

Figure 5-2 Mode Transition Diagram

- Note 1: Returning from the STOP1/STOP2 mode, related bits <WUPSEL2>, <OSCSSEL>, <XEN3>, <XEN2>, <XEN1>, <PLLON> of the register CGOSCCR and CGPLLSEL<PLLSEL> are initialized because of internal high-speed oscillator starts up.
- Note 2: It branches to interrupt service routine of reset when returning from the STOP2 mode and it branches to interrupt service routine of interrupt factor when returning from the STOP1 mode.
- Note 3: The warm-up is needed when returning from the STOP1/STOP2 mode. The warm-up time is needed to set in NORMAL mode, Regarding to warm-up time, refer to "5.6.9 Clock Operations in Mode Transition"

## 5.5 Operation mode

### 5.5.1 NORMAL mode

This mode is to operate the CPU core and the peripheral circuits by using the high-speed clock.

It is shifted to the NORMAL mode after reset.

## 5.6 Low Power Consumption Modes

The TMPM368FDXBG has three low power consumption modes: IDLE, STOP1 and STOP2. To shift to the low power consumption mode, specify the mode in the system control register CGSTBYCR<STBY[2:0]> and execute the WFI (Wait For Interrupt) instruction. In this case, execute reset or generate the interrupt to release the mode. Releasing by the interrupt requires settings in advance. See the chapter "Exceptions" for details.

Note 1: The TMPM368FDXBG does not offer any event for releasing the low power consumption mode. Transition to the low power consumption mode by executing the WFE (Wait For Event) instruction is prohibited.

Note 2: The TMPM368FDXBG does not support the low power consumption mode configured with the SLEEPDEEP bit in the Cortex-M3 core. Setting the <SLEEPDEEP> bit of the system control register is prohibited.

The features of IDLE, STOP1, STOP2 mode are described as follows.

### 5.6.1 IDLE mode

Only the CPU is stopped in this mode. Each peripheral circuit has one bit in its control register for enabling or disabling operation in the IDLE mode. When the IDLE mode is entered, peripheral circuits for which operation in the IDLE mode is disabled stop operation and hold the state at that time.

The following peripheral circuits can be enabled or disabled in the IDLE mode. For setting details, see the chapter on each peripheral circuits.

- 16-bit timer/event counter (TMRB)
- 16-bit multi purpose timer (except PMD operation)
- Serial channel (SIO/UART)
- Serial bus interface (I2C/SIO)
- Analog Digital converter (ADC)
- Digital Analog converter (DAC)
- Watchdog timer (WDT)

Note 1: WDT should be stopped before entering IDLE mode.

Note 2: Please suspend the source clock to USBDM and USBH before changing to IDLE mode. ( USBP\_LLEN<USBDMEN>="0" and USBP\_LLEN<USBHDMEN>="0").

### 5.6.2 STOP1 mode

Except some peripheral circuits, all the internal circuits including the internal oscillator are brought to a stop in STOP1 mode. When releasing STOP1 mode, an internal oscillator begins to operate and the operation mode changes to NORMAL mode.

The STOP1 mode enables to select the pin status by setting the CGSTBYCR<DRVE>. Table 5-4 shows the pin status in the STOP1 mode.

### 5.6.3 STOP2 mode

This mode halts voltage supply, retaining some peripheral circuits operation. This enables to reduce power consumption significantly compares to STOP1 mode.

After releasing the STOP2 mode, voltage is supplied to the halted voltage supply then an internal high-speed oscillator starts, and returns to NORMAL mode.

Before entering STOP2 mode, set CGSTBYCR<PTKEEP>="0"→"1" and keeps each port conditions. If internal voltage is halted, it can be held interface to the external IC, and STOP2 release source interrupt is available.

Note 1: Warming up is needed at the time of a return. It is necessary to set up a setup of warming up time in the mode (NORMAL mode) before going into STOP1 and the STOP2 mode. Please refer to 5.6.9.1 and 5.6.9.2 about warming up time.

Note 2: At the time of the return from STOP1 and the STOP2 mode, for internal high-speed oscillation starting Related bit CGPLLSEL<PLLSEL> and CGOSCCR<HWUPSEL>, <OSCSEL>, <XEN2>, <XEN1>, and <PLLON> are initialized, and CGOSCCR<WUDOR[11:0]> is not initialized.

Note 3: The STOP2 mode should secure the period for 50 μs or more from mode transition to release in order to perform internal electrical power source interception. If it cancels within a period, the internal electrical power source management cannot operate normally.

Table 5-4 Pin States in the STOP1/STOP2 mode

Function	Function name	I/O	STOP1		STOP2
			<DRVE> = 1	<DRVE> = 0	<PTKEEP> = 1
PORT	PAx to PLx	Input	Depend on PxIE[m]	Disable	keep state
		Output	Depend on PxCR[m]	Disable	keep state
Debug	TRST, TCK, TMS, TDI, SWCLK, SWDI	Input	Depend on PxIE[m]		keep state
	TDO, SWDO, SWV, TRACECLK, TRACEDATA0/1/2/3	Output	Depend on PxCR[m] and enable when data is valid		keep state
Interrupt	INT0 to C	Input	Depend on PxIE[m]		keep state
SSP	SPxCLK, SPxFSS, SPxDO	Output	Depend on PxCR[m] and enable when data is valid	Disable	keep state
MPT(PMD mode)	UO, VO, WO, XO, YO, ZO	Output	Depend on PxCR[m] and enable when data is valid	Depend on PxCR[m] and enable when data is valid	keep state
MPT(IGBT mode)	MTOUTxx	Output	Depend on PxCR[m] and enable when data is valid	Depend on PxCR[m] and enable when data is valid	keep state
except above	Except above	Input	Depend on PxIE[m]	Disable	keep state
	Except above	Output	Depend on PxCR[m]	Disable	keep state

Note: x: port number / m: corresponding bit / n: function register number

#### 5.6.4 Low power Consumption Mode Setting

The low power consumption mode is specified by the setting of the standby control register CGSTBYCR<STBY[2:0]>.

Table 5-5 shows the mode setting in the <STBY[2:0]>.

Table 5-5 Low power consumption mode setting

Mode	CGSTBYCR <STBY[2:0]>
STOP1	001
IDLE	011
STOP2	101

Note: Do not set any value other than those shown above in <STBY[2:0]>.

### 5.6.5 Operational Status in Each Mode

Table 5-6 show the operational status in each mode.

Table 5-6 Operational Status in Each Mode

Block	NORMAL Internal high-speed oscillator use (IHOSC)	IDLE Internal high-speed oscillator use (IHOSC)	STOP1 (Note 1)	STOP2 (Note 1)
Processor core	o	–	–	×
DMAC	o	o	–	Δ×
I/O port	o	o	–(note 3)	–(note 4)
I/O port for USB	o	o	–	–
ADC	o	o	Δ	Δ×
DAC	o	o	Δ	–
USB Host	o	o	Δ	Δ×
USB Device	o	o	o	Δ×
CAN	o	o	Δ	Δ×
SSP	o	o	Δ	Δ×
SIO/UART	o	o	Δ	Δ×
I2C/SIO	o	o	Δ	Δ×
WDT	o	o(note 6)	–	Δ×
TMRB	o	o	–	Δ×
MPT	o	o	–	Δ×
RMC	o	o	o	o
RTC	o	o	o	o
POR	o	o	o	o
LVD	o	o	o	o
External bus interface	o	o	–	×
CG	o	o	–	–

Internal high-speed oscillator 2	o	o	–	–
Backup RAM	o	o	o	o
Main RAM	o	o	o	×

o : Operation is available when in the target mode.

– : The clock to module stops automatically when transiting to the target mode.

Δ : Enables to select enabling or disabling module operation by software when in the target mode.

× : Voltage supply to module turns off automatically when transiting to the target mode.

Note 1: The peripheral function of "–", "Δ", and "×" is stopped, so please change in the STOP1/2 mode, before changing in the STOP1/2 mode. It is available to reduce leakage current by stopping reference voltage for AD converter or DA converter.

Note 2: After returning to NORMAL mode, the peripheral circuit which is cutted- down voltage supply in STOP2 mode should be initialized by software,

Note 3: The status depends on the CGSTBYCR<DRVE>.

Note 4: The status depends on the CGSTBYCR<PTKEEP>. The state of port keeps the state when <PTKEEP> is set to "1".

Note 5: After reset or STOP1/STOP2 mode released, clock is provided from internal high-speed oscillator.

Note 6: Pay attention that the counter of watch dog timer function can not be cleared by CPU while in IDLE mode.

### 5.6.6 Releasing the Low Power Consumption Mode

The low power consumption mode can be released by an interrupt request, Non-Maskable Interrupt (NMI) or reset. The release source that can be used is determined by the low power consumption mode selected.

Details are shown in Table 5-7.

Table 5-7 Release Source in Each Mode

Low power consumption mode			IDLE	STOP1	STOP2
Release source	Interrupt	INT0 to B (note 5)	o	o	o (note 4)
		INTC	o	x	x
		INTUSBDPON(INTD), INTUSBWKUP	o	o	x
		INTUSBH, INTUSB	o	x	x
		INTCANGB, INTCANRX, INTCANTX	o	x	x
		INTSSP0 to 2, INTSBI0 to 2	o	x	x
		INTRX0 to 3, INTTX0 to 3, INTUART0 to 1	o	x	x
		INTRTC, INTRMCRX	o	o	o
		INTTB0 to 7, INTCAP00 to 71	o	x	x
		INTMTTB00 to 31, INTMTCAP00 to 31, INTMTEMG0 to 3	o	x	x
		INTPMD, INTEMG, INTENC	o	x	x
		INTADA, INTADAHP, INTADAM0 to 1 (ADC unit A)	o	x	x
		INTADB, INTADBHP, INTADBM0 to 1 (ADC unit B)	o	x	x
		INTDMAAERR, INTDMABERR, $\mu$ DMAC transfer request Note5)	o	x	x
	SysTick interrupt		o	x	x
	Non-Maskable Interrupt (INTWDT)		o	x	x
	Non-Maskable Interrupt ( $\overline{\text{NMI}}$ pin)		o	o	o
	Non-Maskable Interrupt (INTLVD)		o	o	o
	RESET (WDT)		o	x	x
	RESET (POR)		o	o	o
	RESET (LVD)		o	o	o
	RESET (ODF)		o	x	x
	RESET ( $\overline{\text{RESET}}$ pin)		o	o	o

o : Starts the interrupt handling after the mode is released. (The reset initializes the LSI)

x : Unavailable

Note 1: Regarding to the warm-up time which is need to return from each mode, refer to "5.6.8 Warm-up".

Note 2: After STOP2 mode is released, reset operation initializes the internal supply voltage cut off peripheral circuit (Refer to Table 5-6). But back-up module is not initialized.

Note 3: For shifting to the low power consumption mode, set the CPU to prohibit all the interrupts other than the release source. If not, releasing may be executed by an unspecified interrupt.

Note 4: When releasing from IDLE, STOP1/2 mode by interrupting level mode, hold the level until the interrupt handling starts. If the level is changed before that, the correct interrupt handling cannot be started.

Note 5: TMPM368FDXBG has following request factor.

INTDMAADA, INTDMAADB, INTDMADAA, INTDMADAB, INTDMASPR0, INTDMASPT0, INTDMASPR1, INTDMASPT1, INTDMASPR2, INTDMASPT2, INTDMAUTR0, INTDMAUTT0, INTDMAUTR1, INTDMAUTT1, INTDMARX0, INTDMATX0, INTDMARX1, INTDMATX1, INTDMARX2, INTDMATX2, INTDMARX3, INTDMATX3, INTDMASBI1, INTDMASBI2, INTDMATB, INTDMARQ

- Release by interrupt request

To release the low power consumption mode by an interrupt, the interrupt is set to detect interrupt request before entering the low power consumption mode.

regarding to setting the interrupt to be used to release the STOP1 and STOP2 modes, refer to "Exceptions".

- Release by Non-Maskable Interrupt (NMI)

There are two kinds of NMI sources: WDT interrupt (INTWDT), LVD interrupt (INTLVD) and  $\overline{\text{NMI}}$  pin. INTWDT can only be used in the IDLE mode.

INTLVD and the  $\overline{\text{NMI}}$  pin can be used to release all the lower power consumption modes.

- Release by reset

Any low power consumption mode can be released by reset from the  $\overline{\text{RESET}}$  pin, POR or LVD.

IDLE mode can be released by reset from WDT or OFD.

After that, the mode switches to the NORMAL mode and all the registers are initialized as is the case with normal reset.

- Release by SysTick interrupt

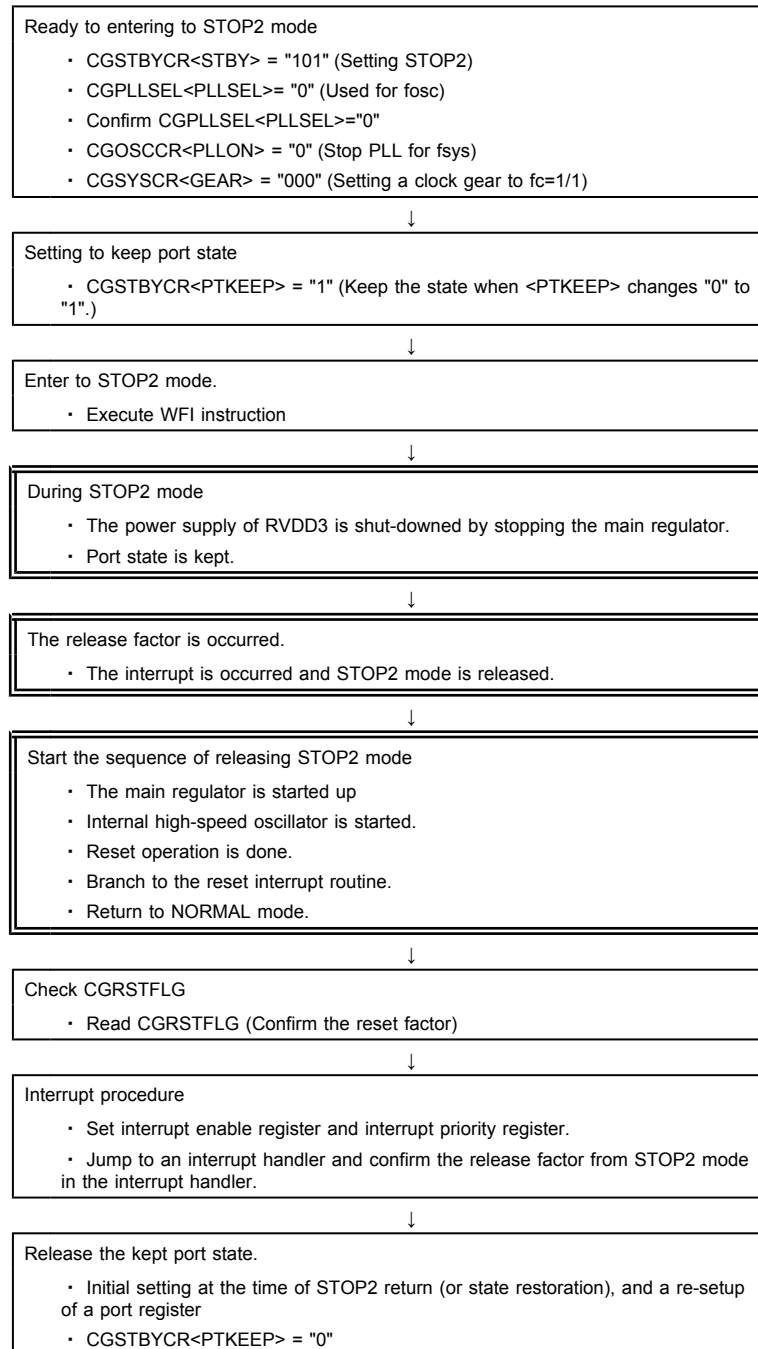

SysTick interrupt can only be used in the IDLE mode.

Refer to "Exceptions" for details.

### 5.6.7 Flow chart of entering and releasing to or from STOP2 mode

The flow chart of entering and releasing to or from STOP2 mode is shown bellows.

indicates hardware handling,  indicates software handling.

### 5.6.8 Warm-up

Mode transition may require the warm-up so that the internal oscillator provides stable oscillation.

In the mode transition from STOP1/STOP2 to the NORMAL, an internal high-speed oscillator is activated automatically. And an internal high-speed oscillator is selected as the source clock of warm-up counter, warm-up counter is activated automatically.

Then the system clock output is started after the elapse of warm-up time. It is necessary to set a warm-up time in the CGOSCCR<WUPT[11:0]> before executing the instruction to enter the STOP1/STOP2 mode. Regarding to warm-up time, refer to "5.6.9 Clock Operations in Mode Transition".

Note: Returning from the STOP1/STOP2 mode, related bits <WUPSEL2>, <XEN3>, <OSCSEL>, <XEN2>, <XEN1>, <PLLON> of the register CGOSCCR and CGPLLSEL<PLLSEL> are initialized because of internal high-speed oscillator starts up.

Table 5-8 shows whether the warm-up setting of each mode transition is required or not.

Table 5-8 Warm-up setting in mode transition

Mode transition	Warm-up setting
NORMAL → IDLE	Not required
NORMAL → STOP1	Not required
NORMAL → STOP2	Not required
IDLE → NORMAL	Not required
STOP1 → NORMAL	Auto-warm-up (Note)
STOP2 → NORMAL	Auto-warm-up (Note)

Note: Returning to NORMAL mode by reset does not induce the automatic warm-up. The reset signal as same as cold reset should be inputted.

5.6.9 Clock Operations in Mode Transition

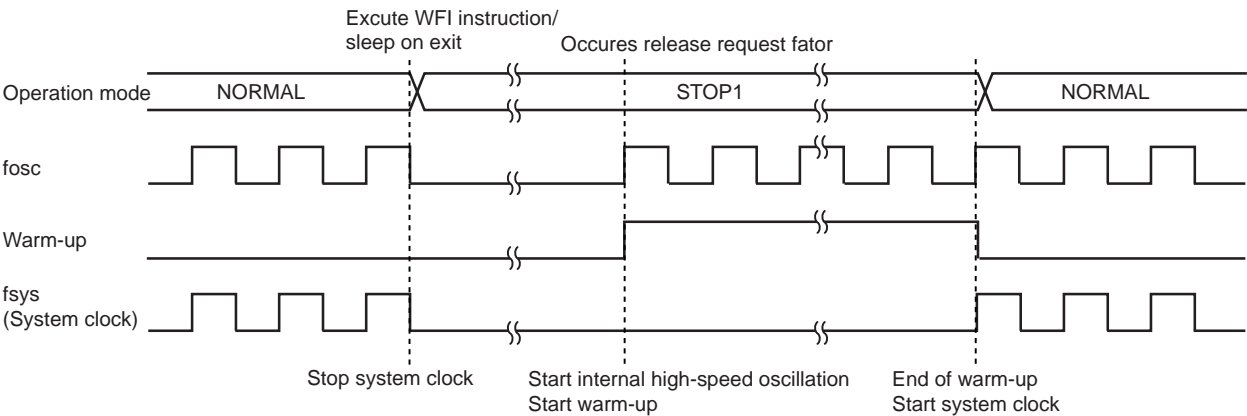

The clock operations in mode transition are described as follows.

5.6.9.1 Transition of operation modes: NORMAL → STOP1 → NORMAL

When returning to the NORMAL mode from the STOP1 mode, the warm-up is activated automatically.

It is necessary for the warm-up to be set CGOSCCR<WUPT[11:0]>=0x03f in this case as a stability time (equal or more than approximate 100μs) of internal circuits before entering the STOP1 mode.

Returning to the NORMAL mode by reset does not induce the automatic warm-up. The reset signal as same as cold reset should be inputted.

### 5.6.9.2 Transition of operation modes: NORMAL → STOP2 → NORMAL

When returning to the NORMAL mode from the STOP2 mode, the warm-up is activated automatically.

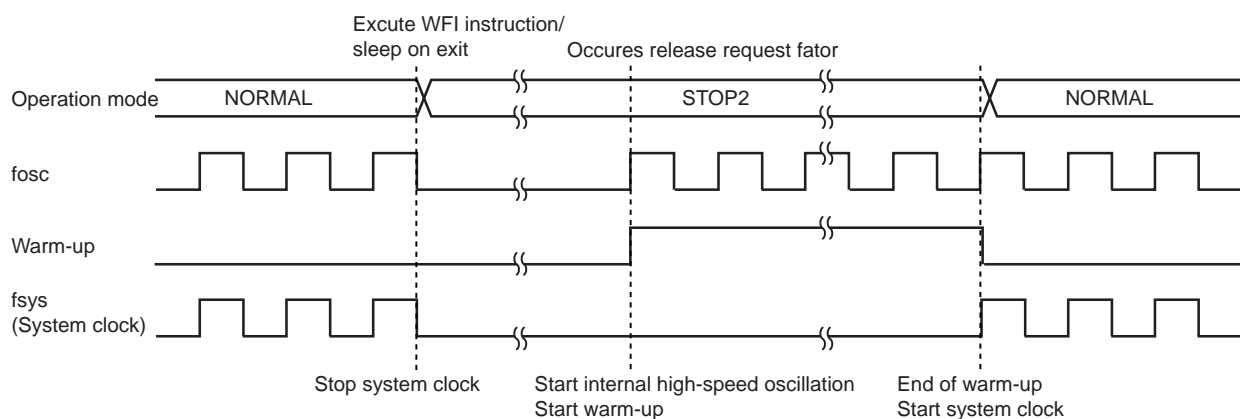

It is necessary for the warm-up to be set  $CGOSCCR<WUPT[11:0]>=0x271$  in this case as a stability time (equal or more than approximate 1ms) of internal circuits before entering the STOP2 mode.

After STOP2 mode is released, reset operation initializes the internal supply voltage cut off peripheral circuits. But the peripheral circuits which are cut the connection with the internal supply voltage are not initialized.

Returning to the NORMAL mode by reset does not induce the automatic warm-up. The reset signal as same as cold reset should be inputted.

Even returning to the NORMAL mode by without reset, it would be branched to interrupt service routine of reset.

Note: When releasing STOP2 by external interrupt pin, set <PTKEE> to "1" before entering STOP2 mode.

## 6. Reset Operation

The following are sources of reset operation.

- Power-on-reset circuit (POR)
- Low Voltage Detection Circuit (LVD)
- RESET pin ( $\overline{\text{RESET}}$ )
- Watch-dog timer (WDT)
- Oscillation frequency circuit (OFD)
- Application interrupt by CPU and a signal from the reset register bit <SYSRESETREQ>

To recognize a source of reset, check CGRSTFLG in the clock generator register described in Chapter of "Exception".

Detail about the power-on-reset circuit, the power detection circuit, the watch-dog timer and the oscillation frequency detection circuit, refer to each chapter.

A reset by <SYSRESETREQ> is referred to "Cortex-M3 Technical Reference Manual".

Note 1: Once reset operation is done, internal RAM data is not assured.

## 6.1 Cold Reset

When turning-on power, it is necessary to take a stable time of built-in regulator, built-in Flash memory and internal high-speed oscillator into consideration. TMPM368FDXBG has a function to insert a stable time automatically.

### 6.1.1 Reset by power-on-reset circuit (not using $\overline{\text{RESET}}$ pin)

Once power voltage is beyond the release voltage of power-on-reset, power counter starts operation, and then after 0.8ms internal reset signal is released.

Power-on-reset circuit operation is referred to Section of "Power-on-reset circuit (POR)".

Note: If power setup time is expected to exceed internal reset time, use a  $\overline{\text{RESET}}$  pin.

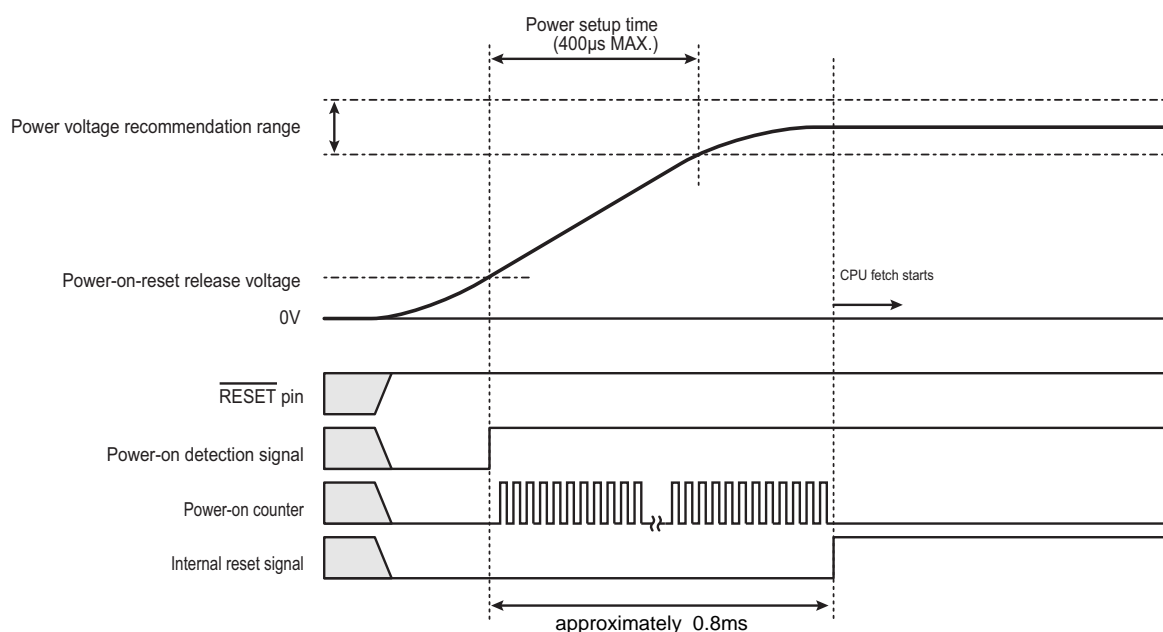

Figure 6-1 Reset Operation by Power-on Circuit

### 6.1.2 Reset by $\overline{\text{RESET}}$ pin

Internal reset signal is released approximately 0.8ms after  $\overline{\text{RESET}}$  pin becomes "High". However if  $\overline{\text{RESET}}$  pin is set to "High" within 400 $\mu\text{s}$  after power-on reset signal becomes "High", the reset process will be the same as the power-on described in 6.1.1.

Figure 6-2 Reset Operation by  $\overline{\text{RESET}}$  pin

## 6.2 Warm-up

### 6.2.1 Reset Duration

To do reset TMPM368FDXBG, the following condition is required; power supply voltage is in the operational range; RESET pin is kept "Low" at least for 12 system clocks by internal high frequency oscillator. Approximately 0.8ms after RESET pin becomes "High", internal reset will be released.

## 6.3 After reset

After reset, the control register of Cortex-M3 and the peripheral function control register (SFR) are initialized. System debug component registers (FPB, DWT, and ITM) of the internal core, CGRSTFLG in the clock generator and FCSECBIT in the Flash related register are only initialized by cold reset.

When reset is released, MCU starts operation by a clock of internal high-speed oscillator. External clock and PLL multiple circuit should be set if necessary.

## 7. Exceptions

This chapter describes features, types and handling of exceptions.

Exceptions have close relation to the CPU core. Refer to "Cortex-M3 Technical Reference Manual" if needed.

### 7.1 Overview

An exception causes the CPU to stop the currently executing process and handle another process.

There are two types of exceptions: those that are generated when some error condition occurs or when an instruction to generate an exception is executed; and those that are generated by hardware, such as an interrupt request signal from an external pin or peripheral function.

All exceptions are handled by the Nested Vectored Interrupt Controller (NVIC) in the CPU according to the respective priority levels. When an exception occurs, the CPU stores the current state to the stack and branches to the corresponding interrupt service routine (ISR). Upon completion of the ISR, the information stored to the stack is automatically restored.

#### 7.1.1 Exception Types

The following types of exceptions exist in the Cortex-M3.

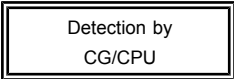

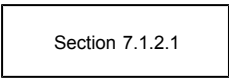

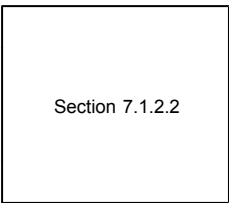

For detailed descriptions on each exception, refer to "Cortex-M3 Technical Reference Manual".

- Reset
- Non-Maskable Interrupt (NMI)
- Hard Fault
- Memory Management
- Bus Fault
- Usage Fault
- SVCall (Supervisor Call)
- Debug Monitor
- PendSV
- SysTick
- External Interrupt

7.1.2 Handling Flowchart

The following shows how an exception/interrupt is handled. In the following descriptions,  indicates hardware handling.  Indicates software handling.

Each step is described later in this chapter.

Processing	Description	See
 Detection by CG/CPU	The CG/CPU detects the exception request.	 Section 7.1.2.1
		
 Handling by CPU	The CPU handles the exception request.	 Section 7.1.2.2
		
 Branch to ISR	The CPU branches to the corresponding interrupt service routine (ISR).	
		
 Execution of ISR	Necessary processing is executed.	 Section 7.1.2.3
		
 Return from exception	The CPU branches to another ISR or returns to the previous program.	 Section 7.1.2.4

7.1.2.1 Exception Request and Detection

(1) Exception occurrence

Exception sources include instruction execution by the CPU, memory accesses, and interrupt requests from external interrupt pins or peripheral functions.

An exception occurs when the CPU executes an instruction that causes an exception or when an error condition occurs during instruction execution.

An exception also occurs by an instruction fetch from the Execute Never (XN) region or an access violation to the Fault region.

An interrupt request is generated from an external interrupt pin or peripheral function. For interrupts that are used for releasing a standby mode, relevant settings must be made in the clock generator. For details, refer to "7.5 Interrupts".

(2) Exception detection

If multiple exceptions occur simultaneously, the CPU takes the exception with the highest priority.

Table 7-1 shows the priority of exceptions. "Configurable" means that you can assign a priority level to that exception. Memory Management, Bus Fault and Usage Fault exceptions can be enabled or disabled. If a disabled exception occurs, it is handled as Hard Fault.

Table 7-1 Exception Types and Priority

No.	Exception type	Priority	Description
1	Reset	~3 (highest)	Reset pin, POR, LVD, OFD, WDT or SYSRETRQ
2	Non-Maskable Interrupt	~2	$\overline{\text{NMI}}$ pin, WDT or LVD
3	Hard Fault	~1	Fault that cannot activate because a higher-priority fault is being handled or it is disabled
4	Memory Management	Configurable	Exception from the Memory Protection Unit (MPU) (Note 1) Instruction fetch from the Execute Never (XN) region
5	Bus Fault	Configurable	Access violation to the Hard Fault region of the memory map
6	Usage Fault	Configurable	Undefined instruction execution or other faults related to instruction execution
7 to 10	Reserved	–	
11	SVCall	Configurable	System service call with SVC instruction
12	Debug Monitor	Configurable	Debug monitor when the CPU is not faulting
13	Reserved	–	
14	PendSV	Configurable	Pendable system service request
15	SysTick	Configurable	Notification from system timer
up to 16	External Interrupt	Configurable	External interrupt pin or peripheral function (Note 2)

Note 1: **This product does not contain the MPU.**

Note 2: **External interrupts have different sources and numbers in each product. For details, see "7.5.1.5 List of Interrupt Sources".**

### (3) Priority setting

- Priority levels

The external interrupt priority is set to the interrupt priority register and other exceptions are set to <PRI\_n> bit in the system handler priority register.

The configuration <PRI\_n> can be changed, and the number of bits required for setting the priority varies from 3 bits to 8 bits depending on products. Thus, the range of priority values you can specify is different depending on products.

In the case of 8-bit configuration, the priority can be configured in the range from 0 to 255. The highest priority is "0". If multiple elements with the same priority exist, the smaller the number, the higher the priority becomes.

Note: **<PRI\_n> bit is defined as a 3-bit configuration with this product.**

- Priority grouping

The priority group can be split into groups. By setting the <PRIGROUP> of the application interrupt and reset control register, <PRI\_n> can be divided into the pre-emption priority and the sub priority.

A priority is compared with the pre-emption priority. If the priority is the same as the pre-emption priority, then it is compared with the sub priority. If the sub priority is the same as the priority, the smaller the exception number, the higher the priority.

The Table 7-2 shows the priority group setting. The pre-emption priority and the sub priority in the table are the number in the case that <PRI\_n> is defined as an 8-bit configuration.

Table 7-2 Priority grouping setting

<PRIGROUP[2:0]> setting	<PRI_n[7:0]>		Number of pre-emption priorities	Number of sub-priorities
	Pre-emption field	Sub-priority field		
000	[7:1]	[0]	128	2
001	[7:2]	[1:0]	64	4
010	[7:3]	[2:0]	32	8
011	[7:4]	[3:0]	16	16
100	[7:5]	[4:0]	8	32
101	[7:6]	[5:0]	4	64
110	[7]	[6:0]	2	128
111	None	[7:0]	1	256

Note: If the configuration of <PRI\_n> is less than 8 bits, the lower bit is "0".  
For the example, in the case of 3-bit configuration, the priority is set as <PRI\_n[7:5]>  
and <PRI\_n[4:0]> is "00000".

7.1.2.2 Exception Handling and Branch to the Interrupt Service Routine (Pre-emption)

When an exception occurs, the CPU suspends the currently executing process and branches to the interrupt service routine. This is called "pre-emption".

(1) Stacking

When the CPU detects an exception, it pushes the contents of the following eight registers to the stack in the following order:

- Program Counter (PC)
- Program Status Register (xPSR)
- r0 - r3
- r12
- Link Register (LR)

The SP is decremented by eight words by the completion of the stack push. The following shows the state of the stack after the register contents have been pushed.

(2) Fetching an ISR

The CPU enables instruction to fetch the interrupt processing with data store to the register.

Prepare a vector table containing the top addresses of ISRs for each exception. After reset, the vector table is located at address 0x0000\_0000 in the Code area. By setting the Vector Table Offset Register, you can place the vector table at any address in the Code or SRAM space.

The vector table should also contain the initial value of the main stack.

### (3) Late-arriving

If the CPU detects a higher priority exception before executing the ISR for a previous exception, the CPU handles the higher priority exception first. This is called "late-arriving".

A late-arriving exception causes the CPU to fetch a new vector address for branching to the corresponding ISR, but the CPU does not newly push the register contents to the stack.

### (4) Vector table

The vector table is configured as shown below.

You must always set the first four words (stack top address, reset ISR address, NMI ISR address, and Hard Fault ISR address). Set ISR addresses for other exceptions if necessary.

Offset	Exception	Contents	Setting
0x00	Reset	Initial value of the main stack	Required
0x04	Reset	ISR address	Required
0x08	Non-Maskable Interrupt	ISR address	Required
0x0C	Hard Fault	ISR address	Required
0x10	Memory Management	ISR address	Optional
0x14	Bus Fault	ISR address	Optional
0x18	Usage Fault	ISR address	Optional
0x1C to 0x28	Reserved		
0x2C	SVCall	ISR address	Optional
0x30	Debug Monitor	ISR address	Optional
0x34	Reserved		
0x38	PendSV	ISR address	Optional
0x3C	SysTick	ISR address	Optional
0x40	External Interrupt	ISR address	Optional

#### 7.1.2.3 Executing an ISR

An ISR performs necessary processing for the corresponding exception. ISRs must be prepared by the user.

An ISR may need to include code for clearing the interrupt request so that the same interrupt will not occur again upon return to normal program execution.

For details about interrupt handling, see "7.5 Interrupts".

If a higher priority exception occurs during ISR execution for the current exception, the CPU abandons the currently executing ISR and services the newly detected exception.

#### 7.1.2.4 Exception exit

##### (1) Execution after returning from an ISR

When returning from an ISR, the CPU takes one of the following actions:

- Tail-chaining

If a pending exception exists and there are no stacked exceptions or the pending exception has higher priority than all stacked exceptions, the CPU returns to the ISR of the pending exception.

In this case, the CPU skips the pop of eight registers and push of eight registers when exiting one ISR and entering another. This is called "tail-chaining".

- Returning to the last stacked ISR

If there are no pending exceptions or if the highest priority stacked exception is of higher priority than the highest priority pending exception, the CPU returns to the last stacked ISR.

- Returning to the previous program

If there are no pending or stacked exceptions, the CPU returns to the previous program.

##### (2) Exception exit sequence

When returning from an ISR, the CPU performs the following operations:

- Pop eight registers

Pops the eight registers (PC, xPSR, r0 to r3, r12 and LR) from the stack and adjust the SP.

- Load current active interrupt number

Loads the current active interrupt number from the stacked xPSR. The CPU uses this to track which interrupt to return to.

- Select SP

If returning to an exception (Handler Mode), SP is SP\_main. If returning to Thread Mode, SP can be SP\_main or SP\_process.

## 7.2 Reset Exceptions

Reset exceptions are generated from the following sources.

Use the Reset Flag (CGRSTFLG) Register of the Clock Generator to identify the source of a reset.

- External reset pin

A reset exception occurs when an external reset pin changes from "Low" to "High".

- Reset exception by POR

The power on reset (POR) has a reset generating feature. For details, see the chapter on the POR.

- Reset exception by LVD

The low voltage detection circuit (LVD) has a reset generating feature. For details, see the chapter on the LVD.

- Reset exception by OFD

The oscillation frequency detector (OFD) has a reset generating feature. For details, see the chapter on the OFD.

- Reset exception by WDT

The watchdog timer (WDT) has a reset generating feature. For details, see the chapter on the WDT.

- Reset exception by SYSRESETREQ

A reset can be generated by setting the SYSRESETREQ bit in the NVIC's Application Interrupt and Reset Control Register.

## 7.3 Non-Maskable Interrupts (NMI)

Non-maskable interrupts are generated from the following three sources.

Use the NMI Flag (CGNMIFLG) Register of the clock generator to identify the source of a non-maskable interrupt.

- External  $\overline{\text{NMI}}$  pin

A non-maskable interrupt is generated when an external  $\overline{\text{NMI}}$  pin changes from "High" to "Low".

- Non-maskable interrupt by WDT

The watchdog timer (WDT) has a non-maskable interrupt generating feature. For details, see the chapter on the WDT.

- Non-maskable interrupt by LVD

The LVD has a non-maskable interrupt generating feature. For details, see the chapter on the LVD.

## 7.4 SysTick

SysTick provides interrupt features using the CPU's system timer.

When you set a value in the SysTick Reload Value Register and enable the SysTick features in the SysTick Control and Status Register, the counter loads with the value set in the Reload Value Register and begins counting down. When the counter reaches "0", a SysTick exception occurs. You may be pending exceptions and use a flag to know when the timer reaches "0".

The SysTick Calibration Value Register holds a reload value for counting 10 ms with the system timer. The count clock frequency varies with each product, and so the value set in the SysTick Calibration Value Register also varies with each product.

**Note:** In this product, fosc which is selected by CGOSCCR <OSCSEL> <EHOSCSEL> by 32 is used as external reference clock.

## 7.5 Interrupts

This chapter describes routes, sources and required settings of interrupts.

The CPU is notified of interrupt requests by the interrupt signal from each interrupt source.

It sets priority on interrupts and handles an interrupt request with the highest priority.

Interrupt requests for clearing a standby mode are notified to the CPU via the clock generator. Therefore, appropriate settings must be made in the clock generator.

### 7.5.1 Interrupt Sources

#### 7.5.1.1 Interrupt Route

Figure 7-1 shows an interrupt request route.

The interrupts issued by the peripheral function that is not used to release standby are directly input to the CPU (route 1).

The peripheral function interrupts used to release standby (route 2) and interrupts from the external interrupt pin (route 3) are input to the clock generator and are input to the CPU through the logic for releasing standby (route 4 and 5).

If interrupts from the external interrupt pins are not used to release standby, they are directly input to the CPU, not through the logic for standby release (route 6).

Figure 7-1 Interrupt Route

### 7.5.1.2 Generation

An interrupt request is generated from an external pin or peripheral function assigned as an interrupt source or by setting the NVIC's Interrupt Set-Pending Register.

- From external pin  
Set the port control register so that the external pin can perform as an interrupt function pin.
- From peripheral function  
Set the peripheral function to make it possible to output interrupt requests.  
See the chapter of each peripheral function for details.
- By setting Interrupt Set-Pending Register (forced pending)  
An interrupt request can be generated by setting the relevant bit of the Interrupt Set-Pending Register.

### 7.5.1.3 Transmission

An interrupt signal from an external pin or peripheral function is directly sent to the CPU unless it is used to exit a standby mode.

Interrupt requests from interrupt sources that can be used for clearing a standby mode are transmitted to the CPU via the clock generator. For these interrupt sources, appropriate settings must be made in the clock generator in advance. External interrupt sources not used for exiting a standby mode can be used without setting the clock generator.

### 7.5.1.4 Precautions when using external interrupt pins

If you use external interrupts, be aware the followings not to generate unexpected interrupts.

If input disabled ( $PxIE < PxIE = 0$ ), inputs from external interrupt pins are "High". Also, if external interrupts are not used as a trigger to release standby (route 6 of "Figure 7-1 Interrupt Route"), input signals from the external interrupt pins are directly sent to the CPU. Since the CPU recognizes "High" input as an interrupt, interrupts occur if corresponding interrupts are enabled by the CPU as inputs are being disabled.

To use the external interrupt without setting it as a standby trigger, set the interrupt pin input as "Low" and enable it. Then, enable interrupts on the CPU.

### 7.5.1.5 List of Interrupt Sources

Table 7-3 shows the list of interrupt sources.

Table 7-3 List of Interrupt Sources

No.	Interrupt Source		active level (Clearing standby)	CG interrupt mode control register
0	INT0	Interrupt pin 0	Selectable	CGIMCGA
1	INT1	Interrupt pin 1		
2	INT2	Interrupt pin 2		
3	INT3	Interrupt pin 3		
4	INT4	Interrupt pin 4		CGIMCGB
5	INT5	Interrupt pin 5		
6	INT6	Interrupt pin 6		
7	INT7	Interrupt pin 7		
8	INT8	Interrupt pin 8		CGIMCGC
9	INT9	Interrupt pin 9		
10	INTA	Interrupt pin A		
11	INTB	Interrupt pin B		
12	INTC	Interrupt pin C		
13	INTUSBDPON(INTD)	USB Device bus power (Interrupt pin D)	Selectable	CGIMCGD
14	Reserved	-		
15	Reserved	-		
16	INTRX0	Serial reception (channel 0)		
17	INTTX0	Serial transmission (channel 0)		
18	INTRX1	Serial reception (channel 1)		
19	INTTX1	Serial transmission (channel 1)		
20	INTRX2	Serial reception (channel 2)		
21	INTTX2	Serial transmission (channel 2)		
22	INTRX3	Serial reception (channel 3)

#### 7.5.1.6 Active level

The active level indicates which change in signal of an interrupt source triggers an interrupt. The CPU recognizes interrupt signals in "High" level as interrupt. Interrupt signals directly sent from peripheral functions to the CPU are configured to output "High" to indicate an interrupt request.

Active level is set to the clock generator for interrupts which can be a trigger to release standby. Interrupt requests from peripheral functions are set as rising-edge or falling-edge triggered. Interrupt requests from interrupt pins can be set as level-sensitive ("High" or "Low") or edge-triggered (rising or falling).

If an interrupt source is used for clearing a standby mode, setting the relevant clock generator register is also required. Enable the CGIMCGx<INTxEN> bit and specify the active level in the CGIMCGx<EMCGx> bits. You must set the active level for interrupt requests from each peripheral function as shown in Table 7-3.

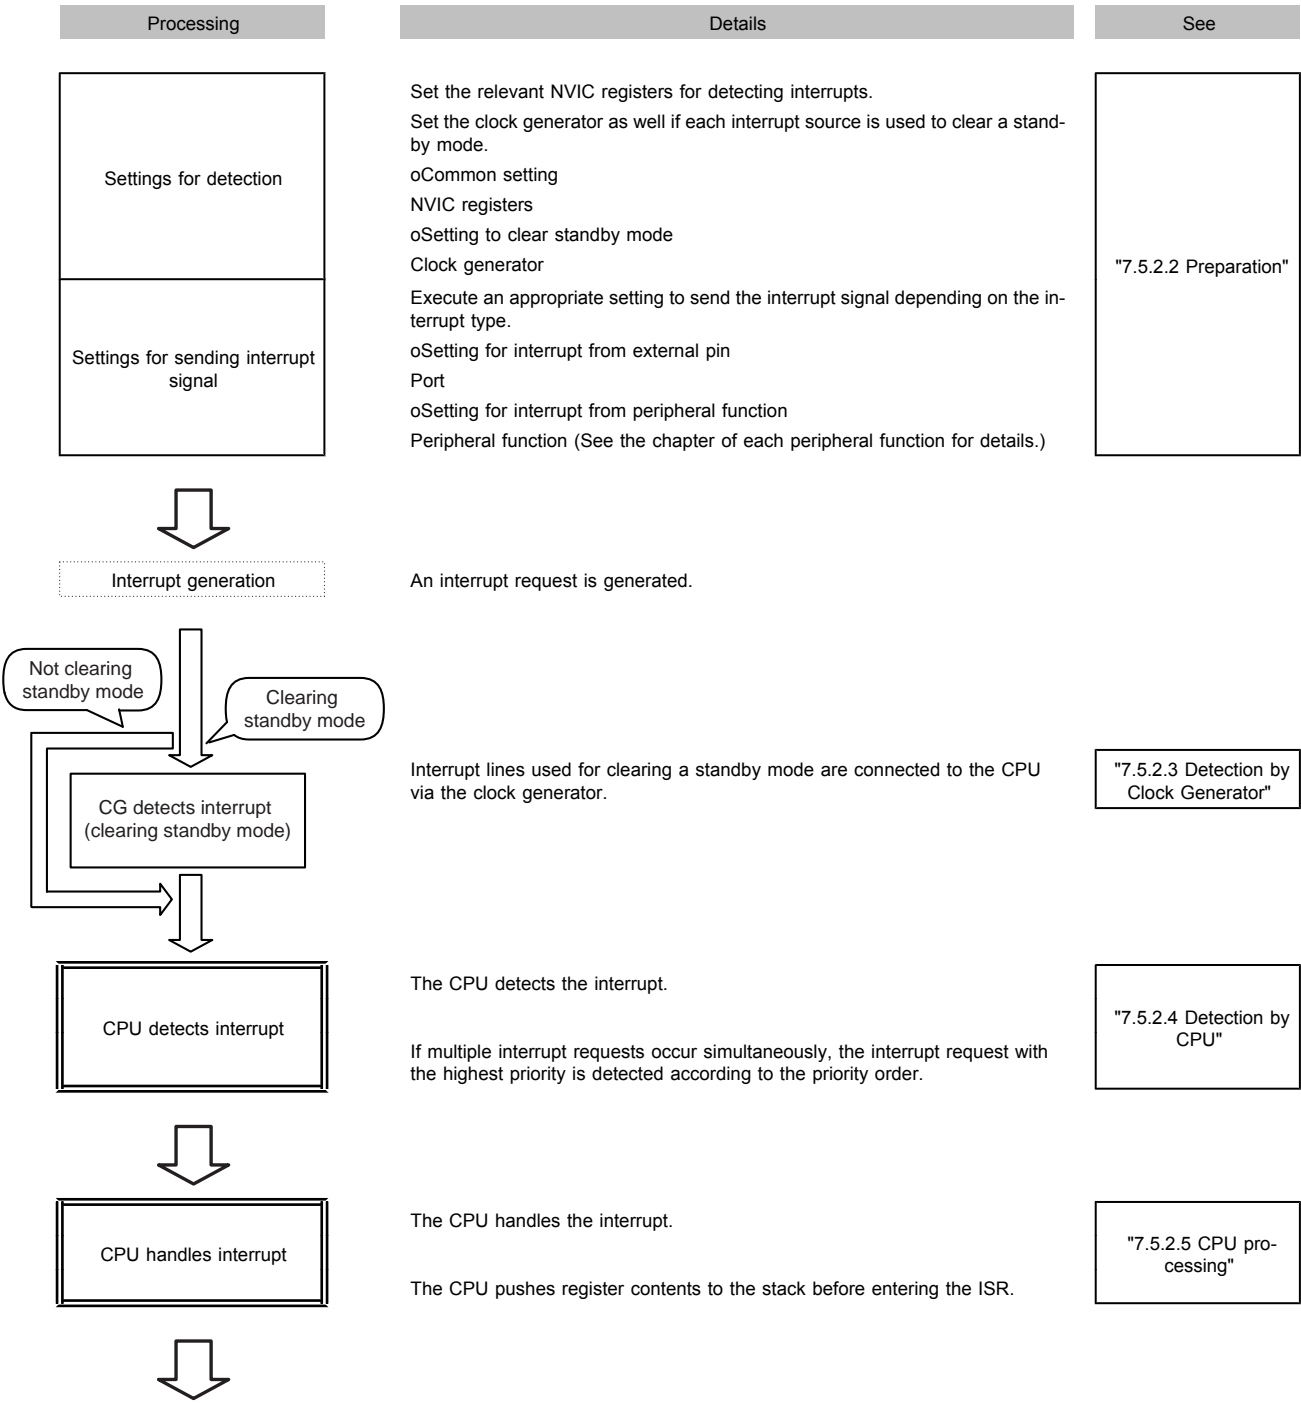

An interrupt request detected by the clock generator is notified to the CPU with a signal in "High" level.

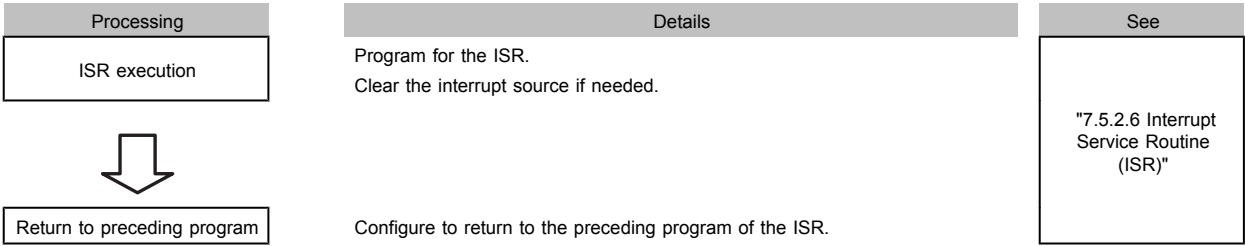

7.5.2 Interrupt Handling

7.5.2.1 Flowchart

The following shows how an interrupt is handled.

In the following descriptions,  indicates hardware handling.  indicates software handling.

7.5.2.2 Preparation

When preparing for an interrupt, you need to pay attention to the order of configuration to avoid any unexpected interrupt on the way.

Initiating an interrupt or changing its configuration must be implemented in the following order basically. Disable the interrupt by the CPU. Configure from the farthest route from the CPU. Then enable the interrupt by the CPU.

To configure the clock generator, you must follow the order indicated here not to cause any unexpected interrupt. First, configure the precondition. Secondly, clear the data related to the interrupt in the clock generator and then enable the interrupt.

The following sections are listed in the order of interrupt handling and describe how to configure them.

- 1. Disabling interrupt by CPU
- 2. CPU registers setting
- 3. Pre configuration (1) (Interrupt from external pin)
- 4. Pre configuration (2) (Interrupt from peripheral function)
- 5. Pre configuration (3) (Interrupt Set-Pending Register)
- 6. Configuring the clock generator
- 7. Enabling interrupt by CPU

(1) Disabling interrupt by CPU

To make the CPU for not accepting any interrupt, write "1" to the corresponding bit of the PRIMASK Register. All interrupts and exceptions other than non-maskable interrupts and hard faults can be masked.

Use "MSR" instruction to set this register.

Interrupt mask register		
PRIMASK	←	"1" (interrupt disabled)

Note 1: PRIMASK register cannot be modified by the user access level.  
Note 2: If a fault causes when "1" is set to the PRIMASK register, it is treated as a hard fault.

## (2) CPU registers setting

You can assign a priority level by writing to <PRI\_n> field in an Interrupt Priority Register of the NVIC register.

Each interrupt source is provided with eight bits for assigning a priority level from 0 to 255, but the number of bits actually used varies with each product. Priority level 0 is the highest priority level. If multiple sources have the same priority, the smallest-numbered interrupt source has the highest priority.

You can assign grouping priority by using the PRIGROUP field in the Application Interrupt and Reset Control Register.

NVIC register		
<PRI_n>	←	"priority"
<PRIGROUP>	←	"group priority"(This is configurable if required.)

Note: "n" indicates the corresponding exceptions/interrupts.

This product uses three bits for assigning a priority level.

## (3) Pre configuration (1) (Interrupt from external pin)

Set "1" to the port function register of the corresponding pin. Setting PxFRn[m] allows the pin to be used as the function pin. Setting PxIE[m] allows the pin to be used as the input port.

Port register		
PxFRn<PxIFn>	←	"1"
PxIE<PxIE>	←	"1"

Note: x: port number / m: corresponding bit / n: function register number

In modes other than STOP mode, setting PxIE to enable input enables the corresponding interrupt input regardless of the PxFR setting. Be careful not to enable interrupts that are not used. Also, be aware of the description of "7.5.1.4 Precautions when using external interrupt pins".

## (4) Pre configuration (2) (Interrupt from peripheral function)

The setting varies depending on the peripheral function to be used. See the chapter of each peripheral function for details.

## (5) Pre configuration (3) (Interrupt Set-Pending Register)

To generate an interrupt by using the Interrupt Set-Pending Register, set "1" to the corresponding bit of this register.

NVIC register		
Interrupt Set-Pending [m]	←	"1"

Note: m: corresponding bit

## (6) Configuring the clock generator

For an interrupt source to be used for exiting a standby mode, you need to set the active level and enable interrupts in the CGIMCG register of the clock generator. The CGIMCG register is capable of configuring each source.

Before enabling an interrupt, clear the corresponding interrupt request already held. This can avoid unexpected interrupt. To clear corresponding interrupt request, write a value corresponding to the interrupt to be used to the CGICRCG register. See "7.6.3.5 CGICRCG (CG Interrupt Request Clear Register)" for each value.

Interrupt requests from external pins can be used without setting the clock generator if they are not used for exiting a standby mode. However, an "High" pulse or "High"-level signal must be input so that the CPU can detect it as an interrupt request. Also, be aware of the description of "7.5.1.4 Precautions when using external interrupt pins".

Clock generator register		
CGIMCGn<EMCGm>	←	active level
CGICRCG<ICRCG>	←	Value corresponding to the interrupt to be used
CGIMCGn<INTmEN>	←	"1" (interrupt enabled)

Note: n: register number / m: number assigned to interrupt source

#### (7) Enabling interrupt by CPU

Enable the interrupt by the CPU as shown below.

Clear the suspended interrupt in the Interrupt Clear-Pending Register. Enable the intended interrupt with the Interrupt Set-Enable Register. Each bit of the register is assigned to a single interrupt source.

Writing "1" to the corresponding bit of the Interrupt Clear-Pending Register clears the suspended interrupt. Writing "1" to the corresponding bit of the Interrupt Set-Enable Register enables the intended interrupt.

To generate interrupts in the Interrupt Set-Pending Register setting, factors to trigger interrupts are lost if pending interrupts are cleared. Thus, this operation is not necessary.

At the end, PRIMASK register is zero cleared.

NVIC register		
Interrupt Clear-Pending [m]	←	"1"
Interrupt Set-Enable [m]	←	"1"
Interrupt mask register		
PRIMASK	←	"0"

Note 1: m : corresponding bit

Note 2: PRIMASK register cannot be modified by the user access level.

#### 7.5.2.3 Detection by Clock Generator

If an interrupt source is used for exiting a standby mode, an interrupt request is detected according to the active level specified in the clock generator, and is notified to the CPU.

An edge-triggered interrupt request, once detected, is held in the clock generator. A level-sensitive interrupt request must be held at the active level until it is detected, otherwise the interrupt request will cease to exist when the signal level changes from active to inactive.

When the clock generator detects an interrupt request, it keeps sending the interrupt signal in "High" level to the CPU until the interrupt request is cleared in the CG Interrupt Request Clear (CGICRCG) Register. If a standby mode is exited without clearing the interrupt request, the same interrupt will be detected again when normal operation is resumed. Be sure to clear each interrupt request in the ISR.

#### 7.5.2.4 Detection by CPU

The CPU detects an interrupt request with the highest priority.

#### 7.5.2.5 CPU processing

On detecting an interrupt, the CPU pushes the contents of PC, PSR, r0-r3, r12 and LR to the stack then enter the ISR.

#### 7.5.2.6 Interrupt Service Routine (ISR)

An ISR requires specific programming according to the application to be used. This section describes what is recommended at the service routine programming and how the source is cleared.

##### (1) Pushing during ISR

An ISR normally pushes register contents to the stack and handles an interrupt as required. The Cortex-M3 core automatically pushes the contents of PC, PSR, r0-r3, r12 and LR to the stack. No extra programming is required for them.

Push the contents of other registers if needed.

Interrupt requests with higher priority and exceptions such as NMI are accepted even when an ISR is being executed. We recommend you to push the contents of general-purpose registers that might be rewritten.

##### (2) Clearing an interrupt source

If an interrupt source is used for clearing a standby mode, each interrupt request must be cleared with the CG Interrupt Request Clear (CGICRCG) Register.

If an interrupt is set as edge-sensitive, clear an interrupt request by setting the corresponding value in the CGICRCG register. When an active edge occurs again, a new interrupt request will be detected.

If an interrupt source is set as level-sensitive, an interrupt request continues to exist until it is cleared at its source. Therefore, the interrupt source must be cleared. Clearing the interrupt source automatically clears the interrupt request signal from the clock generator.

## 7.6 Exception/Interrupt-Related Registers

The CPU's NVIC registers and clock generator registers described in this chapter are shown below with their respective addresses.

### 7.6.1 Register List

NVIC registers		Base Address = 0xE000_E000
Register name		Address
SysTick Control and Status Register		0x0010
SysTick Reload Value Register		0x0014
SysTick Current Value Register		0x0018
SysTick Calibration Value Register		0x001C
Interrupt Set-Enable Register 1		0x0100
Interrupt Set-Enable Register 2		0x0104
Interrupt Set-Enable Register 3		0x0108
Interrupt Set-Enable Register 4		0x010C
Interrupt Clear-Enable Register 1		0x0180
Interrupt Clear-Enable Register 2		0x0184
Interrupt Clear-Enable Register 3		0x0188
Interrupt Clear-Enable Register 4		0x018C
Interrupt Set-Pending Register 1		0x0200
Interrupt Set-Pending Register 2		0x0204
Interrupt Set-Pending Register 3		0x0208
Interrupt Set-Pending Register 4		0x020C
Interrupt Clear-Pending Register 1		0x0280
Interrupt Clear-Pending Register 2		0x0284
Interrupt Clear-Pending Register 3		0x0288
Interrupt Clear-Pending Register 4		0x028C
Interrupt Priority Register		0x0400 to 0x047F
Vector Table Offset Register		0x0D08
Application Interrupt and Reset Control Register		0x0D0C
System Handler Priority Register		0x0D18, 0x0D1C, 0x0D20
System Handler Control and State Register		0x0D24

Clock generator registers		Base Address = 0x400F_3000
Register name		Address
CG Interrupt Mode Control Register A	CGIMCGA	0x0040
CG Interrupt Mode Control Register B	CGIMCGB	0x0044
CG Interrupt Mode Control Register C	CGIMCGC	0x0048
CG Interrupt Mode Control Register D	CGIMCGD	0x004C
CG Interrupt Request Clear Register	CGICRCG	0x0060
Reset Flag Register	CGRSTFLG	0x0064
NMI Flag Register	CGNMIFLG	0x0068

## 7.6.2 NVIC Registers

### 7.6.2.1 SysTick Control and Status Register

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	COUNTFLAG
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	CLKSOURCE	TICKINT	ENABLE
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-17	-	R	Read as 0.
16	COUNTFLAG	R/W	0: Timer not counted to 0 1: Timer counted to 0 Returns "1" if timer counted to "0" since last time this was read. Clears on read of any part of the SysTick Control and Status Register.
15-3	-	R	Read as 0.
2	CLKSOURCE	R/W	0: External reference clock (fosc/32) 1: CPU clock (fsys)
1	TICKINT	R/W	0: Do not pend SysTick 1: Pend SysTick
0	ENABLE	R/W	0: Disable 1: Enable If "1" is set, it reloads with the value of the Reload Value Register and starts operation.

Note: In this product, fosc which is selected by CGOSCCR <OSCSEL> <EHOSCSEL> by 32 is used as external reference clock.

## 7.6.2.2 SysTick Reload Value Register

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	RELOAD							
After reset	Undefined							
	15	14	13	12	11	10	9	8
bit symbol	RELOAD							
After reset	Undefined							
	7	6	5	4	3	2	1	0
bit symbol	RELOAD							
After reset	Undefined							

Bit	Bit Symbol	Type	Function
31-24	-	R	Read as 0.
23-0	RELOAD	R/W	Reload value Set the value to load into the SysTick Current Value Register when the timer reaches "0".

## 7.6.2.3 SysTick Current Value Register

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	CURRENT							
After reset	Undefined							
	15	14	13	12	11	10	9	8
bit symbol	CURRENT							
After reset	Undefined							
	7	6	5	4	3	2	1	0
bit symbol	CURRENT							
After reset	Undefined							

Bit	Bit Symbol	Type	Function
31-24	-	R	Read as 0.
23-0	CURRENT	R/W	[Read] Current SysTick timer value [Write] Clear Writing to this register with any value clears it to 0. Clearing this register also clears the <COUNTFLAG> bit of the SysTick Control and Status Register.

## 7.6.2.4 SysTick Calibration Value Register

	31	30	29	28	27	26	25	24
bit symbol	NOREF	SKEW	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	TENMS							
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	TENMS							
After reset	0	0	0	0	1	1	0	0
	7	6	5	4	3	2	1	0
bit symbol	TENMS							
After reset	0	0	1	1	0	1	0	1

Bit	Bit Symbol	Type	Function
31	NOREF	R	0: Reference clock provided 1: No reference clock
30	SKEW	R	0: Calibration value is 10 ms. 1: Calibration value is not 10 ms.
29-24	-	R	Read as 0.
23-0	TENMS	R	Calibration value Reload value to use for 10 ms timing (0xC35) by external reference clock. (Note)

Note: In the case of multishot, please use <TENMS>-1.

## 7.6.2.5 Interrupt Set-Enable Register 1

	31	30	29	28	27	26	25	24
bit symbol	SETENA (Interrupt 31)	SETENA (Interrupt 30)	SETENA (Interrupt 29)	SETENA (Interrupt 28)	SETENA (Interrupt 27)	SETENA (Interrupt 26)	SETENA (Interrupt 25)	SETENA (Interrupt 24)
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	SETENA (Interrupt 23)	SETENA (Interrupt 22)	SETENA (Interrupt 21)	SETENA (Interrupt 20)	SETENA (Interrupt 19)	SETENA (Interrupt 18)	SETENA (Interrupt 17)	SETENA (Interrupt 16)
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	SETENA (Interrupt 13)	SETENA (Interrupt 12)	SETENA (Interrupt 11)	SETENA (Interrupt 10)	SETENA (Interrupt 9)	SETENA (Interrupt 8)
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	SETENA (Interrupt 7)	SETENA (Interrupt 6)	SETENA (Interrupt 5)	SETENA (Interrupt 4)	SETENA (Interrupt 3)	SETENA (Interrupt 2)	SETENA (Interrupt 1)	SETENA (Interrupt 0)
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-16	SETENA	R/W	<p>Interrupt number [31:16]</p> <p>[Write] 1: Enable</p> <p>[Read] 0: Disabled 1: Enabled</p> <p>Each bit corresponds to the specified number of interrupts. Writing "1" to a bit in this register enables the corresponding interrupt. Writing "0" has no effect. Reading the bits can see the enable/disable condition of the corresponding interrupts.</p>
15-14	-	R/W	Write as "0".
13-0	SETENA	R/W	<p>Interrupt number [13:0]</p> <p>[Write] 1: Enable</p> <p>[Read] 0: Disabled 1: Enabled</p> <p>Each bit corresponds to the specified number of interrupts. Writing "1" to a bit in this register enables the corresponding interrupt. Writing "0" has no effect. Reading the bits can see the enable/disable condition of the corresponding interrupts.</p>

Note: For descriptions of interrupts and interrupt numbers, see Section "7.5.1.5 List of Interrupt Sources".

## 7.6.2.6 Interrupt Set-Enable Register 2

	31	30	29	28	27	26	25	24
bit symbol	SETENA (Interrupt 63)	SETENA (Interrupt 62)	SETENA (Interrupt 61)	SETENA (Interrupt 60)	SETENA (Interrupt 59)	SETENA (Interrupt 58)	SETENA (Interrupt 57)	SETENA (Interrupt 56)
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	SETENA (Interrupt 55)	SETENA (Interrupt 54)	-	-	-	SETENA (Interrupt 50)	SETENA (Interrupt 49)	SETENA (Interrupt 48)
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	SETENA (Interrupt 47)	SETENA (Interrupt 46)	SETENA (Interrupt 45)	SETENA (Interrupt 44)	SETENA (Interrupt 43)	SETENA (Interrupt 42)	SETENA (Interrupt 41)	SETENA (Interrupt 40)
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	SETENA (Interrupt 37)	SETENA (Interrupt 36)	SETENA (Interrupt 35)	SETENA (Interrupt 34)	SETENA (Interrupt 33)	SETENA (Interrupt 32)
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-22	SETENA	R/W	Interrupt number [63:54] [Write] 1: Enable [Read] 0: Disabled 1: Enable Each bit corresponds to the specified number of interrupts. Writing "1" to a bit in this register enables the corresponding interrupt. Writing "0" has no effect. Reading the bits can see the enable/disable condition of the corresponding interrupts.
21-19	-	R/W	Write as "0".
18-8	SETENA	R/W	Interrupt number [50:40] [Write] 1: Enable [Read] 0: Disabled 1: Enable Each bit corresponds to the specified number of interrupts. Writing "1" to a bit in this register enables the corresponding interrupt. Writing "0" has no effect. Reading the bits can see the enable/disable condition of the corresponding interrupts.
7-6	-	R/W	Write as "0".
5-0	SETENA	R/W	Interrupt number [37:32] [Write] 1: Enable [Read] 0: Disabled 1: Enable Each bit corresponds to the specified number of interrupts. Writing "1" to a bit in this register enables the corresponding interrupt. Writing "0" has no effect. Reading the bits can see the enable/disable condition of the corresponding interrupts.

Note: For descriptions of interrupts and interrupt numbers, see Section "7.5.1.5 List of Interrupt Sources".

**Note:** For descriptions of interrupts and interrupt numbers, see Section "7.5.1.5 List of Interrupt Sources".

## 7.6.2.21 Interrupt Priority Register

Each interrupt is provided with eight bits of an Interrupt Priority Register.

The following shows the addresses of the Interrupt Priority Registers corresponding to interrupt numbers.

	31	24 23	16 15	8 7	0
0xE000_E400	PRI_3	PRI_2	PRI_1	PRI_0	
0xE000_E404	PRI_7	PRI_6	PRI_5	PRI_4	
0xE000_E408	PRI_11	PRI_10	PRI_9	PRI_8	
0xE000_E40C	Reserved	Reserved	PRI_13	PRI_12	
0xE000_E410	PRI_19	PRI_18	PRI_17	PRI_16	
0xE000_E414	PRI_23	PRI_22	PRI_21	PRI_20	
0xE000_E418	PRI_27	PRI_26	PRI_25	PRI_24	
0xE000_E41C	PRI_31	PRI_30	PRI_29	PRI_28	
0xE000_E420	PRI_35	PRI_34	PRI_33	PRI_32	
0xE000_E424	Reserved	Reserved	PRI_37	PRI_36	
0xE000_E428	PRI_43	PRI_42	PRI_41	PRI_40	
0xE000_E42C	PRI_47	PRI_46	PRI_45	PRI_44	
0xE000_E430	Reserved	PRI_50	PRI_49	PRI_48	
0xE000_E434	PRI_55	PRI_54	Reserved	Reserved	
0xE000_E438	PRI_59	PRI_58	PRI_57	PRI_56	
0xE000_E43C	PRI_63	PRI_62	PRI_61	PRI_60	
0xE000_E440	PRI_67	PRI_66	PRI_65	PRI_64	
0xE000_E444	PRI_71	PRI_70	PRI_69	PRI_68	
0xE000_E448	PRI_75	PRI_74	PRI_73	PRI_72	
0xE000_E44C	PRI_79	PRI_78	PRI_77	PRI_76	
0xE000_E450	PRI_83	PRI_82	PRI_81	PRI_80	
0xE000_E454	PRI_87	Reserved	Reserved	PRI_84	
0xE000_E458	PRI_91	PRI_90	Reserved	Reserved	
0xE000_E45C	Reserved	Reserved	PRI_93	PRI_92	
0xE000_E460	PRI_99	Reserved	Reserved	PRI_96	
0xE000_E464	PRI_103	PRI_102	PRI_101	PRI_100	
0xE000_E468	PRI_107	PRI_106	PRI_105	PRI_104	
0xE000_E46C	PRI_111	PRI_110	PRI_109	PRI_108	
0xE000_E470	PRI_115	PRI_114	PRI_113	PRI_112	
0xE000_E474	PRI_119	PRI_118	PRI_117	PRI_116	
0xE000_E478	PRI_123	PRI_122	PRI_121	PRI_120	
0xE000_E47C	PRI_127	PRI_126	PRI_125	PRI_124	

The number of bits to be used for assigning a priority varies with each product. This product uses three bits for assigning a priority.

The following shows the fields of the Interrupt Priority Registers for interrupt numbers 0 to 3. The Interrupt Priority Registers for all other interrupt numbers have the identical fields. Unused bits return "0" when read, and writing to unused bits has no effect.

	31	30	29	28	27	26	25	24
bit symbol	PRI_3			-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	PRI_2			-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	PRI_1			-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	PRI_0			-	-	-	-	-
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-29	PRI_3	R/W	Priority of interrupt number 3
28-24	-	R	Read as 0.
23-21	PRI_2	R/W	Priority of interrupt number 2
20-16	-	R	Read as 0.
15-13	PRI_1	R/W	Priority of interrupt number 1
12-8	-	R	Read as 0.
7-5	PRI_0	R/W	Priority of interrupt number 0
4-0	-	R	Read as 0.

## 7.6.2.22 Vector Table Offset Register

	31	30	29	28	27	26	25	24
bit symbol	TBLOFF							
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	TBLOFF							
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	TBLOFF							
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	TBLOFF	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-7	TBLOFF	R/W	Offset value Set the offset value from the top of the space specified in TBLBASE. The offset must be aligned based on the number of exceptions in the table. This means that the minimum alignment is 32 words that you can use for up to 16 interrupts. For more interrupts, you must adjust the alignment by rounding up to the next power of two.
6-0	-	R	Read as 0.

Note: <TBLOFF[31:30]> should be set to "00".

## 7.6.2.23 Application Interrupt and Reset Control Register

	31	30	29	28	27	26	25	24
bit symbol	VECTKEY/VECTKEYSTAT							
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	VECTKEY/VECTKEYSTAT							
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	ENDIANESS	-	-	-	-	PRIGROUP		
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	SYSRESET REQ	VECTCLR ACTIVE	VECTRESET
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-16	VECTKEY (Write)/ VECTKEY- STAT(Read)	R/W	Register key [Write] Writing to this register requires 0x5FA in the <VECTKEY> field. [Read] Read as 0xFA05.
15	ENDIANESS	R/W	Endianness bit:(Note1) 1: big endian 0: little endian
14-11	-	R	Read as 0.
10-8	PRIGROUP	R/W	Interrupt priority grouping 000: seven bits of pre-emption priority, one bit of sub-priority 001: six bits of pre-emption priority, two bits of sub-priority 010: five bits of pre-emption priority, three bits of sub-priority 011: four bits of pre-emption priority, four bits of sub-priority 100: three bits of pre-emption priority, five bits of sub-priority 101: two bits of pre-emption priority, six bits of sub-priority 110: one bit of pre-emption priority, seven bits of sub-priority 111: no pre-emption priority, eight bits of sub-priority The bit configuration to split the interrupt priority register <PRI_n> into pre-emption priority and sub priority.
7-3	-	R	Read as 0.
2	SYSRESET REQ	R/W	System Reset Request. 1=CPU outputs a SYSRESETREQ signal. (note2)
1	VECTCLR ACTIVE	R/W	Clear active vector bit 1: clear all state information for active NMI, fault, and interrupts 0: do not clear. This bit self-clears. It is the responsibility of the application to re initialize the stack.
0	VECTRESET	R/W	System Reset bit 1: reset system 0: do not reset system Resets the system, with the exception of debug components (FPB, DWT and ITM) by setting "1" and this bit is also zero cleared.

Note 1: **Little-endian is the default memory format for this product.**

Note 2: **When SYSRESETREQ is output, warm reset is performed on this product. <SYSRESETREQ> is cleared by warm reset.**

### 7.6.2.24 System Handler Priority Register

Each exception is provided with eight bits of a System Handler Priority Register.

The following shows the addresses of the System Handler Priority Registers corresponding to each exception.

	31	24 23	16 15	8 7	0
0xE000_ED18	PRI_7	PRI_6 (Usage Fault)	PRI_5 (Bus Fault)	PRI_4 (Memory Management)	
0xE000_ED1C	PRI_11 (SVCall)	PRI_10	PRI_9	PRI_8	
0xE000_ED20	PRI_15 (SysTick)	PRI_14 (PendSV)	PRI_13	PRI_12 (Debug Monitor)	

The number of bits to be used for assigning a priority varies with each product. This product uses three bits for assigning a priority.

The following shows the fields of the System Handler Priority Registers for Memory Management, Bus Fault and Usage Fault. Unused bits return "0" when read, and writing to unused bits has no effect.

	31	30	29	28	27	26	25	24
bit symbol	PRI_7			-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	PRI_6			-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	PRI_5			-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	PRI_4			-	-	-	-	-
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-29	PRI_7	R/W	Reserved
28-24	-	R	Read as 0.
23-21	PRI_6	R/W	Priority of Usage Fault
20-16	-	R	Read as 0.
15-13	PRI_5	R/W	Priority of Bus Fault
12-8	-	R	Read as 0.
7-5	PRI_4	R/W	Priority of Memory Management
4-0	-	R	Read as 0.

## 7.6.2.25 System Handler Control and State Register

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	USGFAULT ENA	BUSFAULT ENA	MEMFAULT ENA
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	SVCALL PENDE	BUSFAULT PENDE	MEMFAULT PENDE	USGFAULT PENDE	SYSTICKACT	PENDSVACT	-	MONITOR ACT
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	SVCALLACT	-	-	-	USGFAULT ACT	-	BUSFAULT ACT	MEMFAULT ACT
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-19	-	R	Read as 0.
18	USGFAULT ENA	R/W	Usage Fault 0: Disabled 1: Enable
17	BUSFAUL TENA	R/W	Bus Fault 0: Disabled 1: Enable
16	MEMFAULT ENA	R/W	Memory Management 0: Disabled 1: Enable
15	SVCALL PENDE	R/W	SVCall 0: Not pended 1: Pended
14	BUSFAULT PENDE	R/W	Bus Fault 0: Not pended 1: Pended
13	MEMFAULT PENDE	R/W	Memory Management 0: Not pended 1: Pended
12	USGFAULT PENDE	R/W	Usage Fault 0: Not pended 1: Pended
11	SYSTICKACT	R/W	SysTick 0: Inactive 1: Active
10	PENDSVACT	R/W	PendSV 0: Inactive 1: Active
9	-	R	Read as 0.
8	MONITORACT	R/W	Debug Monitor 0: Inactive 1: Active
7	SVCALLACT	R/W	SVCall 0: Inactive 1: Active
6-4	-	R	Read as 0.

Bit	Bit Symbol	Type	Function
3	USGFAULT ACT	R/W	Usage Fault 0: Inactive 1: Active
2	–	R	Read as 0.
1	BUSFAULT ACT	R/W	Bus Fault 0: Inactive 1: Active
0	MEMFAULT ACT	R/W	Memory Management 0: Inactive 1: Active

Note: You must clear or set the active bits with extreme caution because clearing and setting these bits does not repair stack contents.

### 7.6.3 Clock generator registers

#### 7.6.3.1 CGIMCGA(CG Interrupt Mode Control Register A)

	31	30	29	28	27	26	25	24
bit symbol	-	EMCG3				EMST3		-
After reset	0	0	1	0	0	0	undefined	0
	23	22	21	20	19	18	17	16
bit symbol	-	EMCG2				EMST2		-
After reset	0	0	1	0	0	0	undefined	0
	15	14	13	12	11	10	9	8
bit symbol	-	EMCG1				EMST1		-
After reset	0	0	1	0	0	0	undefined	0
	7	6	5	4	3	2	1	0
bit symbol	-	EMCG0				EMST0		-
After reset	0	0	1	0	0	0	undefined	0

Bit	Bit Symbol	Type	Function
31	-	R	Read as 0.
30-28	EMCG3[2:0]	R/W	active level setting of INT3 standby clear request. (101 to 111: setting prohibited) 000: "Low" level 001: "High" level 010: Falling edge 011: Rising edge 100: Both edges
27-26	EMST3[1:0]	R	active level of INT3 standby clear request 00: - 01: Rising edge 10: Falling edge 11: Both edges
25	-	R	Reads as undefined.
24	INT3EN	R/W	INT3 clear input 0: Disable 1: Enable
23	-	R	Read as 0.
22-20	EMCG2[2:0]	R/W	active level setting of INT2 standby clear request. (101 to 111: setting prohibited) 000: "Low" level 001: "High" level 010: Falling edge 011: Rising edge 100: Both edges
19-18	EMST2[1:0]	R	active level of INT2 standby clear request 00: - 01: Rising edge 10: Falling edge 11: Both edges
17	-	R	Reads as undefined.
16	INT2EN	R/W	INT2 clear input 0: Disable 1: Enable
15	-	R	Read as 0.

Bit	Bit Symbol	Type	Function
14-12	EMCG1[2:0]	R/W	active level setting of INT1 standby clear request. (101 to 111: setting prohibited) 000: "Low" level 001: "High" level 010: Falling edge 011: Rising edge 100: Both edges
11-10	EMST1[1:0]	R	active level of INT1 standby clear request 00: – 01: Rising edge 10: Falling edge 11: Both edges
9	–	R	Reads as undefined.
8	INT1EN	R/W	INT1 clear input 0: Disable 1: Enable
7	–	R	Read as 0.
6-4	EMCG0[2:0]	R/W	active level setting of INT0 standby clear request. (101 to 111: setting prohibited) 000: "Low" level 001: "High" level 010: Falling edge 011: Rising edge 100: Both edges
3-2	EMST0[1:0]	R	active level of INT0 standby clear request 00: – 01: Rising edge 10: Falling edge 11: Both edges
1	–	R	Reads as undefined.
0	INT0EN	R/W	INT0 clear input 0: Disable 1: Enable

Note 1: <EMSTx> is effective only when <EMCGx[2:0]> is set to "100" for both rising and falling edge. The active level used for the reset of standby can be checked by referring <EMSTx>. If interrupts are cleared with the CGICRCG register, <EMSTx> is also cleared.

Note 2: Please specify the bit for the edge first and then specify the bit for the <INTxEN>. Setting them simultaneously is prohibited.

## 7.6.3.2 CGIMCGB(CG Interrupt Mode Control Register B)

	31	30	29	28	27	26	25	24
bit symbol	-	EMCG7				EMST7		-
After reset	0	0	1	0	0	0	undefined	0
	23	22	21	20	19	18	17	16
bit symbol	-	EMCG6				EMST6		-
After reset	0	0	1	0	0	0	undefined	0
	15	14	13	12	11	10	9	8
bit symbol	-	EMCG5				EMST5		-
After reset	0	0	1	0	0	0	undefined	0
	7	6	5	4	3	2	1	0
bit symbol	-	EMCG4				EMST4		-
After reset	0	0	1	0	0	0	undefined	0

Bit	Bit Symbol	Type	Function
31	-	R	Read as 0.
30-28	EMCG7[2:0]	R/W	active level setting of INT7 standby clear request. (101 to 111: setting prohibited) 000: "Low" level 001: "High" level 010: Falling edge 011: Rising edge 100: Both edges
27-26	EMST7[1:0]	R	active level of INT7 standby clear request 00: - 01: Rising edge 10: Falling edge 11: Both edges
25	-	R	Reads as undefined.
24	INT7EN	R/W	INT7 clear input 0: Disable 1: Enable
23	-	R	Read as 0.
22-20	EMCG6[2:0]	R/W	active level setting of INT6 standby clear request. (101 to 111: setting prohibited) 000: "Low" level 001: "High" level 010: Falling edge 011: Rising edge 100: Both edges
19-18	EMST6[1:0]	R	active level of INT6 standby clear request 00: - 01: Rising edge 10: Falling edge 11: Both edges
17	-	R	Reads as undefined.
16	INT6EN	R/W	INT6 clear input 0: Disable 1: Enable
15	-	R	Read as 0.
14-12	EMCG5[2:0]	R/W	active level setting of INT5 standby clear request. (101 to 111: setting prohibited) 000: "Low" level 001: "High" level 010: Falling edge 011: Rising edge 100: Both edges

Bit	Bit Symbol	Type	Function
11-10	EMST5[1:0]	R	active level of INT5 standby clear request 00: – 01: Rising edge 10: Falling edge 11: Both edges
9	–	R	Reads as undefined.
8	INT5EN	R/W	INT5 clear input 0: Disable 1: Enable
7	–	R	Read as 0.
6-4	EMCG4[2:0]	R/W	active level setting of INT4 standby clear request. (101 to 111: setting prohibited) 000: "Low" level 001: "High" level 010: Falling edge 011: Rising edge 100: Both edges
3-2	EMST4[1:0]	R	active level of INT4 standby clear request 00: – 01: Rising edge 10: Falling edge 11: Both edges
1	–	R	Reads as undefined.
0	INT4EN	R/W	INT4 clear input 0: Disable 1: Enable

Note 1: <EMSTx> is effective only when <EMCGx[2:0]> is set to "100" for both rising and falling edge. The active level used for the reset of standby can be checked by referring <EMSTx>. If interrupts are cleared with the CGICRCG register, <EMSTx> is also cleared.

Note 2: Please specify the bit for the edge first and then specify the bit for the <INTxEN>. Setting them simultaneously is prohibited.

## 7.6.3.3 CGIMCGC(CG Interrupt Mode Control Register C)

	31	30	29	28	27	26	25	24
bit symbol	-	EMCGB			EMSTB		-	INTBEN
After reset	0	0	1	0	0	0	undefined	0
	23	22	21	20	19	18	17	16
bit symbol	-	EMCGA			EMSTA		-	INTAEN
After reset	0	0	1	0	0	0	undefined	0
	15	14	13	12	11	10	9	8
bit symbol	-	EMCG9			EMST9		-	INT9EN
After reset	0	0	1	0	0	0	undefined	0
	7	6	5	4	3	2	1	0
bit symbol	-	EMCG8			EMST8		-	INT8EN
After reset	0	0	1	0	0	0	undefined	0

Bit	Bit Symbol	Type	Function
31	-	R	Read as 0.
30-28	EMCGB[2:0]	R/W	active level setting of INTB standby clear request. (101 to 111: setting prohibited) 000: "Low" level 001: "High" level 010: Falling edge 011: Rising edge 100: Both edges
27-26	EMSTB[1:0]	R	active level of INTB standby clear request 00: - 01: Rising edge 10: Falling edge 11: Both edges
25	-	R	Reads as undefined.
24	INTBEN	R/W	INTB clear input 0: Disable 1: Enable
23	-	R	Read as 0.
22-20	EMCGA[2:0]	R/W	active level setting of INTA standby clear request. (101 to 111: setting prohibited) 000: "Low" level 001: "High" level 010: Falling edge 011: Rising edge 100: Both edges
19-18	EMSTA[1:0]	R	active level of INTA standby clear request 00: - 01: Rising edge 10: Falling edge 11: Both edges
17	-	R	Reads as undefined.
16	INTAEN	R/W	INTA clear input 0: Disable 1: Enable
15	-	R	Read as 0.
14-12	EMCG9[2:0]	R/W	active level setting of INT9 standby clear request. (101 to 111: setting prohibited) 000: "Low" level 001: "High" level 010: Falling edge 011: Rising edge 100: Both edges

Bit	Bit Symbol	Type	Function
11-10	EMST9[1:0]	R	active level of INT9 standby clear request 00: – 01: Rising edge 10: Falling edge 11: Both edges
9	–	R	Reads as undefined.
8	INT9EN	R/W	INT9 clear input 0: Disable 1: Enable
7	–	R	Read as 0.
6-4	EMCG8[2:0]	R/W	active level setting of INT8 standby clear request. (101 to 111: setting prohibited) 000: "Low" level 001: "High" level 010: Falling edge 011: Rising edge 100: Both edges
3-2	EMST8[1:0]	R	active level of INT8 standby clear request 00: – 01: Rising edge 10: Falling edge 11: Both edges
1	–	R	Reads as undefined.
0	INT8EN	R/W	INT8 clear input 0: Disable 1: Enable

Note 1: <EMSTx> is effective only when <EMCGx[2:0]> is set to "100" for both rising and falling edge. The active level used for the reset of standby can be checked by referring <EMSTx>. If interrupts are cleared with the CGICRCG register, <EMSTx> is also cleared.

Note 2: Please specify the bit for the edge first and then specify the bit for the <INTxEN>. Setting them simultaneously is prohibited.

## 7.6.3.4 CGIMCGD(CG Interrupt Mode Control Register D)

	31	30	29	28	27	26	25	24
bit symbol	-	EMCGRMCRX				EMSTRMCRX		-
After reset	0	0	1	0	0	0	undefined	0
	23	22	21	20	19	18	17	16
bit symbol	-	EMCGRTC				EMSTRTC		-
After reset	0	0	1	0	0	0	undefined	0
	15	14	13	12	11	10	9	8
bit symbol	-	EMCGD				EMSTD		-
After reset	0	0	1	0	0	0	undefined	0
	7	6	5	4	3	2	1	0
bit symbol	-	EMCGUSBWKUP				EMSTUSBWKUP		-
After reset	0	0	1	0	0	0	undefined	0
bit symbol	-	EMCGUSBWKUP				EMSTUSBWKUP		-
After reset	0	0	1	0	0	0	undefined	0

Bit	Bit Symbol	Type	Function
31	-	R	Read as 0.
30-28	EMCGRMCRX[2:0]	R/W	active level setting of INTRMCRX standby clear request. (except below : setting prohibited) 011: Rising edge
27-26	EMSTRMCRX[1:0]	R	active level of INTRMCRX standby clear request 00: - 01: Rising edge 10: Falling edge 11: Both edges
25	-	R	Reads as undefined.
24	INTRMCRXEN	R/W	INTRMCRX clear input 0: Disable 1: Enable
23	-	R	Read as 0.
22-20	EMCGRTC[2:0]	R/W	active level setting of INTRTC standby clear request. (except below: setting prohibited) 010: Falling edge
19-18	EMSTRTC[1:0]	R	active level of INTRTC standby clear request 00: - 01: Rising edge 10: Falling edge 11: Both edges
17	-	R	Reads as undefined.
16	INTRTCEN	R/W	INTRTC clear input 0: Disable 1: Enable
15	-	R	Read as 0.
14-12	EMCGD[2:0]	R/W	active level setting of INTD standby clear request. (101 to 111: setting prohibited) 000: "Low" level 001: "High" level 010: Falling edge 011: Rising edge 100: Both edges
11-10	EMSTD[1:0]	R	active level of INTD standby clear request 00: - 01: Rising edge 10: Falling edge 11: Both edges
9	-	R	Reads as undefined.

Bit	Bit Symbol	Type	Function
8	INTDEN	R/W	INTD clear input 0: Disable 1: Enable
7	–	R	Read as 0.
6-4	EMCGUSB WKUP[2:0]	R/W	active level setting of INTUSBWKUP standby clear request. (101 to 111: setting prohibited) 000: "Low" level 001: "High" level 010: Falling edge 011: Rising edge 100: Both edges
3-2	EMSTUSB WKUP[1:0]	R	active level of INTUSBWKUP standby clear request 00: – 01: Rising edge 10: Falling edge 11: Both edges
1	–	R	Reads as undefined.
0	INTUSB WKUPEN	R/W	INTUSBWKUP clear input 0: Disable 1: Enable

Note 1: <EMSTx> is effective only when <EMCGx[2:0]> is set to "100" for both rising and falling edge. The active level used for the reset of standby can be checked by referring <EMSTx>. If interrupts are cleared with the CGICRCG register, <EMSTx> is also cleared.

Note 2: Please specify the bit for the edge first and then specify the bit for the <INTxEN>. Setting them simultaneously is prohibited.

## 7.6.3.5 CGICRCG(CG Interrupt Request Clear Register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	ICRCG				
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-5	-	R	Read as 0.
4-0	ICRCG[4:0]	W	Clear interrupt requests. 0_0000: INT0    0_1000: INT8 0_0001: INT1    0_1001: INT9 0_0010: INT2    0_1010: INTA 0_0011: INT3    0_1011: INTB 0_0100: INT4    0_1100: INTUSBWKUP 0_0101: INT5    0_1101: INTD 0_0110: INT6    0_1110: INTRTC 0_0111: INT7    0_1111: INTRMCRX 1_0000 to 1_1111: Reserved. Read as 0.

## 7.6.3.6 CGNMIFLG(NMI Flag Register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	NMIFLG3	NMIFLG2	NMIFLG1	NMIFLG0
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-4	-	R	Read as 0.
3	NMIFLG3	R	NMI source generation flag 0: not applicable 1: Only upper than the setting voltage when voltage decreasing.
2	NMIFLG2	R	NMI source generation flag 0: not applicable 1: Only lower than the setting voltage when voltage decreasing.
1	NMIFLG1	R	NMI source generation flag 0: not applicable 1: generated from $\overline{\text{NMI}}$ pin
0	NMIFLG0	R	NMI source generation flag 0: not applicable 1: generated from WDT

Note: <NMIFLG[3:0]> are cleared to "0" when they are read.

## 7.6.3.7 CGRSTFLG (Reset Flag Register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After power on reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After power on reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After Power on reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	LVDRSTF	OFDRSTF	DBGRSTF	STOP2RSTF	WDTRSTF	PINRSTF	PONRSTF
After power on reset	0	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	1

Bit	Bit Symbol	Type	Function
31-7	-	R	Read as 0.
6	LVDRSTF	R/W	LVD reset flag 0: "0" is written 1: Reset by LVD
5	OFDRSTF	R/W	OFD reset flag 0: "0" is written 1: Reset by OFD
4	DBGRSTF	R/W	Debug reset flag (Note2) 0: "0" is written 1: Reset from SYSRESETREQ
3	STOP2RSTF	R/W	STOP2 reset flag 0: "0" is written 1: Reset flag by STOP2 mode release
2	WDTRSTF	R/W	WDT reset flag 0: "0" is written 1: Reset from WDT
1	PINRSTF	R/W	RESET pin flag 0: "0" is written 1: Reset from $\overline{\text{RESET}}$ pin.
0	PONRSTF	R/W	Power on reset flag 0: "0" is written 1: Reset by Power On Reset

Note 1: The reset which is generated by application interrupt in NVIC of CPU and setting reset control register <SYSRESETREQ> is displayed.

Note 2: CGRSTFLG is not cleared automatically. Therefore, clear the corresponded bit to "0" to clear it.

Note 3: TMPM368FDXBG has a built-in power on reset circuit. <PONRSTF> is set to "1" after a power supply is turned on. After other reset is occurred, the corresponded reset flag is set to "1".

Note 4: After a power supply is turned on, the flag excepted <PONRSTF> is invalid.

## 8. $\mu$ DMA Controller ( $\mu$ DMAC)

### 8.1 Function Overview

#### 8.1.1 Function list

The main functions are shown below.

Table 8-1  $\mu$ DMA outline

Functions	Features		Outline
Channels	64 channels (2 units)		Unit A: 32 channels, Unit B: 32 channels
Start trigger	Hardware	Burst (continuous transfer)	DMA requests from peripheral functions
		Single (single transfer)	
	Software		Configuring using DMAxChnlSwRequest register
Priority	Between units	Unit A > Unit B	Hardware fixation
	Between channels	ch0 (high priority) > ... > ch31 (high priority) > ch0 (normal priority) > ... > ch31 (normal priority)	High-priority can be configured by DMAxChnlPriority-Set register
Transfer data size	8/16/32bit		
Address	Transfer source address	Increment / fixed	Transfer source address and destination address can be set to increment or fixed.
	transfer destination address	Increment / fixed	
The number of transfer	1 to 1024		
Transfer type	Peripheral circuits (register) $\rightarrow$ memory Memory $\rightarrow$ peripheral circuits (register) Memory $\rightarrow$ memory		If you select memory to memory, hardware start for DMA start up is not supported.
Interrupt function	Transfer end interrupt Error interrupt		
Transfer mode	Basic mode Automatic request mode Ping-pong mode Memory scatter / gather mode Peripheral scatter / gather mode		

Note: 1 word = 32bit

## 8.1.2 DMA requests

The below table shows DMA requests. The compositions of the unit A and the unit B are the same.

Table 8-2 DMA request list

ch	Hardware request (The request from the peripheral function connected to DMA)			Software request (Request setting register)		The interrupt request which DMA outputs	
	Factor	Burst	Single	0x4004_C014 (Unit A)	0x4004_D014 (Unit B)	No	Factor
0	ADC A Conversion End	o	–	bit0	bit0	100	INTDMAADA
1	ADC B Conversion End	o	–	bit1	bit1	101	INTDMAADB
2	DAC0 conversion trigger	–	o	bit2	bit2	102	INTDMADAA
3	DAC1 conversion trigger	–	o	bit3	bit3	103	INTDMADAB
4	SSP0 reception	o	o	bit4	bit4	104	INTDMASPR0
5	SSP0 transmission	o	o	bit5	bit5	105	INTDMASPT0
6	SSP1 reception	o	o	bit6	bit6	106	INTDMASPR1
7	SSP1 transmission	o	o	bit7	bit7	107	INTDMASPT1
8	SSP2 reception	o	o	bit8	bit8	108	INTDMASPR2
9	SSP2 transmission	o	o	bit9	bit9	109	INTDMASPT2
10	UART4 reception	o	o	bit10	bit10	110	INTDMAUTR0
11	UART4 transmission	o	o	bit11	bit11	111	INTDMAUTT0
12	UART5 reception	o	o	bit12	bit12	112	INTDMAUTR1
13	UART5 transmission	o	o	bit13	bit13	113	INTDMAUTT1
14	SIO/UART0 reception	o	–	bit14	bit14	114	INTDMARX0
15	SIO/UART0 transmission	o	–	bit15	bit15	115	INTDMATX0
16	SIO/UART1 reception	o	–	bit16	bit16	116	INTDMARX1
17	SIO/UART1 transmission	o	–	bit17	bit17	117	INTDMATX1
18	SIO/UART2 reception	o	–	bit18	bit18	118	INTDMARX2
19	SIO/UART2 transmission	o	–	bit19	bit19	119	INTDMATX2
20	SIO/UART3 reception	o	–	bit20	bit20	120	INTDMARX3
21	SIO/UART3 transmission	o	–	bit21	bit21	121	INTDMATX3
22	I2C/SIO0 receive / transmit	o	–	bit22	bit22	104	INTDMASPR0
23	I2C/SIO1 receive / transmit	o	–	bit23	bit23	122	INTDMASBI1
24	I2C/SIO2 receive / transmit	o	–	bit24	bit24	123	INTDMASBI2
25	TMRB0 compare match	o	–	bit25	bit25	124	INTDMATB
26	TMRB1 compare match	o	–	bit26	bit26		
27	TMRB2 compare match	o	–	bit27	bit27		
28	TMRB3 compare match	o	–	bit28	bit28		
29	TMRB4 compare match	o	–	bit29	bit29		
30	DMA request pin	o	–	bit30	bit30	125	INTDMARQ
31	–	–	–	bit31	bit31	–	–
						126	INTDMAAERR
						127	INTDMABERR

Note 1: After setting the units A and B as DMAxCfg = 0x00000001, DMAxChnlReqMaskSet = 0xFFFFFFFF and DMAxChnlEnableSet = 0xFFFFFFFF, the channel of the unit to be used is set as mask release (it is an applicable bit of DMAxChnlReqMaskClr "1"). However, please do not cancel the same factor by the unit A and B both.

Note 2: Interruption corresponding to each request factor of the software request and the hardware request generated by register setup of a notes relevance bit is outputted. The interruption factor list is a name corresponding to a hardware request. (see the table of the interruption factor list of exceptions chapters)

## 8.2 Block Diagram

The  $\mu$ DMA controller contains the following blocks.

- APB block  
This block controls the access to the control register.
- AHB block  
This block controls the bus cycle of the DMA transfer.
- DMA control block  
This block controls the whole operation of the DMA.

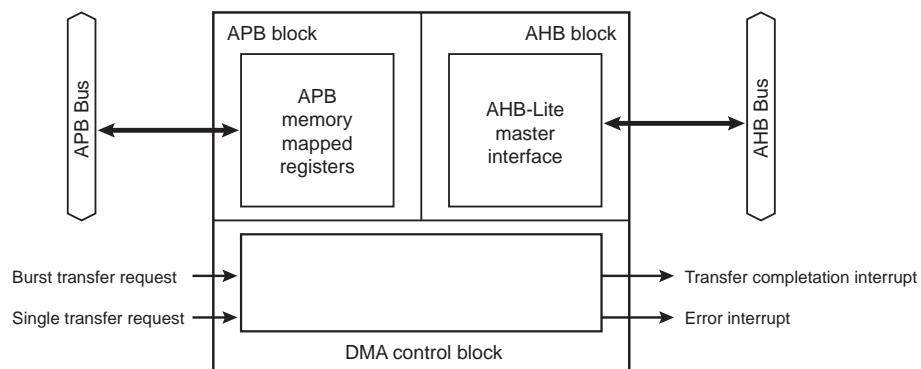

Figure 8-1  $\mu$ DMA Block Diagram (common to the Unit A and B)

## 8.3 Descriptions of Registers

### 8.3.1 Register list

The following lists the control registers and addresses.

Unit x	Base Address
Unit A	0x4004_C000
Unit B	0x4004_D000

Register names		Address (Base+)
DMA status Register	DMAxStatus	0x0000
DMA configuration Register	DMAxCfg	0x0004
channel control data base pointer Register	DMAxCtrlBasePtr	0x0008
channel alternate control data base pointer Register	DMAxAltCtlBasePtr	0x000C
reserved	-	0x0010
channel software request Register	DMAxChnlSwRequest	0x0014
channel useburst set Register	DMAxChnlUseburstSet	0x0018
channel useburst clear Register	DMAxChnlUseburstClr	0x001C
channel request mask set Register	DMAxChnlReqMaskSet	0x0020
channel request mask clear Register	DMAxChnlReqMaskClr	0x0024
channel enable set Register	DMAxChnlEnableSet	0x0028
channel enable clear Register	DMAxChnlEnableClr	0x002C
channel primary-alternate set Register	DMAxChnlPriAltSet	0x0030
channel primary-alternate clear Register	DMAxChnlPriAltClr	0x0034
channel priority set Register	DMAxChnlPrioritySet	0x0038
channel priority clear Register	DMAxChnlPriorityClr	0x003C
reserved	-	0x0040 - 0x004B
Bus error clear Register	DMAxErrClr	0x004C
reserved	-	0x0050 - 0x0FFF

Note 1: Access the registers by using word (32 bit) reads and word writes.

Note 2: Access to the "Reserved" address is prohibited.

## 8.3.2 DMAxStatus (DMA Status Register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	1	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	1	1	1	1	1
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	-	-	master_ enable
After reset	Undefined	Undefined	Undefined	Undefined	0	0	0	0

Bit	Bit Symbol	Type	Functions
31-29	-	R	Read as zero.
28	-	R	Read as one.
27-21	-	R	Read as zero.
20-16	-	R	Read as one.
15-8	-	R	Read as zero.
7-4	-	R	Read as undefined value.
3-1	-	R	Read as zero.
0	master_enable	R	DMA operation 0: Disabled 1: Enabled

## 8.3.3 DMAxCfg (DMA Configuration Register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	-	-	master_ enable
After reset	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined

Bit	Bit Symbol	Type	Function
31-1	-	W	Write zero.
0	master_ enable	W	DMA operation 0: Disabled 1: Enabled

## 8.3.4 DMAxCtrlBasePtr (Channel control data base pointer Register)

	31	30	29	28	27	26	25	24
bit symbol	ctrl_base_ptr							
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	ctrl_base_ptr							
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	ctrl_base_ptr							-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-10	ctrl_base_ptr	R/W	Primary database pointer Specifies the base address of the primary data.
9-0	-	R	Read as zero.

## 8.3.5 DMAxAltCtrlBasePtr (Channel alternate control data base pointer Register)

	31	30	29	28	27	26	25	24
bit symbol	alt_ctrl_base_pt							
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	alt_ctrl_base_pt							
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	alt_ctrl_base_pt							
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	alt_ctrl_base_pt							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-0	alt_ctrl_base_pt	R	Alternative data base pointer. Reads the base address of the alternative data.

## 8.3.6 DMAxChnlSwRequest(Channel software request Register)

	31	30	29	28	27	26	25	24
bit symbol	chnl_sw_re quest (ch31)	chnl_sw_re quest (ch30)	chnl_sw_re quest (ch29)	chnl_sw_re quest (ch28)	chnl_sw_re quest (ch27)	chnl_sw_re quest (ch26)	chnl_sw_re quest (ch25)	chnl_sw_re quest (ch24)
After reset	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined
	23	22	21	20	19	18	17	16
bit symbol	chnl_sw_re quest (ch23)	chnl_sw_re quest (ch22)	chnl_sw_re quest (ch21)	chnl_sw_re quest (ch20)	chnl_sw_re quest (ch19)	chnl_sw_re quest (ch18)	chnl_sw_re quest (ch17)	chnl_sw_re quest (ch16)
After reset	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined
	15	14	13	12	11	10	9	8
bit symbol	chnl_sw_re quest (ch15)	chnl_sw_re quest (ch14)	chnl_sw_re quest (ch13)	chnl_sw_re quest (ch12q)	chnl_sw_re quest (ch11)	chnl_sw_re quest (ch10)	chnl_sw_re quest (ch9)	chnl_sw_re quest (ch8)
After reset	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined
	7	6	5	4	3	2	1	0
bit symbol	chnl_sw_re quest (ch7)	chnl_sw_re quest (ch6)	chnl_sw_re quest (ch5)	chnl_sw_re quest (ch4)	chnl_sw_re quest (ch3)	chnl_sw_re quest (ch2)	chnl_sw_re quest (ch1)	chnl_sw_re quest (ch0)
After reset	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined

Bit	Bit Symbol	Type	Function
31-0	chnl_sw_re quest	W	DMA request 0: Requests a transfer 1: Does not request a transfer Specifies transfer requests to the each channel.

## 8.3.7 DMAxChnlUseburstSet(Channel useburst set Register)

	31	30	29	28	27	26	25	24
bit symbol	chnl_useburst_set (ch31)	chnl_useburst_set (ch30)	chnl_useburst_set (ch29)	chnl_useburst_set (ch28)	chnl_useburst_set (ch27)	chnl_useburst_set (ch26)	chnl_useburst_set (ch25)	chnl_useburst_set (ch24)
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	chnl_useburst_set (ch23)	chnl_useburst_set (ch22)	chnl_useburst_set (ch21)	chnl_useburst_set (ch20)	chnl_useburst_set (ch19)	chnl_useburst_set (ch18)	chnl_useburst_set (ch17)	chnl_useburst_set (ch16)
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	chnl_useburst_set (ch15)	chnl_useburst_set (ch14)	chnl_useburst_set (ch13)	chnl_useburst_set (ch12)	chnl_useburst_set (ch11)	chnl_useburst_set (ch10)	chnl_useburst_set (ch9)	chnl_useburst_set (ch8)
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	chnl_useburst_set (ch7)	chnl_useburst_set (ch6)	chnl_useburst_set (ch5)	chnl_useburst_set (ch4)	chnl_useburst_set (ch3)	chnl_useburst_set (ch2)	chnl_useburst_set (ch1)	chnl_useburst_set (ch0)
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-0	chnl_useburst_set	R/W	<p>Single transfer disabled [ Write ] 1: Single transfer is disabled.</p> <p>[ Read ] 0: Single transfer enabled 1: Single transfer disabled.</p> <p>Each bit corresponds to the channels in specified numbers.</p> <p>Writing "1" disables the single transfer to the corresponding channel, and only burst transfer request becomes valid. Writing "0" is invalid. Set the DMAxChnlUseburstClr register in order to cancel the disabled single transfer.</p> <p>The enable / disable state of the corresponding bit can be confirmed by reading the bit.</p> <p>Bits are automatically set in the following condition:</p> <ul style="list-style-type: none"> <li>• This bit is zero cleared, if the number of remaining transfer is less than <math>2^R</math> times at the end of second <math>2^R</math> time transfer from the end ("R" is specified by the channel_cfg&lt;R_power&gt; of the control data).</li> <li>• If the channel_cfg&lt;next_useburst&gt; of the control data is set to "1" in the peripheral scatter / gather mode, this bit is set to "1" when the DMA transfer of the alternative data ends.</li> </ul>

Note: Do not set this bit to "1" if you do not use the burst transfer request in the condition that the number of transfer is less than  $2^R$  times.

## 8.3.8 DMAxChnlUseburstClr(Channel useburst clear Register)

	31	30	29	28	27	26	25	24
bit symbol	chnl_useburst_clr (ch31)	chnl_useburst_clr (ch30)	chnl_useburst_clr (ch29)	chnl_useburst_clr (ch28)	chnl_useburst_clr (ch27)	chnl_useburst_clr (ch26)	chnl_useburst_clr (ch25)	chnl_useburst_clr (ch24)
After reset	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined
	23	22	21	20	19	18	17	16
bit symbol	chnl_useburst_clr (ch23)	chnl_useburst_clr (ch22)	chnl_useburst_clr (ch21)	chnl_useburst_clr (ch20)	chnl_useburst_clr (ch19)	chnl_useburst_clr (ch18)	chnl_useburst_clr (ch17)	chnl_useburst_clr (ch16)
After reset	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined
	15	14	13	12	11	10	9	8
bit symbol	chnl_useburst_clr (ch15)	chnl_useburst_clr (ch14)	chnl_useburst_clr (ch13)	chnl_useburst_clr (ch12)	chnl_useburst_clr (ch11)	chnl_useburst_clr (ch10)	chnl_useburst_clr (ch9)	chnl_useburst_clr (ch8)
After reset	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined
	7	6	5	4	3	2	1	0
bit symbol	chnl_useburst_clr (ch7)	chnl_useburst_clr (ch6)	chnl_useburst_clr (ch5)	chnl_useburst_clr (ch4)	chnl_useburst_clr (ch3)	chnl_useburst_clr (ch2)	chnl_useburst_clr (ch1)	chnl_useburst_clr (ch0)
After reset	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined

Bit	Bit Symbol	Type	Function
31-0	chnl_useburst_clr	W	<p>Single transfer enabled.</p> <p>1: Enables single transfer</p> <p>Each bit corresponds to the channels in specified numbers.</p> <p>Writing "1" enables the single transfer to the corresponding channel. Writing "0" is invalid.</p> <p>To disable or confirm signal transfer, configure the DMAxChnlUseburstSet register.</p>

## 8.3.9 DMAxChnlReqMaskSet(Channel request mask set Register)

	31	30	29	28	27	26	25	24
bit symbol	chnl_req_mas k_set (ch31)	chnl_req_mas k_set (ch30)	chnl_req_mas k_set (ch29)	chnl_req_mas k_set (ch28)	chnl_req_mas k_set (ch27)	chnl_req_mas k_set (ch26)	chnl_req_mas k_set (ch25)	chnl_req_mas k_set (ch24)
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	chnl_req_mas k_set (ch23)	chnl_req_mas k_set (ch22)	chnl_req_mas k_set (ch21)	chnl_req_mas k_set (ch20)	chnl_req_mas k_set (ch19)	chnl_req_mas k_set (ch18)	chnl_req_mas k_set (ch17)	chnl_req_mas k_set (ch16)
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	chnl_req_mas k_set (ch15)	chnl_req_mas k_set (ch14)	chnl_req_mas k_set (ch13)	chnl_req_mas k_set (ch12)	chnl_req_mas k_set (ch11)	chnl_req_mas k_set (ch10)	chnl_req_mas k_set (ch9)	chnl_req_mas k_set (ch8)
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	chnl_req_mas k_set (ch7)	chnl_req_mas k_set (ch6)	chnl_req_mas k_set (ch5)	chnl_req_mas k_set (ch4)	chnl_req_mas k_set (ch3)	chnl_req_mas k_set (ch2)	chnl_req_mas k_set (ch1)	chnl_req_mas k_set (ch0)
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-0	chnl_req_mask _set	R/W	<p>DMA request mask</p> <p>[ Write ]</p> <p>1: Mask a DMA request</p> <p>[ Read ]</p> <p>0: DMA request valid</p> <p>1: DMA request invalid</p> <p>Each bit corresponds to the channels in specified numbers.</p> <p>Writing "1" disables the single transfer to the corresponding channel. Writing "0" is invalid. To disable mask, configure the DMAxChnlReqMaskClr register.</p> <p>The status of DMA request mask valid / invalid can be confirmed by reading the bit.</p>

## 8.3.10 DMAxChnlReqMaskClr(Channel request mask clear Register)

	31	30	29	28	27	26	25	24
bit symbol	chnl_req_mas k_clr (ch31)	chnl_req_mas k_clr (ch30)	chnl_req_mas k_clr (ch29)	chnl_req_mas k_clr (ch28)	chnl_req_mas k_clr (ch27)	chnl_req_mas k_clr (ch26)	chnl_req_mas k_clr (ch25)	chnl_req_mas k_clr (ch24)
After reset	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined
	23	22	21	20	19	18	17	16
bit symbol	chnl_req_mas k_clr (ch23)	chnl_req_mas k_clr (ch22)	chnl_req_mas k_clr (ch21)	chnl_req_mas k_clr (ch20)	chnl_req_mas k_clr (ch19)	chnl_req_mas k_clr (ch18)	chnl_req_mas k_clr (ch17)	chnl_req_mas k_clr (ch16)
After reset	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined
	15	14	13	12	11	10	9	8
bit symbol	chnl_req_mas k_clr (ch15)	chnl_req_mas k_clr (ch14)	chnl_req_mas k_clr (ch13)	chnl_req_mas k_clr (ch12)	chnl_req_mas k_clr (ch11)	chnl_req_mas k_clr (ch10)	chnl_req_mas k_clr (ch9)	chnl_req_mas k_clr (ch8)
After reset	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined
	7	6	5	4	3	2	1	0
bit symbol	chnl_req_mas k_clr (ch7)	chnl_req_mas k_clr (ch6)	chnl_req_mas k_clr (ch5)	chnl_req_mas k_clr (ch4)	chnl_req_mas k_clr (ch3)	chnl_req_mas k_clr (ch2)	chnl_req_mas k_clr (ch1)	chnl_req_mas k_clr (ch0)
After reset	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined

Bit	Bit Symbol	Type	Function
31-0	chnl_req_mask _clr	W	<p>DMA request mask clear</p> <p>1: Clears the corresponding channel of the DMA request mask.</p> <p>Each bit corresponds to the channels in specified numbers.</p> <p>DMA request mask of the corresponding channel is cleared by writing "1". Writing "0" is invalid.</p> <p>Configure the DMAxChnlReqMaskSet register to enable and to confirm the function.</p>

## 8.3.11 DMAxChnlEnableSet(Channel enable set Register)

	31	30	29	28	27	26	25	24
bit symbol	chnl_enable_ set (ch31)	chnl_enable_ set (ch30)	chnl_enable_ set (ch29)	chnl_enable_ set (ch28)	chnl_enable_ set (ch27)	chnl_enable_ set (ch26)	chnl_enable_ set (ch25)	chnl_enable_ set (ch24)
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	chnl_enable_ set (ch23)	chnl_enable_ set (ch22)	chnl_enable_ set (ch21)	chnl_enable_ set (ch20)	chnl_enable_ set (ch19)	chnl_enable_ set (ch18)	chnl_enable_ set (ch17)	chnl_enable_ set (ch16)
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	chnl_enable_ set (ch15)	chnl_enable_ set (ch14)	chnl_enable_ set (ch13)	chnl_enable_ set (ch12)	chnl_enable_ set (ch11)	chnl_enable_ set (ch10)	chnl_enable_ set (ch9)	chnl_enable_ set (ch8)
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	chnl_enable_ set (ch7)	chnl_enable_ set (ch6)	chnl_enable_ set (ch5)	chnl_enable_ set (ch4)	chnl_enable_ set (ch3)	chnl_enable_ set (ch2)	chnl_enable_ set (ch1)	chnl_enable_ set (ch0)
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-0	chnl_enable_ set	R/W	<p>DMA operation</p> <p>[ Write ]</p> <p>1: Enable the corresponding channels.</p> <p>[ Read ]</p> <p>0: Corresponding bits are invalid.</p> <p>1: Corresponding bits are valid.</p> <p>Each bit corresponds to the channels in specified numbers.</p> <p>Writing "1" enables the corresponding channels. Writing "0" is invalid. To disable the setting, configure the DMAxChnlEnableClr register.</p> <p>The status of valid / invalid if the corresponding channels can be confirmed by reading.</p> <p>In the following conditions, the functions automatically becomes invalid.</p> <ul style="list-style-type: none"> <li>• DMA cycle end</li> <li>• If the channel_cfg&lt;cycle_ctrl&gt; reads the control data of "000".</li> <li>• A bus error occurs.</li> </ul>

## 8.4 Operation

This DMA is controlled by the channel control data, which locates on the memory. A channel of the each data is four words and allocated in the contiguous areas same as the number of channels.

There are two kinds of channel control data - primary data and alternative data. According to the operation mode, one of them is selected by setting the register or both data is used.

## 8.4.1 Channel control data memory map

Figure 8-2 shows the memory map of the channel control data.

Since the channel control data uses a 1KB area, the start address [9:0] of the channel control data must be set to 0x000.

Set the start address of the primary data to the DMAxCtrlBasePtr and the start address of the alternative data to the DMAxAltCtrlBasePtr.

Alternate Ch31	0x3F0	Primary Ch31	0x1F0
Alternate Ch30	0x3E0	Primary Ch30	0x1E0
Alternate Ch29	0x3D0	Primary Ch29	0x1D0

Source End Pointer	0x000

Figure 8-2 Memory Map of the Control Data

Figure 8-2 shows the memory map of which all 32 channels can be used. Necessary areas are determined by the number of usable channels. Table 8-3 shows the relationship between the number of channels and addresses.

Table 8-3 Address bit setting of channel control

Channel	Address						Settable base address	
	[9]	[8]	[7]	[6]	[5]	[4]		[3:0]
0	-	-	-	-	-	A	Channel control data setting	0xFFFF_XX00, 0xFFFF_XX20, 0xFFFF_XX40, 0xFFFF_XX60, 0xFFFF_XX80, 0xFFFF_XXA0, 0xFFFF_XXC0, 0xFFFF_XXE0
0 to 1	-	-	-	-	A	C[0]		0xFFFF_XX00, 0xFFFF_XX40, 0xFFFF_XX80, 0xFFFF_XXC0
0 to 3	-	-	-	A	C[1:0]			0xFFFF_XX00, 0xFFFF_XX80
0 to 7	-	-	A	C[2:0]				0xFFFF_X000, 0xFFFF_X100, 0xFFFF_X200, 0xFFFF_X300, 0xFFFF_X400, 0xFFFF_X500, 0xFFFF_X600, 0xFFFF_X700, 0xFFFF_X800, 0xFFFF_X900, 0xFFFF_XA00, 0xFFFF_XB00, 0xFFFF_XC00, 0xFFFF_XD00, 0xFFFF_XE00, 0xFFFF_XF00
0 to 15	-	A	C[3:0]					0xFFFF_X000, 0xFFFF_X200, 0xFFFF_X400, 0xFFFF_X600, 0xFFFF_X800, 0xFFFF_XA00, 0xFFFF_XC00, 0xFFFF_XE00
0 to 31	A	C[4:0]						0xFFFF_X000, 0xFFFF_X400, 0xFFFF_X800, 0xFFFF_XC00

A: Primary/alternative setting (0:primary, 1:alternative)

C[x:0]: Channel number setting

8.4.2 Channel control data structure

The channel control data contains the three kinds of data shown below.

- The final address of the transfer source address
- The final address of the transfer destination address
- Control data

Each of these data is described below.

8.4.2.1 Final address of the transfer source data

Specifies the final address of the data to be transferred. The DMA calculates the start address of the source address using this data.

bit	bit symbol	Function
[31:0]	src_data_end_ptr	The final address of source transfer data

8.4.2.2 Final address of the transfer destination address

Specifies the final address of the destination address. The DMA calculates the start address of the destination address of the transfer destination address.

bit	bit symbol	Function
[31:0]	dst_data_end_ptr	The final address of the transfer destination address

8.4.2.3 Control data settings

bit	bit symbol	Function
[31:30]	dst_inc	Increment the transfer destination address (note 2) 00: 1 byte 01: 2 bytes 10: 4 bytes 11: Do not increment
[29:28]	dst_size	Data size of transfer destination (note1) 00: 1 byte 01: 2 bytes 10: 4 bytes 11: Reserved
[27:26]	src_inc	Increment the transfer source address (note 2) 00: 1 byte 01: 2 bytes 10: 4 bytes 11: Do not increment
[25:24]	src_size	Data size of transfer source (note 1) 00: 1 byte 01: 2 bytes 10: 4 bytes 11: Reserved
[23:18]	-	Set "000000".
[17:14]	R_power	Arbitration 0000: After one transfer 0001: After two transfers 0010: After four transfers 0011: After eight transfers 0100: After 16 transfers 0101: After 32 transfers 0110: After 64 transfers 0111: After 128 transfers 1000: After 256 transfers 1001: After 512 transfers 1010 - 1111: Do not arbitration  After the specified numbers of transfers, an existence of a transfer request is checked. If there is a high-priority request, the control is switched to high-priority channel.
[13:4]	n_minus_1	The number of transfers 0x000: Once 0x001: Twice 0x002: Three times : 0x3FF: 1024 times
[3]	next_useburst	Changes the setting of single transfer 0: Do not change the value of <chnl_useburst_set>. 1: Sets <chnl_useburst_set> to "1".  Specifies whether to set "1" to the <chnl_useburst_set> bit at the end of the DMA transfer using alternative data in the peripheral scatter/ gather mode.  Note) This bit <chnl_useburst_set> is zero cleared, if the number of remaining transfer is less than 2 <sup>R</sup> times at the end of second 2 <sup>R</sup> time transfer from the end ("R" is specified by the <R_power>). Setting this bit to "1" sets "1" to the <chnl_userburst_set>.
[2:0]	cycle_ctrl	Operation mode 000: Invalid. DMA stops the operation. 001: Basic mode 010: Automatic request mode 011: Ping-pong mode 100: Memory scatter / gather mode (primary data) 101: Memory scatter / gather mode (alternative data) 110: Peripheral memory scatter / gather mode (primary data) 111: Peripheral memory scatter / gather mode (alternative data)

Note 1: The setting value of  $\langle \text{dst\_size} \rangle$  must be the same as  $\langle \text{src\_size} \rangle$ .

Note 2: According to the settings of  $\langle \text{dst\_size} \rangle$  and  $\langle \text{src\_size} \rangle$ , the settings of  $\langle \text{dst\_inc} \rangle$  and  $\langle \text{src\_inc} \rangle$  are limited as shown below.

$\langle \text{src\_inc} \rangle / \langle \text{dst\_inc} \rangle$	$\langle \text{src\_size} \rangle / \langle \text{dst\_size} \rangle$		
	00 (1byte)	01 (2byte)	10 (4byte)
00(1byte)	o	-	-
01(2byte)	o	o	-
10(4byte)	o	o	o
No increments	o	o	o

### 8.4.3 Operation modes

This section describes the operation modes configured by  $\text{channel\_cfg} \langle \text{cycle\_ctrl} \rangle$  of the channel control data.

#### 8.4.3.1 Invalid setting

The DMA sets the operation mode invalid after the end of transfer. This operation prevents a transfer from being performed again. Also, the operation completes if an invalid data is read either in ping-pong mode, memory scatter / gather mode or peripheral scatter / gather mode.

#### 8.4.3.2 Basic mode

A transfer starts by receiving a transfer request.

An arbitration is performed for every transfer configured by  $\langle \text{R\_power} \rangle$ . If a higher-priority request exists, the DMA switches a channel. If a transfer request for the operating channel is received, the transfer is continued.

After performing transfers for the number of times specified by  $\langle \text{n\_minus\_1} \rangle$ , a transfer end interrupt is generated.

#### 8.4.3.3 Automatic request mode

A single transfer request stops the transfer in this mode.

A transfer request starts a transfer.

For every transfers configured by  $\langle \text{R\_power} \rangle$ , a channel is switched if a higher-priority request is received. If not, the transfer is continued.

After performing transfers for the number of times specified by  $\langle \text{n\_minus\_1} \rangle$ , a transfer end interrupt is generated.

#### 8.4.3.4 Ping-pong mode

In ping-pong mode, continuous DMA transfer is performed by switching primary data and alternative data. Reading a data that invalid ("000") is set to  $\langle \text{cycle\_ctrl} \rangle$  or setting the channel invalid stops the transfer operation and generates a transfer end interrupt.

## Preparation:

Prepare primary data and alternative data, and set "1" to the bits of the channels corresponding to both DMAxdma\_cfg<master\_enable> and DMAxchnl\_enable\_set.

## Task A: Primary data

<cycle\_ctrl[2:0]> = "011"

(ping-pong mode)

<R\_power[3:0]> = "0010"

(4 times)

<n\_minus\_1[9:0]> =

"00\_0000\_0101"

(6 times)

Receiving a transfer request, DMA performs a transfer four times and performs arbitration.

If there is no other high-priority requests, DMA performs remaining transfers twice toward a request for a transfer to the corresponding channels.

DMA generates a transfer end interrupt request and performs an arbitration.

After completing the Task A, a primary data for the Task C can be set.

## Task B: Alternative data

<cycle\_ctrl[2:0]> = "011"

<R\_powe[3:0]> = "0010"

(4 times)

<n\_minus\_1[9:0]> =

"00\_0000\_1011"

(12 times)

Receiving a transfer request, DMA performs a transfer four times and performs arbitration.

If there is no other high-priority requests, DMA performs transfers twice toward a request for a transfer to the corresponding channels.

DMA generates a transfer end interrupt request and performs an arbitration.

After completing the Task B, an alternative data for the Task D can be set.

## Task C: Primary data

<cycle\_ctrl[2:0]> = "011"

<R\_power[3:0]> = "0001"

(2 times)

<n\_minus\_1[9:0]> =

"00\_0000\_0001"

(2 times)

Receiving a transfer request, DMA performs a transfer twice and performs arbitration.

DMA generates a transfer end interrupt request and performs an arbitration.

After completing the Task C, an alternative data for the Task E can be set.

## Task D: Alternative data

<cycle\_ctrl[2:0]> = "011"

<R\_powe[3:0]> = "0010"

(4 times)

<n\_minus\_1[9:0]> =

"00\_0000\_0100"

(5 times)

Receiving a transfer request, DMA performs a transfer four times and performs arbitration.

If there is no other high-priority requests, DMA performs a transfer once toward a request for a transfer to the corresponding channels.

DMA generates a transfer end interrupt request and performs an arbitration.

## Task E: Primary data

<cycle\_ctrl[2:0]> = "011"

<R\_power[3:0]> = "0010"

(4 times)

<n\_minus\_1[9:0]> =

"00\_0000\_0110"

(7 times)

Receiving a transfer request, DMA performs a transfer four times and performs arbitration.

If there is no other high-priority requests, DMA performs transfers three times toward a request for a transfer to the corresponding channels.

DMA generates a transfer end interrupt request and performs an arbitration.

## Final: Alternative data

<cycle\_ctrl[2:0]> = "000"

(invalid)

Even receiving a transfer request, the operation stops because <cycle\_ctrl> is set to invalid.

(The operation can be also stopped by setting the <cycle\_ctrl> of the Task E to normal mode "001".)

#### 8.4.3.5 Memory scatter / gather mode

In memory scatter / gather mode, primary data is used in order to transfer data for alternative data.

Receiving a transfer request, the DMA transfers four alternative data using primary data. If there is no new requests, it starts data transferring using alternative data. Then, it keeps transferring alternative data using primary data and transfer using alternative data, until either invalid setting ("000") of the <cycle\_ctrl> or setting data of the basic mode ("001") is read. A new transfer request is not required during this period. After the transfer operation, an interrupt is generated.

The settings of the channel\_cfg of primary data must be configured as shown below.

Table 8-4 Setting values of Memory scatter / gather mode (Primary data)

bit	bit symbol	Setting values	Description
[31:30]	dst_inc	10	4-byte increment is specified for transfer destination address.
[29:28]	dst_size	10	4 bytes are specified as transfer destination address.
[27:26]	src_inc	10	4-byte increment is specified for transfer source address.
[25:24]	src_size	10	4 bytes are specified as transfer source address.
[17:14]	R_power	0010	4 is specified as arbitration cycle.
[13:4]	n_minus_1	N	The number of alternative task to be prepared $\times 4$ is specified.
[3]	next_useburst	0	"0" is specified in memory scatter / gather mode.
[2:0]	cycle_ctrl	100	Memory scatter / gather mode (Primary data) is specified. (note)

Note: If transfers in the number of transfers set to the <n\_minus\_1> completes, invalid data "000" is automatically set.

## Preparation:

Prepare primary data. Set "100" to <cycle\_ctrl[2:0]> and set four task data  $4 \times 4 = 16$  as the number of transfer <n\_minus\_1[9:0]>. Set alternative data for the task A,B,C and D to the memory location which is set to the <src\_data\_end\_ptr>.

Set "1" to bits of channels corresponding to DMAxdma\_cfg<master\_enable> and DMAxchnl\_enable\_set.

## Copy A: Primary data

<cycle\_ctrl[2:0]> = "100"  
(Memory scatter / gather mode)

<R\_power[3:0]> = "0010"  
(4 times)

<n\_minus\_1[9:0]> =  
"00\_0000\_1111"  
(16 times)

## Task A: Alternative data

<cycle\_ctrl[2:0]> = "100"  
<R\_power[3:0]> = "0010"  
(4 times)

<n\_minus\_1[9:0]> =  
"00\_0000\_0010"  
(3 times)

## Copy B: Primary data

## Task B: Alternative data

<cycle\_ctrl[2:0]> = "100"  
<R\_power[3:0]> = "0001"  
(2 times)

<n\_minus\_1[9:0]> =  
"00\_0000\_0111"  
(8 times)

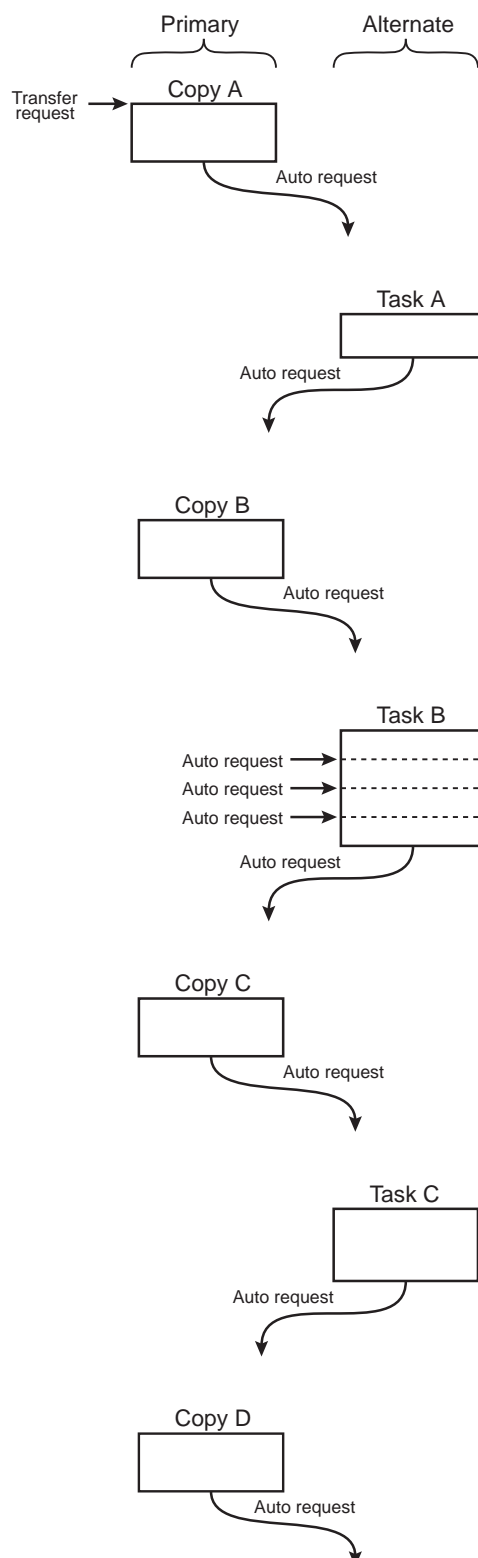

## Copy C: Primary data

## Task C: Alternative data

<cycle\_ctrl[2:0]> = "100"  
<R\_power[3:0]> = "0011"  
(8 times)

<n\_minus\_1[9:0]> =  
"00\_0000\_0100"  
(5 times)

## Copy D: Primary data

Receiving a transfer request, DMA performs a transfer for alternative data of the task A for four times.

After completing the transfer, a transfer request is automatically generated and arbitration starts.

DMA performs the task A.

After completing the transfer, a transfer request is automatically generated and arbitration starts.

DMA performs transfers for alternative data of the task B for four times.

After completing the transfer, a transfer request is automatically generated and arbitration starts.

DMA performs the task B.

After completing the transfer, a transfer request is automatically generated and arbitration starts.

DMA performs transfers for alternative data of the task C for four times.

After completing the transfer, a transfer request is automatically generated and arbitration starts.

DMA performs the task C.

After completing the transfer, a transfer request is automatically generated and arbitration starts.

DMA performs transfers for alternative data of the task D for four times. DMA also sets "000" to <cycle\_ctrl> of the primary data in order to set the next primary data invalid.

A transfer request is automatically generated and arbitration starts.

Task D: Alternative data  
<cycle\_ctrl[2:0]> = "001"  
<R\_power[3:0]> = "0010"  
(4 times)  
<n\_minus\_1[9:0]> =  
"00\_0000\_0011"  
(4 times)

DMA performs the task D.  
Since <cycle\_ctrl> is set to the basic mode "001",  
DMA generates a transfer end interrupt request af-  
ter the end of the transfer, and completes the opera-  
tion.

8.4.3.6 Peripheral scatter / gather mode

Primary data is used in order to transfer data for alternative data in the peripheral scatter / gather mode.

Receiving a transfer request, the DMA transfers four alternative data using primary data, and then starts transfer using alternative data.

After that, if a transfer request is generated, it starts alternative data transferring using primary data. Then, it keeps transferring alternative data using primary data and transfer using alternative data, until ei-  
ther invalid setting ("000") of the <cycle\_ctrl> or setting data of the basic mode ("001") is read. A new trans-  
fer request is not required during this period. After the transfer operation, an interrupt is generated.

The settings of the channel\_cfg of primary data must be configured as shown below.

Table 8-5 Fixed values in peripheral scatter / gather mode (Primary data)

bit	bit symbol	Setting value	Description
[31:30]	dst_inc	10	4-byte increment is specified for transfer destination ad- dress.
[29:28]	dst_size	10	4 bytes are specified as transfer destination address.
[27:26]	src_inc	10	4-byte increment is specified for transfer source address.
[25:24]	src_size	10	4 bytes are specified as transfer source address.
[17:14]	R_power	0010	
[13:4]	n_minus_1	N	The number of alternative task to be prepared ×4 is speci- fied.
[2:0]	cycle_ctrl	110	Specify peripheral scatter / gather mode (Primary data).

Note: If transfers in the number of transfers set to the <n\_minus\_1> completes, invalid data "000" is auto-  
matically set.

Preparation:  
Prepare primary data. Set "110" to <cycle\_ctrl[2:0]> and 4 × 4 =  
16 for four tasks to the number of transfers <n\_minus\_1[9:0]>.  
Set alternative data for the task A,B,C and D to the memory loca-  
tion which is set to the <src\_data\_end\_ptr>.  
Set "1" to bits of channels corresponding to DMAxdma\_cfg<mas-  
ter\_enable> and DMAxchnl\_enable\_set.

Copy A: Primary data  
<cycle\_ctrl[2:0]> = "110"  
(Peripheral scatter / gath-  
er)  
<R\_power[3:0]> = "0010"  
(4 times)  
<n\_minus\_1[9:0]> =  
"00\_0000\_1111"  
(16 times)

Receiving a transfer request, DMA performs trans-  
fers for alternative data of the task A for four times.  
After completing the transfer, operation automatical-  
ly moves on to the task A.

Task A: Alternative data

<cycle\_ctrl[2:0]> = "111"

<R\_power[3:0]> = "0010"

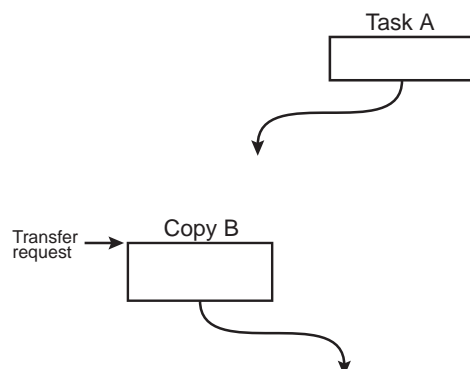

(4 times)

<n\_minus\_1[9:0]> =

"00\_0000\_0010"

(3 times)

Copy B: Primary data

Task B: Alternative data

<cycle\_ctrl[2:0]> = "111"

<R\_power[3:0]> = "0001"

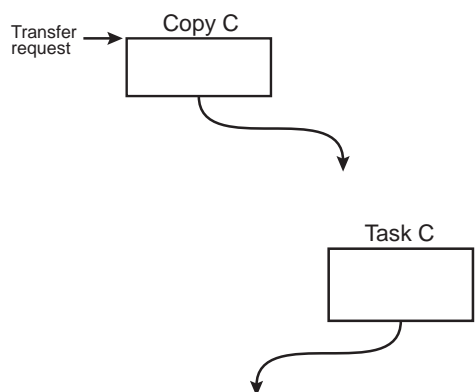

(2 times)

<n\_minus\_1[9:0]> =

"00\_0000\_0111"

(8 times)

Copy C: Primary data

Task C: Alternative data

<cycle\_ctrl[2:0]> = "111"

<R\_power[3:0]> = "0011"

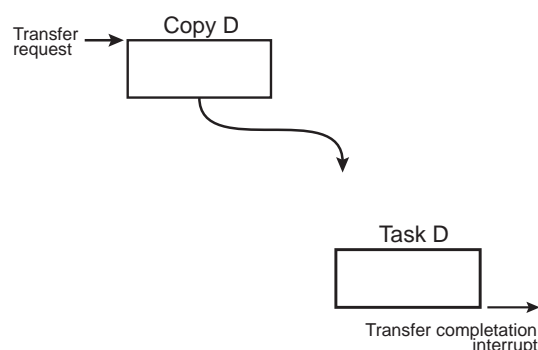

(8 times)

<n\_minus\_1[9:0]> =

"00\_0000\_0100"

(5 times)

Copy D: Primary data

Task D: Alternative data

<cycle\_ctrl[2:0]> = "001"

<R\_power[3:0]> = "0010"

(4 times)

<n\_minus\_1[9:0]> =

"00\_0000\_0011"

(4 times)

DMA performs the task A.

After completing the transfer, if a transfer request is sent from peripheral function and if it is high-priority request, the next operation starts.

DMA performs transfers for alternative data of the task B for four times.

After completing the transfer, processing of the task B automatically starts.

DMA performs the task B. Since an arbitration occurs every  $2^R$  times of transfers, three times of transfer is required at least to complete the task B.

After completing the transfer, if a transfer request is sent from peripheral function and if it is high-priority request, the next operation starts

DMA performs transfers for alternative data of the Task C for four times.

After completing the transfer, operation automatically moves on to the task C.

DMA performs the task C.

After completing the transfer, if a transfer request is sent from peripheral function and if it is high-priority request, the next operation starts.

DMA performs transfers for alternative data of the Task D for four times. Also, DMA performs transfers for alternative data for four times. Sets "000" to <cycle\_ctrl> of the primary data and makes the next primary data invalid.

The operation automatically moves on to the task D.

DMA performs the task D.

Since <cycle\_ctrl> is set to the basic mode "001", DMA generates a transfer end interrupt request after the end of the transfer, and completes the operation.

## 9. Input / OUtput port

### 9.1 Port Function

#### 9.1.1 Function List

TMPM368FDXBG has 60 ports. These ports are also used as input/output pins for built-in peripheral functions.

Table 9-1 show lists of port functions.

Table 9-1 List of Port Function

Port	Pin name	Input / Output	Programmable Pull-up Pull-down	Schmitt input	Noise filter	Program- mable Open-drain	Function pin
Port A							
	PA0	I/O	Pull-up Pull-down	o	-	o	TDO/SWV/DTR5

	PL3	I/O	Pull-up Pull-down	o	–	o	MTOUT01/MTTB1OUT/SCLK2/ CTS2

Note: The noise elimination width of the noise filter is approximately 30 ns under typical conditions.

### 9.1.2 Port Register General Description

When port registers are used, the following registers must be set.

- PxDATA: Port x data register  
This register reads/writes port data.
- PxCR: Port x output control register  
This register controls outputs.  
To enable/disable input with PxIE register.
- PxFRn: Port x function register n  
This register sets the functions.  
The assigned function can be enabled by setting "1".
- PxOD: Port x open-drain control register  
This register controls programmable open-drain outputs.  
Programmable open-drain outputs are set with PxOD. When output data is "1", output buffer is disabled and becomes a pseudo-open-drain output.
- PxPUP: Port x pull-up control register  
This register controls programmable pull-ups.
- PxPDN: Port x pull-down control register  
This register controls programmable pull-downs.
- PxIE: Port x input control register  
This register controls inputs.  
To prevent through-current, the initial state is disabled to input.

### 9.1.3 Port Status during STOP mode

The CGSTBYCR<DRVE> of the clock/mode control part controls inputs/outputs during STOP1 mode. The CGSTBYCR<PTKEEP> controls inputs/outputs during STOP2 mode as well.

While PxIE or PxCR is enabled, if <DRVE>="1" is set or <PTKEEP>="0" → "1" is set, inputs or outputs is disabled even during STOP1/STOP2 mode. When <DRVE> is set to "0", inputs or outputs is disabled during STOP1 mode except partial ports even PxIE or PxCR is enabled. When transferring the normal mode to the STOP2 mode, <PTKEEP> bit must be set to "0" → "1" to sustain the port status.

Table 9-2 shows pin status in the STOP mode

Table 9-2 Pin status in the STOP mode

Function setting	Function	Input/Output	STOP1 mode		STOP2 mode
			<DRVE> = 1	<DRVE> = 0	<PTKEEP> = 1
Port	PAx to PLx	Input	Setting with PxIE[m]	Disabled	Status is sustained.
		Output	Setting with PxCR[m]	Disabled	Status is sustained.
Debug function	TRST, TCKI, TMS, TDI, SWCLK, SWDI	Input	Setting with PxIE[m]		Status is sustained.
	TDO, SWDO, SWV, TRACECLK, TRACEDATA0/1/2/3	Output	Setting with PxCR[m] and it is enabled when data is valid		Status is sustained.
External interrupt	INT0 to C	Input	Setting with PxIE[m]		Status is sustained.
SSP	SPxCLK, SPxFSS, SPxDO	Output	Setting with PxCR[m] and it is enabled when data is valid	Disabled	Status is sustained.
MPT (PMDmode)	UO, VO, WO, XO, YO, ZO	Output	Setting with PxCR[m] and it is enabled when data is valid	Setting with PxCR[m] and it is enabled when data is valid.	Status is sustained.
MPT (IGBTmode)	MTOUTxx	Output	Setting with PxCR[m] and it is enabled when data is valid.	Setting with PxCR[m] and it is enabled when data is valid.	Status is sustained.
Other than the above function	Other than the above function	Input	Setting with PxIE[m]	Disabled	Status is sustained.
	Other than the above function	Output	Setting with PxCR[m]	Disabled	Status is sustained.

Note: In the above table, "x" indicates a specified port number; "m" indicates a specified bit; and "n" indicates function register numbers.

#### 9.1.4 Precaution on exiting STOP1 / STOP2 mode using interrupts

When interrupt input is used to exit STOP1/STOP2, set functions using the function register and set inputs using the control register. In this case, interrupts can be input even CGSTBYCR<DRVE> in the clock mode control part is set to the setting where pins are not driven during STOP mode.

When ports are used as input ports, set the input control register.

#### 9.1.5 Setting an external interrupt pin

Interrupts are enabled to input in the following two conditions while the control register is enabled; where CGSTBYCR<DRVE> bit is set to "1" in the STOP1/STOP2 mode, or where input is enabled by PxIE in the NORMAL/IDLE mode. Both conditions are regardless of function register settings. Do not enable unused interrupts when interrupts are set.

## 9.2 Function Details in Each Ports

This chapter describes details of registers in each port.

### 9.2.1 Port A (PA0 to PA7)

#### 9.2.1.1 List of Port A register

Base Address = 0x400C\_0000

register name		Address (Base+)
Port A data register	PADATA	0x0000
Port A output control register	PACR	0x0004
Port A function register 1	PAFR1	0x0008
Port A function register 2	PAFR2	0x000C
Port A function register 3	PAFR3	0x0010
Port A function register 4	PAFR4	0x0014
Port A function register 5	PAFR5	0x0018
Reserved	-	0x001C
Reserved	-	0x0020
Reserved	-	0x0024
Port A open-drain control register	PAOD	0x0028
Port A pull-up control register	PAPUP	0x002C
Port A pull-down control register	PAPDN	0x0030
Reserved	-	0x0034
Port A input control register	PAIE	0x0038

Note 1: Do not access the addresses described as "Reserved".

Note 2: If PA1 and PA0 are set to TMS/SWDIO and TDO/SWV respectively, outputs are kept as valid regardless of CGSTBYCR<DRVE>/<PTKEEP> setting during STOP1/STOP2 mode.

## 9.2.1.2 PADATA (Port A data register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-

1	PE1F3	R/W	0: PORT 1: A17
0	PE0F3	R/W	0: PORT 1: A16

## 9.2.3.6 PEFR4 (Port E function register 4)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	PE7F4	-	-	PE4F4	PE3F4	-	PE1F4	PE0F4
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7	PE7F4	R/W	0: PORT 1: INT6
6-5	-	R	Read as "0".
4	PE4F4	R/W	0: PORT 1: CTS1
3	PE3F4	R/W	0: PORT 1: CTS0
2	-	R	Read as "0".
1	PE1F4	R/W	0: PORT 1: INT5
0	PE0F4	R/W	0: PORT 1: INT4

## 9.2.3.7 PEFR5 (Port E function register 5)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	PE7F5	-	-	PE4F5	PE3F5	PE2F5	PE1F5	PE0F5
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7	PE7F5	R/W	0: PORT 1: TB2IN
6-5	-	R	Read as "0".
4	PE4F5	R/W	0: PORT 1: TB2OUT
3	PE3F5	R/W	0: PORT 1: TB0OUT
2	PE2F5	R/W	0: PORT 1: TB1OUT
1	PE1F5	R/W	0: PORT 1: TB1IN
0	PE0F5	R/W	0: PORT 1: TB0IN

## 9.2.3.8 PEOD (Port E open-drain control register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	PE7OD	PE6OD	PE5OD	PE4OD	PE3OD	PE2OD	PE1OD	PE0OD
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7-0	PE7OD-PE0OD	R/W	0: Push-pull output 1: Open-drain output

## 9.2.3.9 PEPUP (Port E pull-up control register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	PE7UP	PE6UP	PE5UP	PE4UP	PE3UP	PE2UP	PE1UP	PE0UP
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7-0	PE7UP-PE0UP	R/W	Pull-up 0: Disable 1: Enable

## 9.2.3.10 PEPDN (Port E pull-down control register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	PE7DN	PE6DN	PE5DN	PE4DN	PE3DN	PE2DN	PE1DN	PE0DN
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7-0	PE7DN-PE0DN	R/W	Pull-down 0: Disable 1: Enable

## 9.2.3.11 PEIE (Port E input control register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	PE7IE	PE6IE	PE5IE	PE4IE	PE3IE	PE2IE	PE1IE	PE0IE
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7-0	PE7IE-PE0IE	R/W	Input 0: Disable 1: Enable

## 9.2.4 Port F (PF0 to PF7)

### 9.2.4.1 List of Port F register

Base Address = 0x400C\_0500

register name		Address (Base+)
Port F data register	PFDATA	0x0000
Port F output control register	PFCR	0x0004
Port F function register 1	PFFR1	0x0008
Port F function register 2	PFFR2	0x000C
Port F function register 3	PFFR3	0x0010
Port F function register 4	PFFR4	0x0014
Reserved	-	0x0018
Reserved	-	0x001C
Reserved	-	0x0020
Reserved	-	0x0024
Port F open-drain control register	PFOD	0x0028
Port F pull-up control register	PFPUP	0x002C
Port F pull-down control register	PFPDN	0x0030
Reserved	-	0x0034
Port F input control register	PFIE	0x0038

Note: Do not access the addresses described as "Reserved".

## 9.2.4.2 PFDATA (Port F data register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	PF7	PF6	PF5	PF4	PF3	PF2	PF1	PF0
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7-0	PF7-PF0	R/W	Port F data register

## 9.2.4.3 PFCR (Port F output control register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	PF7C	PF6C	PF5C	PF4C	PF3C	PF2C	PF1C	PF0C
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7-0	PF7C-PF0C	R/W	Output 0: Disable 1: Enable

## 9.2.4.4 PFFR1 (Port F function register 1)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	PF7F1	PF6F1	PF5F1	PF4F1	PF3F1	PF2F1	PF1F1	PF0F1
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7	PF7F1	R/W	0: PORT 1: AD7
6	PF6F1	R/W	0: PORT 1: AD6
5	PF5F1	R/W	0: PORT 1: AD5
4	PF4F1	R/W	0: PORT 1: AD4
3	PF3F1	R/W	0: PORT 1: AD3
2	PF2F1	R/W	0: PORT 1: AD2
1	PF1F1	R/W	0: PORT 1: AD1
0	PF0F1	R/W	0: PORT 1: AD0

## 9.2.4.5 PFFR2 (Port F function register 2)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	PF7F2	PF6F2	PF5F2	PF4F2	-	-	-	-
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7	PF7F2	R/W	0: PORT 1: ENCA
6	PF6F2	R/W	0: PORT 1: ENCB
5	PF5F2	R/W	0: PORT 1: ENCZ
4	PF4F2	R/W	0: PORT 1: INT0
3-0	-	R	Read as "0".

## 9.2.4.6 PFFR3 (Port F function register 3)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	PF7F3	PF6F3	PF5F3	PF4F3	PF3F3	PF2F3	PF1F3	PF0F3
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7	PF7F3	R/W	0: PORT 1: DTR4
6	PF6F3	R/W	0: PORT 1: DSR4
5	PF5F3	R/W	0: PORT 1: RIN4
4	PF4F3	R/W	0: PORT 1: DCD4
3	PF3F3	R/W	0: PORT 1: RTS4
2	PF2F3	R/W	0: PORT 1: RXD4
1	PF1F3	R/W	0: PORT 1: TXD4
0	PF0F3	R/W	0: PORT 1: $\overline{\text{CTS4}}$

## 9.2.4.7 PFFR4 (Port F function register 4)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	PF7F4	PF6F4	PF5F4	-	-	PF1F4	PF0F4	-
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7	PF7F4	R/W	0: PORT 1: SO1/SDA1
6	PF6F4	R/W	0: PORT 1: SI1/SCL1
5	PF5F4	R/W	0: PORT 1: SCK1
4-3	-	R	Read as "0".
2	PF2F4	R/W	0: PORT 1: IRIN4
1	PF1F4	R/W	0: PORT 1: IROUT4
0	-	R	Read as "0".

## 9.2.4.8 PFOD (Port F open-drain control register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	PF7OD	PF6OD	PF5OD	PF4OD	PF3OD	PF2OD	PF1OD	PF0OD
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7-0	PF7OD-PF0OD	R/W	0: Push-pull output 1: Open-drain output

## 9.2.4.9 PFPUP (Port F pull-up control register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	PF7UP	PF6UP	PF5UP	PF4UP	PF3UP	PF2UP	PF1UP	PF0UP
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7-0	PF7UP-PF0UP	R/W	Pull-up 0: Disable 1: Enable

## 9.2.4.10 PFPDN (Port F pull-down control register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	PF7DN	PF6DN	PF5DN	PF4DN	PF3DN	PF2DN	PF1DN	PF0DN
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7-0	PF7DN-PF0DN	R/W	Pull-down 0: Disable 1: Enable

## 9.2.4.11 PFIE (Port F input control register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	PF7IE	PF6IE	PF5IE	PF4IE	PF3IE	PF2IE	PF1IE	PF0IE
After reset	0	0	0	0	0	0	0	0

7-4	-	R/W	Write as "0".
3-0	PH3IE-PH0IE	R/W	Input 0: Disable 1: Enable

## 9.2.7 Port I (PI0 to PI7)

### 9.2.7.1 List of Port I register

Base Address = 0x400C\_0800

register name		Address (Base+)
Port I data resister	PIDATA	0x0000
Port I output control resister	PICR	0x0004
Port I function resister 1	PIFR1	0x0008
Port I function resister 2	PIFR2	0x000C
Reserved	-	0x0010
Reserved	-	0x0014
Reserved	-	0x0018
Reserved	-	0x001C
Reserved	-	0x0020
Reserved	-	0x0024
Port B open-drain control resister	PIOD	0x0028
Port B pull-up control resister	PIPUP	0x002C
Port B pull-down control resister	PIPDN	0x0030
Reserved	-	0x0034
Port B input controlresister	PIIE	0x0038

Note:Do not access the addresses described as "Reserved".

## 9.2.7.2 PIDATA (Port I data register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	PI7	PI6	PI5	PI4	PI3	PI2	PI1	PI0
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7-0	PI7-PI0	R/W	Port I data register

## 9.2.7.3 PICR (Port I output control register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	PI7C	PI6C	PI5C	PI4C	PI3C	PI2C	PI1C	PI0C
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7-0	PI7C-PI0C	R/W	Output 0: Disable 1: Enable

## 9.2.7.4 PIFR1 (Port I function register 1)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	PI3F1	PI2F1	PI1F1	PI0F1
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-4	-	R	Read as "0".
3	PI3F1	R/W	0: PORT 1: INTC
2	PI2F1	R/W	0: PORT 1: INTB
1	PI1F1	R/W	0: PORT 1: INTA
0	PI0F1	R/W	0: PORT 1: INT9

## 9.2.7.5 PIFR2 (Port I function register 2)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	PI3F2	-	-	-
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-4	-	R	Read as "0".
3	PI3F2	R/W	0: PORT 1: <u>DMAREQ</u>
2-0	-	R	Read as "0".

## 9.2.7.6 PIOD (Port I open-drain control register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	PI7OD	PI6OD	PI5OD	PI4OD	PI3OD	PI2OD	PI1OD	PI0OD
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7-0	PI7OD-PI0OD	R/W	0: Push-pull output 1: Open-drain output

## 9.2.7.7 PIPUP (Port I pull-up control register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	PI7UP	PI6UP	PI5UP	PI4UP	PI3UP	PI2UP	PI1UP	PI0UP
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7-0	PI7UP-PI0UP	R/W	Pull-up 0: Disable 1: Enable

## 9.2.7.8 PIPDN (Port I pull-down control register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	PI7DN	PI6DN	PI5DN	PI4DN	PI3DN	PI2DN	PI1DN	PI0DN
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7-0	PI7DN-PI0DN	R/W	Pull-down 0: Disable 1: Enable

## 9.2.7.9 PIIE (Port I input control register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	PI7IE	PI6IE	PI5IE	PI4IE	PI3IE	PI2IE	PI1IE	PI0IE
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7-0	PI7IE-PI0IE	R/W	Input 0: Disable 1: Enable

### 9.2.8 Port K (PK0 to PK4)

Only when input is enabled, PK0 tolerates 5V input. Note that this pin cannot be pulled up over the power supply voltage when using as open-drain output.

#### 9.2.8.1 List of Port K register

Base Address = 0x400C\_0A00

register name		Address (Base+)
Port K data register	KIDATA	0x0000
Port K output control register	PKCR	0x0004
Port K function register 1	PKFR1	0x0008
Port K function register 2	PKFR2	0x000C

Bit	Bit Symbol	Type	Function
31-5	-	R	Read as "0".
4-0	PK4IE-PK0IE	R/W	Input 0: Disable 1: Enable

Note: PK0 is used as USBDPON input or output port when USB device controller is used. It is used as INTD input or input / output port when USB device controller is not used.

## 9.2.9 Port L (PL0 to PL3)

### 9.2.9.1 List of Port L register

Base Address = 0x400C\_0B00

register name		Address (Base+)
Port L data resister	LIDATA	0x0000
Port L output control resister	PLCR	0x0004
Reserved	-	0x0008
Port L function resister 2	PLFR2	0x000C
Port L function resister 3	PLFR3	0x0010
Port L function resister 4	PLFR4	0x0014
Port L function resister 5	PLFR5	0x0018
Port L function resister 6	PLFR6	0x001C
Reserved	-	0x0020
Reserved	-	0x0024
Port L open-drain control resister	PLOD	0x0028
Port L pull-up control resister	PLPUP	0x002C
Port L pull-down control resister	PLPDN	0x0030
Reserved	-	0x0034
Port L input controlresister	PLIE	0x0038

Note: Do not access the addresses described as "Reserved".

## 9.2.9.2 PLDATA (Port L data register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	PL3	PL2	PL1	PL0
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7-4	-	R/W	Write as "0".
3-0	PL3-PL0	R/W	Port L data register

## 9.2.9.3 PLCR (Port L output control register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	PL3C	PL2C	PL1C	PL0C
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7-4	-	R/W	Write as "0".
3-0	PL3C-PL0C	R/W	Output 0: Disable 1: Enable

## 9.2.9.4 PLFR2 (Port L function register 2)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	-	-	PL0F2
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7-1	-	R/W	Write as "0".
0	PL0F2	R/W	0: PORT 1: INT2

## 9.2.9.5 PLFR3 (Port L function register 3)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	PL3F3	PL2F3	PL1F3	PL0F3
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-4	-	R	Read as "0".
3	PL3F3	R/W	0: PORT 1: MTOUT01
2	PL2F3	R/W	0: PORT 1: MTOUT11
1	PL1F3	R/W	0: PORT 1: GEMG1
0	PL0F3	R/W	0: PORT 1: MT1IN

## 9.2.9.6 PLFR4 (Port L function register 4)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	PL3F4	PL2F4	PL1F4	PL0F4
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-4	–	R	Read as "0".
3	PL3F4	R/W	0: PORT 1: MTTB1OUT
2	PL2F4	R/W	0: PORT 1: MTTB1IN
1	PL1F4	R/W	0: PORT 1: DATRG
0	PL0F4	R/W	0: PORT 1: ADTRGA

## 9.2.9.7 PLFR5 (Port L function register 5)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	PL3F5	PL2F5	PL1F5	-
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-4	-	R	Read as "0".
3	PL3F5	R/W	0: PORT 1: SCLK2
2	PL2F5	R/W	0: PORT 1: TXD2
1	PL1F5	R/W	0: PORT 1: RXD2
0	-	R	Read as "0".

## 9.2.9.8 PLFR6 (Port L function register 6)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	PL3F6	-	-	-
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-4	-	R	Read as "0".
3	PL3F6	R/W	0: PORT 1: $\overline{\text{CTS2}}$
2-0	-	R	Read as "0".

## 9.2.9.9 PLOD (Port L open-drain control register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	PL3OD	PL2OD	PL1OD	PL0OD
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7-4	-	R/W	Write as "0".
3-0	PL3OD-PL0OD	R/W	0: Push-pull output 1: Open-drain output

## 9.2.9.10 PLPUP (Port L pull-up control register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	PL3UP	PL2UP	PL1UP	PL0UP
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7-4	-	R/W	Write as "0".
3-0	PL3UP-PL0UP	R/W	Pull-up 0: Disable 1: Enable

## 9.2.9.11 PLPDN (Port L pull-down control register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	PL3DN	PL2DN	PL1DN	PL0DN
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7-4	-	R/W	Write as "0".
3-0	PL3DN-PL0DN	R/W	Pull-down 0: Disable 1: Enable

## 9.2.9.12 PLIE (Port L input control register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	PL3IE	PL2IE	PL1IE	PL0IE
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7-4	-	R/W	Write as "0".
3-0	PL3IE-PL0IE	R/W	Input 0: Disable 1: Enable

## 9.3 Block Diagram of Port

### 9.3.1 Port Types

The ports are classified as shown below. Please refer to the following pages for the block diagrams of each port type. Dot lines in the figure indicate the part of the equivalent circuit described in the "Block diagrams of ports".

Table 9-3 Function Lists

Type	GP Port	Function	Analog	Pull-up	Pull-down	Programmable open-drain	Note
FT1	I/O	I/O	-	R	R	o	-
FT2	I/O	I/O	-	R	R	o	Function output triggered by enable signal
FT3	I/O	I/O	-	R	R	o	Function output triggered by enable signal
FT4	I/O	Input(int)	-	R	R	o	with Noise filter
FT5	I/O	Input	o	R	R	o	Analog input
FT6	Output	Output	-	EnR	R	o	$\overline{\text{BOOT}}$ input enabled during reset
FT7	I/O	I/O	-	R	R	o	Function output triggered by enable signal
FT8	I/O	I/O	-	R	R	o	-
FT9	I/O	I/O	-	R	R	o	-
FT10	I/O	I/O	-	R	R	o	Function output triggered by enable signal

int: Interrupt input

-: Not exit

o: Exit

R: Force disable during reset.

NoR: Unaffected by reset.

EnR: Force enable during reset.

9.3.2 Type FT1

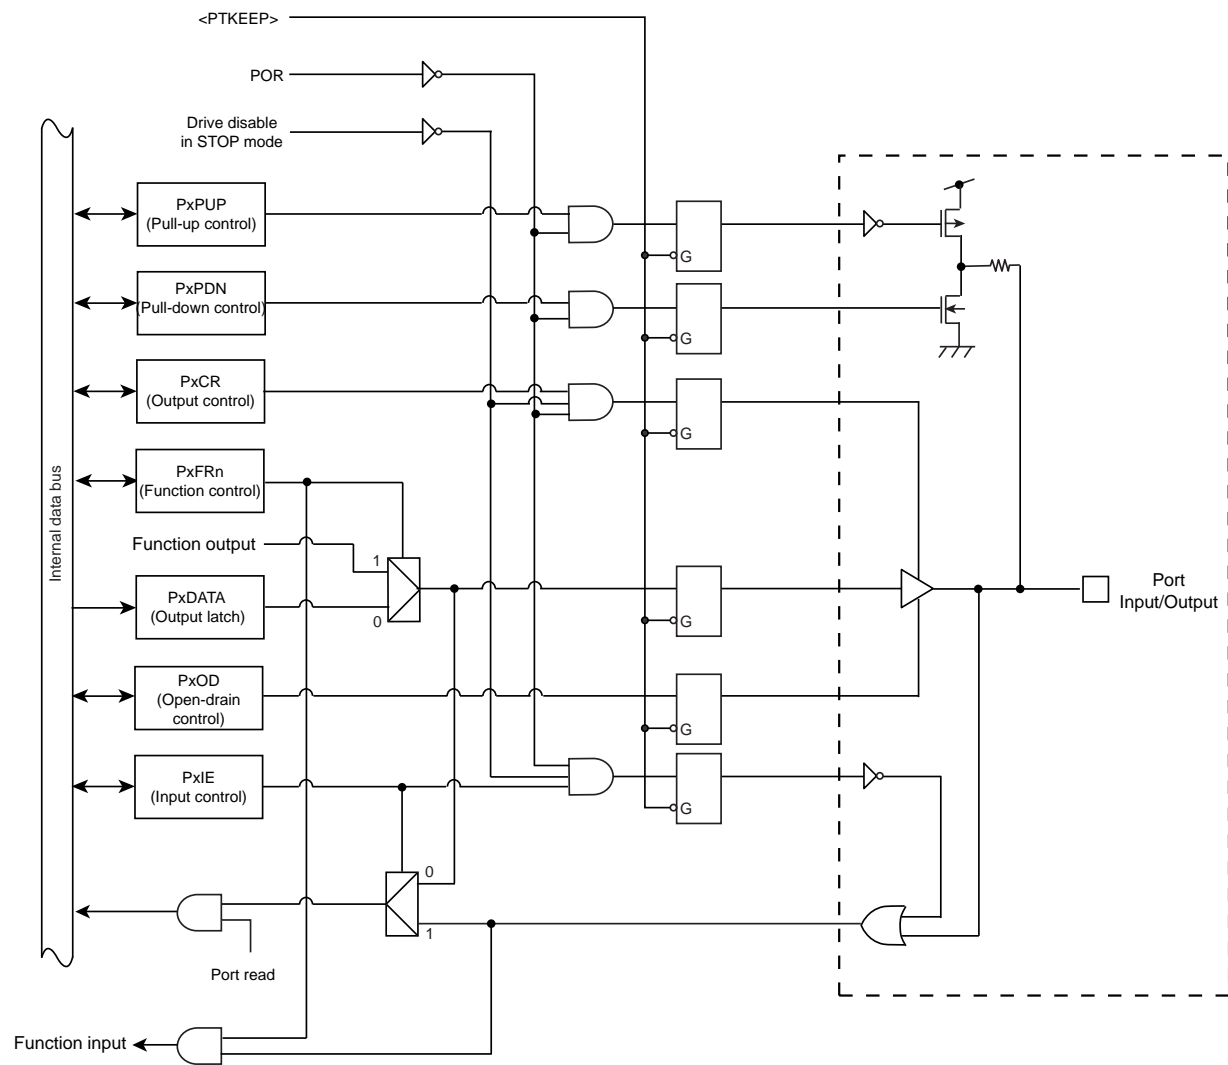

Figure 9-1 Port Type FT1

## 9.3.3 Type FT2

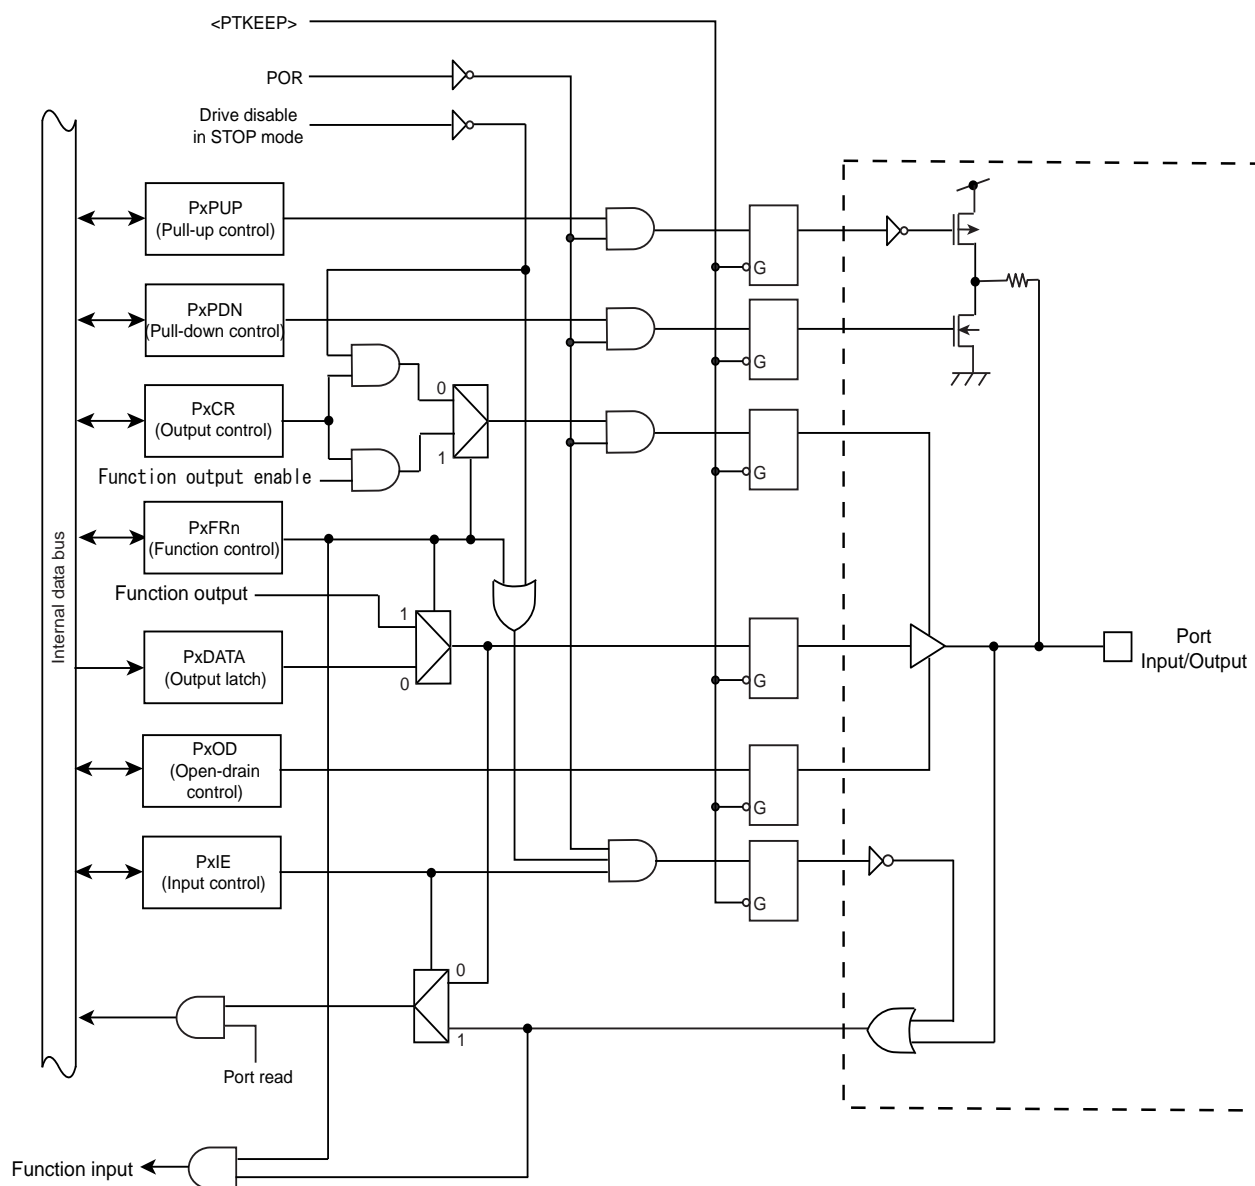

Figure 9-2 Port Type FT2

Note:  $\overline{\text{TRST}}$  has noise filter(30ns Typ.).

### 9.3.4 Type FT3

## 9.3.11 Type FT10

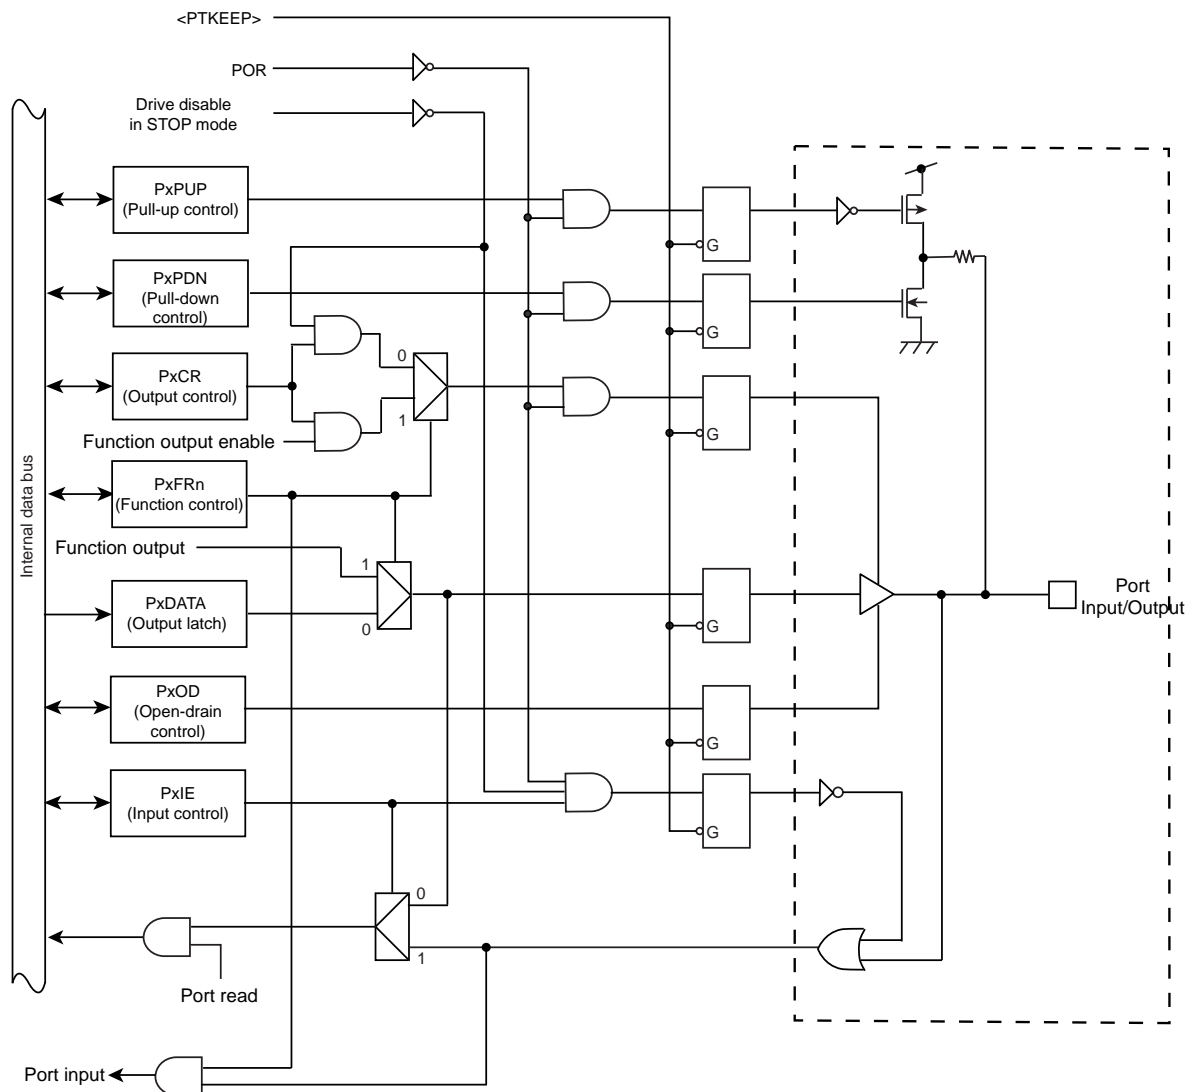

Figure 9-10 Port Type FT10

## 9.4 Apendex (List of Port Setting)

The following tables show port register settings in each pin.

The register is set or cleared for a peripheral function.

- Setting of using PE4 as SCLKx (Output)
  - "1" appeared below PE4C means setting <PE4C> to "1".
  - "PE4F1" appeared below PEFRn means setting <PE4F1> to "1".
  - "x" appeared below PEO, PEPUP and PEPDN means setting voluntary.
  - "0" appeared below PEIE means setting <PE4IE> to "0".

Pin name	Port type	Function	After reset	Px CR	Px FRn	Px OD	Px PUP	Px PDN	Px IE
PE4	FT2	SCLKx (Output)		"1"	PE4 F1	x	x	x	0

### 9.4.1 The Setting of I/O DEdicated Port

When an I/O dedicated port is used, set its registers as follows:

Pin name	Port type	Function	After reset	Px CR	Px FRn	Px OD	Px PUP	Px PDN
Pxn	-	Input port		0	x	x	x	1
		Output port		1	x	x	x	0

### 9.4.2 The Setting of Input Dedicated Port

When an input dedicated port is used, set its registers as follows:

Pin name	Port type	Function	After reset	Px CR	Px FRn	Px OD	Px PUP	Px PDN
Pxn	-	Input port		0	x	x	x	1

### 9.4.3 The Setting of Output Dedicated Port

When an output dedicated port is used, set its registers as follows:

Pin name	Port type	Function	After reset	Px CR	Px FRn	Px OD	Px PUP	Px PDN
Pxn	-	Output port (Hi-Z output)		0	0	x	x	x
		Output port		1	0	x	x	x

#### 9.4.4 Setting of peripheral's I/O port

This section describes the settings in case that ports are used for peripheral functions.

Some pins are specified as a certain function after reset. In this case, the symbol "o" is described in the "After reset" Column of the following tables.

## 9.4.4.1 Port A Setting

Table 9-4 Port Setting List (Port A)

Pin name	Port Type	Function	After reset	PA CR	PA FRx	PA OD	PA PUP	PA PDN	PA IE
PA0	FT2	TDO (Output)/ SWV (Output)	o	1	PA0 F1	0	0	0	0
	FT1	DTR5 (Output)		1	PA0 F2	x	x	x	0
PA1	FT2	TMS (Input)/ SWDIO (I/O)	o	1	PA1 F1	0	1	0	1
	FT1	DSR5 (Input)		0	PA1 F2	x	x	x	1
PA2	FT2	TCK (Input)/ SWCLK (Input)	o	0	PA2 F1	0	0	1	1
	FT1	RIN5 (Input)		0	PA2 F2	x	x	x	1
PA3	FT2	TDI (Input)	o	0	PA3 F1	0	1	0	1
	FT1	DCD5 (Input)		0	PA3 F2	x	x	x	1
	FT4	INT3 (Input)		0	PA3 F3	x	x	x	1
PA4	FT2	$\overline{\text{TRST}}$ (Input)	o	0	PA4 F1	0	1	0	1
	FT1	$\overline{\text{RTS5}}$ (Output)		1	PA4 F2	x	x	x	0
PA5	FT9	TRACECLK (Output)		1	PA5 F1	0	0	0	0
	FT1	RXD5 (Input)		0	PA5 F2	x	x	x	1
	FT1	IRIN5 (Input)		0	PA5 F3	x	x	x	1
PA6	FT9	TRACEDATA0 (Output)		1	PA6 F1	0	0	0	0
	FT1	TXD5 (Output)		1	PA6 F2	x	x	x	0
	FT1	IROUT5 (Output)		1	PA6 F3	x	x	x	0
PA7	FT9	TRACEDATA1 (Output)		1	PA7 F1	0	0	0	0
	FT1	$\overline{\text{CTS5}}$ (Input)		0	PA7 F2	x	x	x	1
	FT1	SCLK3 (Input)		0	PA7 F3	x	x	x	1
	FT1	SCLK3 (Output)		1	PA7 F3	x	x	x	0
	FT1	$\overline{\text{CTS3}}$ (Input)		0	PA7 F4	x	x	x	1
	FT1	TB7OUT (Output)		1	PA7 F5	x	x	x	0

## 9.4.4.2 Port B Setting

Table 9-5 Port Setting List (Port B)

Pin name	Port Type	Function	After reset	PB CR	PB FRx	PB OD	PB PUP	PB PDN	PB IE
PB0	FT9	TRACEDATA2 (Output)		1	PB0 F1	0	0	0	0
	FT1	TXD3 (Output)		1	PB0 F3	x	x	x	0
PB1	FT9	TRACEDATA3 (Output)		1	PB1 F1	0	0	0	0
	FT1	RXD3 (Input)		0	PB1 F3	x	x	x	1
PB2	FT9	$\overline{WR}$ (Output)		1	PB2 F1	x	x	x	0
	FT3	SP2CLK (Input)		0	PB2 F2	x	x	x	1
		SP2CLK (Output)		1	PB2 F2	x	x	x	0
	FT2	MTOUT03 (Output)		1	PB2 F3	x	x	x	0
	FT1	MTTB3OUT (Output)		1	PB2 F4	x	x	x	0
PB3	FT9	$\overline{RD}$ (Output)		1	PB3 F1	x	x	x	0
	FT3	SP2DO (Output)		1	PB3 F2	x	x	x	0
	FT2	MTOUT13 (Output)		1	PB3 F3	x	x	x	0
	FT1	MTTB3IN (Input)		0	PB3 F4	x	x	x	1
PB4	FT9	$\overline{CS0}$ (Output)		1	PB4 F1	x	x	x	0
	FT3	SP2DI (Input)		0	PB4 F2	x	x	x	1
	FT1	$\overline{GEMG3}$ (Input)		0	PB4 F3	x	x	x	1
	FT4	INT7 (Input)		0	PB4 F4	x	x	x	1
PB5	FT9	ALE (Output)		1	PB5 F1	x	x	x	0
	FT3	SP2FSS (Input)		0	PB5 F2	x	x	x	1
		SP2FSS (Output)		1	PB5 F2	x	x	x	0
	FT1	MT3IN (Input)		0	PB5 F3	x	x	x	1
	FT4	INT1 (Input)		0	PB5 F4	x	x	x	1

Table 9-5 Port Setting List (Port B)

Pin name	Port Type	Function	After reset	PB CR	PB FRx	PB OD	PB PUP	PB PDN	PB IE
PB6	FT9	$\overline{\text{BELL}}$ (Output)		1	PB6 F1	x	x	x	0
	FT1	SCOUT (Output)		1	PB6 F2	x	x	x	0
	FT1	TB3OUT (Output)		1	PB6 F4	x	x	x	0

Note: The input and pulled-up of PB6 are enabled when  $\overline{\text{RESET}}$  pin is low. PB6 is used as  $\overline{\text{BOOT}}$  pin.

## 9.4.4.3 Port E Setting

Table 9-6 Port Setting List (Port E)

Pin name	Port Type	Function	After reset	PE CR	PE FRx	PE OD	PE PUP	PE PDN	PE IE
PE0	FT9	A16 (Output)		1	PE0 F3	x	x	x	0
	FT4	INT4 (Input)		0	PE0 F4	x	x	x	1
	FT1	TB0IN (Input)		0	PE0 F5	x	x	x	1
PE1	FT1	RXD0 (Input)		0	PE1 F1	x	x	x	1
	FT9	A17 (Output)		1	PE1 F3	x	x	x	0
	FT4	INT5 (Input)		0	PE1 F4	x	x	x	1
	FT1	TB1IN (Input)		0	PE1 F5	x	x	x	1
PE2	FT1	TXD0 (Output)		1	PE2 F1	x	x	x	0
	FT9	A18 (Output)		1	PE2 F3	x	x	x	0
	FT1	TB1OUT (Output)		1	PE2 F5	x	x	x	0
PE3	FT1	SCLK0 (Input)		0	PE3 F1	x	x	x	1
	FT1	SCLK0 (Output)		1	PE3 F1	x	x	x	0
	FT9	A19 (Output)		1	PE3 F3	x	x	x	0
	FT1	$\overline{\text{CTS0}}$ (Input)		0	PE3 F4	x	x	x	1
	FT1	TB0OUT (Output)		1	PE3 F5	x	x	x	0
PE4	FT1	SCLK1 (Input)		0	PE4 F1	x	x	x	1
	FT1	SCLK1 (Output)		1	PE4 F1	x	x	x	0
	FT9	A20 (Output)		1	PE4 F3	x	x	x	0
	FT1	$\overline{\text{CTS1}}$ (Input)		0	PE4 F4	x	x	x	1
	FT1	TB2OUT (Output)		1	PE4 F5	x	x	x	0
PE5	FT1	TXD1 (Output)		1	PE5 F1	x	x	x	0

## 10. External bus interface (EBIF)

### 10.1 Overview

The TMPM368FDXBG has a built-in external bus interface function to connect to external memory, I/Os, etc. This interface consists of an external bus interface circuit (EBIF), a chip selector (CS) and a wait controller.

The chip selector and wait controller designate mapping addresses in a 4-block address space and also control wait states and data bus widths (8- or 16-bit) in these and other external address spaces.

The external bus interface circuit (EBIF) controls the timing of external buses based on the chip selector and wait controller settings.

Their features are given in the following.

Table 10-1 Features of External bus interface

features	
Memory supports	Asynchronous memory (NOR Flash memory, SRAM, Peripheral I/O and e.t.c.) Selectable multiplex bus mode.
Data bus width	Either an 8- or 16-bit width can be set for each channel.
Chip select	4 channels ( $\overline{CS0}$ , $\overline{CS1}$ , $\overline{CS2}$ , $\overline{CS3}$ )
Address access spaces	Supports up to 64MB memory spaces $\overline{CS0}$ : 0x6000_0000 to 0x63FF_FFFF (Max. 16MB for each CS)
Internal wait function	This function can be enabled for each channel. A wait of up to 15 cycles can be automatically inserted.
ALE wait function	This function can be enabled for each channel. An ALE high pulse of up to 4 cycles can be automatically inserted.
Setup cycle insertion function	This function can be enabled for each channel. A $\overline{RD}$ or $\overline{WR}$ setup cycle can be automatically inserted. (tAC cycle expanded)
Recovery (Hold) cycle insertion function	When an external bus is selected, a dummy cycle of up to 8 clocks can be inserted and this dummy cycle can be specified for each channel. Address/Data hold cycle can be inserted for $\overline{CS}$ , $\overline{RD}$ and $\overline{WR}$ . (tCAR, tRAE cycles expanded)
Bus expansion function	The internal wait, the ALE wait, the Setup wait and the Recovery cycle can be expanded double or quadruple.
Control pins	Multiplex bus mode: AD[15:0], A[23:16], $\overline{RD}$ , $\overline{WR}$ , $\overline{BELL}$ , $\overline{BELH}$ , $\overline{CS0}$ , $\overline{CS1}$ , $\overline{CS2}$ , $\overline{CS3}$ , ALE

## 10.2 Address and Data pin setting

The TMPM368FDXBG can be set to multiplexed bus mode. Setting the bit <EXBSEL> of EXBMOD register to "0" as the multiplexed bus mode. Port pins E to G which are to be connected to external devices (memory), are used as address buses, data buses and address/data buses. The below table shows these.

Table 10-2 Bus Mode, Address and Data Pins

PORT	Multiplex Mode EXBMOD<EXBSEL> = "0"
Port E(PE0 to PE7)	A16 to A23
Port F(PF0 to PF7)	AD0 to AD7
Port G(PG0 to PG7)	AD8 to AD15

Each port is put into input mode after a reset. To access an external device, set the address and data bus functions by using the port control register (PxCR) and the port function register (PxFRm), and set the input enable register (PxIE).

When the access changing from the external area to internal area, the address buses are kept the previously external area address output and the data buses will be high impedance.

## 10.3 Registers

### 10.3.1 Registers List

Address and names of EBIF control registers are shown below.

Base Address = 0x4005_C000		
Register name		Address (Base+)
External Bus Mode Control Register	EXBMOD	0x0000
Reserved	-	0x0004 to 0x000C
External Bus Area and Start Address Configuration Register 0	EXBAS0	0x0010
External Bus Area and Start Address Configuration Register 1	EXBAS1	0x0014
External Bus Area and Start Address Configuration Register 2	EXBAS2	0x0018
External Bus Area and Start Address Configuration Register 3	EXBAS3	0x001C
Reserved	-	0x0020 to 0x003C
External Bus Chip Select Control Register 0	EXBCS0	0x0040
External Bus Chip Select Control Register 1	EXBCS1	0x0044
External Bus Chip Select Control Register 2	EXBCS2	0x0048
External Bus Chip Select Control Register 3	EXBCS3	0x004C
Reserved	-	0x0050 to 0x0FFC

Note 1: Access the registers by using word reads and word writes.

Note 2: Access to the "Reserved" area is prohibited.

10.3.2 EXBMOD (External Bus Mode Control Register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	EXBWAIT		EXBSEL
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-3	-	R	Read as 0.
2-1	EXBWAIT[1:0]	R/W	Bus cycle extension 00: None 01: Double 10: Quadruple 11: Prohibited  These bits are used to set the setup, wait and recovery of the bus cycle to be double or quadruple. For example, if a Read setup cycle is set as two cycles by setting <EXBWAIT>="00" (no extension), the two cycles can be quadruplicated by changing the bit setting to <EXBWAIT>="01" (double). It also can be octuplicated by setting the bits to <EXBWAIT>="10" (quadruple). The extended cycle is configured by setting Read/Write setup, chip select/Read/Write recovery, ALE/internal wait cycle and <EXBWAIT> (double or quadruple).
0	EXBSEL	R/W	Write as "0".

## 10.3.3 EXBAS0 to 3 (External Bus Area and Start Address Configuration Register)

	31	30	29	28	27	26	25	24
bit symbol	SA31	SA30	SA29	SA28	SA27	SA26	SA25	SA24
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16

10.4 Data Format

Internal registers and external bus interfaces of the TMPM368FDXBG are configured as described below.

10.4.1 Little-endian mode

10.4.1.1 Word access

- 16-bit bus width

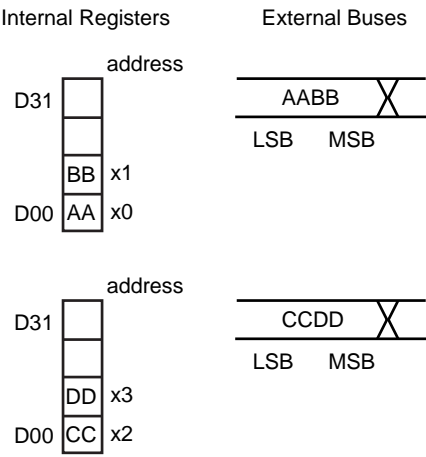

- 8-bit bus width

10.4.1.2 Half word access

- 16-bit bus width

- 8-bit bus width

10.4.1.3 Byte access

- 16-bit bus width

- 8-bit bus width

## 10.5 External Bus Operations (Multiplexed Bus Mode)

This section describes various bus timing values. The timing diagram shown below assumes that the address buses are A23 through A16 and that the data buses are AD15 through AD0.

### 10.5.1 Basic bus operation

The external bus cycle of the TMPM368FDXBG basically consists of four clock pulses. The basic clock of an external bus cycle is the same as the internal system clock. Figure 10-1 shows read bus timing and Figure 10-2 shows write bus timing. If internal areas are accessed, address buses remain unchanged and the ALE does not output latch pulse as shown in these figures.

Additionally, address/data buses are in a state of high impedance and control signals such as  $\overline{\text{RD}}$  and  $\overline{\text{WR}}$  do not become active.

Figure 10-1 Read Operation Timing

Figure 10-2 Write Operation Timing

10.5.2 Wait timing

A wait cycle can be inserted for each channel by using the chip selector (CS) and wait controller.

The following wait can be inserted.

- A wait of up to 15 clocks can be automatically inserted.

The setting of the number of waits to be automatically inserted and the setting can be made using the chip select control registers, EXBCSx<CSIW[4:0]>.

Figure 10-3 through Figure 10-4 show the timing diagrams in which waits have been inserted.

Figure 10-3 Read Operation Timing

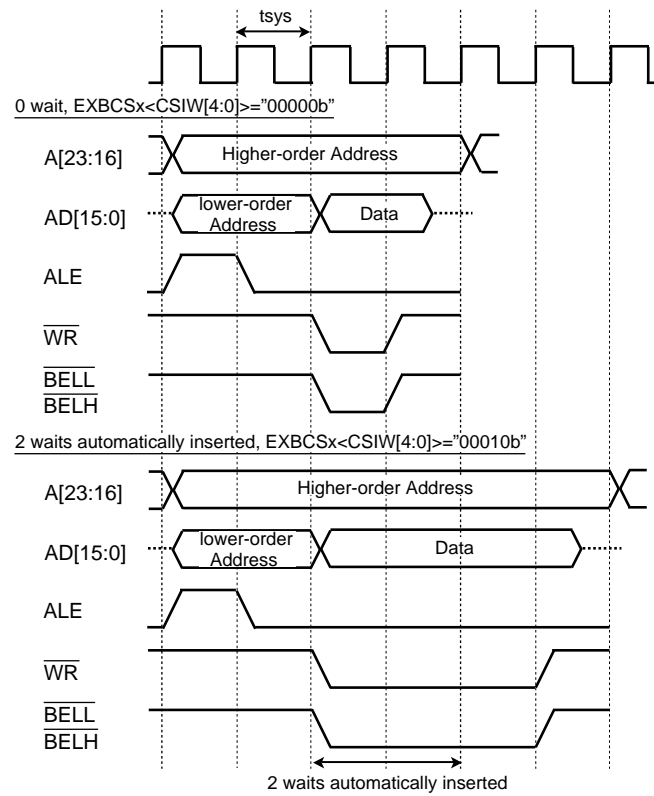

Figure 10-4 Write Operation Timing

10.5.3 Time that it takes before ALE is asserted

One of system clocks of 1, 2 or 4 can be selected as the time that it takes before ALE is asserted. The setting can be made using the chip select control registers, EXBCSx<ALEW[1:0]>. The default is asserted the  $\overline{\text{RD}}$  or  $\overline{\text{WR}}$  signal from the address is generated after 2 clocks.

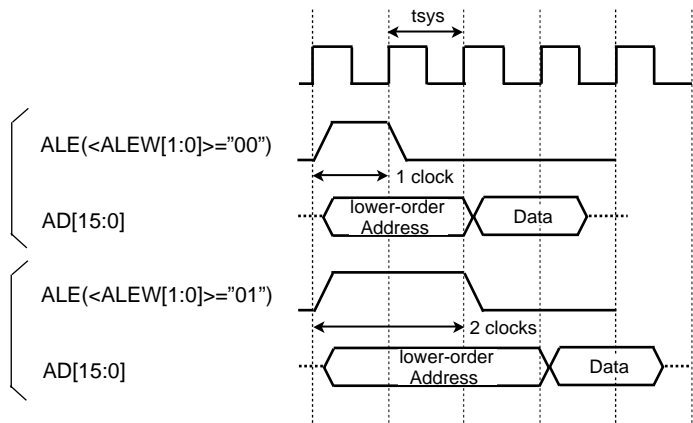

Figure 10-5 Time that it takes before ALE is asserted

Figure 10-6 shows the timing when the ALE is 1 clock or 2 clocks.

Figure 10-6 Read Operation Timing (When the ALE is 1 Clock or 2 Clocks)

### 10.5.4 Read and Write Recovery Time

If access to external areas occurs consecutively, a dummy cycle can be inserted for recovery time.

A dummy cycle can be inserted in both a read and a write cycle. The dummy cycle insertion setting can be made in the chip select control registers, EXBCSx<WRR[2:0]> (write recovery cycle) and <RDR[2:0]> (read recovery cycle). As for the number of dummy cycles, none, one to six or eight system clocks (internal) can be specified for each channel. Figure 10-7 shows the timing of recovery time insertion.

Figure 10-7 Timing of Recovery Time Insertion

### 10.5.5 Chip select recovery time

If access to external areas occurs consecutively, a dummy cycle can be inserted for recovery time.

The dummy cycle insertion setting can be made in the chip select control registers, EXBCSx<CSR[1:0]>. As for the number of dummy cycles, none, one, two and four system clocks (internal) can be specified for each channel. Figure 10-8 shows the timing of recovery time insertion.

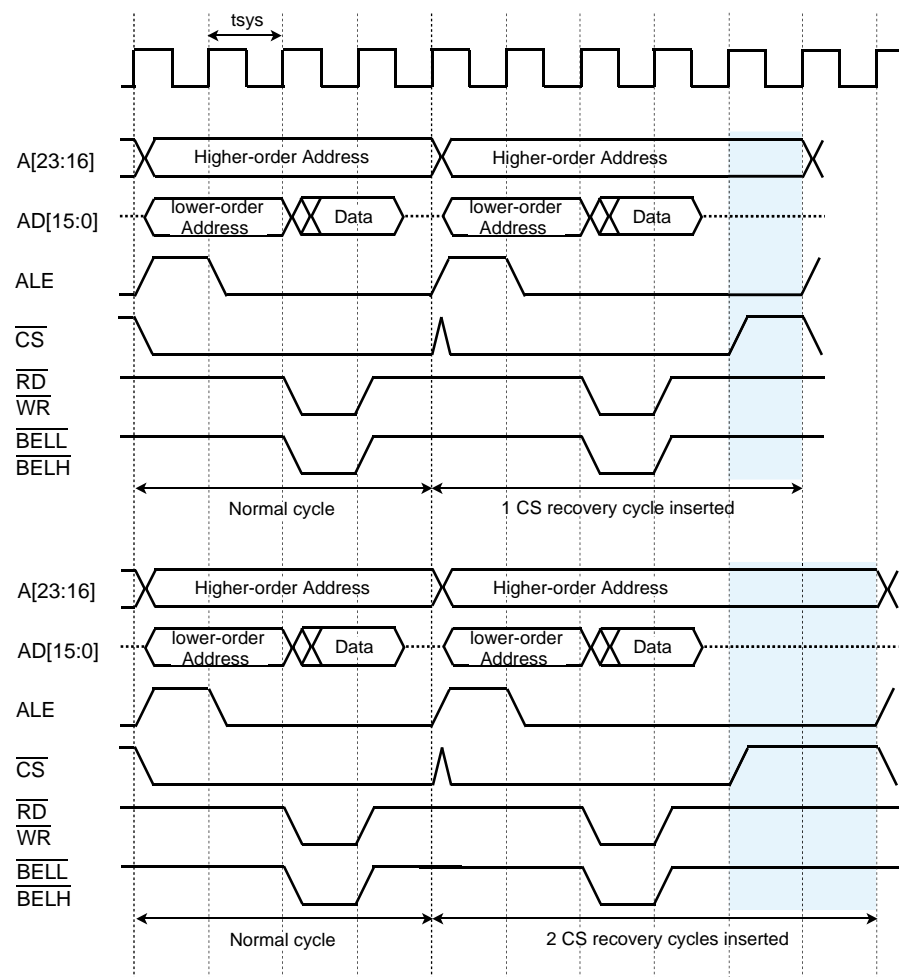

Figure 10-8 Timing of CS Recovery Time Insertion (ALE width: 1 clock)

### 10.5.6 Read and Write setup cycle

A read and a write setup cycle can be inserted for each channel by using the chip selector (CS) and wait controller.

The following can be inserted.

- A read and a write setup cycle of up to 4 clocks can be automatically inserted.

The setting of the number of setup cycles to be automatically inserted and the setting can be made using the chip select control registers, EXBCSx<WRS[1:0]> and <RDS[1:0]>.

Figure 10-9 shows the timing diagrams in which the read or write setup cycle have been inserted.

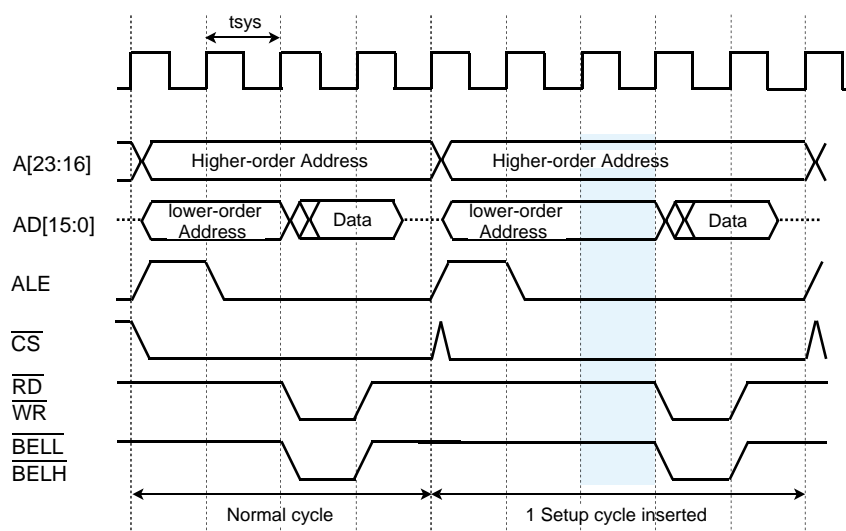

Figure 10-9 Timing of Read or Write Setup Time Insertion

10.6 Connection example for external memory

10.6.1 Connection Example for external 16-bit SRAM and NOR-Flash (Multiplex bus)

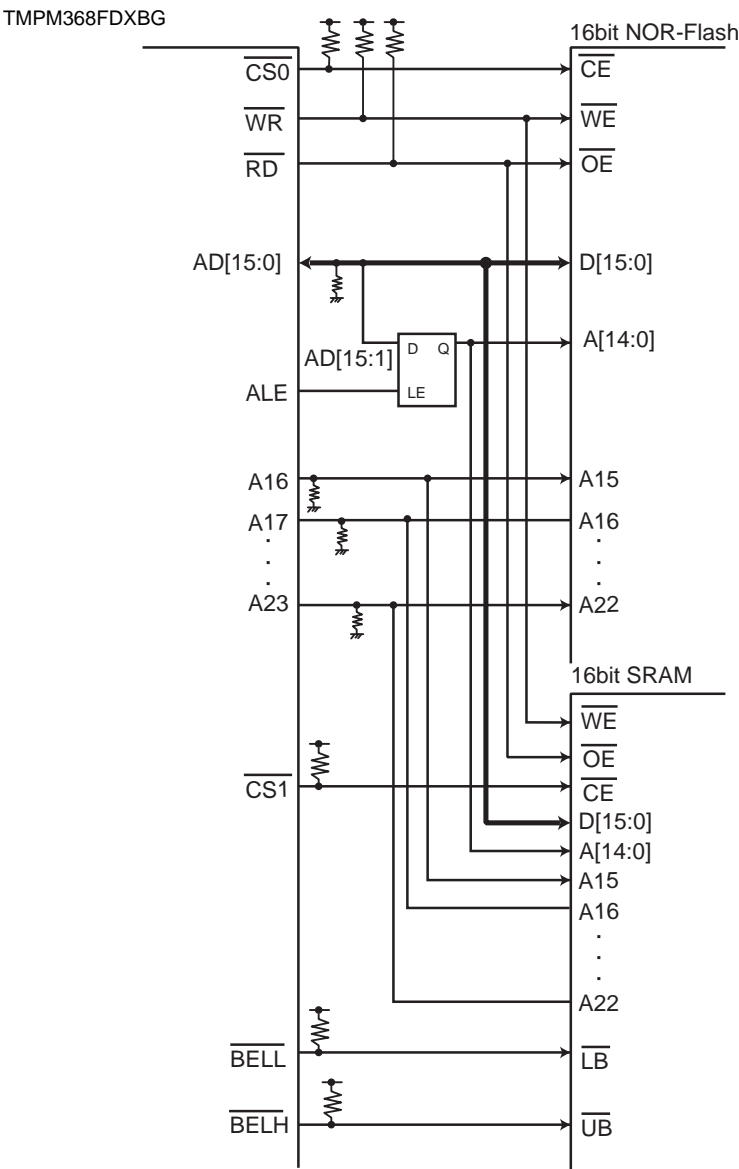

Figure 10-10 Connection Example for external 16-bit SRAM and NOR-Flash (Multiplex bus)

## 11. 16-bit Timer / Event Counters (TMRB)

### 11.1 Outline

TMRB operate in the following four operation modes:

- 16-bit interval timer mode
- 16-bit event counter mode
- 16-bit programmable pulse generation mode (PPG)
- Timer synchronous mode

The use of the capture function allows TMRB to perform the following three measurements.

- One shot pulse output by an external trigger
- Frequency measurement
- Pulse width measurement

In the following explanation of this section, "x" indicates a channel number.

## 11.2 Differences in the Specifications

TMPM368FDXBG contains 8-channel of TMRB.

Each channel functions independently and the channels operate in the same way except for the differences in their specification as shown in Table 11-1.

Some of the channels can put the capture trigger and the synchronous start trigger on other channels.

1. The flip-flop output of TMRB 2, 5 and 7 can be used as the capture trigger of other channels.
  - TB2OUT → available for TMRB3 through TMRB5
  - TB5OUT → available for TMRB6 through TMRB7
  - TB7OUT → available for TMRB0 through TMRB7
2. The start trigger of the timer synchronous mode (with TBxRUN)
  - TMRB0 → can start TMRB0 through TMRB3 synchronously
  - TMRB4 → can start TMRB4 through TMRB7 synchronously
3. The start trigger of the timer prescaler synchronous mode (with TBxPRUN)
  - TMRB0 → can start TMRB0 through TMRB3 synchronously
  - TMRB4 → can start TMRB4 through TMRB7 synchronously

Table 11-1 Differences in the Specifications of TMRB Modules

Specifica- tion	External pins		Trigger function between timers		Interrupt		Internal Connects		
Channel	Timer Flip-Flop output pins	External clock / capture trigger in- put pins	Capture trigger	Synchro- nous start trigger channel	Capture interrupt	TMRB interrupt	Start AD conversion Start DAC conversion	Timer Flip-Flop Connect with SIO/ UART, RMC (TXTRG : Transfer clock)	μDMA re- quest (DMATMR B compare match0/1 overflow (channel0 to 4))
TMRB0	TB0OUT	TB0IN	TB7OUT	-	INTCAP00 INTCAP01	INTTB0	-	-	INTTB0
TMRB1	TB1OUT	TB1IN	TB7OUT	TB0PRUN TB0RUN	INTCAP10 INTCAP11	INTTB1	-	RMC	INTTB1

TMRB7	TB7OUT	-	TB5OUT	TB4PRUN TB4RUN	-	INTTB7	INTTB71	SIO2 SIO3	-

Note:fs is connected to T5BIN in TMPM368FDXBG. For more detail, refer to internal High-speed Oscillation Adjustment function.

## 11.3 Configuration

Each channel consists of a 16-bit up-counter, two 16-bit timer registers (double-buffered), two 16-bit capture registers, two comparators, a capture input control, a timer flip-flop and its associated control circuit. Timer operation modes and the timer flip-flop are controlled by a register.

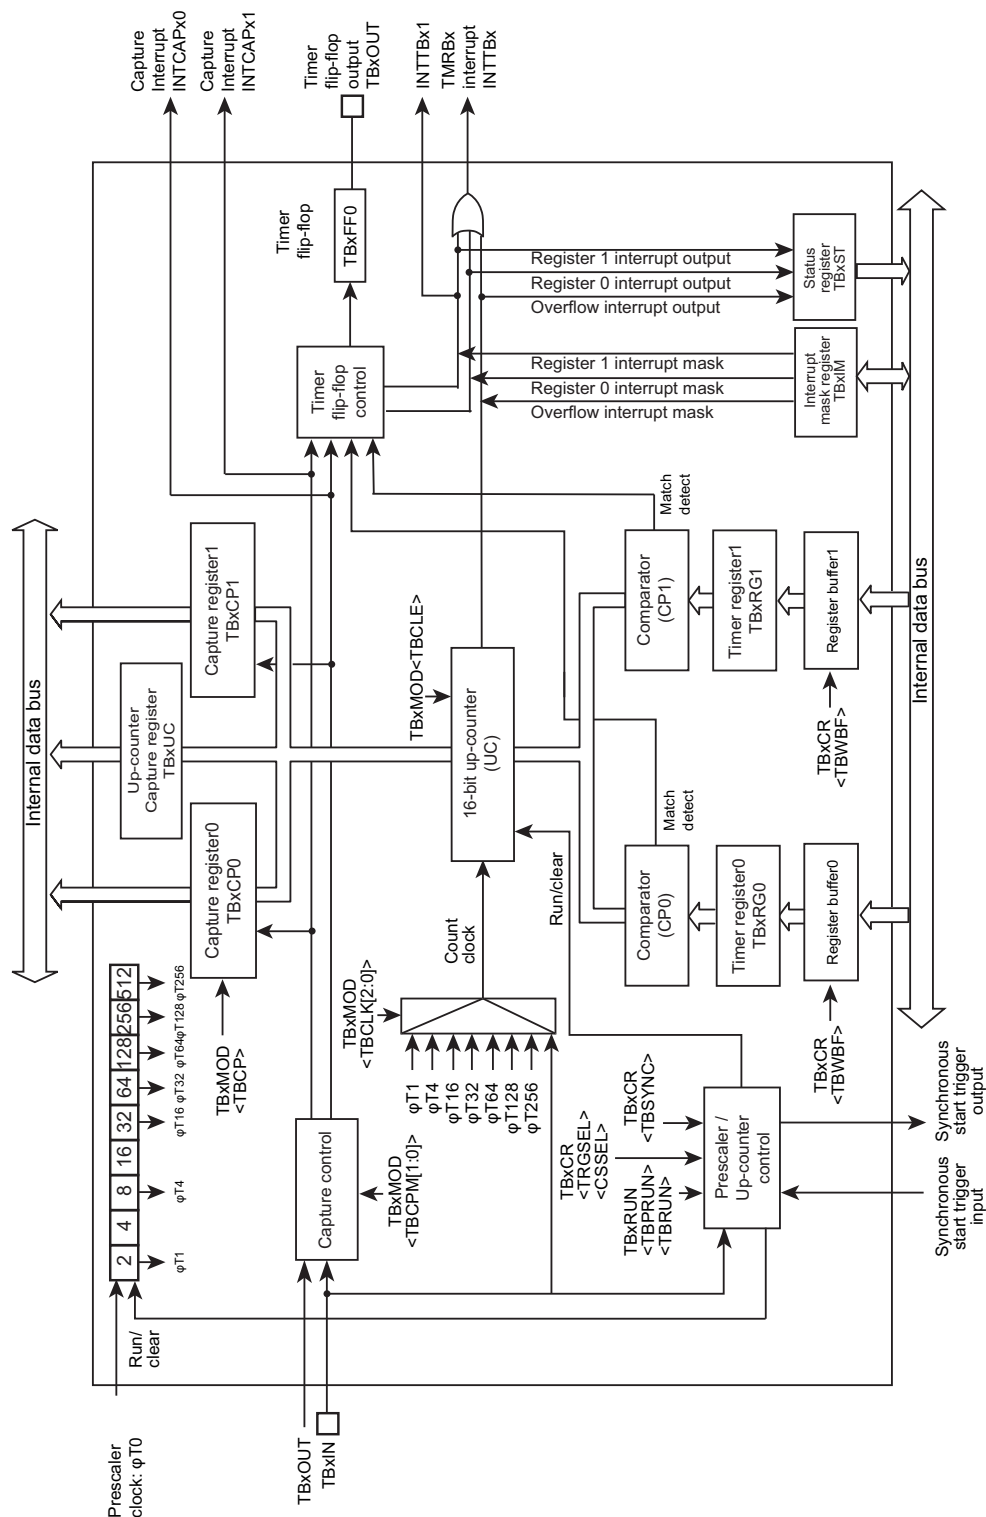

Figure 11-1 TMRBx Block Diagram

## 11.4 Registers

### 11.4.1 Register list according to channel

The following table shows the register names and addresses of each channel.

Channel x	Base Address
Channel 0	0x400C_4000
Channel 1	0x400C_4100
Channel 2	0x400C_4200
Channel 3	0x400C_4300
Channel 4	0x400C_4400
Channel 5	0x400C_4500
Channel 6	0x400C_4600
Channel 7	0x400C_4700

Register name (x=0 to F)		Address (Base+)
Enable register	TBxEN	0x0000
RUN register	TBxRUN	0x0004
Control register	TBxCR	0x0008
Mode register	TBxMOD	0x000C
Flip-flop control register	TBxFFCR	0x0010
Status register	TBxST	0x0014
Interrupt mask register	TBxIM	0x0018
Up counter capture register	TBxUC	0x001C
Timer register 0	TBxRG0	0x0020
Timer register 1	TBxRG1	0x0024
Capture register 0	TBxCP0	0x0028
Capture register 1	TBxCP1	0x002C

Note: During timer operation, timer control register, timer mode register and timer Flip-Flop control register should not be modified. After stopping timer operation, they should be modified.

## 11.4.2 TBxEN (Enable register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	TBEN	TBHALT	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7	TBEN	R/W	<p>TMRBx operation</p> <p>0: Disable</p> <p>1: Enable</p> <p>Specifies the TMRB operation. When the operation is disabled, no clock is supplied to the other registers in the TMRB module. This can reduce power consumption. (This disables reading from and writing to the other registers except TBxEN register.)</p> <p>To use the TMRB, enable the TMRB operation (set to "1") before programming each register in the TMRB module. If the TMRB operation is executed and then disabled, the settings will be maintained in each register.</p>
6	TBEN	R/W	<p>Clock operation during debug HALT</p> <p>0: Operation</p> <p>1: Stop</p> <p>When using debug tool, in case of operation mode transition to HALT mode, TMRB clock is operated or stopped by this bit.</p>
5-0	-	R	Read as "0".

## 11.4.3 TBxRUN (RUN register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	TBPRUN	-	TBRUN
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-3	-	R	Read as "0".
2	TBPRUN	R/W	Prescaler operation 0: Stop & clear 1: Count
1	-	R	Read as "0".
0	TBRUN	R/W	Count operation 0: Stop & clear 1: Count

Note: When the counter is stopped (<TBRUN>=0) and TBxUC<TBUC[15:0]> is read, the value which was captured when the counter was operated is read.

## 11.4.4 TBxCR (Control register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	TBWWF	-	TBSYNC	-	I2TB	TBINSEL	TRGSEL	CSSEL
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0"
7	TBWWF	R/W	Double buffer 0: Disable 1: Enable
6	-	R/W	Write as "0".
5	TBSYNC	R/W	Synchronous mode switching 0: individual (unit of channel) 1: synchronous
4	-	R	Read as "0".
3	I2TB	R/W	Operation at IDLE mode 0: Stop 1: Operation
2	TBINSEL	R/W	Select external input 0: TBxIN 1: Reserved This bit should be written to "0".
1	TRGSEL	R/W	Select external trigger 0: Rising edge 1: Falling edge Select the edge of the external trigger (Signal to TBxIN pin)
0	CSSEL	R/W	Select count start 0: Soft start 1: External trigger

## 11.4.5 TBxMOD (Mode register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	TBCP	TBCPM		TBCLE	TBCLK		
After reset	0	1	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7	-	R/W	Write as "0".
6	TBCP	W	Capture control by software 0: Capture by software 1: Don't care When "0" is written, the capture register 0 (TBxCP0) takes count value. Read as "1".
5-4	TBCPM[1:0]	R/W	Capture timing 00: Disable 01: TBxIN↑ Takes count values into capture register 0 (TBxCP0) upon rising of TBxIN pin input. 10: TBxIN↑ TBxIN↓ Takes count values into capture register 0 (TBxCP0) upon rising of TBxIN pin input. Takes count values into capture register 1 (TBxCP1) upon falling of TBxIN pin input. 11: TBxOUT↑ TBxOUT↓ Takes count values into capture register 0 (TBnCP0) upon rising of 16-bit timer match output (TBxOUT) and into capture register 1 (TBnCP1) upon falling of TBxOUT. (x=7, n=0, 1, 2), (x=2, n=3, 4, 5), (x=5, n=6, 7), (TMRB0 to 2: TB7OUT, TMRB3 to 5: TB2OUT, TMRB6 to 7: TB5OUT)
2	TBCLE	R/W	Up-counter control 0: Disables clearing of the up-counter. 1: Enables clearing of the up-counter. Clears and controls the up-counter. When "0" is written, it disables clearing of the up-counter. When "1" is written, it clears up counter when there is a match with Timer Regsiter1 (TBxRG1).
1-0	TBCLK[1:0]	R/W	Selects the TMRBx source clock. 000: TBxIN pin input 001: φT1 010: φT4 011: φT16 100: φT32 101: φT64 110: φT128 111: φT256

Note: <TBCPM[1:0]> in TBxMOD (x=2, 5, 7) should not be set "11"

## 11.4.6 TBxFFCR (Flip-flop control register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	TBC1T1	TBC0T1	TBE1T1	TBE0T1	TBFF0C	
After reset	1	1	0	0	0	0	1	1

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7-6	-	R	Read as "1".
5	TBC1T1	R/W	TBxFF0 reverse trigger when the up-counter value is taken into the TBxCP1. 0: Disable trigger 1: Enable trigger By setting "1", the timer-flip-flop reverses when the up-counter value is taken into the Capture register 1 (TBxCP1).
4	TBC0T1	R/W	TBxFF0 reverse trigger when the up-counter value is taken into the TBxCP0. 0: Disable trigger 1: Enable trigger By setting "1", the timer-flip-flop reverses when the up-counter value is taken into the Capture register 0 (TBxCP0).
3	TBE1T1	R/W	TBxFF0 reverse trigger when the up-counter value is matched with TBxRG1. 0: Disable trigger 1: Enable trigger By setting "1", the timer-flip-flop reverses when the up-counter value is matched with the Timer register 1 (TBxRG1).
2	TBE0T1	R/W	TBxFF0 reverse trigger when the up-counter value is matched with TBxRG0. 0: Disable trigger 1: Enable trigger By setting "1", the timer-flip-flop reverses when an up-counter value is matched with the Timer register 0 (TBxRG0).
1-0	TBFF0C[1:0]	R/W	TBxFF0 control 00: Invert Reverses the value of TBxFF0 (reverse by using software). 01: Set Sets TBxFF0 to "1". 10: Clear Clears TBxFF0 to "0". 11: Don't care * This is always read as "11".

## 11.4.7 TBxST (Status register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	INTTBOF	INTTB1	INTTB0
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-3	-	R	Read as "0".
2	INTTBOF	R	Overflow flag 0:No overflow occurs 1:Overflow occurs When an up-counter is overflow, "1" is set.
1	INTTB1	R	Match flag (TBxRG1) 0:No detection of a mach 1:Detects a match with TBxRG1 When a match with the timer register 1 (TBxRG1) is detected, "1" is set.
0	INTTB0	R	Match flag (TBxRG0) 0:No match is detected 1:Detects a match with TBxRG0 When a match with the timer register 0 (TBxRG0) is detected, "1" is set.

Note 1: The factors only which is not masked by TBxIM output interrupt request to the CPU. Even if the mask setting is done, the flag is set.

Note 2: The flag is cleared by reading the TBxST register. To clear the flag, TBxST register should be read.

Note 3: Even if TBxIM setting is done, TBxST is set.

## 11.4.8 TBxIM (Interrupt mask register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	TBIMOF	TBIM1	TBIM0
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-3	-	R	Read as "0".
2	TBIMOF	R/W	Overflow interrupt mask 0:Disable 1:Enable Sets the up-counter overflow interrupt to disable or enable.
1	TBIM1	R/W	Match interrupt mask (TBxRG1) 0:Disable 1:Enable Sets the match interrupt mask with the Timer register 1 (TBxRG1) to enable or disable.
0	TBIM0	R/W	Match interrupt mask (TBxRG0) 0:Disable 1:Enable Sets the match interrupt mask with the Timer register 0 (TBxRG0) to enable or disable.

Note: Even if TBxIM setting is done, TBxST is set.

11.4.9 TBxUC (Up counter capture register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	TBUC							
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	TBUC							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-16	-	R	Read as "0".
15-0	TBUC[15:0]	R	Captures a value by reading up-counter out. If TBxUC is read, current up-counter value can be captured.

Note:When the counter is operated and TBxUC is read, the value of the up counter is captured and read.

## 11.4.10 TBxRG0 (Timer register 0)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	TBRG0							
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	TBRG0							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-16	-	R	Read as "0".
15-0	TBRG0[15:0]	R/W	Sets a value comparing to the up-counter.

## 11.4.11 TBxRG1 (Timer register 1)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16

## 11.5 Description of Operations for Each Circuit

The channels operate in the same way, except for the differences in their specifications as shown in Table 11-1.

### 11.5.1 Prescaler

There is a 4-bit prescaler to generate the source clock for up-counter UC.

The prescaler input clock  $\phi T0$  is  $f_s$ ,  $f_{\text{periph}}/1$ ,  $f_{\text{periph}}/2$ ,  $f_{\text{periph}}/4$ ,  $f_{\text{periph}}/8$ ,  $f_{\text{periph}}/16$  or  $f_{\text{periph}}/32$  selected by CGSYSCR<PRCK[2:0]> in the CG. The peripheral clock,  $f_{\text{periph}}$ , is either  $f_{\text{gear}}$ , a clock selected by CGSYSCR<FPSEL> in the CG, or  $f_c$ , which is a clock before it is divided by the clock gear.

The operation or the stoppage of a prescaler is set with TBxRUN<TBPRUN> where writing "1" starts counting and writing "0" clears and stops counting. Below tables show prescaler output clock resolutions.

Table 11-2 Prescaler Output Clock Resolutions (fc = 80MHz)

Select peripheral clock CGSYSCR <FPSEL>	Select gear clock CGSYSCR <GEAR[2:0]>	Select prescaler clock CGSYSCR <PRCK[2:0]>	Prescaler output clock function		
			$\phi T1$	$\phi T4$	$\phi T16$
0 (fgear)	000 (fc)	000 (fperiph/1)	$fc/2^1$ (0.025 $\mu s$ )	$fc/2^3$ (0.1 $\mu s$ )	$fc/2^5$ (0.4 $\mu s$ )

		001 (fperiph/2)	–	–	$fc/2^6$ (0.8 $\mu s$ )
		010 (fperiph/4)	–	$fc/2^5$ (0.4 $\mu s$ )	$fc/2^7$ (1.6 $\mu s$ )
		011 (fperiph/8)	–	$fc/2^6$ (0.8 $\mu s$ )	$fc/2^8$ (3.2 $\mu s$ )
		100 (fperiph/16)	$fc/2^5$ (0.4 $\mu s$ )	$fc/2^7$ (1.6 $\mu s$ )	$fc/2^9$ (6.4 $\mu s$ )
		101 (fperiph/32)	$fc/2^6$ (0.8 $\mu s$ )	$fc/2^8$ (3.2 $\mu s$ )	$fc/2^{10}$ (12.8 $\mu s$ )

Note 1: The prescaler output clock  $\phi Tn$  must be selected so that  $\phi Tn < f_{sys}$  is satisfied (so that  $\phi Tn$  is slower than  $f_{sys}$ ).

Note 2: Do not change the clock gear while the timer is operating.

Note 3: "–" denotes a setting prohibited.

Note 1: The prescaler output clock  $\phi Tn$  must be selected so that  $\phi Tn < f_{sys}$  is satisfied (so that  $\phi Tn$  is slower than  $f_{sys}$ ).

Note 2: Do not change the clock gear while the timer is operating.

Note 3: "." denotes a setting prohibited.

### 11.5.2 Up-counter (UC)

UC is a 16-bit binary counter.

- Source clock

UC source clock, specified by TBxMOD<TBCLK[2:0]>, can be selected from either three types -  $\phi T1$ ,  $\phi T4$ ,  $\phi T16$ ,  $\phi T32$ ,  $\phi T64$ ,  $\phi T128$  and  $\phi T256$  - of prescaler output clock or the external clock of the TBxIN pin.

- Counter start / stop

Counter operation is specified by TBxRUN<TBRUN>. UC starts counting if <TBRUN> = "1", and stops counting and clears counter value if <TBRUN> = "0".

- Timing to clear UC

1. When a match is detected.

By setting TBxMOD<TBCLE> = "1", UC is cleared if when the comparator detects a match between counter value and the value set in TBxRG1. UC operates as a free-running counter if TBxMOD<TBCLE> = "0".

2. When UC stops

UC stops counting and clears counter value if TBxRUN<TBRUN> = "0".

- UC overflow

If UC overflow occurs, the INTTBx overflow interrupt is generated.

### 11.5.3 Timer registers (TBxRG0, TBxRG1)

TBxRG0 and TBxRG1 are registers for setting values to compare with up-counter values and two registers are built into each channel. If the comparator detects a match between a value set in this timer register and that in a UC up-counter, it outputs the match detection signal.

TBxRG0 and TBxRG1 are consisted of the double-buffered configuration which are paired with register buffers. The double buffering is disabled in the initial state.

Controlling double buffering disable or enable is specified by TBxCR<TBWBF> bit. If <TBWBF> = "0", the double buffering becomes disable. If <TBWBF> = "1", it becomes enable. When the double buffering is enabled, a data transfer from the register buffer to the timer register (TBxRG0/1) is done in the case that UC is matched with TBxRG1. When the counter is stopped even if double buffering is enabled, the double buffering operates as a single buffer, and an immediate data can be written to the TBxRG0 and TBxRG1.

### 11.5.4 Capture

This is a circuit that controls the timing of latching values from the UC up-counter into the TBxCP0 and TBxCP1 capture registers. The timing with which to latch data is specified by TBxMOD<TBCPM[1:0]>.

Software can also be used to import values from the UC up-counter into the capture register; specifically, UC values are taken into the TBxCP0 capture register each time "0" is written to TBxMOD<TBCP>.

### 11.5.5 Capture registers (TBxCP0, TBxCP1)

This register captures an up-counter (UC) value.

### 11.5.6 Up-counter capture register (TBxUC)

Other than the capturing functions shown above, the current count value of the UC can be captured by reading the TBxUC registers.

### 11.5.7 Comparators (CP0, CP1)

This register compares with the up-counter (UC) and the value setting of the Timer Register (TBxRG0 and TBxRG1) to detect whether there is a match or not. If a match is detected, INTTBx is generated.

### 11.5.8 Timer Flip-flop (TBxFF0)

The timer flip-flop (TBxFF0) is reversed by a match signal from the comparator and a latch signal to the capture registers. It can be enabled or disabled to reverse by setting the TBxFFCR<TBC1T1, TBC0T1, TBE1T1, TBE0T1>.

The value of TBxFF0 becomes undefined after a reset. The flip-flop can be reversed by writing "00" to TBxFFCR<TBFF0C[1:0]>. It can be set to "1" by writing "01," and can be cleared to "0" by writing "10."

The value of TBxFF0 can be output to the Timer output pin (TBxOUT). If the timer output is performed, the corresponding port settings must be programmed beforehand.

### 11.5.9 Capture interrupt (INTCAPx0, INTCAPx1)

Interrupts INTCAPx0 and INTCAPx1 can be generated at the timing of latching values from the UC up-counter into the TBxCP0 and TBxCP1 capture registers. The interrupt timing is specified by the CPU.

11.6 Description of Operations for Each Mode

11.6.1 16-bit interval Timer Mode

In the case of generating constant period interrupt, set the interval time to the Timer register (TBxRG1) to generate the INTTBx interrupt.

		7	6	5	4	3	2	1	0	
TBxEN	←	1	X	X	X	X	X	X	X	Enables TMRBx operation.
TBxRUN	←	X	X	X	X	X	0	X	0	Stops count operation.
Interrupt Set-Enable Register	←	*	*	*	*	*	*	*	*	Permits INTTBx interrupt by setting corresponding bit to "1".
TBxFFCR	←	X	X	0	0	0	0	1	1	Disable to TBxFF0 reverse trigger
TBxMOD	←	X	1	0	0	1	*	*	*	Changes to prescaler output clock as input clock. Specifies capture function to disable.
						(** = 001 to 111)				
TBxRG1	←	*	*	*	*	*	*	*	*	Specifies a time interval. (16 bits)
	←	*	*	*	*	*	*	*	*	
TBxRUN	←	*	*	*	*	*	1	X	1	Starts TMRBx.

Note:X; Don't care -; No change

11.6.2 16-bit Event Counter Mode

It is possible to make it the event counter by using an input clock as an external clock (TBxIN pin input).

The up-counter counts up on the rising edge of TBxIN pin input. It is possible to read the count value by capturing value using software and reading the captured value.

		7	6	5	4	3	2	1	0	
TBxEN	←	1	X	X	X	X	X	X	X	Enables TMRBx operation.
TBxRUN	←	X	X	X	X	X	0	X	0	Stops count TMRBx.
Set PORT registers.										Allocates corresponding port to TBxIN.
TBxFFCR	←	X	X	0	0	0	0	1	1	Disable to TBxFF0 reverse trigger.
TBxMOD	←	X	1	0	0	0	0	0	0	Changes to TBxIN as an input clock.
TBxRUN	←	*	*	*	*	*	1	X	1	Starts TMRBx.
TBxMOD	←	X	0	0	0	0	0	0	0	Software capture is done.

Note:X; Don't care -; No change

### 11.6.3 16-bit PPG (Programmable Pulse Generation) Output Mode

Square waves with any frequency and any duty (programmable square waves) can be output. The output pulse can be either low-active or high-active

Programmable square waves can be output from the TBxOUT pin by triggering the timer flip-flop (TBxFF) to reverse when the set value of the up-counter (UC) matches the set values of the timer registers (TBxRG0 and TBxRG1). Note that the set values of TBxRG0 and TBxRG1 must satisfy the following requirement:

Set value of TBxRG0 < Set value of TBxRG1

Figure 11-2 Example of Output of Programmable Pulse Generation (PPG)

In this mode, by enabling the double buffering of TBxRG0, the value of register buffer 0 is shifted into TBxRG0 when the set value of the up-counter matches the set value of TBxRG1. This facilitates handling of small duties.

Figure 11-3 Register Buffer Operation

The block diagram of this mode is shown below.

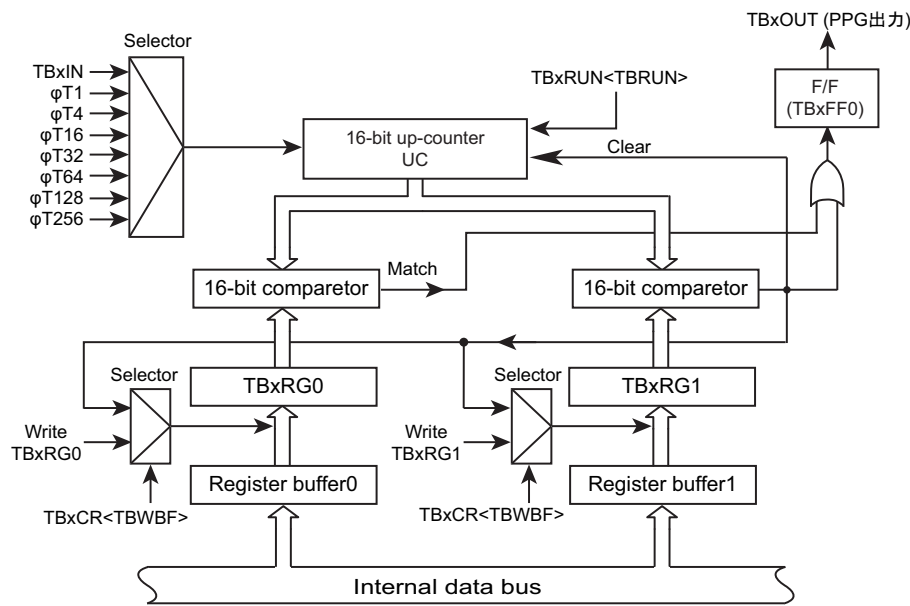

Figure 11-4 Block Diagram of 16-bit PPG Mode

Each register in the 16-bit PPG output mode must be programmed as listed below.

		7	6	5	4	3	2	1	0	
TBxEN	←	1	X	X	X	X	X	X	X	Enables TMRBx operation.
TBxRUN	←	X	X	X	X	X	0	X	0	Stops count operation.
TBxCR	←	0	0	-	X	-	X	X	X	Disable double buffering.
TBxRG0	←	*	*	*	*	*	*	*	*	Specifies a duty. (16 bits)
	←	*	*	*	*	*	*	*	*	
TBxRG1	←	*	*	*	*	*	*	*	*	Specifies a cycle. (16 bits)
	←	*	*	*	*	*	*	*	*	
TBxCR	←	1	0	X	0	0	0	0	0	Enables the TBxRG0 double buffering. (Changes the duty / cycle when the INTTBx interrupt is generated)
TBxFFCR	←	X	X	0	0	1	1	1	0	Specifies to trigger TBxFF0 to reverse when a match with TBxRG0 or TBxRG1 is detected, and sets the initial value of TBxFF0 to "0".
TBxMOD	←	X	1	0	0	1	*	*	*	Designates the prescaler output clock as the input clock, and disables the capture function.
							(** = 001 to 111)			
Set PORT registers.										
TBxRUN	←	*	*	*	*	*	1	X	1	Starts TMRBx.

Note 1: m ; corresponding bit of port  
Note 2: X; Don't care  
-; No change

11.6.4 Timer synchronous mode

This mode enables the timers to start synchronously.

If the mode is used with PPG output, the output can be applied to drive a motor.

TMRB is consisted of pairs of 4-channel TMRB. If one channel starts, remaining 3 channels can be start synchronously. In the TMPM368FDXBG, the following combinations allow to use.

Start trigger channel (Master channel)	Synchronous operation channel (Slave channel)
TMRB0	TMRB1, TMRB2, TMRB3
TMRB4	TMRB5, TMRB6, TMRB7

Use of the timer synchronous mode is specified in TBxCR<TBSYNC> bit.

- <TBSYNC> = "0" : Timer operates individually.
- <TBSYNC> = "1" : Timers operates synchronously.

Set "0" to the <TBSYNC> bit in the master channel.

If <TBSYNC> = "1" is set in the slave channel, the start timing is synchronized with master channel start timing. Setting of start timing for TBxRUN<TBPRUN, TBRUN> bit in the slave channel is not required.

Note 1: Except timer synchronous mode, TBxCR<TBSYNC> should be cleared to "0". In case of setting timer synchronous mode, other channels are waiting start until they are started by TMRB0 or TMRB4.

Note 2: <TBSYNC> bit of TMRB0 and TMRB4 which are the trigger of timer start is always clear to "0".

### 11.6.5 External trigger count start mode

A timer can be started by an external signal when using external trigger count start mode.

Select count start by TBxCR<CSSEL>.

- <CSSEL>="0": A timer is operated with each timing.
- <CSSEL>="1": A timer is started by an external signal.

The edge of trigger is selected by TBxCR<TRGSEL>.

- <TRGSEL>="0": Select a rising edge of TBxIN input.
- <TRGSEL>="1": Select a falling edge of TBxIN input.

In case of setting timer synchronous mode, it has higher priority than this mode.

## 11.7 Applications using the Capture Function

The capture function can be used to develop many applications, including those described below:

- 1. One-shot pulse output triggered by an external pulse
- 2. Frequency measurement
- 3. Pulse width measurement

### 11.7.1 One-shot pulse output triggered by an external pulse

One-shot pulse output triggered by an external pulse is carried out as follows:

The 16-bit up-counter is made to count up by putting it in a free-running state using the prescaler output clock. An external pulse is input through the TBxIN0 pin. A trigger is generated at the rising of the external pulse by using the capture function and the value of the up-counter is taken into the capture registers (TBxCP0).

The CPU must be programmed so that an interrupt INTCAPx0 is generated at the rising of an external trigger pulse. This interrupt is used to set the timer registers (TBxRG0) to the sum of the TBxCP0 value (c) and the delay time (d), (c + d), and set the timer registers (TBxRG1) to the sum of the TBxRG0 values and the pulse width (p) of one-shot pulse, (c + d + p). TBxRG1 change must be completed before the next match.

In addition, the timer flip-flop control registers(TBxFFCR<TBE1T1, TBE0T1>) must be set to "11". This enables triggering the timer flip-flop (TBxFF0) to reverse when UC matches TBxRG0 and TBxRG1. This trigger is disabled by the INTTBx interrupt after a one-shot pulse is output.

Symbols (c), (d) and (p) used in the text correspond to symbols c, d and p in "Figure 11-5 One-shot Pulse Output (With Delay)".

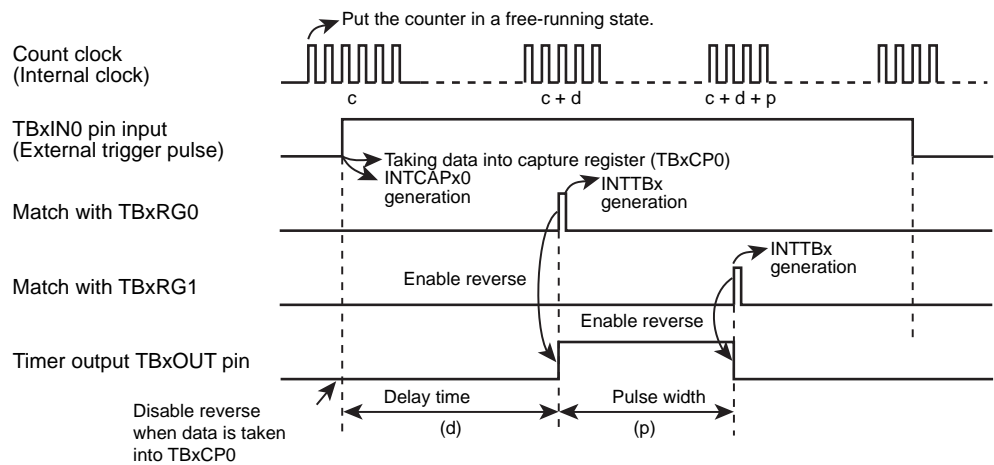

Figure 11-5 One-shot Pulse Output (With Delay)

The followings show the settings in the case that 2 ms width one-shot pulse is output after 3ms by triggering TBxIN input at the rising edge. ( $\phi T1$  is selected for counting.)

	7	6	5	4	3	2	1	0	
[Main processing] Capture setting by TBxIN0									
Set PORT registers.									
TBxEN	← 1	X	X	X	X	X	X	X	Allocates corresponding port to TBxIN0.
TBxRUN	← X	X	X	X	X	0	X	0	Enables TMRBx operation.
TBxMOD	← X	1	0	1	0	0	0	1	Stops count operation.
TBxFFCR	← X	X	0	0	0	0	1	0	Changes source clock to $\phi T1$ . Fetches a count value into the TBxCP0 at the rising edge of TBxIN0.
Set PORT registers.									
Interrupt Set-Enable Register	← *	*	*	*	*	*	*	*	Clears TBxFF0 reverse trigger and disables.
TBxRUN	← *	*	*	*	*	1	X	1	Allocates corresponding port to TBxOUT.
[Processing of INTCAPx0 interrupt service routine] Pulse output setting									
TBxRG0	← *	*	*	*	*	*	*	*	Permits to generate interrupts specified by INTCAPx0 interrupt corresponding bit by setting to "1".
TBxRG1	← *	*	*	*	*	*	*	*	Starts the TMRBx module.
TBxFFCR	← X	X	-	-	1	1	-	-	Sets count value. (16bit) (TBxCP0 + 3ms/ $\phi T1$ )
TBxIM	← X	X	X	X	X	1	0	1	Sets count value.(16bit) (TBxCP0 + (3+2)ms/ $\phi T1$ )
Interrupt Set-Enable Register	← *	*	*	*	*	*	*	*	Reverses TBxFF0 if UC consistent with TBxRG0 and TBxRG1.
[Processing of INTTBx interrupt service routine] Output disable									
TBxFFCR	← X	X	-	-	0	0	-	-	Masks except TBxRG1 correspondence interrupt.
Interrupt enable clear register	← *	*	*	*	*	*	*	*	Permits to generate interrupt specified by INTTBx interrupt corresponding bit setting to "1".

Note 1: m ; corresponding bit of port

Note 2: X; Don't care

-; No change

If a delay is not required, TBxFF0 is reversed when data is taken into TBxCP0, and TBxRG1 is set to the sum of the TBxCP0 value (c) and the one-shot pulse width (p), (c + p), by generating the INTCAPx0 interrupt. TBxRG1 change must be completed before the next match.

TBxFF0 is enabled to reverse when UC matches with TBxRG1, and is disabled by generating the INTTBx interrupt.

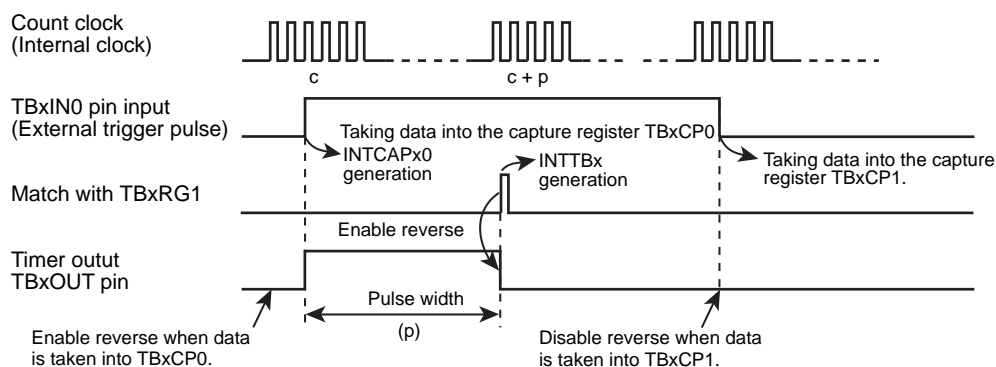

Figure 11-6 One-shot Pulse Output Triggered by an External Pulse (Without Delay)

11.7.2 Frequency measurement

The frequency of an external clock can be measured by using the capture function.

To measure frequency, another 16-bit timer is used in combination with the 16-bit event counter mode. As an example, we explain with TMRB1 and TMRB0. TB0OUT of the 16-bit timer TMRB0 is used to specify the measurement time.

TMRB1 count clock selects TB1IN input and performs count operation by using external clock input. If TB1MOD<TB1CPM[1:0]> is set "11", TMRB1 count clock takes the counter value into the TB1CP0 at the rising edge of TB0OUT and takes the counter value into TB1CP1 at the falling edge of TB0OUT.

This setting allows a count value of the 16-bit up-counter UC to be taken into the capture register (TB1CP0) upon rising of a timer flip-flop output (TB0OUT) of the 16-bit timer (TMRB0), and an UC counter value to be taken into the capture register (TB1CP1) upon falling of TB0OUT of the 16-bit timer (TMRB0).

A frequency is then obtained from the difference between TB1CP0 and TB1CP1 based on the measurement, by generating the INTTB0 16-bit timer interrupt.

For example, if the difference between TB1CP0 and TB1CP1 is 100 and the level width setting value of TB0OUT is 0.5 s, the frequency is 200 Hz ( $100 \div 0.5 \text{ s} = 200 \text{ Hz}$ ).

Figure 11-7 Frequency Measurement

11.7.3 Pulse width measurement

By using the capture function, the "High" level width of an external pulse can be measured. Specifically, by putting it in a free-running state using the prescaler output clock, an external pulse is input through the TBxIN pin and the up-counter (UC) is made to count up. A trigger is generated at each rising and falling edge of the external pulse by using the capture function and the value of the up-counter is taken into the capture registers (TBxCP0, TBxCP1). The CPU must be programmed so that INTCAPx1 is generated at the falling edge of an external pulse input through the TBxIN0 pin.

The "High" level pulse width can be calculated by multiplying the difference between TBxCP0 and TBxCP1 by the clock cycle of an internal clock.

For example, if the difference between TBxCP0 and TBxCP1 is 100 and the cycle of the prescaler output clock is 0.5 μs, the pulse width is  $100 \times 0.5 \text{ μs} = 50 \text{ μs}$ .

Caution must be exercised when measuring pulse widths exceeding the UC maximum count time which is dependant upon the source clock used. The measurement of such pulse widths must be made using software.

The "Low" level width of an external pulse can also be measured. In such cases, the difference between C2 generated the first time and C1 generated the second time is initially obtained by performing the second stage of INTCAPx0 interrupt processing as shown in "Figure 11-8 Pulse Width Measurement" and this difference is multiplied by the cycle of the prescaler output clock to obtain the "Low" level width.

Figure 11-8 Pulse Width Measurement

## 12. Serial Channel (SIO/UART)

### 12.1 Overview

This device has two modes for the serial channel, one is the synchronous communication mode (I/O interface mode), and the other is the asynchronous communication mode (UART mode).

Their features are described as follows.

- Transfer Clock
  - Generate the transfer clock by dividing the peripheral clock ( $\phi T0$ ) frequency into 1/2, 1/8, 1/32, 1/128.
  - The prescaler output clock frequency can be divided by each of the numbers from 1 to 16.
  - The prescaler output frequency can be divided by each of the numbers from 1,  $N+m/16$  ( $N=2$  to 15,  $m=1$  to 15), and 16. (only UART mode)
  - The system clock is usable. (only UART mode)
- Double buffer / FIFO
 

The double buffer function and the FIFO buffers (total of transmit and receive) can be used up to 4bytes.
- I/O Interface mode
  - Transfer Mode : the half duplex (transmit / receive) and the full duplex
  - Clock : Output (fixed rising edge) / Input (selectable rising / falling edge)
  - A time interval can be set within a range where continuous transmission is performed.
- UART Mode
  - Data length : 7, 8, 9 bits
  - Add parity bit (to be against 9 bits data length)
  - Serial links to use wake-up function
  - Handshaking function with  $\overline{CTS}$  pin

In the following explanation, "x" represents channel number.

### 12.2 Difference in the Specification of SIO / UART Modules

TMPM368FDXBG has 4 channels.

Each channel function is not depended. The pins and interrupts for each channel are assigned as follows.

Table 12-1 Differences for each channels of SIO / UART Modules

	Pin name			Interrupt		Timer for serial clock	DMA
	TXD	RXD	$\overline{CTS}$ / SCLK	Receive interrupt	Transmit interrupt		
channel 0	PE2	PE1	PE3	INTRX0	INTTX0	TB4OUT	support
channel 1	PE5	PE6	PE4	INTRX1	INTTX1	TB4OUT	support
channel 2	PL2	PL1	PL3	INTRX2	INTTX2	TB7OUT	support
channel 3	PB0	PB1	PA7	INTRX3	INTTX3	TB7OUT	support

Figure 12-1 shows SIO / UART block diagram.

## 12.4 Registers Description

### 12.4.1 Registers List in Each Channel

The below table shows registers and addresses for each register.

Channel x	Base Address
Channel0	0x400E_1000
Channel1	0x400E_1100
Channel2	0x400E_1200
Channel3	0x400E_1300

Register name (x=0 to 3)		Address (Base+)
Enable register	SCxEN	0x0000
Buffer register	SCxBUF	0x0004
Control register	SCxCR	0x0008
Mode control register 0	SCxMOD0	0x000C
Baud rate generator control register	SCxBRCR	0x0010
Baud rate generator control register 2	SCxBRADD	0x0014
Mode control register 1	SCxMOD1	0x0018
Mode control register 2	SCxMOD2	0x001C
Receive FIFO configuration register	SCxRFC	0x0020
Transmit FIFO configuration register	SCxTFC	0x0024
Receive FIFO status register	SCxRST	0x0028
Transmit FIFO status register	SCxTST	0x002C
FIFO configuration register	SCxFCNF	0x0030

12.4.2 SCxEN (Enable Register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	-	-	SIOE
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-1	-	R	Read as "0".
0	SIOE	R/W	SIO/UART operation 0: disable 1: Operation Specifies the SIO/UART operation. To use the SIO/UART, set <SIOE> = "1". When the operation is disabled, no clock is supplied to the other registers in the SIO/UART module. This can reduce the power consumption. If the SIO/UART operation is executed and then disabled, the settings will be maintained in each register except for SCxTFC<TIL>.

Note: In case that SCxEN<SIOE>="0" (Stop SIO/UART operation) or the operation mode is changed to IDLE mode with SCxMOD<I2SC>="0" (Stop SIO/UART operation in IDLE mode), SCxTFC is initialized again.

### 12.4.3 SCxBUF (Buffer Register)

SCxBUF works as a transmit buffer or FIFO for write operation and as a receive buffer or FIFO for read operation.

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	TB / RB							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7-0	TB[7:0] / RB [7:0]	R/W	[write] TB :Transmit buffer / FIFO [read] RB : Receive buffer / FIFO

## 12.4.4 SCxCR (Control Register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	RB8	EVEN	PE	OERR	PERR	FERR	SCLKS	IOC
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7	RB8	R	Receive data bit 8 (for UART mode) 9th bit of the received data in the 9 bits UART mode.
6	EVEN	R/W	Parity (for UART mode) 0: Odd 1: Even Selects even or odd parity. "0" :odd parity, "1" : even parity The parity bit can be used only in the 7-bit or 8-bit UART mode.
5	PE	R/W	Adding parity (for UART mode) 0: Disabled 1: Enabled Controls enabling / disabling parity The parity bit can be used only in the 7-bit or 8-bit UART mode.
4	OERR	R	Overrun error flag (Note) 0: Normal operation 1: Error
3	PERR	R	Parity / Underrun error flag (Note) 0: Normal operation 1: Error
2	FERR	R	Framing error flag (Note) 0: Normal operation 1: Error
1	SCLKS	R/W	Selecting input clock edge (for I/O Interface mode) Set to "0" in the clock output mode. 0:Data in the transmit buffer is sent to TXDx pin one bit at a time on the falling edge of SCLKx. Data from RXDx pin is received in the receive buffer one bit at a time on the rising edge of SCLKx. In this case, the SCLKx starts from high level. 1:Data in the transmit buffer is sent to TXDx pin one bit at a time on the rising edge of SCLKx. Data from RXDx pin is received in the receive buffer one bit at a time on the falling edge of SCLKx. In this case, the SCLKx starts from low level.
0	IOC	R/W	Selecting clock (for I/O Interface) 0: Baud rate generator 1: SCLK pin input

Note:<OERR>, <PERR> and <FERR> are cleared to "0" when they are read.

## 12.4.5 SCxMOD0 (Mode Control Register 0)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	TB8	CTSE	RXE	WU	SM		SC	
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7	TB8	R/W	Transmit data bit 8 (For UART mode) Writes the 9th bit of transmit data in the 9 bits UART mode.
6	CTSE	R/W	Handshake function control (For UART mode) 0: CTS disabled 1: CTS enabled Controls handshake function. Setting "1" enables handshake function using $\overline{CTSx}$ pin.
5	RXE	R/W	Receive control (Note1) (Note2) 0: Disabled 1: Enabled
4	WU	R/W	Wake-up function (For UART mode) 0: Disabled 1: Enabled This function is available only at 9-bit UART mode. In other mode, this function has no meaning. When it is set to be enabled, Interrupt occurs only when <RB8> = "1" at 9-bit in the UART mode.
3-2	SM[1:0]	R/W	Specifies transfer mode. 00: I/O interface mode 01: 7-bit length UART mode 10: 8-bit length UART mode 11: 9-bit length UART mode
1-0	SC[1:0]	R/W	Serial transfer clock (For UART mode) 00: Timer TBxOUT Refer to Table 12-1. 01: Baud rate generator 10: Internal clock fsys 11: External clock (SCLK input) (As for the I/O interface mode, the serial transfer clock can be set in the control register (SCxCR).

Note 1: Specify all register first and then enable the <RXE> bit.

Note 2: Do not clear SCxMOD0<RXE> when data is being received.

## 12.4.6 SCxMOD1 (Mode Control Register 1)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	I2SC	FDPX		TXE	SINT			-
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7	I2SC	R/W	IDLE 0: Stop 1: Operate Specifies the IDLE mode operation.
6-5	FDPX[1:0]	R/W	Transfer mode setting 00: Transfer prohibited 01: Half duplex (Receive) 10: Half duplex (Transmit) 11: Full duplex Configures the transfer mode in the I/O interface mode. Also configures the FIFO if it is enabled. In the UART mode, it is used only to specify the FIFO configuration.
4	TXE	R/W	Transmit control (Note1) (Note2) 0: Disabled 1: Enabled This bit enables transmission and is valid for all the transfer modes.
3-1	SINT[2:0]	R/W	Interval time of continuous transmission (For I/O interface mode) 000: None 001: 1SCLK 010: 2SCLK 011: 4SCLK 100: 8SCLK 101: 16SCLK 110: 32SCLK 111: 64SCLK This parameter is valid only for the I/O interface mode when SCLK pin output is selected. In other modes, this function has no meaning. Specifies the interval time of continuous transmission when double buffering or FIFO is enabled in the I/O interface mode.
0	-	R/W	Write to "0".

Note 1: Specify all register first and then enable the <TXE> bit.

Note 2: Do not stop the transmit operation (by setting <TXE> = "0") when data is being transmitted.

Note 3: In case that SCxEN<SIOE>="0" (Stop SIO/UART operation) or the operation mode is changed to IDLE mode with SCxMOD<I2SC>="0" (Stop SIO/UART operation in IDLE mode), SCxTFC is initialized again.

## 12.4.7 SCxMOD2 (Mode Control Register 2)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	TBEMP	RBFL	TXRUN	SBLN	DRCHG	WBUF	SWRST	
After reset	1	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function											
31-8	–	R	Read as "0".											
7	TBEMP	R	Transmit buffer empty flag. 0: Full 1: Empty If double buffering is disabled, this flag is insignificant. This flag shows that the transmit double buffers are empty. When data in the transmit double buffers is moved to the transmit shift register and the double buffers are empty, this bit is set to "1". Writing data again to the double buffers sets this bit to "0".											
6	RBFL	R	Receive buffer full flag. 0: Empty 1: Full If double buffering is disabled, this flag is insignificant. This is a flag to show that the receive double buffers are full. When a receive operation is completed and received data is moved from the receive shift register to the receive double buffers, this bit changes to "1" while reading this bit changes it to "0".											
5	TXRUN	R	In transmission flag 0: Stop 1: Operate This is a status flag to show that data transmission is in progress. <TXRUN> and <TBEMP> bits indicate the following status. <table><tr><td>&lt;TXRUN&gt;</td><td>&lt;TBEMP&gt;</td><td>Status</td></tr><tr><td>1</td><td>–</td><td>Transmission in progress</td></tr><tr><td rowspan="2">0</td><td>1</td><td>Transmission completed</td></tr><tr><td>0</td><td>Wait state with data in transmit buffer.</td></tr></table>	<TXRUN>	<TBEMP>	Status	1	–	Transmission in progress	0	1	Transmission completed	0	Wait state with data in transmit buffer.
<TXRUN>	<TBEMP>	Status												
1	–	Transmission in progress												
0	1	Transmission completed												
	0	Wait state with data in transmit buffer.												
4	SBLN	R/W	STOP bit (For UART mode) 0: 1-bit 1: 2-bit This specifies the length of transmission stop bit in the UART mode. On the receive side, the decision is made using only a single bit regardless of the <SBLN> setting.											
3	DRCHG	R/W	Setting transfer direction 0: LSB first 1: MSB first Specifies the direction of data transfer in the I/O interface mode. In the UART mode, set this bit to LSB first.											
2	WBUF	R/W	Double buffer 0: Disabled 1: Enabled This parameter enables or disables the transmit / receive double buffers to transmit (in both SCLK output / input modes) and receive (in SCLK output mode) data in the I/O interface mode and to transmit data in the UART mode. When receiving data in the I/O interface mode (SCLK input) and UART mode, double buffering is enabled in both case that "0" or "1" is set to <WBUF> bit.											

Bit	Bit Symbol	Type	Function										
1-0	SWRST[1:0]	R/W	<div>Software reset</div> <div>Overwriting "01" in place of "10" generates a software reset. When this software reset is executed, the following bits are initialized and the transmit/receive circuit and the FIFO become initial state (see Note1 and Note2).</div> <table><tr><td>Register</td><td>Bit</td></tr><tr><td>SCxMOD0</td><td>&lt;RXE&gt;</td></tr><tr><td>SCxMOD1</td><td>&lt;TXE&gt;</td></tr><tr><td>SCxMOD2</td><td>&lt;TBEMP&gt;, &lt;RBFL&gt;, &lt;TXRUN&gt;</td></tr><tr><td>SCxCR</td><td>&lt;OERR&gt;, &lt;PERR&gt;, &lt;FERR&gt;</td></tr></table>	Register	Bit	SCxMOD0	<RXE>	SCxMOD1	<TXE>	SCxMOD2	<TBEMP>, <RBFL>, <TXRUN>	SCxCR	<OERR>, <PERR>, <FERR>
Register	Bit												
SCxMOD0	<RXE>												
SCxMOD1	<TXE>												
SCxMOD2	<TBEMP>, <RBFL>, <TXRUN>												
SCxCR	<OERR>, <PERR>, <FERR>												

- Note 1: While data transmission is in progress, any software reset operation must be executed twice in succession.
- Note 2: A software reset requires 2 clocks-duration at the time between the end of recognition and the start of execution of software reset instruction.

## 12.4.8 SCxBRCR (Baud Rate Generator Control Register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	BRADDE	BRCK		BRS			
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7	-	R/W	Write to "0".
6	BRADDE	R/W	$N + (16 - K)/16$ divider function (For UART mode) 0: Disabled 1: Enabled This division function can only be used in the UART mode.
5-4	BRCK[1:0]	R/W	Select input clock to the baud rate generator. 00: $\phi T1$ 01: $\phi T4$ 10: $\phi T16$ 11: $\phi T64$
3-0	BRS[3:0]	R/W	Division ratio "N" (note1)(note2) 0000: 16 0001: 1 0010: 2 : 1111: 15

Note 1: As a division ratio, 1 ("0001") or 16 ("0000") can not be applied to N when using the " $N + (16 - K)/16$ " division function in the UART mode.

Note 2: The division ratio "1" of the baud rate generator can be specified only when the double buffering is used in the I/O interface mode.

12.4.9 SCxBRADD (Baud Rate Generator Control Register 2)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	BRK			
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-4	-	R	Read as "0".
3-0	BRK[3:0]	R/W	Specify K for "N + (16 - K)/16" division (For UART mode) 0000: Prohibited 0001: K = 1 0010: K = 2 : 1111: K = 15

Table 12-2 lists the setting of baud rate generator division ratio.

Table 12-2 Setting division ratio

	<BRADDE> = "0"	<BRADDE> = "1" (Note1) (Only UART mode)
<BRS>	Specify "N" (Note2) (Note3)	
<BRK>	No setting required	Specify "K" (Note4)
Division ratio	Divide by N	$N + \frac{(16 - K)}{16}$ division

Note 1: To use the "N + (16 - K)/16" division function, be sure to set <BRADDE> to "1" after setting the K value to <BRK>. The "N + (16 - K)/16" division function can only be used in the UART mode.  
Note 2: Specifying "K = 0" is prohibited.

## 12.4.10 SCxFCNF (FIFO Configuration Register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	RFST	TFIE	RFIE	RXTXCNT	CNFG
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function						
31-8	-	R	Read as "0".						
7-5	-	R/W	Be sure to write "000".						
4	RFST	R/W	Bytes used in Receive FIFO 0: Maximum 1: Same as FILL level of Receive FIFO When Receive FIFO is enabled, the number of Receive FIFO bytes to be used is selected (Note1) 0: The maximum number of bytes of the FIFO configured (see also <CNFG>). 1: Same as the fill level for receive interrupt generation specified by SCxRFC <RIL[1:0]>						
3	TFIE	R/W	Transmit interrupt for Transmit FIFO 0:Disabled 1:Enabled When Transmit FIFO is enabled, transmit interrupts are enabled or disabled by this parameter.						
2	RFIE	R/W	Receive interrupt for Receive FIFO 0:Disabled 1:Enabled When Receive FIFO is enabled, receive interrupts are enabled or disabled by this parameter.						
1	RXTXCNT	R/W	Automatic disable of SCxMOD0<RXE> / SCxMOD1<TXE> 0: None 1: Auto disabled Controls automatic disabling of transmission and reception. Setting "1" enables to operate as follows <table><tr><td>Half duplex Re-ceive</td><td>When receive shift register, the receive buffer and the Receive FIFO are filled, SCxMOD0&lt;RXE&gt; is automatically set to "0" to inhibit further reception.</td></tr><tr><td>Half duplex Transmit</td><td>When the Transmit FIFO, the transmit buffer and the transmit shift register is empty, SCxMOD1&lt;TXE&gt; is automatically set to "0" to inhibit further transmission.</td></tr><tr><td>Full duplex</td><td>When either of the above two conditions is satisfied, TXE/RXE are automatically set to "0" to inhibit further transmission and reception.</td></tr></table>	Half duplex Re-ceive	When receive shift register, the receive buffer and the Receive FIFO are filled, SCxMOD0<RXE> is automatically set to "0" to inhibit further reception.	Half duplex Transmit	When the Transmit FIFO, the transmit buffer and the transmit shift register is empty, SCxMOD1<TXE> is automatically set to "0" to inhibit further transmission.	Full duplex	When either of the above two conditions is satisfied, TXE/RXE are automatically set to "0" to inhibit further transmission and reception.
Half duplex Re-ceive	When receive shift register, the receive buffer and the Receive FIFO are filled, SCxMOD0<RXE> is automatically set to "0" to inhibit further reception.								
Half duplex Transmit	When the Transmit FIFO, the transmit buffer and the transmit shift register is empty, SCxMOD1<TXE> is automatically set to "0" to inhibit further transmission.								
Full duplex	When either of the above two conditions is satisfied, TXE/RXE are automatically set to "0" to inhibit further transmission and reception.								
0	CNFG	R/W	Enables FIFO 0: Disabled 1: Enabled Enabled bit for FIFO. (note2) If <CNFG> is set to "1", the SCxMOD1 <FDPX[1:0]> setting automatically configures FIFO as follows: <table><tr><td>Half duplex Re-ceive</td><td>Receive FIFO 4 bytes</td></tr><tr><td>Half duplex Transmit</td><td>Transmit FIFO 4 bytes</td></tr><tr><td>Full duplex</td><td>Receive FIFO 2 bytes + Transmit FIFO 2 bytes</td></tr></table>	Half duplex Re-ceive	Receive FIFO 4 bytes	Half duplex Transmit	Transmit FIFO 4 bytes	Full duplex	Receive FIFO 2 bytes + Transmit FIFO 2 bytes
Half duplex Re-ceive	Receive FIFO 4 bytes								
Half duplex Transmit	Transmit FIFO 4 bytes								
Full duplex	Receive FIFO 2 bytes + Transmit FIFO 2 bytes								

Note 1: **Regarding Transmit FIFO, the maximum number of bytes (Refer to <CNFG>) being configured is always available. The available number of bytes is the bytes already written to the Transmit FIFO.**

Note 2: **The FIFO can not use in 9bit UART mode.**

## 12.4.11 SCxRFC (Receive FIFO Configuration Register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	RFCS	RFIS	-	-	-	-	RIL	
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function															
31-8	–	R	Read as "0".															
7	RFCS	W	Receive FIFO clear (Note1) 1: Clear When SCxRFC<RFCS> is set to "1", the receive FIFO is cleared and SCxRST<RLVL> is "000". And also the read pointer is initialized.

Note:<TUR> is cleared to "0" when transmit data is written to the SCxBUF register.

## 12.5 Operation in Each Mode

Table 12-3 shows the modes and data format.

Table 12-3 Mode and Data format

Mode	Mode type	Data length	Transfer direction	Specifies whether to use parity bits	STOP bit length (Transmit)
Mode 0	Synchronous communication mode (IO interface mode)	8 bit	LSB first / MSB first	-	-
Mode 1	Asynchronous communication mode (UART mode)	7 bit	LSB first	o	1 bit or 2 bits
Mode 2		8 bit		o	
Mode 3		9bit		x	

Mode 0 is synchronous communication and can be used to extend I/O. This mode transmits and receives data in synchronization with SCLK. SCLK can be used for both input and output.

The direction of data transfer can be selected from LSB first and MSB first. This mode is not allowed either to add a parity or STOP bits.

The mode 1, mode 2 and mode 3 are asynchronous modes and the transfer direction is fixed to the LSB first.

Parity bits can be added in the mode 1 and mode 2. The mode 3 has a wake-up function in which the master controller can start up slave controllers via the serial link (multi-controller system).

STOP bit in transmission can be selected from 1 bit and 2 bits. The STOP bit length in reception is fixed to a one bit.

## 12.6 Data Format

### 12.6.1 Data Format List

Figure 12-2 shows data format.

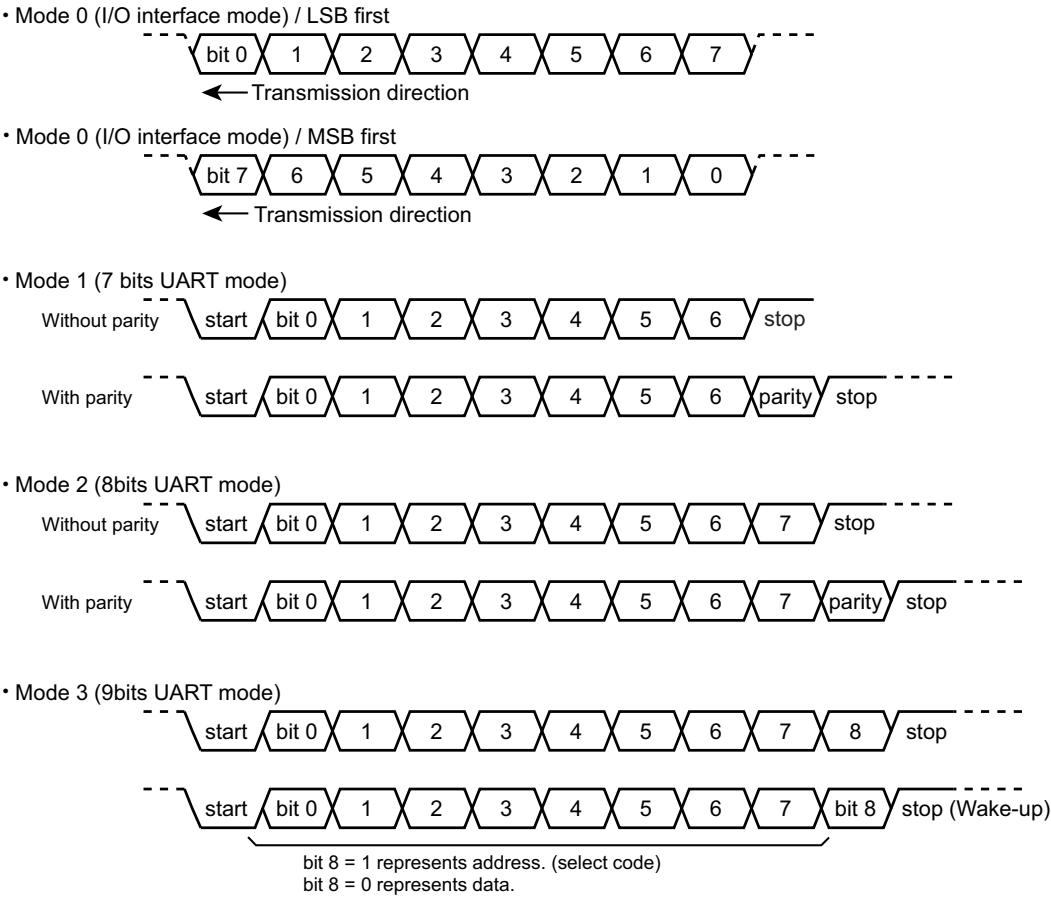

Figure 12-2 Data Format

## 12.6.2 Parity Control

The parity bit can be added only in the 7- or 8-bit UART mode.

Setting "1" to SCxCR<PE> enables the parity.

The SCxCR<EVEN> selects either even or odd parity.

### 12.6.2.1 Transmission

Upon data transmission, the parity control circuit automatically generates the parity with the data in the transmit buffer.

After data transmission is complete, the parity bit will be stored in SCxBUF<TB7> in the 7-bit UART mode SCxMOD0<TB8> in the 8-bit UART mode.

The <PE> and <EVEN> settings must be completed before data is written to the transmit buffer.

### 12.6.2.2 Receiving Data

If the received data is moved from the receive shift register to the receive buffer, a parity is generated.

In the 7-bit UART mode, the generated parity is compared with the parity stored in SCxBUF<RB7>, while in the 8-bit UART mode, it is compared with the one in SCxCR<RB8>.

If there is any difference, a parity error occurs and the <PERR> of the SCxCR register is set to "1".

In use of the FIFO, <PERR> indicates that a parity error was generated in one of the received data.

## 12.6.3 STOP Bit Length

The length of the STOP bit in the UART transmission mode can be selected from one bit or two bits by setting the SCxMOD2<SBLN>. The length of the STOP bit data is determined as one-bit when it is received regardless of the setting of this bit.

## 12.7 Clock Control

### 12.7.1 Prescaler

There is a 7-bit prescaler to divide a prescaler input clock  $\phi T0$  by 2, 8, 32 and 128.

Use the CGSYSCR register in the clock / mode control block to select the input clock  $\phi T0$  of the prescaler.

The prescaler becomes active only when the baud rate generator is selected as a transfer clock by  $SCxMOD0<SC[1:0]> = "01"$ .

The below tables show the resolution of the input clock to the baud rate generator.

Table 12-4 Clock resolution to the Baud Rate Generator  $f_c = 80 \text{ MHz}$

		101 (fperiph/32)	$fc/2^6$ (1.33 $\mu s$ )	$fc/2^8$ (5.33 $\mu s$ )	$fc/2^{10}$ (21.3 $\mu s$ )	$fc/2^{12}$ (85.3 $\mu s$ )

Note 1: The prescaler output clock  $\phi Tn$  must be selected so that the relationship " $\phi Tn \leq f_{sys}/2$ " is satisfied (so that  $\phi Tn$  is slower than  $f_{sys}$ ).

Note 2: Do not change the clock gear while SIO/UART is operating.

Note 3: The "—" indicates that the setting is prohibited in the above table.

12.7.2 Serial Clock Generation Circuit

The serial clock circuit is a block to generate transmit and receive clocks (SIOCLK) and consists of the circuits in which clocks can be selected by the settings of the baud rates generator and modes.

12.7.2.1 Baud Rate Generator

The baud rate generator generates transmit and receive clocks to determine the serial channel transfer rate.

(1) Buad Rate Generator input clock

The input clock of the baud rate generator is selected from the prescaler outputs divided by 2, 8, 32 and 128.

This input clock is selected by setting the SCxBRCR<BRCK>.

(2) Baud Rate Generator output clock

The frequency division ratio of the output clock in the baud rate generator is set by SCxBRCR and SCxBRADD.

The following frequency divide ratios can be used; 1/N frequency division in the I/O interface mode, either 1/N or  $N + (16-K)/16$  in the UART mode.

The table below shows the frequency division ratio which can be selected.

Mode	Divide Function Setting SCxBRCR<BRADDE>	Divide by N SCxBRCR<BRS>	Divide by K SCxBRADD<BRK>
I/O interface mode	Divide by N	1 to 16 (Note)	-
UART mode	Divide by N	1 to 16	-
	$N + (16-K)/16$ division	2 to 15	1 to 15

Note: 1/N (N=1)frequency division ratio can be used only when a double buffer is enabled.

12.7.2.2 Clock Selection Circuit

A clock can be selected by setting the modes and the register.

Modes can be specified by setting the SCxMOD0<SM>.

The input clock in I/O interface mode is selected by setting SCxCR.

The clock in UART mode is selected by setting SCxMOD0<SC>.

(1) Transfer Clock in I/O interface mode

Table 12-6 shows clock selection in I/O interface mode.

Table 12-6 Clock selection in I/O interface Mode

Mode SCxMOD0<SM>	Input / Output selection SCxCR<IOC>	Clock edge selection SCxCR<SCLKS>	Clock of use
I/O interface mode	SCLK output	Set to "0" (Fixed to the rising edge)	Divided by 2 of the baud rate generator output
	SCLK input	Rising edge	SCLK input rising edge
		Falling edge	SCLK input falling edge

To get the highest baud rate, the baud rate generator must be set as below.

Note: **When deciding clock settings, make sure that AC electrical character is satisfied.**

- Clock / mode control block settings
  - $f_c = 80\text{MHz}$
  - $f_{\text{gear}} = 80\text{MHz}$  (CGSYSCR<GEAR[2:0]> = "000" :  $f_c$  selected)
  - $\phi T_0 = 80\text{MHz}$  (CGSYSCR<PRCK[2:0]> = "000" : 1 division ratio)
- SIO/UART settings (if double buffer is used)
  - Clock (SCxBRCR<BRCK[1:0]> = "00" :  $\phi T_1$  selected) = 40MHz
  - Divided clock frequency (SCxBRCR<BRS[3:0]> = "0001" : 1 division ratio) = 40MHz

1 division ratio can be selected if double buffer is used. In this case, baud rate is 20Mbps because 40MHz is divided by 2.
- SIO/UART settings (if double buffer is not used)
  - Clock (SCxBRCR<BRCK[1:0]> = "00" :  $\phi T_1$  selected) = 40MHz
  - Divided clock frequency (SCxBRCR<BRS[3:0]> = "0010" : 2 division ratio) = 20MHz

2 division ratio is the highest if double buffer is not used. In this case, baud rate is 10Mbps because 20MHz is divided by 2.

To use SCLK input, the following conditions must be satisfied.

- If double buffer is used
  - SCLK cycle >  $6/f_{\text{sys}}$

The highest baud rate is less than  $80 \div 6 = 13.33\text{ Mbps}$ .
- If double buffer is not used
  - SCLK cycle >  $8/f_{\text{sys}}$

The highest baud rate is less than  $80 \div 8 = 10\text{ Mbps}$ .

## (2) Transfer clock in the UART mode

Table 12-7 shows the clock selection in the UART mode. In the UART mode, selected clock is divided by 16 in the receive counter or the transmit counter before use.

Table 12-7 Clock selection in UART Mode

Mode SCxMOD0<SM>	Clock selection SCxMOD0<SC>
UART Mode	Timer output
	Baud rate generator
	fsys
	SCLK input

The examples of baud rate in each clock settings.

- If baud rate generator is used.
  - $f_c = 80\text{MHz}$
  - $f_{\text{gear}} = 80\text{MHz}$  (CGSYSCR<GEAR[2:0]> = "000" :  $f_c$  selected)
  - $\phi T_0 = 80\text{MHz}$  (CGSYSCR<PRCK[2:0]> = "000" : 1 division ratio)
  - Clock =  $\phi T_1 = 40\text{MHz}$  (SCxBRCR<BRCK[1:0]> = "00" :  $\phi T_1$  selected)

The highest baud rate is 2.5MHz because 40MHz is divided by 16.

Table 12-8 shows examples of baud rate when the baud rate generator is used with the following clock settings.

- $f_c = 9.8304\text{MHz}$
- $f_{\text{gear}} = 9.8304\text{MHz}$  (CGSYSCR<GEAR[2:0]> = "000" :  $f_c$  selected)
- $\phi T_0 = 4.9152\text{MHz}$  (CGSYSCR<PRCK[2:0]> = "001" : 2 division ratio)

Table 12-8 Example of UART Mode Baud Rate (Using the Baud Rate Generator)

$f_c$ [MHz]	Division ratio N (SCxBRCR<BRS[3:0]>)	$\phi T_1$ ( $f_c/4$ )	$\phi T_4$ ( $f_c/16$ )	$\phi T_{16}$ ( $f_c/64$ )	$\phi T_{64}$ ( $f_c/256$ )
9.830400	2	76.800	19.200	4.800	1.200
	4	38.400	9.600	2.400	0.600
	8	19.200	4.800	1.200	0.300
	16	9.600	2.400	0.600	0.150

Unit : kbps

- If the SCLK input is used

To use SCLK input, the following conditions must be satisfied.

  - SCLK cycle >  $2/f_{\text{sys}}$

The highest baud rate must be less than  $80 \div 2 \div 16 = 2.5$  Mbps.
- If fsys is used

Since the highest value of  $f_{\text{sys}}$  is 80MHz, the highest baud rate is  $80 \div 16 = 5$  Mbps.
- If timer output is used

To enable the timer output, the following condition must be set: a timer flip-flop output inverts when the value of the counter and that of TBxRG1 match. The SIOCLK clock frequency is "Setting value of TBxRG1  $\times$  2".

Baud rate can be obtained by using the following formula.

## Baud rate calculation

$$\text{Transfer rate} = \frac{\text{Clock frequency selected by CGSYSCR<PRCK[1:0]>}}{(\text{TBxRG1} \times 2) \times 2 \times 16}$$

One clock cycle is a period that the timer flip-flop is inverted twice.  
 In the case the timer prescaler clock fT1(2 division ratio) is selected

Table 12-9 shows the examples of baud rates when the timer output is used with the following clock settings.

- $f_c = 32\text{MHz} / 9.8304\text{MHz} / 8\text{MHz}$
- $f_{\text{gear}} = 32\text{MHz} / 9.8304\text{MHz} / 8\text{MHz}$  (CGSYSCR<GEAR[2:0]> = "000" : $f_c$  selected)
- $\phi T_0 = 16\text{MHz} / 4.9152\text{MHz} / 4\text{MHz}$  (CGSYSCR<PRCK[2:0]> = "001" :2 division)
- Timer count clock =  $4\text{MHz} / 1.2287\text{MHz} / 1\text{MHz}$  (TBxMOD<TBCLK[1:0]> = "01" : $\phi T_1$  selected)

Table 12-9 Example of UART Mode Baud Rate (Using the Timer Output)

TBxRG1 setting	$f_c$		
	32MHz	9.8304MHz	8MHz
0x0001	250	76.8	62.5
0x0002	125	38.4	31.25
0x0003	-	25.6	-

## 12.8 Transmit / Receive Buffer and FIFO

### 12.8.1 Configuration

Figure 12-3 shows the configuration of transmit buffer, receive buffer and FIFO.

Appropriate settings are required for using buffer and FIFO. The configuration may be predefined depending on the mode.

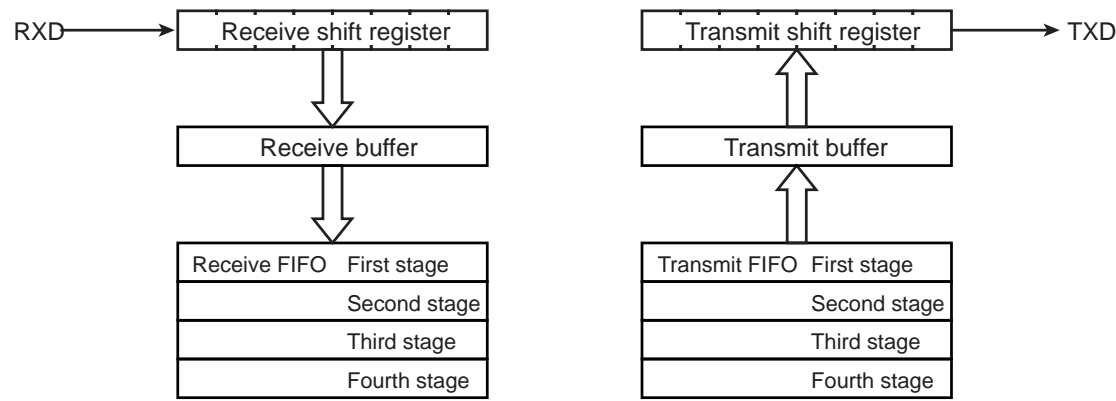

Figure 12-3 The Configuration of Buffer and FIFO

### 12.8.2 Transmit / Receive Buffer

Transmit buffer and receive buffer are double-buffered. The buffer configuration is specified by SCxMOD2<WBUF>.

In the case of using a receive buffer, if SCLK input is set to generate clock output in the I/O interface mode or the UART mode is selected, it's double buffered despite the <WBUF> settings. In other modes, it's according to the <WBUF> settings.

Table 12-10 shows correlation between modes and buffers.

Table 12-10 Mode and buffer Composition

Mode		SCxMOD2<WBUF>	
		"0"	"1"
UART mode	Transmit	Single	Double
	Receive	Double	Double
I/O interface mode (SCLK input)	Transmit	Single	Double
	Receive	Double	Double
I/O interface mode (SCLK output)	Transmit	Single	Double
	Receive	Single	Double

### 12.8.3 FIFO

In addition to the double buffer function above described, 4-byte FIFO can be used.

To enable FIFO, enable the double buffer by setting SCxMOD2<WBUF> to "1" and SCxFCNF<CNFG> to "1". The FIFO configuration is specified by SCxMOD1<FDPX[1:0]>.

Note: To use Transmit/Receive FIFO buffer, Transmit/Receive FIFO must be cleared after setting the SIO/UART transfer mode (half duplex/ full duplex) and enabling FIFO (SCxFCNF<CNFG> = "1").

Table 12-11 shows correction between modes and FIFO.

Table 12-11 Mode and FIFO Composition

	SCxMOD1<FDPX[1:0]>	Receive FIFO	Transmit FIFO
Half duplex Receive	"01"	4byte	-
Half duplex Transmit	"10"	-	4byte
Full duplex	"11"	2byte	2byte

## 12.9 Status Flag

The SCxMOD2 register has two types of flag. This bit is significant only when the double buffer is enabled.

<RBFL> is a flag to show that the receive buffer is full. When one frame of data is received and the data is moved from the receive shift register to the receive buffers, this bit changes to "1" while reading this bit changes it to "0".

<TBEMP> shows that the transmit buffers are empty. When data in the transmit buffers is moved to the transmit shift register, this bit is set to "1" When data is set to the transmit buffers, the bit is cleared to "0".

## 12.10 Error Flag

Three error flags are provided in the SCxCR register. The meaning of the flags is changed depending on the modes. The table below shows the meaning in each mode.

These flags are cleared to "0" after reading the SCxCR register.

Mode	Flag		
	<OERR>	<PERR>	<FERR>
UART mode	Overrun error	Parity error	Framing error
I/O interface mode (SCLK input)	Overrun error	Underrun error (When using double buffer or FIFO)	Fixed to "0"
		Fixed to "0" (When a double buffer and FIFO unused)	
I/O interface mode (SCLK output)	Undefined	Undefined	Fixed to "0"

### 12.10.1 OERR Flag

In both UART and I/O interface modes, this bit is set to "1" when an error is generated by completing the reception of the next frame of receive data before the receive buffer has been read. If the receive FIFO is enabled, the received data is automatically moved to the receive FIFO and no overrun error will be generated until the receive FIFO is full (or until the usable bytes are fully occupied).

In the I/O interface with SCLK output mode, the SCLK output stops upon setting the flag.

**Note:** To switch the I/O interface SCLK output mode to other modes, read the SCxCR register and clear the overrun flag.

### 12.10.2 PERR Flag

This flag indicates a parity error in the UART mode and an under-run error in the I/O interface mode.

In the UART mode, <PERR> is set to "1" when the parity generated from the received data is different from the parity received.

In the I/O interface mode, <PERR> is set to "1" under the following conditions when a double buffer is enabled.

In the SCLK input mode, <PERR> is set to "1" when the SCLK is input after completing data output of the transmit shift register with no data in the transmit buffer.

In the SCLK output mode, <PERR> is set to "1" after completing output of all data and the SCLK output stops.

**Note:** To switch the I/O interface SCLK output mode to other modes, read the SCxCR register and clear the underrun flag.

### 12.10.3 FERR Flag

A framing error is generated if the corresponding stop bit is determined to be "0" by sampling the bit at around the center. Regardless of the stop bit length settings in the SCxMOD2<SBLN>register, the stop bit status is determined by only 1.

This bit is fixed to "0" in the I/O interface mode.

## 12.11 Receive

### 12.11.1 Receive Counter

The receive counter is a 4-bit binary counter and is up-counted by SIOCLK.

In the UART mode, sixteen SIOCLK clock pulses are used in receiving a single data bit and the data symbol is sampled at the seventh, eighth, and ninth pulses. From these three samples, majority logic is applied to decide the received data.

### 12.11.2 Receive Control Unit

#### 12.11.2.1 I/O interface mode

In the SCLK output mode with SCxCR <IOC> set to "0", the RXD pin is sampled on the rising edge of the shift clock outputted to the SCLK pin.

In the SCLK input mode with SCxCR <IOC> set to "1", the serial receive data RXD pin is sampled on the rising or falling edge of SCLK input signal depending on the SCxCR <SCLKS> setting.

#### 12.11.2.2 UART Mode

The receive control unit has a start bit detection circuit, which is used to initiate receive operation when a normal start bit is detected.

### 12.11.3 Receive Operation

#### 12.11.3.1 Receive Buffer

The received data is stored by 1 bit in the receive shift register. When a complete set of bits has been stored, the interrupt INTRXx is generated.

When the double buffer is enabled, the data is moved to the receive buffer (SCxBUF) and the receive buffer full flag (SCxMOD2<RBFL>) is set to "1". The receive buffer full flag is "0" cleared by reading the receive buffer. The receive buffer full flag does not have no meaning for the single buffer.

Figure 12-4 Receive Buffer Operation

12.11.3.2 Receive FIFO Operation

When FIFO is enabled, the received data is moved from receive buffer to receive FIFO and the receive buffer full flag is cleared immediately. An interrupt will be generated according to the SCxRFC<RIL> setting.

**Note:**When the data with parity bit are received in UART mode by using the FIFO, the parity error flag is shown the occurring the parity error in the received data.

The configurations and operations in the half duplex RX mode are described as follows.

- SCxMOD1[6:5] = 01 :Transfer mode is set to half duplex mode
- SCxFCNF[4:0] = 10111 :Automatically inhibits continuous reception after reaching the fill level.  
: The number of bytes to be used in the receive FIFO is the same as the interrupt generation fill level.
- SCxRFC[1:0] = 00 :The fill level of FIFO in which generated receive interrupt is set to 4-byte
- SCxRFC[7:6] = 11 :Clears receive FIFO and sets the condition of interrupt generation.

After setting of the above FIFO configuration, the data reception is started by writing "1" to the SCxMOD0<RXE>. When the data is stored all in the receive shift register, receive buffer and receive FIFO, SCxMOD0<RXE> is automatically cleared and the receive operations finished.

In the above condition, if the cutaneous reception after reaching the fill level is enabled, it becomes possible to receive a data continuously by reading the data in the FIFO.

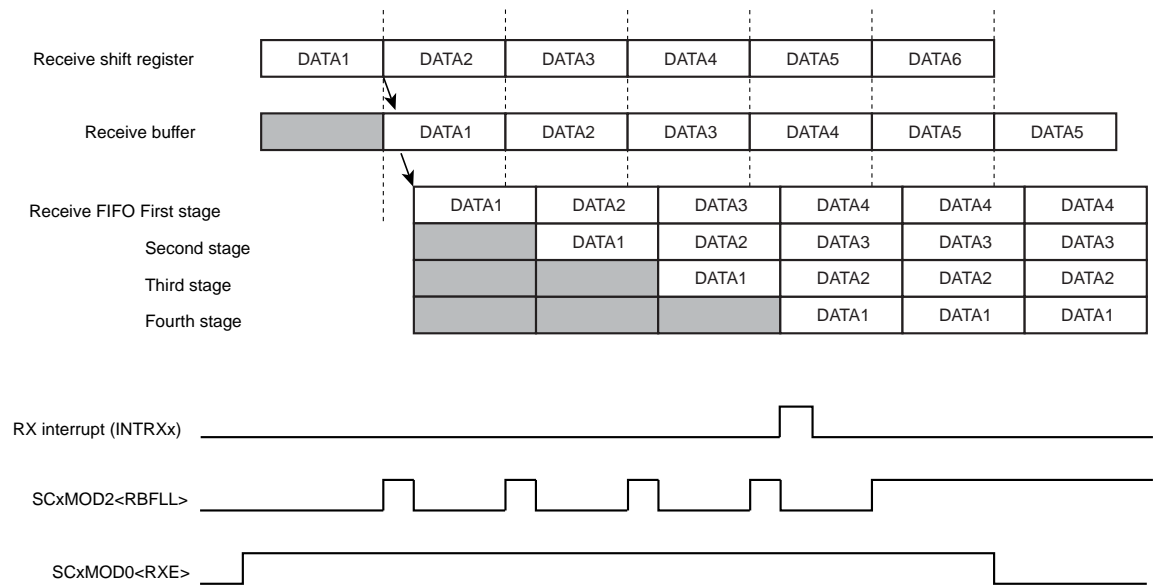

Figure 12-5 Receive FIFO Operation

### 12.11.3.3 I/O interface mode with SCLK output

In the I/O interface mode and SCLK output setting, SCLK output stops when all received data is stored in the receive buffer and FIFO. Thus, in this mode, the overrun error flag has no meaning.

The timing of SCLK output stop and re-output depends on receive buffer and FIFO.

#### (1) Case of single buffer

Stop SCLK output after receiving a data. In this mode, I/O interface mode can transfer each data with the transfer device by hand-shake.

When the data in a buffer is read, SCLK output restarts.

#### (2) Case of double buffer

Stop SCLK output after receiving the data into a receive shift register and a receive buffer.

When the data is read, SCLK output restarts.

#### (3) Case of FIFO

Stop SCLK output after receiving the data into a shift register, received buffer and FIFO.

When one byte data is read, the data in the received buffer is transferred into FIFO and the data in the receive shift register is transferred into the received buffer and SCLK output restarts.

And if SCxFCNF<RXTXCNT> is set to "1", SCLK stops and receive operation stops with clearing SCxMOD0<RXE> bit, too.

### 12.11.3.4 Read Received Data

In spite of enabling or disabling FIFO, read the received data from the receive buffer (SCxBUF).

When receive FIFO is disabled, the buffer full flag SCxMOD2<RBFL> is cleared to "0" by this reading. In the case of the next data can be received in the receive shift register before reading a data from the receive buffer. The parity bit to be added in the 8-bit UART mode as well as the most significant bit in the 9-bit UART mode will be stored in SCxCR<RB8>.

When the receive FIFO is available, the 9-bit UART mode is prohibited because up to 8-bit data can be stored in FIFO. In the 8-bit UART mode, the parity bit is lost but parity error is determined and the result is stored in SCxCR<PERR>.

### 12.11.3.5 Wake-up Function

In the 9-bit UART mode, the slave controller can be operated in the wake-up mode by setting the wake-up function SCxMOD0 <WU> to "1". In this case, the interrupt INTRXx will be generated only when SCxCR<RB8> is set to "1".

#### 12.11.3.6 Overrun Error

When FIFO is disabled, the overrun error occurs and an overrun error is without completing reading data before receiving the next data. When an overrun error occurs, a content of receive buffer and SCxCR<RB8> is not lost, but a content of receive shift register is lost.

When FIFO is enabled, overrun error is occurred and set overrun flag by no reading the data before moving the next data into received buffer when FIFO is full. In this case, the contents of FIFO are not lost.

In the I/O interface mode with SCLK output setting, the clock output automatically stops, so this flag has no meaning.

**Note:** When the mode is changed from I/O interface mode SCLK output mode to the other mode, read SCxCR and clear overrun flag.

## 12.12 Transmission

### 12.12.1 Transmission Counter

The transmit counter is a 4-bit binary counter and is counted by SIOCLK as in the case of the receive counter.

In UART mode, it generates a transmit clock (TXDCLK) on every 16th clock pulse.

Figure 12-6 Generation of Transmission Clock in UART Mode

### 12.12.2 Transmission Control

#### 12.12.2.1 I/O interface Mode

In the SCLK output mode with SCxCR<IOC> set to "0", each bit of data in the transmit buffer is outputted to the TXD pin on the falling edge of the shift clock outputted from the SCLK pin.

In the SCLK input mode with SCxCR<IOC> set to "1", each bit of data in the transmit buffer is outputted to the TXD pin on the rising or falling edge of the SCLK input signal according to the SCxCR<SCLKS> setting.

#### 12.12.2.2 UART Mode

When the transmit data is written in the transmit buffer, data transmission is initiated on the rising edge of the next TXDCLK and the transmit shift clock signal is also generated.

12.12.3 Transmit Operation

12.12.3.1 Operation of Transmission Buffer

If double buffering is disabled, the CPU writes data only to Transmit shift Register and the transmit interrupt INTTXX is generated upon completion of data transmission.

If double buffering is enabled (including the case the transmit FIFO is enabled), data written to the transmit buffer is moved to the transmit shift register. The INTTXX interrupt is generated at the same time and the transmit buffer empty flag (SCxMOD2<TBEMP>) is set to "1". This flag indicates that the next transmit data can be written. When the next data is written to the transmit buffer, the <TBEMP> flag is cleared to "0".

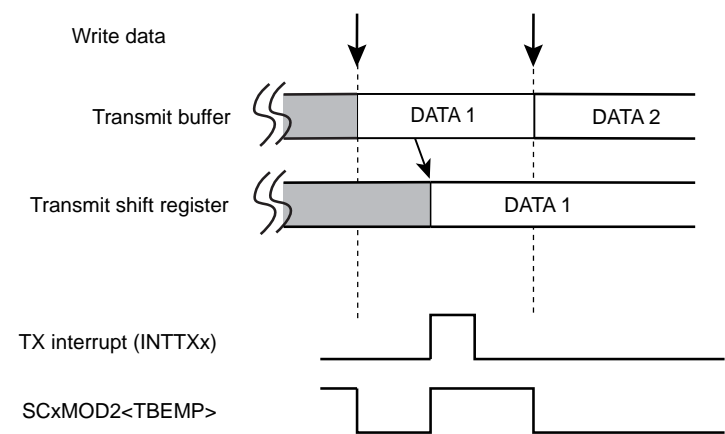

Figure 12-7 Operation of Transmission Buffer (Double buffer is enabled)

12.12.3.2 Transmit FIFO Operation

When FIFO is enabled, the maximum 5-byte data can be stored using the transmit buffer and FIFO. Once transmission is enabled, data is transferred to the transmit shift register from the transmit buffer and start transmission. If data exists in the FIFO, the data is moved to the transmit buffer immediately, and the <TBEMP> flag is cleared to "0".

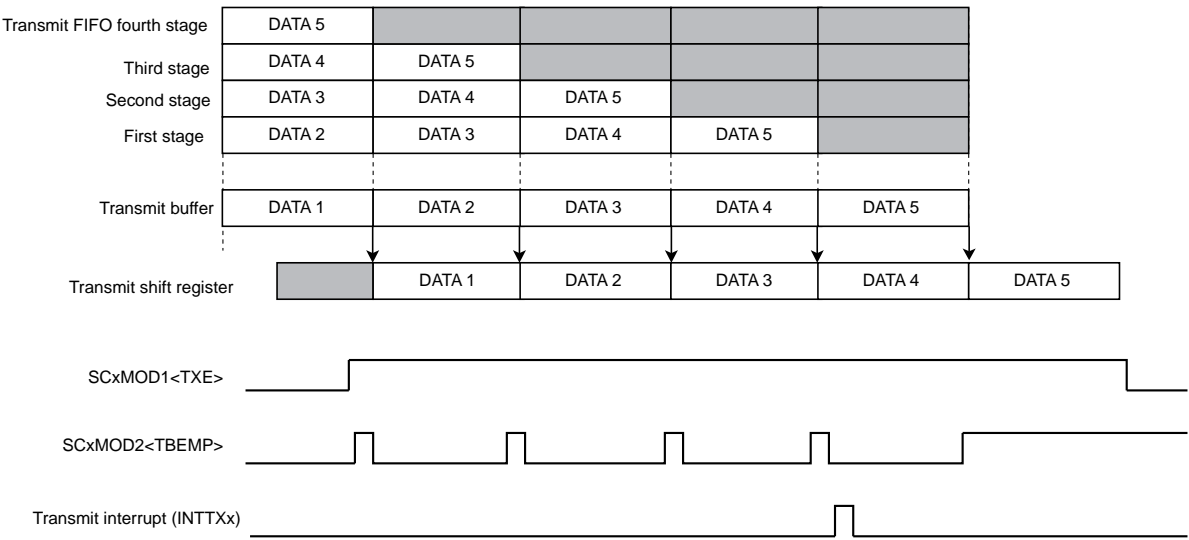

**Note:**To use Transmit FIFO buffer, Transmit FIFO must be cleared after setting the SIO/UART transfer mode (half duplex/ full duplex) and enabling FIFO (SCxFCNF<CNFG>="1").

Settings and operations to transmit 4-byte data stream by setting the transfer mode to half duplex are shown as below.

SCxMOD1[6:5] = 10	:Transfer mode is set to half duplex.
SCxFCNF[4:0] = 11011	:Transmission is automatically disabled if FIFO becomes empty.
	:The number of bytes to be used in the receive FIFO is the same as the interrupt generation fill level.
SCxTFC[1:0] = 00	:Sets the interrupt generation fill level to "0".
SCxTFC[7:6] = 11	:Clears receive FIFO and sets the condition of interrupt generation.
SCxFCNF[0] = 1	:Enable FIFO

After above settings are configured, data transmission can be initiated by writing 5 bytes of data to the transmit buffer or FIFO, and setting the SCxMOD1<TXE> bit to "1". When the last transmit data is moved to the transmit buffer, the transmit FIFO interrupt is generated. When transmission of the last data is completed, the clock is stopped and the transmission sequence is terminated.

Once above settings are configured, if the transmission is not set as auto disabled, the transmission should lasts writing transmit data.

12.12.3.3 I/O interface Mode/Transmission by SCLK Output

If SCLK is set to generate clock in the I/O interface mode, the SCLK output automatically stops when all data transmission is completed and underrun error will not occur.

The timing of suspension and resume of SCLK output is different depending on the buffer and FIFO usage.

(1) Single Buffer

The SCLK output stops each time one frame of data is transferred. Handshaking for each data with the other side of communication can be enabled. The SCLK output resumes when the next data is written in the buffer.

(2) Double Buffer

The SCLK output stops upon completion of data transmission of the transmit shift register and the transmit buffer. The SCLK output resumes when the next data is written in the buffer.

(3) FIFO

The transmission of all data stored in the transmit shift register, transmit buffer and FIFO is completed, the SCLK output stops. The next data is written, SCLK output resumes.

If SCxFCNF<RXTXCNT> is configured, SCxMOD0<TXE> bit is cleared at the same time as SCLK stop and the transmission stops.

#### 12.12.3.4 Underrun Error

If the transmit FIFO is disabled in the I/O interface mode SCLK input mode and if no data is set in transmit buffer before the next frame clock input, which occurs upon completion of data transmission from transmit shift register, an under-run error occurs and SCxCR<PERR> is set to "1".

In the I/O interface mode with SCLK output setting, the clock output automatically stops, so this flag has no meaning/

**Note:** Before switching the I/O interface mode SCLK output mode to other modes, read the SCxCR register and clear the underrun flag.

## 12.13 Handshake Function

The function of the handshake is to enable frame-by-frame data transmission by using the CTS (Clear to send) pin and to prevent overrun errors. This function can be enabled or disabled by SCxMOD0<CTSE>.

When the  $\overline{\text{CTS}}$  pin is set to "High" level, the current data transmission can be completed but the next data transmission is suspended until  $\overline{\text{CTS}}$  pin returns to the "Low" level. However in this case, the INTTXx interrupt is generated in the normal timing, the next transmit data is written in the transmit buffer, and it waits until it is ready to transmit data.

Note 1: If the  $\overline{\text{CTS}}$  signal is set to "High" during transmission, the next data transmission is suspended after the current transmission is completed (Point "a" in Figure 12-9).

Note 2: Data transmission starts on the first falling edge of the TXDCLK clock after  $\overline{\text{CTS}}$  is set to "Low" (Point "b" in Figure 12-9).

Although no  $\overline{\text{RTS}}$  pin is provided, a handshake control function can easily implemented by assigning one bit of the port for the  $\overline{\text{RTS}}$  function. By setting the port to "High" level upon completion of data reception (in the receive interrupt routine), the transmit side can be requested to suspend data transmission.

Figure 12-8 Handshake Function

Figure 12-9  $\overline{\text{CTS}}$  Signal timing

12.14 Interrupt / Error Generation Timing

12.14.1 RX Interrupt

Figure 12-10 shows the data flow of receive operation and the route of read.

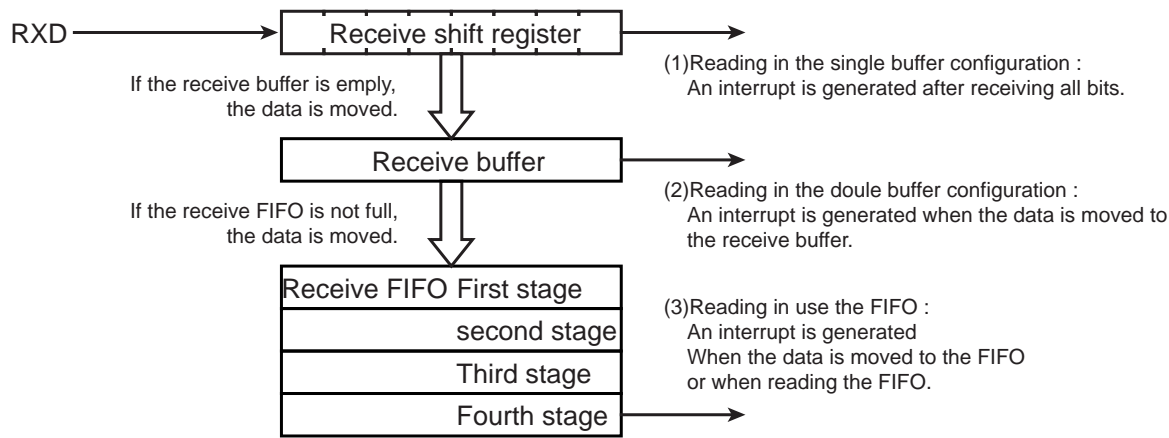

Figure 12-10 Receive Buffer / FIFO Configuration Diagram

12.14.1.1 Single Buffer / Double Buffer

Receive interrupts are generated at the time depends on the transfer mode and the buffer configurations, which are given follows.

Table 12-12 Transmit interrupt condition with single buffer and double buffers

Buffer Configuration	UART modes	I/O interface modes
Single Buffer	-	Immediately after the rising / falling edge of the last SCLK (Rising or falling is determined according to SCxCR<SCLKS> setting.)
Double Buffer	Around the center of the first stop bit	Immediately after the rising / falling edge of the last SCLK (Rising or falling is determined according to SCxCR<SCLKS> setting.) On data transfer from the shift register to the buffer by reading buffer.

Note:Interrupts are not generated when an overrun error occurs.

12.14.1.2 FIFO

When the FIFO is used, a receive interrupt occurs depending on the timing described in Table 12-13 and the condition specified with SCxRFC<RFIS>.

Table 12-13 Receive Interrupt Conditions in use of FIFO

SCxRFC <RFIS>	Interrupt conditions	Interrupt generation timing
"0"	When FIFO fill level (SCxRST<RLVL[2:0]>) = Receive FIFO fill level to generate receive interrupt <RIL[1:0]>	• When received data is transferred from receive buffer to receive FIFO
"1"	When FIFO fill level (SCxRST<RLVL[2:0]>) ≥ Receive FIFO fill level to generate receive interrupt <RIL[1:0]>	• When received data is transferred from receive buffer to receive FIFO • When received data is read from receive FIFO

## 12.14.2 Transmit interrupt

Figure 12-11 shows the data flow of transmit operation and the route of write.

Figure 12-11 Transmit Buffer / FIFO Configuration Diagram

### 12.14.2.1 Single Buffer / Double Buffer

Transmit interrupts are generated at the time depends on the transfer mode and the buffer configurations, which are given as follows.

Table 12-14 Receive interrupt condition with single buffer and double buffers

Buffer Configuration	UART modes	I/O interface modes
Single Buffer	Just before the stop bit is sent	Immediately after the rising / falling edge of the last SCLK (Rising or falling is determined according to SCxCR<SCLKS> setting.)
Double Buffer	When a data is moved from the transmit buffet to the transmit shift register. In case of transmit shift register is empty, transmit interrupt is generated not depend on SCxMOD1<TXE> because a data written to transfer buffer is moved from transmit buffer to transmit shift register.	

### 12.14.2.2 FIFO

When the FIFO is used, a transmit interrupt occurs depending on the timing described in Table 12-15 and the condition specified with SCxTFC<TFIS>.

Table 12-15 Transmit Interrupt conditions in use of FIFO

SCxTFC <TFIS>	Interrupt condition	Interrupt generation timing
"0"	When FIFO fill level (SCxTST<TLVL[2:0]>) = Transmit FIFO fill level to generate transmit interrupt <TIL[1:0]>	• When transmitted data is transferred from transmit FIFO to transmit buffer
"1"	When FIFO fill level (SCxTST<TLVL[2:0]>) ≤ Transmit FIFO fill level to generate transmit interrupt <TIL[1:0]>	• When transmitted data is transferred from transmit FIFO to transmit buffer • When transmit data is write into transmit FIFO

12.14.3 Error Generation

12.14.3.1 UART Mode

Modes	9 bits	7 bits 8 bits 7 bits + parity 8bits + parity
Framing error Overrun error	Around the center of stop bit	
Parity Error	-	Around center of parity bit

12.14.3.2 I/O Interface Mode

Overrun error	Immediately after the rising / falling edge of the last SCLK (Rising or falling is determined according to SCxCR<SCLKS> setting.)
Underrun error	Immediately after the rising or falling edge of the next SCLK. (Rising or falling is determined according to SCxCR<SCLKS> setting.)

Note:Over-run error and Under-run error have no meaning in SCLK output mode.

12.15 DMA Transfer

DMA transfer can be started at the timing of interrupt request.

TMPM368FDXBG can be started at the half duplex mode (Transmit and Receive interrupt request) and full duplex mode (Transfer / Receive).

Note:In case using DMA transfer by transmit or receive interrupt request, enabled DMA and set transmit and receive registers after generating software reset by SCxMOD2<SWRST>.

12.15.1 Single and double buffer are used

The DMA transfer is started by generating interrupt request at the timing in 12.14.1.1 and 12.14.2.1.

12.15.2 FIFO is used

The DMA transfer is started by generating interrupt request at the timing in 12.14.1.2 and 12.14.2.2.

In the transmit mode, the fill level of interrupt generation, the minimum number of the written data into transmit FIFO before starting transmit and the maximum number of the DMA transfer data are shown as below.

Table 12-16 the fill level of interrupt generation, the minimum number of the written data into transmit FIFO before starting transmit and the maximum number of the DMA transfer data

SCxTFC <TIL[1:0]>	Half Duplex		Full duplex	
	The minimum number of the written data into transmit FIFO before starting transmit	The maximum number of the DMA transfer data	The minimum number of the written data into transmit FIFO before starting transmit	The maximum number of the DMA transfer data
00	3	4 bytes	3	2 bytes
01	4	3 bytes	4	1 byte
10	5	2 bytes	3	2 bytes
11	6	1 byte	4	1 byte

Note: In case of transmit shift register is empty, transmit interrupt is generated not depend on SCxMOD1<TXE> because a data written to transfer buffer is moved from transmit buffer to transmit shift register. The DMA transfer must be not started by this interrupt. Regarding to DMA transfer in detail, refer to DMA section.

In the receive mode, the fill level of interrupt generation and the maximum number of the DMA transfer data are shown as below.

Table 12-17 the fill level of interrupt generation, the minimum number of the written data into transmit FIFO before starting transmit and the maximum number of the DMA transfer data

SCxTFC <RIL[1:0]>	The maximum number of the DMA transfer data (Half duplex)	The maximum number of the DMA transfer data (Full duplex)
00	4 bytes	2 bytes
01	3 bytes	1 byte
10	2 bytes	2 bytes
11	1 byte	1 byte

## 12.16 Software Reset

Software reset is generated by writing SCxMOD2<SWRST[1:0]> as "10" followed by "01". As a result, SCxMOD0<RXE>, SCxMOD1<TXE>, SCxMOD2<TBEMP><RBFL><TXRUN>, SCxCR<OERR><PERR><FERR> are initialized. And the receive circuit, the transmit circuit and the FIFO become initial state. Other states are held.

## 12.17 Operation in Each Mode

### 12.17.1 I/O Interface Mode

The I/O interface mode can be selected by setting the mode control register (SCxMOD<SM[1:0]>) to "00".

This mode consists of two modes, the SCLK output mode to output synchronous clock and the SCLK input mode to accept synchronous clock from an external source.

The following operational descriptions are for the case use of FIFO is disabled. For details of FIFO operation, refer to the previous sections describing receive/transmit FIFO functions.

#### 12.17.1.1 Transmitting Data

##### (1) SCLK Output Mode

- If the transmit double buffer is disabled (SCxMOD2<WBUF> = "0")

Data is output from the TXD pin and the clock is output from the SCLK pin each time the CPU writes data to the transmit buffer. When all data is output, an interrupt (INTTXx) is generated.

- If the transmit double buffer is enabled (SCxMOD2<WBUF> = "1")

Data is moved from the transmit buffer to the transmit shift register when the CPU writes data to the transmit buffer while data transmission is halted or when data transmission from the transmit buffer (shift register) is completed. Simultaneously, the transmit buffer empty flag SCxMOD2<TBEMP> is set to "1", and the INTTXx interrupt is generated.

When data is moved from the transmit buffer to the transmit shift register, if the transmit buffer has no data to be moved to the transmit shift register, INTTXx interrupt is not generated and the SCLK output stops.

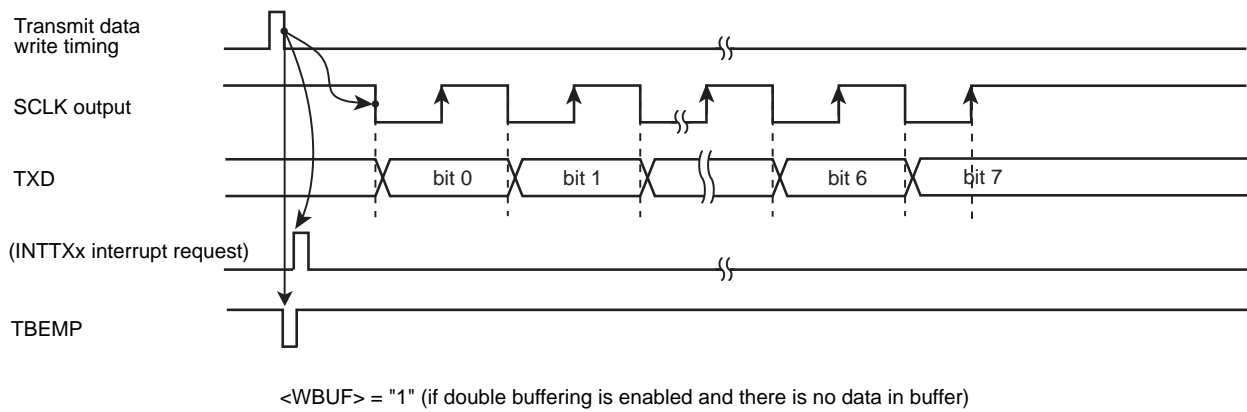

Figure 12-12 Transmit Operation in the I/O Interface Mode (SCLK Output Mode)

## (2) SCLK Input Mode

- If double buffering is disabled (SCxMOD2<WBUF> = "0")

If the SCLK is input in the condition where data is written in the transmit buffer, 8-bit data is outputted from the TXD pin. When all data is output, an interrupt INTTXx is generated. The next transmit data must be written before the timing point "A" as shown in Figure 12-13.

- If double buffer is enabled (SCxMOD2<WBUF> = "1")

Data is moved from the transmit buffer to the transmit shift register when the CPU writes data to the transmit buffer before the SCLK input becomes active or when data transmission from the transmit shift register is completed. Simultaneously, the transmit buffer empty flag SCxMOD2<TBEMP> is set to "1", and the INTTXx interrupt is generated.

If the SCLK input becomes active while no data is in the transmit buffer, although the internal bit counter is started, an under-run error occurs and 8-bit dummy data (0xFF) is sent.

Figure 12-13 Transmit Operation in the I/O Interface Mode (SCLK Input Mode)

## 12.17.1.2 Receive

## (1) SCLK Output Mode

The SCLK output can be started by setting the receive enable bit SCxMOD0<RXE> to "1".

- If double buffer is disabled (SCxMOD2<WBUF> = "0")

A clock pulse is outputted from the SCLK pin and the next data is stored into the shift register each time the CPU reads received data. When all the 8 bits are received, the INTRXx interrupt is generated.

- If double buffer is enabled (SCxMOD2<WBUF> = "1")

Data stored in the shift register is moved to the receive buffer and the receive buffer can receive the next frame. A data is moved from the shift register to the receive buffer, the receive buffer full flag SCxMOD2<RBFL> is set to "1" and the INTRXx is generated.

While data is in the receive buffer, if the data cannot be read from the receive buffer before completing reception of the next 8 bits, the INTRXx interrupt is not generated and the SCLK output stops. In this state, reading data from the receive buffer allows data in the shift register to move to the receive buffer and thus the INTRXx interrupt is generated and data reception resumes.

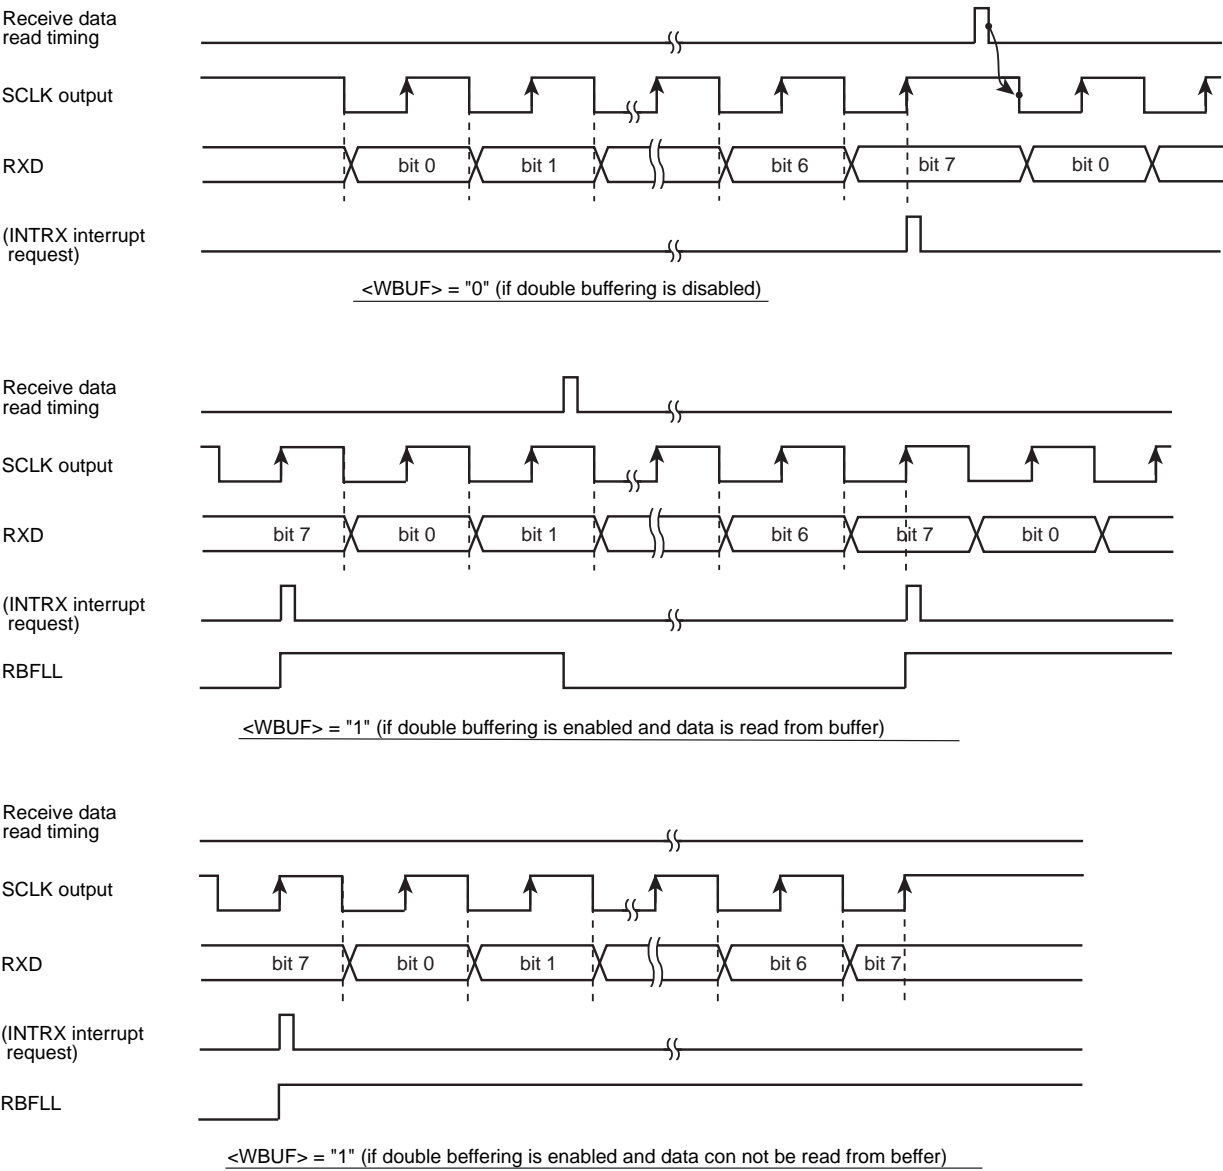

Figure 12-14 Receive Operation in the I/O Interface Mode (SCLK Output Mode)

## (2) SCLK Input Mode

In the SCLK input mode, receiving double buffering is always enabled, the received frame can be moved to the receive buffer from the shift register, and the receive buffer can receive the next frame successively.

The INTRXx receive interrupt is generated each time received data is moved to the receive buffer.

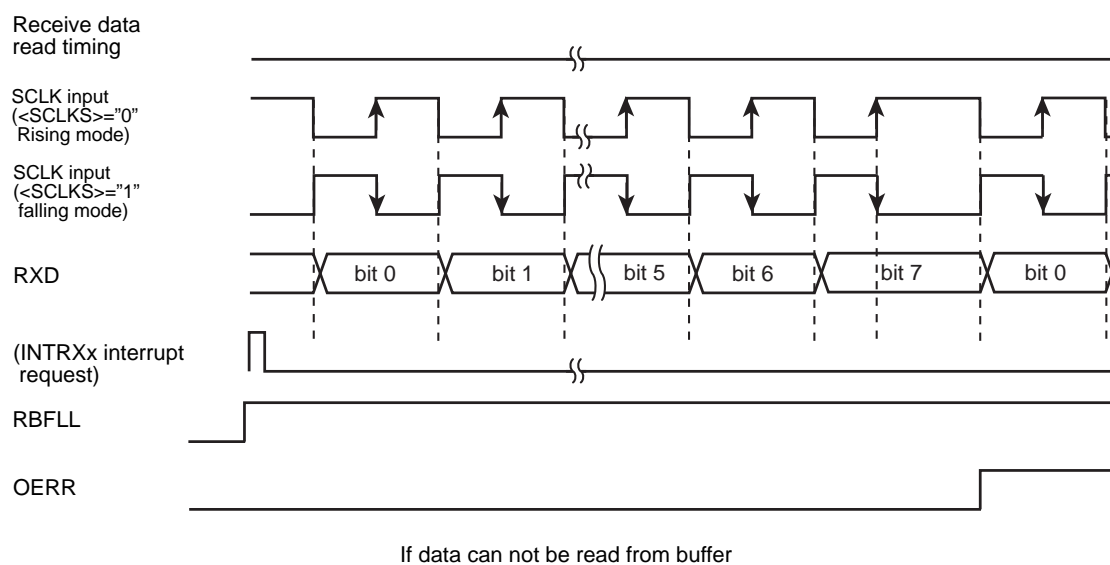

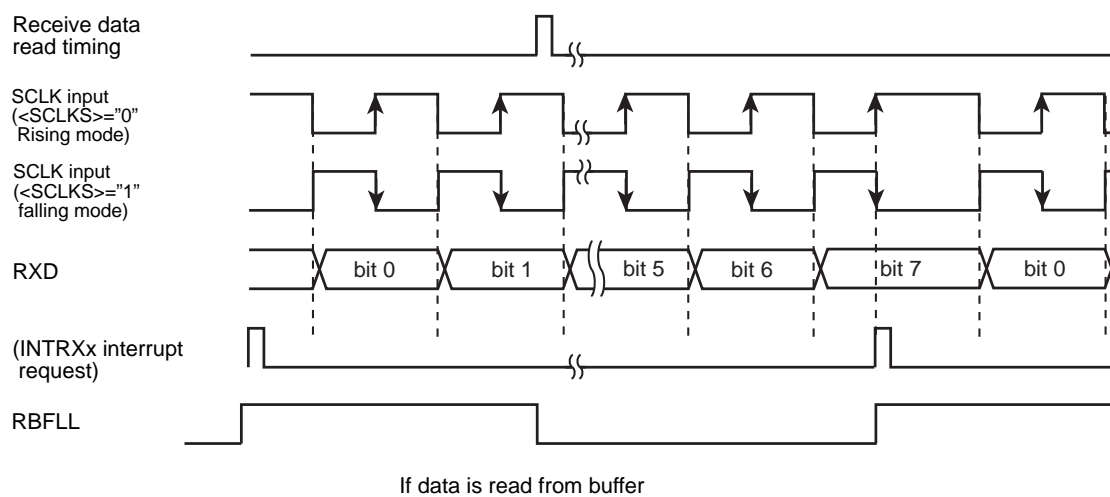

Figure 12-15 Receive Operation in the I/O Interface Mode (SCLK Input Mode)

### 12.17.1.3 Transmit and Receive (Full duplex)

#### (1) SCLK Output Mode

- If SCxMOD2<WBUF> is set to "0" and the double buffers are disabled

SCLK is outputted when the CPU writes data to the transmit buffer.

Subsequently, 8 bits of data are shifted into receive shift register and the INTRXx receive interrupt is generated. Concurrently, 8 bits of data written to the transmit buffer are outputted from the TXD pin, the INTTXx transmit interrupt is generated when transmission of all data bits has been completed. Then, the SCLK output stops.

The next round of data transmission and reception starts when the data is read from the receive buffer and the next transmit data is written to the transmit buffer by the CPU. The order of reading the receive buffer and writing to the transmit buffer can be freely determined. Data transmission is resumed only when both conditions are satisfied.

- If SCxMOD2<WBUF> is set to "1" and the double buffers are enabled

SCLK is outputted when the CPU writes data to the transmit buffer.

8 bits of data are shifted into the receive shift register, moved to the receive buffer, and the INTRXx interrupt is generated. While 8 bits of data is received, 8 bits of transmit data is outputted from the TXD pin. When all data bits are sent out, the INTTXx interrupt is generated and the next data is moved from the transmit buffer to the transmit shift register.

If the transmit buffer has no data to be moved to the transmit buffer (SCxMOD2<TBEMP> = 1) or when the receive buffer is full (SCxMOD2<RBFL> = 1), the SCLK output is stopped. When both conditions, receive data is read and transmit data is written, are satisfied, the SCLK output is resumed and the next round of data transmission and reception is started.

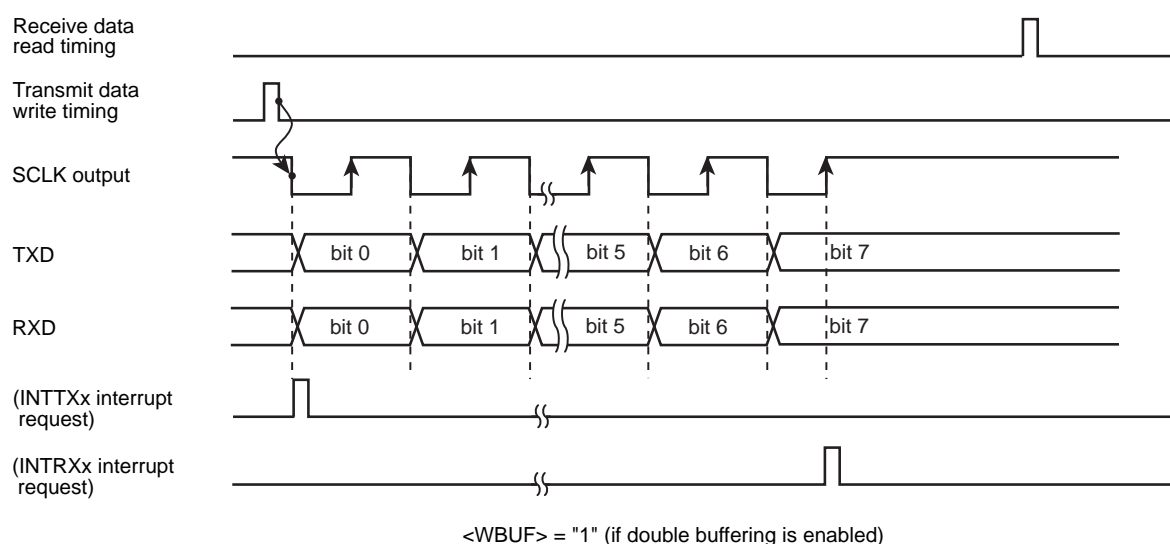

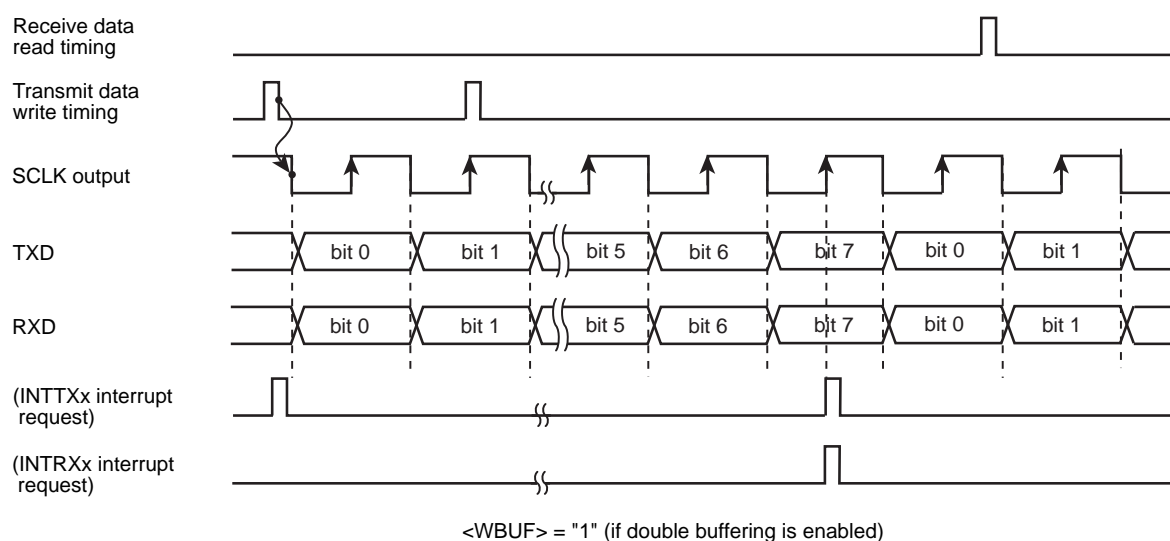

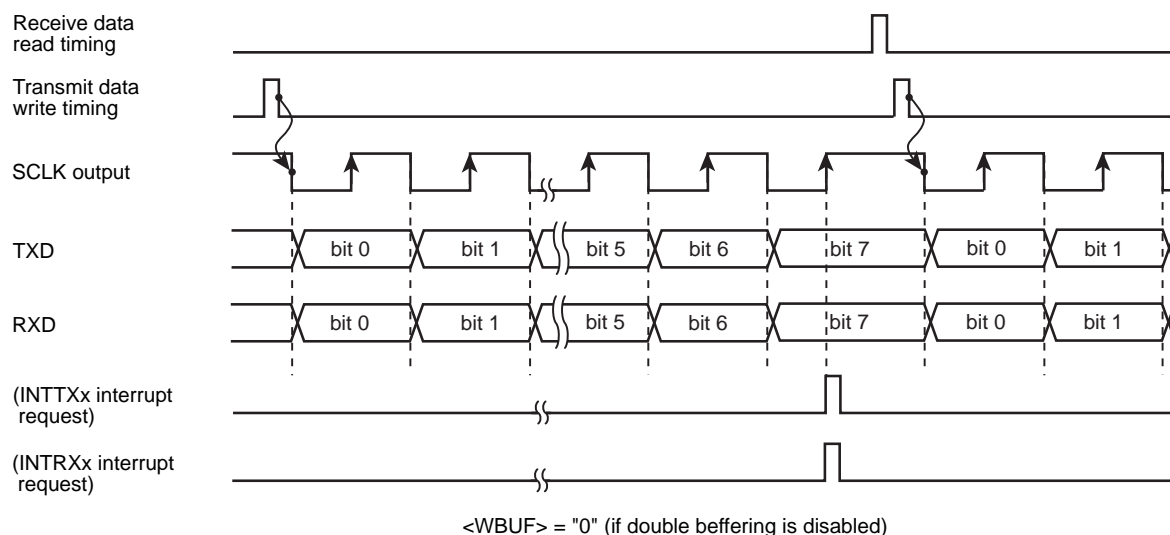

Figure 12-16 Transmit / Receive Operation in the I/O Interface Mode (SCLK Output Mode)

## (2) SCLK Input Mode

- If SCxMOD2<WBUF> is set to "0" and the transmit double buffer is disabled

When receiving data, double buffer is always enabled regardless of the SCxMOD2<WBUF> settings.

8-bit data written in the transmit buffer is outputted from the TXD pin and 8 bit of data is shifted into the receive buffer when the SCLK input becomes active. The INTTXx interrupt is generated upon completion of data transmission. The INTRXx interrupt is generated when the data is moved from receive shift register to receive buffer after completion of data reception.

Note that transmit data must be written into the transmit buffer before the SCLK input for the next frame (data must be written before the point A in Figure 10-17). Data must be read before completing reception of the next frame data.

- If SCxMOD2<WBUF> is set to "1" and the double buffer is enabled.

The interrupt INTTXx is generated at the timing when the transmit buffer data is moved to the transmit shift register after completing data transmission from the transmit shift register. At the same time, data received is shifted to the shift register, it is moved to the receive buffer, and the INTRXx interrupt is generated.

Note that transmit data must be written into the transmit buffer before the SCLK input for the next frame (data must be written before the point A in Figure 12-17). Data must be read before completing reception of the next frame data.

Upon the SCLK input for the next frame, transmission from transmit shift register (in which data has been moved from transmit buffer) is started while receive data is shifted into receive shift register simultaneously.

If data in receive buffer has not been read when the last bit of the frame is received, an over-run error occurs. Similarly, if there is no data written to transmit buffer when SCLK for the next frame is input, an under-run error occurs and the dummy data (0xff) is output.

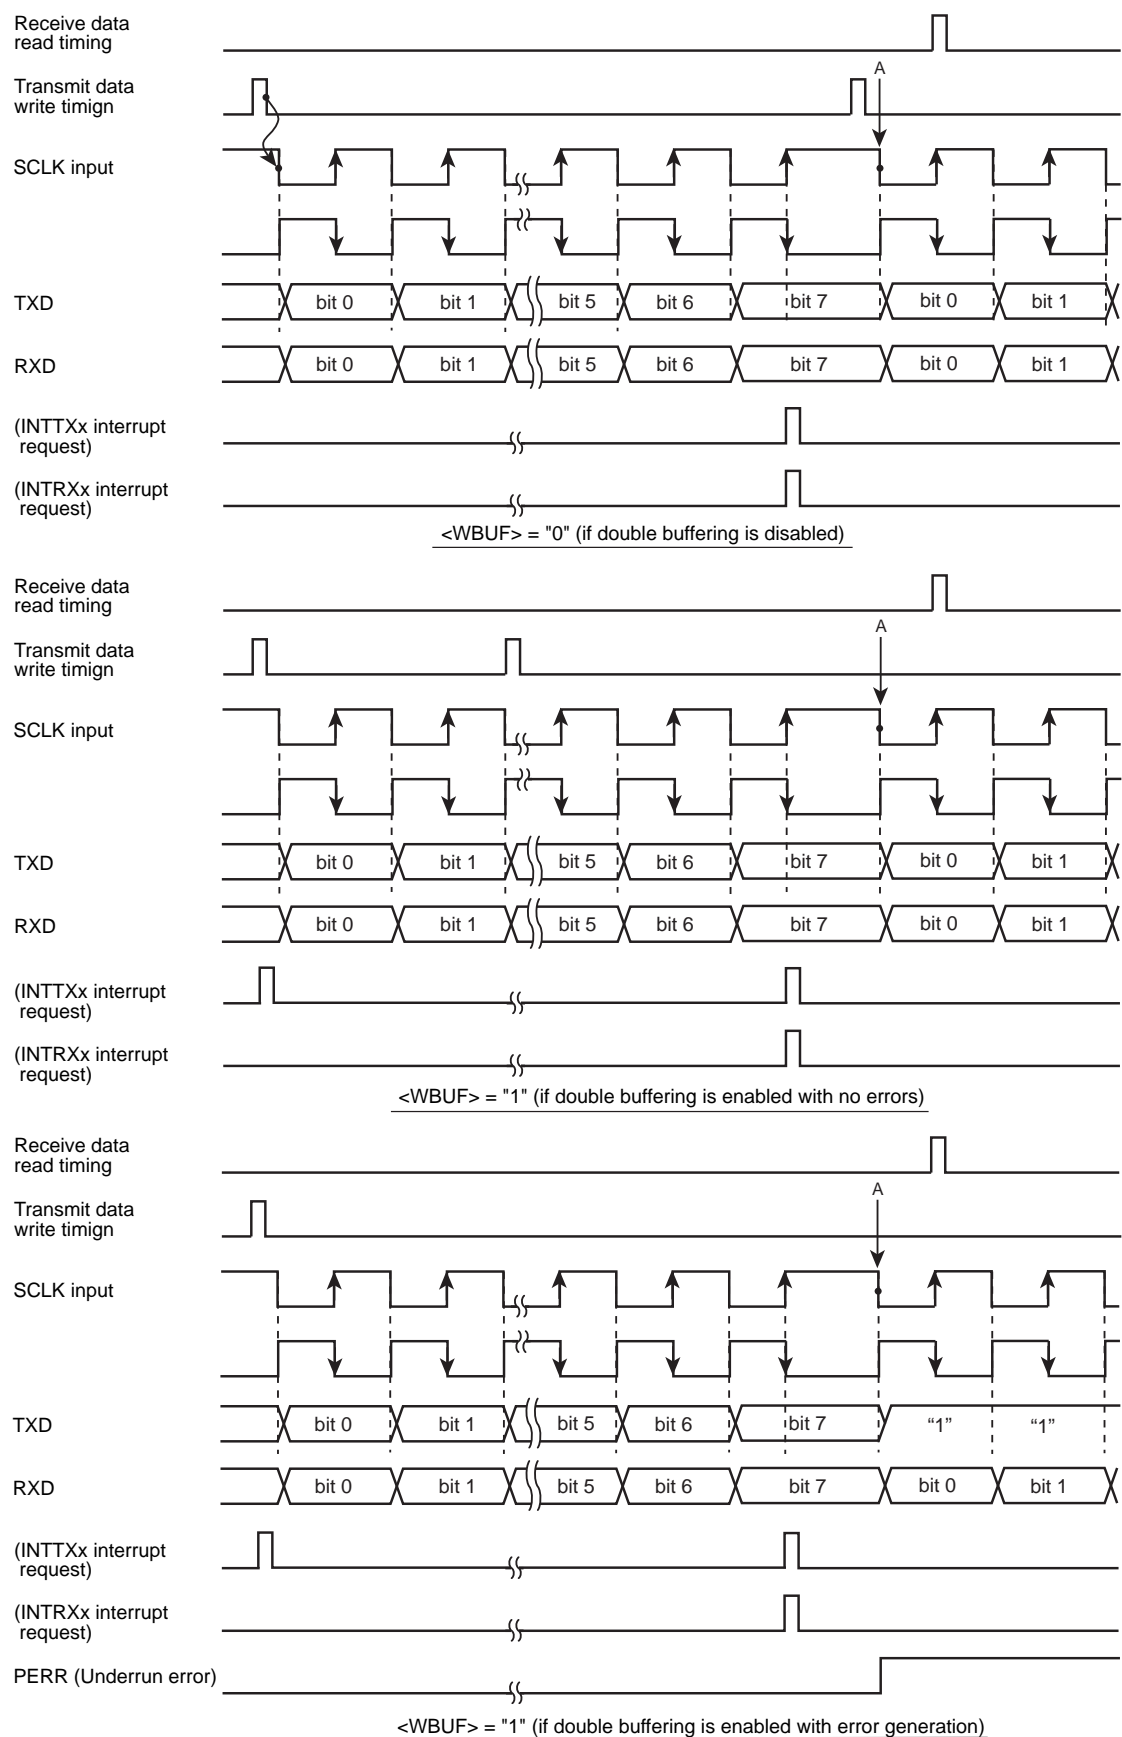

Figure 12-17 Transmit / Receive Operation in the I/O Interface Mode (SCLK Input Mode)

12.17.2 7-bit UART Mode

The 7-bit UART mode can be selected by setting the mode control register (SCxMOD<SM[1:0]>) to "01".

In this mode, parity bits can be added to the transmit data stream; the serial mode control register (SCxCR<PE>) controls the parity enable/disable setting. When <PE> is set to "1" (enable), either even or odd parity may be selected using the SCxCR<EVEN> bit. The length of the stop bit can be specified using SCxMOD2<SBLEN>.

The following table shows the control register settings for transmitting in the following data format.

Clocking condition	System clock :		High-speed (fc)							
	High-speed clock gear :		x1 (fc)							
	Prescaler clock :		fperiph/2 (fperiph = fsys)							
		7	6	5	4	3	2	1	0	
SCxMOD0	←	x	0	-	0	0	1	0	1	Set 7-bit UART mode
SCxCR	←	x	1	1	x	x	x	0	0	Even parity enabled
SCxBRCR	←	0	0	1	0	0	1	0	0	Set 2400bps
SCxBUF	←	*	*	*	*	*	*	*	*	Set transmit data
x : don't care - : no change										

12.17.3 8-bit UART Mode

The 8-bit UART mode can be selected by setting SCxMOD0<SM[1:0]> to "10". In this mode, parity bits can be added and parity enable/disable is controlled using SCxCR<PE>. If <PE> = "1" (enabled), either even or odd parity can be selected using SCxCR<EVEN>.

The control register settings for receiving data in the following format are as follows :

Clocking condition	System clock :		High-speed (fc)						
	High-speed clock gear :		x1 (fc)						
	Prescaler clock :		fperiph/2 (fperiph = fsys)						

		7	6	5	4	3	2	1	0	
SCxMOD0	←	x	0	0	0	1	0	0	1	Set 8-bit UART mode
SCxCR	←	x	0	1	x	x	x	0	0	Odd parity enabled
SCxBRCR	←	0	0	0	1	0	1	0	0	Set 9600bps
SCxMOD0	←	-	-	1	-	-	-	-	-	Reception enabled

x : don't care - : no change

## 12.17.4 9-bit UART Mode

The 9-bit UART mode can be selected by setting SCxMOD0<SM[1:0]> to "11". In this mode, parity bits must be disabled (SCxCR<PE> = "0").

The most significant bit (9th bit) is written to SCxMOD0<TB8> for transmitting data. The received data is stored in SCxCR<RB8>.

When writing or reading data to/from the buffers, the most significant bit must be written or read first before writing or reading to/from SCxBUF. The stop bit length can be specified using SCxMOD2<SLEN>.

### 12.17.4.1 Wake-up Function

In the 9-bit UART mode, slave controllers can be operated in the wake-up mode by setting the wake-up function control bit SCxMOD0<WU> to "1".

In this case, the interrupt INTRXx will be generated only when SCxCR<RB8> is set to "1".

**Note:** The TXD pin of the slave controller must be set to the open drain output mode using the PxOD register.

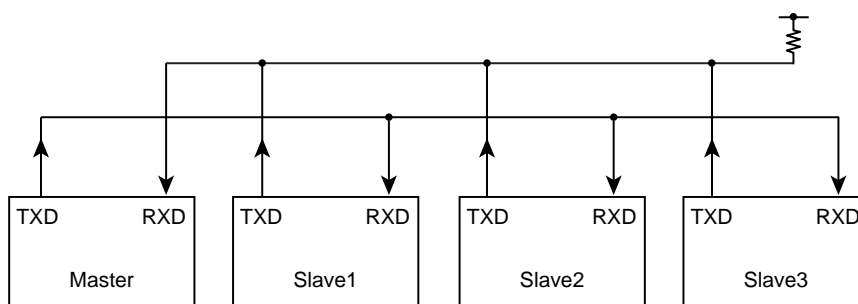

Figure 12-18 Serial Links to Use Wake-up Function

12.17.4.2 Protocol

- 1. Select the 9-bit UART mode for the master and slave controllers.
- 2. Set SCxMOD0<WU> to "1" for the slave controllers to make them ready to receive data.
- 3. The master controller is to transmit a single frame of data that includes the slave controller select code (8 bits). In this, the most significant bit (bit 8) <TB8> must be set to "1".

- 4. Each slave controller receives the above data frame; if the code received matches with the controller's own select code, it clears the <WU> bit to "0".
- 5. The master controller transmits data to the designated slave controller (the controller of which SCxMOD<WU> bit is cleared to "0"). In this, the most significant bit (bit 8) <TB8> must be set to "0".

- 6. The slave controllers with the <WU> bit set to "1" ignore the receive data because the most significant bit (bit 8) <RB8> is set to "0" and thus no interrupt (INTRXx) is generated. Also, the slave controller with the <WU> bit set to "0" can transmit data to the master controller to inform that the data has been successfully received.

## 13. Asynchronous Serial Channel (UART)

### 13.1 Overview

This device has the Asynchronous serial channel (UART) with Modem control.

Their features are given in the following.

- Transmit FIFO  
8-bit width/ 32 location deep.
- Receive FIFO  
12-bit width/ 32 location deep.
- Transmit /Receive data format
  - DATA bits: 5,6,7,8 bits can be selected.
  - PARITY : use / no use
  - STOP bit : 1bit / 2 bits
- FIFO ON/OFF
  - ON (FIFO mode)/
  - OFF (characters mode)
- Interrupt
  - Combined interrupt factors are output to interrupt controller.
  - The permission of each interrupt factor is programmable.
- Baud rate generator  
Generates a common transmit and receive internal clock from UART internal reference clock input.  
Supports baud rates of up to 2.95Mbps at  $f_{sys} = 48\text{MHz}$ .
- DMA
- IrDA 1.0 Function
  - Max data rate : 115.2 kbps (half-duplex).
  - support low power mode
- Control pins  
TXDx (IROUTx)  
RXDx (IRINx)  
 $\overline{\text{CTSx}}$   
RINx  
 $\overline{\text{RTSx}}$   
DCDx  
DSRx  
DTRx
- Hardware flow control  
RTS support  
CTS support

(1) UART transmit / receive data format.

Transmit / receive data format			
START	DATA (LSB → MSB)	PARITY	STOP

(2)Receive FIFO data format

	Receive data (LSB → MSB)								Framing error flag	Parity error flag	Break error flag	Overrun error flag
Bit Number	0	1	2	3	4	5	6	7				
Receive 8-bit data	1	1	1	1	1	1	1	1				
Receive 7-bi data	1	1	1	1	1	1	1	0				
Receive 6-bit data	1	1	1	1	1	1	0	0				
Receive 5-bit data	1	1	1	1	1	0	0	0				

## 13.2 Configuration

Figure 13-1 shows UART block diagram.

Figure 13-1 UART Channel Block Diagram

### 13.3 Registers Description

#### 13.3.1 Registers List

The channel registers and addresses are shown below.

Channel x	Base Address
Channel4	0x4004_8000
Channel5	0x4004_9000

Register name (x= 4, 5)		Address (Base+)
UART Data register	UARTxDR	0x0000
UART Receive status register	UARTxRSR	0x0004
UART Error clear register	UARTxECR	0x0004
Reserved	-	0x0008 to 0x0017
UART Flag register	UARTxFR	0x0018
Reserved	-	0x001C
UART IrDA low-power counter	UARTxILPR	0x0020
UART Integer baud rate register	UARTxIBDR	0x0024
UART Fractional baud rate register	UARTxFBDR	0x0028
UART Line control register	UARTxLCR_H	0x002C
UART Control register	UARTxCR	0x0030
UART Interrupt FIFO level select register	UARTxIFLS	0x0034
UART Interrupt mask set/clear register	UARTxIMSC	0x0038
UART Raw interrupt status register	UARTxRIS	0x003C
UART Masked interrupt status register	UARTxMIS	0x0040
UART Interrupt clear register	UARTxICR	0x0044
UART DMA control register	UARTxDMACR	0x0048
Reserved	-	0x004C to 0x0FFF

Note: **You must disable the UART before any of the control registers are reprogrammed. When the UART is disabled in the middle of transmit or receive operation, it stops after the transmission of the current character is completed.**

## 13.3.2 UARTxDR (UART Data Register)

	31	30	29	28	27	26	25	24

	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	OE	BE	PE	FE
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-4	-	R	Read as 0.
3	OE	R	<p>Overrun error</p> <p>This bit is set to 1 if data is received and the FIFO is already full.</p> <p>This bit is cleared 0 by writing a data to UARTxECCR.</p> <p>When FIFO is already full, the received data is not stored in the FIFO. Therefore the contents of FIFO are valid and only the contents of shift register is over written. In this case, CPU must be read out a data from FIFO to make empty FIFO.</p>
2	BE	R	<p>Break error</p> <p>This bit is set to 1 if a break condition was detected, indicating that the receive data input (defined as start, data bit, data parity, and stop bits) was held Low for longer than a full-word transmission time.</p> <p>This bit is cleared 0 by writing a data to UARTxECCR.</p> <p>In FIFO mode, this error is occurred by the highest character in FIFO. Break is occurred only when one zero character is loaded in FIFO.</p> <p>The next character is enabled when received data makes 1 (marking state) and the next effective start bit is received.</p>
1	PE	R	<p>Parity error</p> <p>When this bit is set to 1, it indicates that the parity of the received data does not match the parity defined by bits 2 and 7 of the UARTxLCR_H register.</p> <p>This bit is cleared 0 by writing a data to UARTxECCR.</p> <p>In FIFO mode, this error is occurred by the highest character in FIFO.</p>
0	FE	R	<p>Framing error</p> <p>When this bit is set to 1, it indicates that the received data did not have a valid stop bit (a valid stop bit is 1).</p> <p>This bit is cleared 0 by writing a data to UARTxECCR.</p> <p>In FIFO mode, this error is occurred by the highest character in FIFO.</p>

## 13.3.4 UARTxECR (UART Error clear register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	OE	BE	PE	FE
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-4	-	R	Read as 0.
3	OE	W	A write to this register clears framing, parity, break, and overrun errors. The data value has no significance. The address of this register is the same as that of the UARTxRSR register.
2	BE	W	
1	PE	W	
0	FE	W	

Note 1: The UARTxRSR/UARTxECR register is the receive status register/error clear register. Receive status can also be read from UARTxRSR. If the status is read from this register, the status information for break, framing and parity corresponds to the data read from UARTxDR prior to reading UARTxRSR. The status information for overrun is set immediately when an overrun condition occurs. A write to UARTxECR clears the framing, parity, break and overrun errors. All the bits are cleared to 0 on reset.

Note 2: The receive data must be read first from UARTxDR before the error status associated with that data is read from UARTxRSR. This read sequence cannot be reversed because the status register UARTxRSR is updated only when the data is read from the data register UARTxDR. The status information can also be read directly from the UARTxDR register.

13.3.5 UARTxFR (UART Flag register)

The <TXFE>, <RXFF>, <TXFF>, and <RXFE> bits differ depending on the state of the <FEN> of the UARTxLCR\_H register.

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0

After reset	0	0	0	0	0	Undefined	Undefined	Undefined

Bit	Bit Symbol	Type	Function
31-9	-	R	Read as undefined.
8	RI	R	RIing indicator flag. 1: Modem status input = 0
7	TXFE	R	UARTxLCR_H<FEN>=1 (Transmit FIFO empty flag) 0: Not empty 1: Empty UARTxLCR_H<FEN>=0 (Transmit hold register empty flag) 0: Not empty 1: Empty
6	RXFF	R	UARTxLCR_H<FEN>=1 (Receive FIFO full flag) 0: Not full 1: Full UARTxLCR_H<FEN>=0 (Receive hold register full flag) 0: Not full 1: Full
5	TXFF	R	UARTxLCR_H<FEN>=1 (Transmit FIFO full flag) 0: Not full 1: Full UARTxLCR_H<FEN>=0 (Transmit hold register full flag) 0: Not full 1: Full
4	RXFE	R	UARTxLCR_H<FEN>=1 (Receive FIFO empty flag ) 0: Not empty 1: Empty UARTxLCR_H<FEN>=0 (Receive hold register empty flag) 0: Not empty 1: Empty
3	BUSY	R	BUSY flag 0: The UART has stopped transmitting data 1: The UART is transmitting data. (BUSY)
2	DCD	R	Data carrier detect (DCD) flag 0: DCDx pin is "High" 1: DCDx pin is "Low"

Bit	Bit Symbol	Type	Function
1	DSR	R	Data set ready (DSR) flag 0: DSRx pin is "High" 1: DSRx pin is "Low"
0	CTS	R	Clear To Send (CTS) flag 0: CTSx pin is "High" 1: CTSx pin is "Low"

#### 1. Transmit FIFO

The transmit FIFO is an 8-bit wide, 32-location deep FIFO memory buffer. CPU data written across the APB interface is stored in the FIFO until it is read out by the transmit logic. The transmit FIFO can be disabled to act like a one-byte holding register.

#### 2. Receive FIFO

The receive FIFO is a 12-bit wide, 32-location deep, FIFO memory buffer. Received data and corresponding error bits are stored in the receive FIFO by the receive logic until they are read out by the CPU across the APB interface. The receive FIFO can be disabled to act like a one-byte holding register.

13.3.6 UARTxILPR(UART IrDA low-power counter Register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	ILPDVSR							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as 0.
7-0	ILPDVSR[7:0]	R/W	Low-power divisor <ILPDVSR> = (f <sub>UARTCLK</sub> / f <sub>IrLPBaud16</sub> ). The UARTxILPR register is the IrDA low-power counter register. This is an 8-bit read/write register that stores the low-power counter divisor value used to generate the IrLPBaud16 signal by dividing down of UARTCLK. All the bits are cleared to 0 when reset

Note 1: **Set this register before the UARTxCR<SIRLP> is set to 1.**  
Note 2: **0x00 setting is prohibited.**

## 13.3.7 UARTxIBDR (UART integer baud rate Register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	BAUDDIVINT							
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	BAUDDIVINT							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-16	-	R	Read as undefined.
15-0	BAUD DIVINT [15:0]	R/W	Integer part of baud rate divisor. (0x0002 to 0xFFFF) This register, when put together with the fractional baud rate divisor described next, provides the baud rate divisor BAUDDIV.

Note 1: To update the contents of UARTxIBDR internally, the write to UARTxLCR\_H must always be executed last. For details, refer to the description of UARTxLCR\_H.

Note 2: Set this register before the UARTxCR<UARTEN> is set to 1.

Note 3: 0x0000, 0x0001 cannot be set.

Note 4: The value of the worst case baud rate divisor of the set value due to the baud rate shift (total error) between the transmitter side and the receiver side is as shown in the table below. (8 bit data + Parity / 9 bit data)

Total error	BAUDDIVINT(Lower limit)
2.0% or less	0x0002
2.8% or less	0x0003
3.3% or less	0x0004

13.3.8 UARTxFBDR(UART Fractional baud rate Register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16

After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-6		R	Read as 0.
5 -0	BAUDDIV FRAC [5:0]	R/W	Fractional part of baud rate divisor. 0x01 to 0x3F. The baud rate divisor is calculated as follows: Baud rate divisor BAUDDIV = (f <sub>UARTCLK</sub> ) / (16 × baud rate) f <sub>UARTCLK</sub> is the frequency of UARTCLK. The BAUDDIV is comprised of the integer value (BAUD DIVINT) and the fractional value (BAUD DIVFRAC).

- Note 1: To update the contents of UARTxFBDR internally, the write to UARTxLCR\_H must always be executed last. For details, refer to the description of UARTxLCR\_H.
- Note 2: Set this register before the UARTxCR<UARTEN> is set to 1.
- Note 3: The minimum baud rate divisor is 1 and the maximum baud rate divisor is 65535. Therefore, The integral part of baud rate divisor can not be set 0. And the fractional part of baud rate divisor must be set to 0 when the integral part of baud rate divisor is 65535.

Example: Calculating the divisor value

When the required baud rate is 230400 and f<sub>UARTCLK</sub> = 4 MHz:

Baud rate divisor =  $(4 \times 10^6) / (16 \times 230400) = 1.085$

Therefore, BRDI = 1 and BRDF = 0.085

Fractional part is  $((0.085 \times 64) + 0.5) = 5.94$ .

The integer part of this, m=0x5, should be set as the fractional baud rate divisor value.

Generated baud rate divisor =  $1 + 5/64 = 1.078$

Generated baud rate =  $(4 \times 10^6) / (16 \times 1.078) = 231911$

Error =  $(231911 - 230400) / 230400 \times 100 = 0.656\%$

The maximum error using a 6-bit UARTxFBDR register =  $1/64 \times 100 = 1.56\%$

This error occurs when m = 1, and it is cumulative over 64 clock ticks.

## 13.3.9 UARTxLCR\_H (UART Line Control Register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16

After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	SPS	WLEN		FEN	STP2	EPS	PEN	BRK
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as 0.
7	SPS	R/W	Stick parity select : refer to Table 13-1 for the truth table. When <SPS>, <EPS> and <PEN> of the UARTxLCR_H register are set, the parity bit is transmitted and checked as a 0. When <SPS> and <PEN> are set and <EPS> is 0, the parity bit is transmitted and checked as a 1. When this bit is cleared, the stick parity is disabled. Refer to Table 13-1 for the truth table of <SPS>, <EPS>, and <PEN> bits.
6-5	WLEN[1:0]	R/W	Word length : 00: 5bits 01: 6bits 10: 7bits 11: 8bits This bit indicates the number of data bits transmitted or received in a frame.
4	FEN	R/W	FIFO control : 0: character mode 1: FIFO mode When this bit is set to 1, transmit and receive FIFO buffers are enabled (FIFO mode). When this bit is cleared to 0, the FIFOs are disabled (character mode) and they become 1-byte deep holding registers.
3	STP2	R/W	Stop bit select : 0: 1bit 1: 2 bits When this bit is set to 1, two stop bits are transmitted at the end of a frame. The receive logic does not check for the second stop bit being received.
2	EPS	R/W	Even parity select: 0: Odd 1: Even When this bit is set to 1, even parity generation and checking are performed during transmission and reception. This function checks whether the number of 1s contained in the data bits and parity bit is even. When this bit is cleared to 0, odd parity check is performed to check whether the number of 1s is odd. This bit has no effect when parity is disabled by Parity Enable bit <PEN> being cleared to 0. Refer to Table 13-1 for the truth table.
1	PEN	R/W	Parity control: 0: Disable 1: Enable When this bit is set to 1, parity check and generation are enabled. Otherwise, parity is disabled and no parity bit is added to data frames. Refer to Table 13-1 for the truth table of <SPS>, <EPS>, and <PEN> bits.
0	BRK	R/W	Send break : 0: No effect 1: Send break When this bit is set to 1, the TXDx output remains LOW after the current character is transmitted. For generation of the transmit break condition, this bit must be asserted while at least one frame is or longer being transmitted. Even when the break condition is generated, the contents of the transmit FIFO are not affected.

Note:When you set UARTxLCR\_H, UARTxIBRD and UARTxFBRD, UARTxLCR\_H must be set at the end. When you update only UARTxIBRD or UARTxFBRD, UARTxLCR\_H register must be set again.

Table 13-1 is the truth table of the <SPS>, <EPS> and <PEN> bits of the UARTxLCR\_H register.

Table 13-1 Truth table of UARTxLCR\_H <SPS>, <EPS> and <PEN>

Parity enable <PEN>	Even parity se- lect <EPS>	Stick parity se- lect <SPS>	Parity bit(transmitted or checked)
0	x	x	No transmitted or checked
1	1	0	Even parity
1	0	0	Odd parity
1	0	1	1
1	1	1	0

After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-16	-	R	Read as undefined.
15	CTSEBN	R/W	CTS hardware flow control enable : 0: Disable 1: Enable When this bit is set to 1, CTS hardware flow control is enabled. Data is transmitted only after the $\overline{\text{CTSx}}$ signal has been asserted.
14	RTSEN	R/W	RTS hardware flow control enable : 0: Disable 1: Enable When this bit is set to 1, RTS hardware flow control is enabled. Data is transmitted only when there is an empty space in the receive FIFO.
13-12	-	R	Read as undefined.
11	RTS	R/W	Complement of the UART Request To Send (RTS) modem status output : 0: Modem status output is 1 1: Modem status output is 0. This bit is the inverting UART Request To Send (RST) modem status output signal. When this bit is set to 1, the output is 0.
10	DTR	R/W	Complement of the UART Data Set Ready (DTS) modem status output : 0: Modem status output is 1. 1: Modem status output is 0. This bit is the inverting UART Data Transmit Ready (DTR) modem status output signal. When this bit is set to 1, the output is 0.
9	RXE	R/W	UART receive enable : 0: Disable 1: Enable When this bit is set to 1, the receive circuit of the UART is enabled. Data reception occurs for either UART function or SIR function according to the setting of <SIREN>. When the UART is disabled in the middle of receive operation, it completes current reception and the subsequent receptions are disabled.
8	TXE	R/W	UART transmit enable : 0: Disable 1: Enable When this bit is set to 1, the transmit circuit of the UART is enabled. Data transmission occurs for either UART function or SIR function according to the setting of <SIREN>. When the UART is disabled in the middle of transmit operation, it completes the current transmission before stopping.
7	Reserved	R/W	Write as zero.
6-3	Reserved	-	Read as undefined.

Bit	Bit Symbol	Type	Function
2	SIRLP	R/W	<p>IrDA encoding mode select for transmitting 0 bit :</p> <p>0 : 0 bit are transmitted as an active high pulse of 3/16th of the bit period.</p> <p>1 : 0 bit are transmitted with a pulse width that is 3 times the period of the IrLPBaud16 input signal.</p> <p>&lt;SIRLP&gt; selects IrDA encoding mode. When this bit is cleared to 0, 0 bits of the IrDA transmission data are transmitted as an active high pulse (IROUT) with a width of 3/16th of the bit period. When this bit is set to 1, 0 bits of the IrDA transmission data are transmitted with a pulse width that is 3 times the period of the IrLPBaud16 input signal. Setting this bit can reduce power consumption but might decrease transmission distances.</p>
1	SIREN	R/W	<p>SIR enable :</p> <p>0 : Disable</p> <p>1 : Enable</p> <p>When this bit is set to 1, the IrDA circuit is enabled. To use the UART, the &lt;UARTEN&gt; must be set to 1. When the IrDA circuit is enabled, the IROUT and IRIN pins are enabled. The TXD pin remains in the marking state (set to 1). Signal transitions on the RXD pin or modem status input have no effect. When IrDA circuit is disabled, IROUT remains cleared to 0 (no light pulse is generated) and the IRIN pin has no effect.</p>
0	UARTEN	R/W	<p>UART enable :</p> <p>0 : Disable</p> <p>1 : Enable</p> <p>When this bit is set to 1, the UART is enabled. Data transmission and reception occur for either UART function or SIR function according to the setting of &lt;SIREN&gt;. When the UART is disabled in the middle of transmit or receive operation, it completes current transmission or reception before stopping.</p>

## 13.3.11 UARTxIFLS (UART interrupt FIFO level select register )

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	RXIFLSEL			TXIFLSEL		
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-6	-	R	Read as undefined .
5-3	RXIFLSEL[2:0]	R/W	Receive interrupt FIFO level select (1 word = 12 bits): The trigger points for the receive interrupt are as follows 000: Receive FIFO becomes $\geq 1/8$ full 001: Receive FIFO becomes $\geq 1/4$ full 010: Receive FIFO becomes $\geq 1/2$ full 011: Receive FIFO becomes $\geq 3/4$ full 100: Receive FIFO becomes $\geq 7/8$ full 101to 111: Reserved
2-0	TXIFSEL[2:0]	R/W	Transmit FIFO level select (1 word = 8 bits) : The trigger points for the transmit interrupt are as follows: 000: Transmit FIFO becomes $\leq 1/8$ full 001: Transmit FIFO becomes $\leq 1/4$ full 010: Transmit FIFO becomes $\leq 1/2$ full 011: Transmit FIFO becomes $\leq 3/4$ full 100: Transmit FIFO becomes $\leq 7/8$ full 101 to 111: Reserved

The UARTxIFLS register is the interrupt FIFO level select register. This register is used to define the FIFO level at which UARTTXINTR and UARTRXINTR are generated.

The interrupts are generated based on a transition through a level rather than based on the level. For example, an interrupt is generated at a point when the third word has been stored in the receive FIFO which contained two words.

13.3.12 UARTxIMSC (UART Interrupt mask set/clear Register)

bit symbol	FEIC	RTIC	TXIC	RXIC	DSRMIC	DCDMIC	CTSMIC	RIMIC
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-11	-	R	Write 0.
10	OEIC	W	Overrun error interrupt clear : 0: Invalid 1: Clear
9	BEIC	W	Break error interrupt clear : 0: Invalid 1: Clear
8	PEIC	W	Parity error interrupt clear : 0: Invalid 1: Clear
7	FEIC	W	Framing error interrupt clear : 0: Invalid 1: Clear
6	RTIC	W	Received time out interrupt clear : 0: Invalid 1: Clear
5	TXIC	W	Transmit interrupt clear : 0: Invalid 1: Clear
4	RXIC	W	Receive interrupt clear : 0: Invalid 1: Clear
3	DSRMIC	W	DSR modem interrupt clear : 0: Invalid 1: Clear
2	DCDMIC	W	DCD modem interrupt clear : 0: Invalid 1: Clear
1	CTSMIC	W	CTS modem interrupt clear : 0: Invalid 1: Clear
0	RIMIC	W	RIN modem interrupt clear : 0: Invalid 1: Clear

Note: The UARTxICR register is a write-only interrupt clear register. When a bit of this register is set to 1, the associated interrupt is cleared. A write of 0 to any bit of this register is invalid.

## 13.3.16 UARTxDMACR (UART DMA control register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	DMAONERR	TXDMAE	RXDMAE
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-3	-	R	Read as undefined.
2	DMAONERR	R/W	DMA on error : 0: Not available 1: Available When this bit is set to 1, the DMA receive request output, UARTRXDMSREQ or UARTRXDMAREQ, is disabled on assertion of a UART error interrupt.
1	TXDMAE	R/W	Transmit FIFO DMA enable : 0: Disable 1: Enable
0	RXDMAE	R/W	Receive FIFO DMA enable : 0: Disable 1: Enable

Note 1: For example, if 19 characters have to be received and the watermark level is programmed to be four, then the DMA controller transfers four bursts of four characters and three single transfers to complete the stream.

Note 2: The bus width must be set to 8-bits, if you transfer the data of transmit/ receive FIFO by using DMAC.

## 13.4 Operation Description

### 13.4.1 Baud rate generator

The baud rate generator contains the internal Baud16 clock circuit which controls the timing of UART transmit and receive, and the internal IrLPBaud16 circuit which generates the pulse width of the IrDA encoded transmit bit stream when in low-power mode.

### 13.4.2 Transmit FIFO

The transmit FIFO is an 8-bit wide, 32-location deep, FIFO memory buffer. CPU data written across the APB interface is stored in the FIFO until it is read out by the transmit logic. You can disable the transmit FIFO to act like a one-byte holding register.

### 13.4.3 Receive FIFO

The receive FIFO is a 12-bit wide, 32 locations deep, FIFO memory buffer. Received data and corresponding error bits are stored in the receive FIFO by the receive logic until they are read out by the CPU across the APB interface. The receive FIFO can be disabled to act like a one-byte holding register.

### 13.4.4 Transmit logic

The transmit logic performs parallel-to-serial conversion on the data read from the transmit FIFO. Control logic outputs the serial bit stream beginning with a start bit, data bits with the Least Significant Bit (LSB) first, followed by the parity bit, and then the stop bits according to the programmed configuration in control registers.

### 13.4.5 Receive logic

The receive logic performs serial-to-parallel conversion on the received bit stream after a start bit has been detected. Error check for overrun, parity and frame and line break detection are also performed. Their error bit data is written to the receive FIFO.

### 13.4.6 Interrupt generation logic

UART outputs a maskable combined interrupt for every interrupt sources.

### 13.4.7 Interrupt timing

Interrupt type	Interrupt timing
Overrun error	After receiving the stop bit of Overflow data
Break error	After receiving STOP bit
Parity error	After receiving parity data
Frame error	After receiving frame over bit
Receive time out error	After 511 clocks(Baud16) from Receive FIFO data storage
Transmit interrupt	After transmitting the last data (MSB data)
Receive interrupt	After receiving STOP bit

Note:STOP bit in above table means the last STOP bit. (The number of STOP bit can be selected among 1 or 2.)

### 13.4.8 UART interrupt block

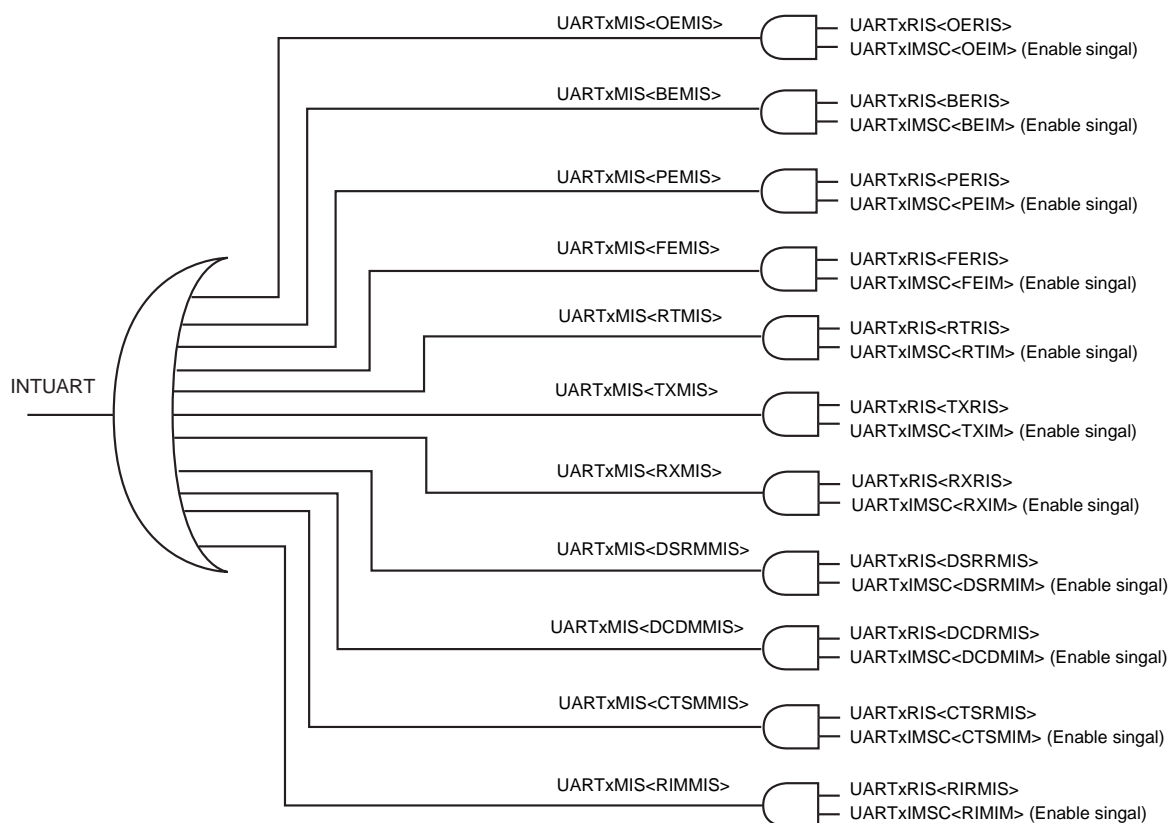

Figure 13-2 UART interrupt block

### 13.4.9 DMA interface

The UART support DMA controller.

### 13.4.10 IrDA circuit description

The IrDA is comprised of:

- IrDA SIR transmit encoder
- IrDA SIR receive decoder

**Note:** The transmit encoder output (IROUT) has the opposite polarity to the receive decoder input (IRIN). Please refer to Figure 13-4

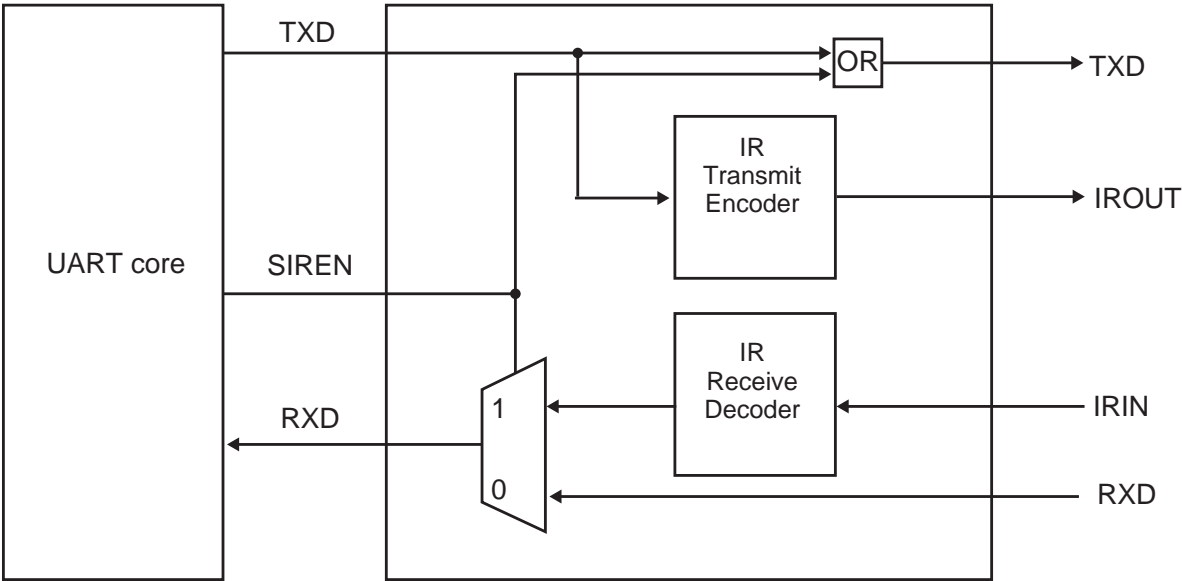

Figure 13-3 IrDA Circuit Block Diagram

Figure 13-4 IrDA Data Modulation

13.4.11 Hardware flow control

The hardware flow control feature is fully selectable, and enables you to control the serial data flow by using the  $\overline{\text{RTSx}}$  output and  $\overline{\text{CTSx}}$  input signals.

Figure 13-5 shows how the two devices can communicate with each other using hardware flow control.

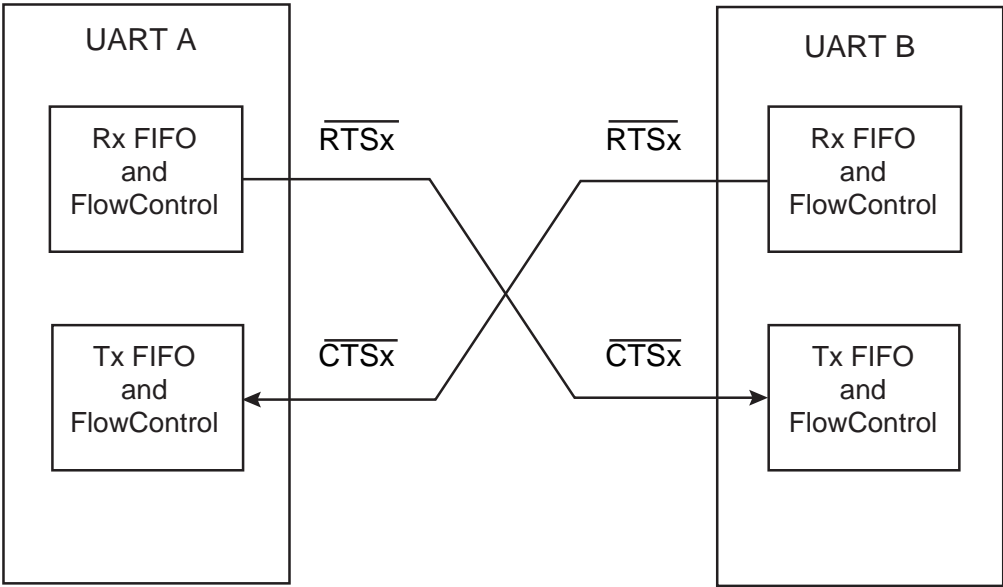

Figure 13-5 Hardware Flow Control

1. RTS flow control

The RTS flow control logic is linked to the programmable receive FIFO watermark levels. When RTS flow control is enabled, the  $\overline{RTSx}$  is asserted until the receive FIFO is filled up to the watermark level.

When the amount of data stored in the receive FIFO exceeds watermark level, the  $\overline{RTSx}$  signal is deasserted, indicating that there is no more room to receive.

The  $\overline{RTSx}$  signal is reasserted when data has been read out of the receive FIFO and it is filled to less than the watermark level.

Even if RTS flow control is disabled, communication can be enabled.

2. CTS flow control

If CTS flow control is enabled, then the transmitter checks the  $\overline{CTSx}$  signal before transmitting. If the  $\overline{CTSx}$  signal is asserted, it transmits the byte, otherwise transmission does not occur.

The data transmission continues while  $\overline{CTSx}$  is asserted and the transmit FIFO is not empty. If the transmit FIFO is empty, no data is transmitted even when the  $\overline{CTSx}$  signal is asserted.

If the  $\overline{CTSx}$  signal is deasserted while CTS flow control is enabled, the current data transmission is completed before stopping.

Even if CTS flow control is disabled, communication can be enabled.

UARTxCR		RTSx	Description
<CTSEN>	<RTSEN>		
1	1	0 (note)	Both RTS and CTS flow control enabled.
1	0	1	Only CTS flow control enabled.
0	1	0 (note)	Only RTS flow control enabled.
0	0	1	Both RTS and CTS flow control disabled.

Note: During in the <RTSEN>=1(Enable), the  $\overline{RTSx}$  is set to 0(Enable) until the receive FIFO is filled up to the watermark level.

## 14. Serial Bus Interface (I2C/SIO)

The TMPM368FDXBG contains 3 Serial Bus Interface (I2C/SIO) channels, in which the following two operating modes are included:

- I2C bus mode (with multi-master capability)
- Clock-synchronous 8-bit SIO mode

In the I2C bus mode, the I2C/SIO is connected to external devices via SCL and SDA.

In the clock-synchronous 8-bit SIO mode, the I2C/SIO is connected to external devices via SCK, SI and SO.

The following table shows the programming required to put the I2C/SIO in each operating mode.

Table 14-1 Port settings for using serial bus interface

channel	Operating mode	pin	Port Function Register	Port Output Control Register	Port Input Control Register	Port Open Drain Output Control Register
SBI0	I2C bus mode	SCL0 :PK3 SDA0 :PK2	PKFR3[3:2] = 11	PKCR[3:2] = 11	PKIE[3:2] = 11	PKOD[3:2] = 11
	SIO mode	SCK0 :PK4 SI0 :PK3 SO0 :PK2	PKFR3[4:2] = 111	PKCR[4:2] = 101(SCK0 output) PKCR[4:2] = 001(SCK0 input)	PKIE[4:2] = 010(SCK0 output) PKIE[4:2] = 110(SCK0 input)	PKOD[4:2] = xxx
SBI1	I2C bus mode	SCL1 :PF6 SDA1 :PF7	PFFR4[6:5] = 11	PFCR[6:5] = 11	PFIE[6:5] = 11	PFOD[6:5] = 11
	SIO mode	SCK1 :PF5 SI1 :PF6 SO1 :PF7	PFFR4[7:5] = 111	PFCR[7:5] = 101(SCK0 output) PFCR[7:5] = 100(SCK0 input)	PFIE[7:5] = 010(SCK0 output) PFIE[7:5] = 011(SCK0 input)	PFOD[7:5] = xxx
SBI2	I2C bus mode	SCL2 :PH1 SDA2 :PH0	PHFR5[1:0] = 11	PHCR[1:0] = 11	PHIE[1:0] = 11	PHOD[1:0] = 11
	SIO mode	SCK2 :PH2 SI2 :PH1 SO2 :PH0	PHFR5[2:0] = 111	PHCR[2:0] = 101(SCK0 output) PHCR[2:0] = 001(SCK0 input)	PHIE[2:0] = 010(SCK0 output) PHIE[2:0] = 110(SCK0 input)	PHOD[2:0] = xxx

Note:x: Don't care

14.1 Configuration

The configuration is shown in Figure 14-1.

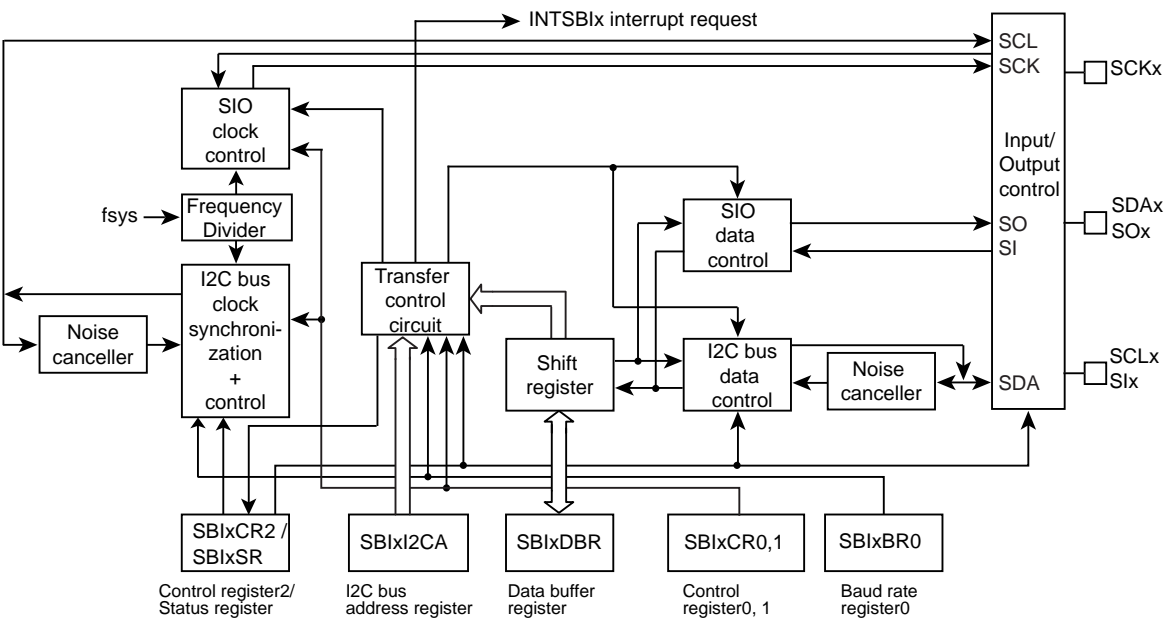

Figure 14-1 (I2C/SIO) Block Interface

## 14.2 Register

The following registers control the serial bus interface and provide its status information for monitoring.

The register below performs different functions depending on the mode. For details, refer to "14.4 Control Registers in the I2C Bus Mode" and "14.7 Control register of SIO mode".

### 14.2.1 Registers for each channel

The tables below show the registers and register addresses for each channel.

Channel x	Base Address
Channel0	0x400E_0000
Channel1	0x400E_0100
Channel2	0x400E_0200

Register name(x=0,1,2,.)		Address(Base+)
Control register 0	SBIXCR0	0x0000
Control register 1	SBIXCR1	0x0004
Data buffer register	SBIXDBR	0x0008
I2C bus address register	SBIXI2CAR	0x000C
Control register 2	SBIXCR2 (writing)	0x0010
Status register	SBIXSR (reading)	
Baud rate register 0	SBIXBR0	0x0014

14.3 I2C Bus Mode Data Format

Figure 14-2 shows the data formats used in the I2C bus mode.

Figure 14-2 I2C Bus Mode Data Formats

## 14.4 Control Registers in the I2C Bus Mode

The following registers control the serial bus interface in the I2C bus mode and provide its status information for monitoring.

### 14.4.1 SBIXCR0(Control register 0)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	SBIEN	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as 0.
7	SBIEN	R/W	Serial bus interface operation 0:Disable 1:Enable To use the serial bus interface, enable this bit first. For the first time in case of setting to enable, the relevant SBI registers can be read or written. Since all clocks except SBIXCR0 stop if this bit is disabled, power consumption can be reduced by disabling this bit. If this bit is disabled after it's been enabled once, the settings of each register are retained.
6-0	-	R	Read as 0.

Note: To use the serial bus interface, enable this bit first.

14.4.2 SBxCR1(Control register 1)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	BC			ACK	-	SCK2	SCK1	SCK0 / SWRMON
After reset	0	0	0	0	1	0	0	1(Note3)

Bit	Bit Symbol	Type	Function																																																	
31-8	-	R	Read as 0.																																																	
7-5	BC[2:0]	R/W	Select the number of bits per transfer (Note 1) <table><tr><th rowspan="2">&lt;BC&gt;</th><th colspan="2">When &lt;ACK&gt; = 0</th><th colspan="2">When &lt;ACK&gt; = 1</th></tr><tr><th>Number of clock cycles</th><th>Data length</th><th>Number of clock cycles</th><th>Data length</th></tr><tr><td>000</td><td>8</td><td>8</td><td>9</td><td>8</td></tr><tr><td>001</td><td>1</td><td>1</td><td>2</td><td>1</td></tr><tr><td>010</td><td>2</td><td>2</td><td>3</td><td>2</td></tr><tr><td>011</td><td>3</td><td>3</td><td>4</td><td>3</td></tr><tr><td>100</td><td>4</td><td>4</td><td>5</td><td>4</td></tr><tr><td>101</td><td>5</td><td>5</td><td>6</td><td>5</td></tr><tr><td>110</td><td>6</td><td>6</td><td>7</td><td>6</td></tr><tr><td>111</td><td>7</td><td>7</td><td>8</td><td>7</td></tr></table>	<BC>	When <ACK> = 0		When <ACK> = 1		Number of clock cycles	Data length	Number of clock cycles	Data length	000	8	8	9	8	001	1	1	2	1	010	2	2	3	2	011	3	3	4	3	100	4	4	5	4	101	5	5	6	5	110	6	6	7	6	111	7	7	8	7

000	n = 5	769kHz																																																		
001	n = 6	588kHz																																																		
010	n = 7	400 kHz																																																		
011	n = 8	244 kHz																																																		
100	n = 9	137 kHz																																																		
101	n = 10	73 kHz																																																		
110	n = 11	38 kHz																																																		
111		reserved																																																		
	SWRMON	R	On reading <SWRMON>: Software reset status monitor 0:Software reset operation is in progress. 1:Software reset operation is not in progress.																																																	

- Note 1: Clear <BC[2:0]> to "000" before switching the operation mode to the SIO mode.
- Note 2: For details on the SCL line clock frequency, refer to "14.5.1 Serial Clock".
- Note 3: After a reset, the <SCK[0]/SWRMON> bit is read as "1". However, if the SIO mode is selected at the SBIxCR2 register, the initial value of the <SCK[0]> bit is "0".
- Note 4: The initial value for selecting a frequency is <SCK[2:0]>=000 and is independent of the read initial value.
- Note 5: When <BC[2:0]>="001" and <ACK>="0" in master mode, SCL line may be fixed to "L" by falling edge of SCL line after generation of STOP condition and the other master devices can not use the bus. In the case of bus which is connected with several master devices, the number of bits per transfer should be set equal or more than 2 before generation of STOP condition.

14.4.3 SBIXCR2(Control register 2)

This register serves as SBIXSR register by reading it.

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	MST	TRX	BB	PIN	SBIM		SWRST	
After reset	0	0	0	1	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as 0.
7	MST	W	Select master/slave 0: Slave mode 1: Master mode
6	TRX	W	Select transmit/ receive 0: Receive 1: Transmit
5	BB	W	Start/stop condition generation 0: Stop condition generated 1: Start condition generated
4	PIN	W	Clear INTSBIX interrupt request 0: - 1: Clear interrupt request
3-2	SBIM[1:0]	W	Select serial bus interface operating mode (Note) 00: Port mode (Disables a serial bus interface output) 01: SIO mode 10: I2C bus mode 11: Reserved
1-0	SWRST[1:0]	W	Software reset generation Write "10" followed by "01" to generate a reset. When writing, set <SBIM[1:0]> to "10"; I2Cbus mode.

Note: Make sure that modes are not changed during a communication session. Ensure that the bus is free before switching the operating mode to the port mode. Ensure that the port is at the "High" level before switching the operating mode from the port mode to the I2C bus or clock-synchronous 8-bit SIO mode.

## 14.4.4 SBIXSR (Status Register)

This register serves as SBIXCR2 by writing to it.

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	MST	TRX	BB	PIN	AL	AAS	ADO	LRB
After reset	0	0	0	1	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as 0.
7	MST	R	Master/slave selection monitor 0: Slave mode 1: Master mode
6	TRX	R	Transmit/receive selection monitor 0: Receive 1: Transmit
5	BB	R	I2C bus state monitor 0: Free 1: Busy
4	PIN	R	INTSBIX interrupt request monitor 0: Interrupt request generated 1: Interrupt request cleared
3	AL	R	Arbitration lost detection 0: - 1: Detected
2	AAS	R	Slave address match detection 0: - 1: Detected (This bit is set when the general call is detected as well.)
1	ADO	R	General call detection 0: - 1: Detected
0	LRB	R	Last received bit monitor 0: Last received bit "0" 1: Last received bit "1"

14.4.5 SB<sub>l</sub>xBR0(Serial bus interface baud rate register 0)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	I2SBI	-	-	-	-	-	-
After reset	1	0	1	1	1	1	1	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as 0.
7	-	R	Read as 1.
6	I2SBI	R/W	Operation at the IDLE mode 0: Stop 1: Operate
5-1	-	R	Read as 1.
0	-	R/W	Be sure to write "0".

14.4.6 SB<sub>l</sub>xDBR (Serial bus interface data buffer register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	DB							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as 0.
7-0	DB[7:0]	R (Receive)/ W (Transmit)	Receive data / Transmit data

- Note 1: The transmission data must be written in to the register from the MSB (bit 7). The received data is stored in the LSB.
- Note 2: Since SB<sub>l</sub>xBDR has independent buffers for writing and reading, a written data cannot be read. Thus, read-modify-write instructions, such as bit manipulation, cannot be used.

## 14.4.7 SB1xI2CAR (I2Cbus address register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	SA							ALS
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as 0.
7-1	SA[6:0]	R/W	Set the slave address when the SBI acts as a slave device.
0	ALS	R/W	Specify address recognition mode. 0: Recognize its slave address. 1: Do not recognize its slave address (free-data format).

Note 1: Please set the bit 0 <ALS> of I2C bus address register SB1xI2CAR to "0", except when you use a free data format. It operates as a free data format when setting it to "1". Selecting the master fixes to transmission. Selecting the slave fixes to reception.

Note 2: Do not set SB1xI2CAR to "0x00" in slave mode. (If SB1xI2CAR is set to "0x00", it's recognized that the slave address matches the START byte ("0x01") of the I2C standard received in slave mode.)

14.5 Control in the I2C Bus Mode

14.5.1 Serial Clock

14.5.1.1 Clock source

SBIxCR1<SCK[2:0]> specifies the maximum frequency of the serial clock to be output from the SCL pin in the master mode.

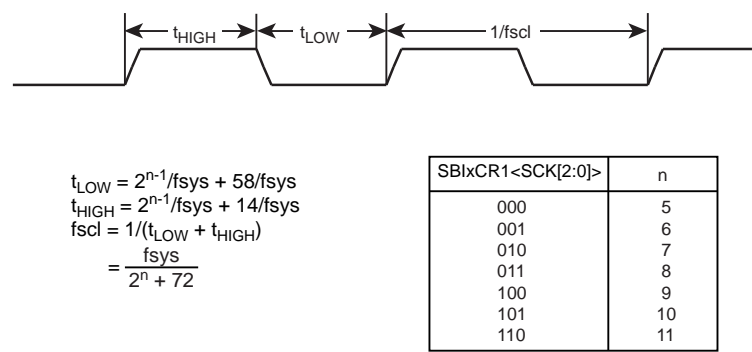

Figure 14-3 Clock source

Note: The maximum speeds in the standard and high-speed modes are specified to 100kHz and 400kHz respectively following the communications standards. Notice that the internal SCL clock frequency is determined by the fsys used and the calculation formula shown above.

14.5.1.2 Clock Synchronization

The I2C bus is driven by using the wired-AND connection due to its pin structure. The first master that pulls its clock line to the "Low" level overrides other masters producing the "High" level on their clock lines. This must be detected and responded by the masters producing the "High" level.

Clock synchronization assures correct data transfer on a bus that has two or more master.

For example, the clock synchronization procedure for a bus with two masters is shown below.

Figure 14-4 Example of Clock Synchronization

At the point a, Master A pulls its internal SCL output to the "Low" level, bringing the SCL bus line to the "Low" level. Master B detects this transition, resets its "High" level period counter, and pulls its internal SCL output level to the "Low" level.

Master A completes counting of its "Low" level period at the point b, and brings its internal SCL output to the "High" level. However, Master B still keeps the SCL bus line at the "Low" level, and Master A stops counting of its "High" level period counting. After Master A detects that Master B brings its internal SCL output to the "High" level and brings the SCL bus line to the "High" level at the point c, it starts counting of its "High" level period.

After that Master finishes counting the "High" level period, the Master pulls the SCL pin to "Low" and the SCL bus line becomes "Low".

This way, the clock on the bus is determined by the master with the shortest "High" level period and the master with the longest "Low" level period among those connected to the bus.

### 14.5.2 Setting the Acknowledgement Mode

Setting SBIxCR1<ACK> to "1" selects the acknowledge mode. When operating as a master, the SBI adds one clock for acknowledgment signal. In slave mode, the clock for acknowledgement signals is counted. In transmitter mode, the SBI releases the SDAx pin during clock cycle to receive acknowledgement signals from the receiver. In receiver mode, the SBI pulls the SDAx pin to the "Low" level during the clock cycle and generates acknowledgement signals. Also in slave mode, if a general-call address is received, the SBI pulls the SDAx pin to the "Low" level during the clock cycle and generates acknowledgement signals.

By setting <ACK> to "0", the non-acknowledgment mode is activated. When operating as a master, the SBI does not generate clock for acknowledgement signals. In slave mode, the clock for acknowledgement signals is counted.

### 14.5.3 Setting the Number of Bits per Transfer

SBIxCR1<BC[2:0]> specifies the number of bits of the next data to be transmitted or received.

Under the start condition, <BC[2:0]> is set to "000", causing a slave address and the direction bit to be transferred in a packet of eight bits. At other times, <BC[2:0]> keeps a previously programmed value.

### 14.5.4 Slave Addressing and Address Recognition Mode

Setting "0" to SBIxI2CAR<ALS> and a slave address in SBIxI2CAR<SA[6:0]> sets addressing format, and then the SBI recognizes a slave address transmitted by the master device and receives data in the addressing format.

If <ALS> is set to "1", the SBI does not recognize a slave address and receives data in the free data format. In the case of free data format, a slave address and a direction bit are not recognized; they are recognized as data immediately after generation of the start condition.

### 14.5.5 Operating mode

The setting of SBIxCR2<SBIM[1:0]> controls the operating mode. To operate in I2C mode, ensure that the serial bus interface pins are at "High" level before setting <SBIM[1:0]> to "10". Also, ensure that the bus is free before switching the operating mode to the port mode.

14.5.6 Configuring the SBI as a Transmitter or a Receiver

Setting SBIxCR2<TRX> to "1" configures the SBI as a transmitter. Setting <TRX> to "0" configures the SBI as a receiver.

At the slave mode:

- when data is transmitted in the addressing format.
- when the received slave address matches the value specified at SBIxI2CAR.
- when a general-call address is received; i.e., the eight bits following the start condition are all zeros.

If the value of the direction bit ( $R/\overline{W}$ ) is "1", <TRX> is set to "1" by the hardware. If the bit is "0", <TRX> is set to "0".

As a master device, the SBI receives acknowledgement from a slave device. If the direction bit of "1" is transmitted, <TRX> is set to "0" by the hardware. If the direction bit is "0", <TRX> changes to "1". If the SBI does not receive acknowledgement, <TRX> retains the previous value.

<TRX> is cleared to "0" by the hardware when it detects the stop condition on the bus or the arbitration lost.

If SBI is used in free data format, <TRX> is not changed by the hardware.

14.5.7 Configuring the SBI as a Master or a Slave

Setting SBIxCR2<MST> to "1" configures the SBI to operate as a master device.

Setting <MST> to "0" configures the SBI as a slave device. <MST> is cleared to "0" by the hardware when it detects the stop condition on the bus or the arbitration lost.

14.5.8 Generating Start and Stop Conditions

When SBIxSR<BB> is "0", writing "1" to SBIxCR2<MST, TRX, BB, PIN> causes the SBI to start a sequence for generating the start condition and to output the slave address and the direction bit prospectively written in the data buffer register. <ACK> must be set to "1" in advance.

Figure 14-5 Generating the Start Condition and a Slave Address

When <BB> is "1", writing "1" to <MST, TRX, PIN> and "0" to <BB> causes the SBI to start a sequence for generating the stop condition on the bus. The contents of <MST, TRX, BB, PIN> should not be altered until the stop condition appears on the bus.

If SCL bus line is pulled "Low" by other devices when the stop condition is generated, the stop condition is generated after the SCL line is released.

Figure 14-6 Generating the Stop Condition

SBIxSR<BB> can be read to check the bus state. <BB> is set to "1" when the start condition is detected on the bus (the bus is busy), and cleared to "0" when the stop condition is detected (the bus is free).

### 14.5.9 Interrupt Service Request and Release

In master mode, a serial bus interface request (INTSBIx) is generated when the transfer of the number of clock cycles set by <BC> and <ACK> is completed.

In slave mode, INTSBIx is generated under the following conditions.

- After output of the acknowledge signal which is generated when the received slave address matches the slave address set to SBIxI2CAR<SA[6:0]>.
- After the acknowledge signal is generated when a general-call address is received.
- When the slave address matches or a data transfer is completed after receiving a general-call address.

In the address recognition mode (<ALS> = "0"), INTSBIx is generated when the received slave address matches the values specified at SBIxI2CAR or when a general-call (eight bits data following the start condition is all "0") is received.

When an interrupt request (INTSBIx) is generated, SBIxCR2<PIN> is cleared to "0". While <PIN> is cleared to "0", the SBI pulls the SCL line to the "Low" level.

<PIN> is set to "1" when data is written to or read from SBIxDBR. It takes a period of  $t_{LOW}$  for the SCL line to be released after <PIN> is set to "1". When the program writes "1" to <PIN>, it is set to "1". However, writing "0" does not clear this bit to "0".

Note: When arbitration occurs while a slave address and direction bit are transferred in the master mode, <PIN> is cleared to "0" and INTSBIx occurs. This does not relate to whether a slave address matches <SA>.

### 14.5.10 Arbitration Lost Detection Monitor

The I2C bus has the multi-master capability (there are two or more masters on a bus), and requires the bus arbitration procedure to ensure correct data transfer.

A master that attempts to generate the start condition while the bus is busy loses bus arbitration, with no start condition occurring on the SDA and SCL lines. The I2C-bus arbitration takes place on the SDA line.

The arbitration procedure for two masters on a bus is shown below.

Up until the point a, Master A and Master B output the same data. At the point a, Master A outputs the "Low" level and Master B outputs the "High" level.

Then Master A pulls the SDA bus line to the "Low" level because the line has the wired-AND connection. When the SCL line goes high at the point b, the slave device reads the SDA line data, i.e., data transmitted by Master A. At this time, data transmitted by Master B becomes invalid.

This condition of Master B is called "Arbitration Lost". Master B releases its SDA pin, so that it does not affect the data transfer initiated by another master. If two or more masters have transmitted exactly the same first data word, the arbitration procedure continues with the second data word.

Figure 14-7 Lost Arbitration

A master compares the SDA bus line level and the internal SDA output level at the rising of the SCL line. If there is a difference between these two values, Arbitration Lost occurs and  $\text{SBIxSR} \langle \text{AL} \rangle$  is set to "1".

When an arbitration lost occurs,  $\text{SBIxSR} \langle \text{MST} \rangle$  and  $\langle \text{TRX} \rangle$  are cleared to "0", causing the SBI to operate as a slave receiver and it stops the clock output during data transfer after  $\langle \text{AL} \rangle$  is set to "1".

If the master device which sends a slave address and direction bit generates Arbitration lost, it receives a slave address and direction bit which are sent by other master devices as slave device.

Regardless of whether a received slave address matches  $\langle \text{SA} \rangle$ ,  $\langle \text{PIN} \rangle$  is cleared to "0" and  $\text{INTSBIx}$  occurs.

$\langle \text{AL} \rangle$  is cleared to "0" when data is written to or read from  $\text{SBIxDBR}$  or data is written to  $\text{SBIxCR2}$ .

Figure 14-8 Example of Master B Lost Arbitration (D7A = D7B, D6A = D6B)

#### 14.5.11 Slave Address Match Detection Monitor

When the SBI operates as a slave device in the address recognition mode (SBIXI2CAR<ALS>="0"), SBIXSR<AAS> is set to "1" on receiving the general-call address or the slave address that matches the value specified at SBIXI2CAR.

When <ALS> is "1", <AAS> is set to "1" when the first data word has been received. <AAS> is cleared to "0" when data is written to or read from SBIDBR.

#### 14.5.12 General-call Detection Monitor

When the SBI operates as a slave device, SBIXSR<ADO> is set to "1" when it receives the general-call address; i.e., the eight bits following the start condition are all zeros.

<ADO> is cleared to "0" when the start or stop condition is detected on the bus.

#### 14.5.13 Last Received Bit Monitor

SBIXSR<LRB> is set to the SDA line value that was read at the rising of the SCL line.

In the acknowledgment mode, reading SBIXSR<LRB> immediately after generation of the INTSBIX interrupt request causes ACK signal to be read.

#### 14.5.14 Data Buffer Register (SBIDBR)

Reading or writing SBIDBR initiates reading received data or writing transmitted data.

When the SBI is acting as a master, setting a slave address and a direction bit to this register generates the start condition.

### 14.5.15 Baud Rate Register (SBIXBR0)

The SBIXBR0<I2SBI> register determines if the SBI operates or not when it enters the IDLE mode.

This register must be programmed before executing an instruction to switch to the standby mode.

### 14.5.16 Software Reset

If the serial bus interface circuit locks up due to external noise, it can be initialized by using a software reset.

Writing "10" followed by "01" to SBIXCR2<SWRST[1:0]> generates a reset signal that initializes the serial bus interface circuit. When writing, set <SBIM[1:0]> to "10"; I2Cbus mode. After a reset, all control registers and status flags are initialized to their reset values. When the serial bus interface is initialized, <SWRST> is automatically cleared to "0".

Note: A software reset causes the SBI operating mode to switch from the I2C mode to the port mode.

## 14.6 Data Transfer Procedure in the I2C Bus Model2C

### 14.6.1 Device Initialization

Firstly, set SBIxCR1<ACK><SCK[2:0]>. Set "1" to <ACK> to specify the acknowledgement mode. Set "000" to SBIxCR1<BC[2:0]>.

Secondly, set <SA[6:0]>(a slave address) and <ALS> to SBIxI2CAR.(IN the addressing format mode, set <ALS>="0").

Finally to configure the Serial Bus Interface as a slave receiver, ensure that the serial bus interface pin is at "High" first. Then write "000" to SBIxCR2<MST><TRX><BB>, "1" to <PIN>, "10" to <SBIM[1:0]> and "00" to <SWRST[1:0]>.

Note: Initialization of the serial bus interface circuit must be completed within a period that any device does not generate start condition after all devices connected to the bus were initialized. If this rule is not followed, data may not be received correctly because other devices may start transfer before the initialization of the serial bus interface circuit is completed.

	7	6	5	4	3	2	1	0	
SBIxCR1	← 0	0	0	1	0	X	X	X	Specifies ACK and SCL clock.

SBIxCR2	← 0	0	0	1	1	0	0	0	Configures the SBI as a slave receiver.

Note: X; Don't care

### 14.6.2 Generating the Start Condition and a Slave Address

#### 14.6.2.1 Master mode

In the master mode, the following steps are required to generate the start condition and a slave address.

First, ensure that the bus is free (<BB> = "0"). Then, write "1" to SBIxCR1<ACK> to select the acknowledgment mode. Write to SBIxDBR a slave address and a direction bit to be transmitted.

When <BB> = "0", writing "1111" to SBIxCR2<MST, TRX, BB, PIN> generates the start condition on the bus. Following the start condition, the SBI generates nine clocks from the SCL pin. The SBI outputs the slave address and the direction bit specified at SBIxDBR with the first eight clocks, and releases the SDA line in the ninth clock to receive an acknowledgment signal from the slave device.

The INTSBIx interrupt request is generated on the falling of the ninth clock, and <PIN> is cleared to "0". In the master mode, the SBI holds the SCL line at the "Low" level while <PIN> is = "0". <TRX> changes its value according to the transmitted direction bit at generation of the INTSBIx interrupt request, provided that an acknowledgment signal has been returned from the slave device.

Note: To output slave address, check with software that the bus is free before writing to SBIxDBR. If this rule is not followed, data being output on the bus may get ruined.

Settings in main routine

76543210

Reg. ← SBIxSR

Reg. ← Reg. e 0x20

if Reg. ≠ 0x00

Then

SBIxCR1 ← X X X 1 0 X X X

SBIxDBR ← X X X X X X X X

SBIxCR2 ← 1 1 1 1 1 0 0 0

Ensures that the bus is free.

Selects the acknowledgement mode.

Specifies the desired slave address and direction.

Generates the start condition.

Example of INTSBI0 interrupt routine

Clears the interrupt request.

Processing

End of interrupt

14.6.2.2 Slave mode

In the slave mode, the SBI receives the start condition and a slave address.

After receiving the start condition from the master device, the SBI receives a slave address and a direction bit from the master device during the first eight clocks on the SCL line.

If the received address matches its slave address specified at SBIxI2CAR or is equal to the general-call address, the SBI pulls the SDA line to the "Low" level during the ninth clock and outputs an acknowledgement signal.

The INTSBIx interrupt request is generated on the falling of the ninth clock, and <PIN> is cleared to "0". In the slave mode, the SBI holds the SCL line at the "Low" level while <PIN> is "0".

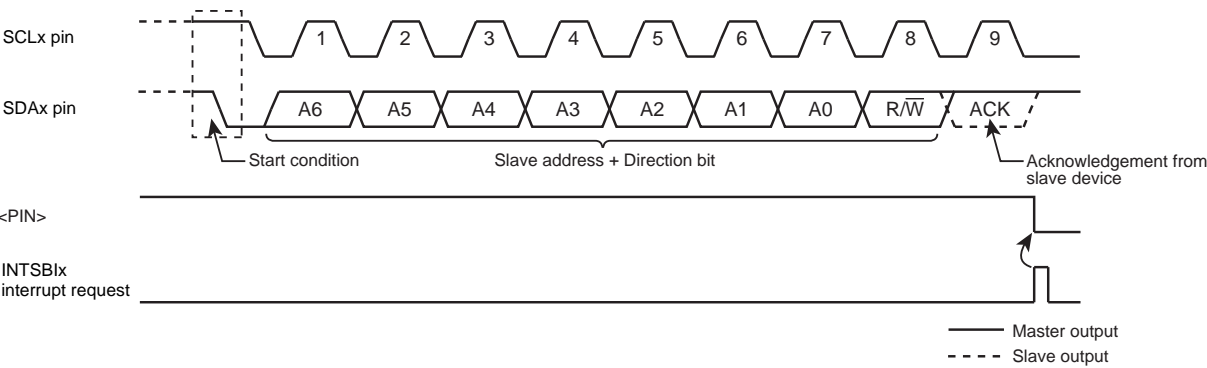

Figure 14-9 Generation of the Start Condition and a Slave Address

14.6.3 Transferring a Data Word

At the end of a data word transfer, the INTSBIx interrupt is generated to test <MST> to determine whether the SBI is in the master or slave mode.

14.6.3.1 Master mode (<MST> = "1")

Test <TRX> to determine whether the SBI is configured as a transmitter or a receiver.

(1) Transmitter mode (<TRX> = "1")

Test <LRB>. If <LRB> is "1", that means the receiver requires no further data.

The master then generates the stop condition as described later to stop transmission.

If <LRB> is "0", that means the receiver requires further data. If the next data to be transmitted has eight bits, the data is written into SBIxDBR. If the data has different length, <BC[2:0]> and <ACK> are programmed and the transmit data is written into SBIxDBR. Writing the data makes <PIN> to "1", causing the SCL pin to generate a serial clock for transferring a next data word, and the SDA pin to transfer the data word.

After the transfer is completed, the INTSBIx interrupt request is generated, <PIN> is cleared to "0", and the SCL pin is pulled to the "Low" level.

To transmit more data words, test <LRB> again and repeat the above procedure.

INTSBIx interrupt

```
if MST = 0
Then go to the slave-mode processing.
if TRX = 0
Then go to the receiver-mode processing.
if LRB = 0
Then go to processing for generating the stop condition.
SBIxCR1    ←  X  X  X  X  0  X  X  X    Specifies the number of bits to be transmitted and
                                         specify whether ACK is required.
SBIxDBR    ←  X  X  X  X  X  X  X  X    Writes the transmit data.
End of interrupt processing.
```

Note: X; Don't care

Figure 14-10 <BC[2:0]>= "000",<ACK>= "1" (Transmitter Mode)

(2) Receiver mode (<TRX> = "0")

If the next data to be transmitted has eight bits, the transmit data is written into SBIxDBR.

If the data has different length, <BC[2:0]> and <ACK> are programmed and the received data is read from SBIxDBR to release the SCL line. (The data read immediately after transmission of a slave address is undefined.)On reading the data, <PIN> is set to "1", and the serial clock is output to the SCL pin to transfer the next data word.In the last bit, when the acknowledgment signal becomes the "Low" level, "0" is output to the SDA pin.

After that, the INTSBIx interrupt request is generated, and <PIN> is cleared to "0", pulling the SCL pin to the "Low" level.Each time the received data is read from SBIxDBR, one-word transfer clock and an acknowledgement signal are output.

Figure 14-11 <BC[2:0]>= "000",<ACK>= "1" (Receiver Mode)

To terminate the data transmission from the transmitter, <ACK> must be cleared to "0" immediately before reading the data word second to last.

This disables generation of an acknowledgment clock for the last data word.

When the transfer is completed, an interrupt request is generated. After the interrupt processing, <BC[2:0]> must be set to "001" and the data must be read so that a clock is generated for 1-bit transfer.

At this time, the master receiver holds the SDA bus line at the "High" level, which signals the end of transfer to the transmitter as an acknowledgment signal.

In the interrupt processing for terminating the reception of 1-bit data, the stop condition is generated to terminate the data transfer.

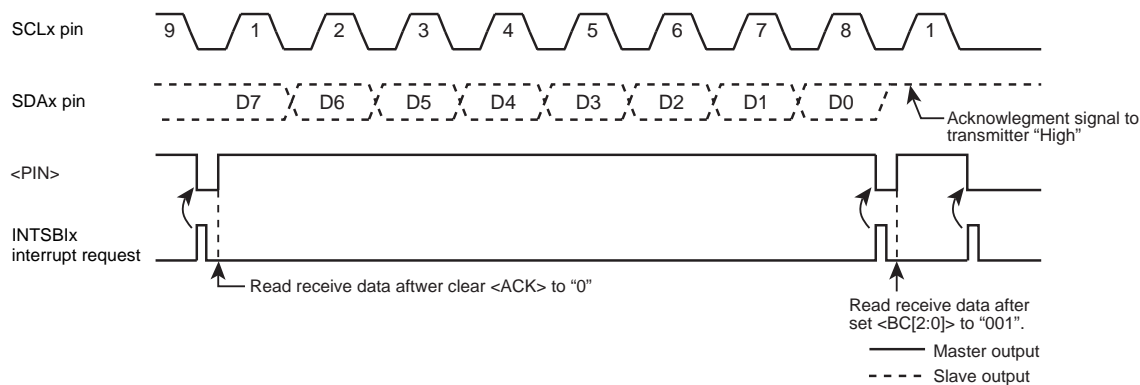

Figure 14-12 Terminating Data Transmission in the Master Receiver Mode

Example: When receiving N data word

INTSBlx interrupt (after data transmission)

		7	6	5	4	3	2	1	0

End of interrupt										

INTSBlx interrupt (Nth data reception)

		7	6	5	4	3	2	1	0	
SBIxCR1	←	0	0	1	0	0	X	X	X	Disables generation of acknowledgement clock.
Reg.	←	SBIxDBR								Reads the Nth data word.
End of interrupt										

INTSBlx interrupt (after completing data reception)

Processing to generate the stop condition.	Terminates the data transmission.
End of interrupt	

Note: X; Don't care

14.6.3.2 Slave mode (<MST> = "0")

In the slave mode, the SBI generates the INTSBIx interrupt request on four occasions:

- 1) when the SBI has received any slave address from the master.
- 2) when the SBI has received a general-call address.
- 3) when the received slave address matches its address.
- 4) when a data transfer has been completed in response to a general-call.

Also, if the SBI detects Arbitration Lost in the master mode, it switches to the slave mode.

Upon the completion of data word transfer in which Arbitration Lost is detected, the INTSBIx interrupt request is generated, <PIN> is cleared to "0", and the SCL pin is pulled to the "Low" level.

When data is written to or read from SBIXDBR or when <PIN> is set to "1", the SCLx pin is released after a period of tLOW.

In the slave mode, the normal slave mode processing or the processing as a result of Arbitration Lost is carried out.

SBIXSR<AL>, <TRX>, <AAS> and <ADO> are tested to determine the processing required.

"Table 14-2 Processing in Slave Mode" shows the slave mode states and required processing.

Example: When the received slave address matches the SBI's own address and the direction bit is "1" in the slave receiver mode.

INTSBIx interrupt

```
if TRX = 0
Then go to other processing.
if AL = 0
Then go to other processing.
if AAS = 0
Then go to other processing.
SBIXCR1    ←  X  X  X  1  0  X  X  X      Sets the number of bits to be transmitted.
SBIXDBR    ←  X  X  X  X  X  X  X  X      Sets the transmit data.
```

Note: X; Don't care

Table 14-2 Processing in Slave Mode

<TRX>	<AL>	<AAS>	<ADO>	State	Processing
1	1	1	0	Arbitration Lost is detected while the slave address was being transmitted and the SBI received a slave address with the direction bit "1" transmitted by another master.	Set the number of bits in a data word to <BC[2:0]> and write the transmit data into SBIxDBR.
	0	1	0	In the slave receiver mode, the SBI received a slave address with the direction bit "1" transmitted by the master.	
		0	0	In the slave transmitter mode, the SBI has completed a transmission of one data word.	Test LRB. If it has been set to "1", that means the receiver does not require further data. Set <PIN> to 1 and reset <TRX> to 0 to release the bus. If <LRB> has been reset to "0", that means the receiver requires further data. Set the number of bits in the data word to <BC[2:0]> and write the transmit data to the SBIxDBR.
0	1	1	1/0	Arbitration Lost is detected while a slave address is being transmitted, and the SBI receives either a slave address with the direction bit "0" or a general-call address transmitted by another master.	Read the SBIxDBR (a dummy read) to set <PIN> to 1, or write "1" to <PIN>.
		0	0	Arbitration Lost is detected while a slave address or a data word is being transmitted, and the transfer is terminated.	
	0	1	1/0	In the slave receiver mode, the SBI received either a slave address with the direction bit "0" or a general-call address transmitted by the master.	
		0	1/0	In the slave receiver mode, the SBI has completed a reception of a data word.	Set the number of bits in the data word to <BC[2:0]> and read the received data from SBIxDBR.

14.6.4 Generating the Stop Condition

When SBIxSR<BB> is "1", writing "1" to SBIxCR2<MST, TRX, PIN> and "0" to <BB> causes the SBI to start a sequence for generating the stop condition on the bus.

Do not alter the contents of <MST, TRX, BB, PIN> until the stop condition appears on the bus.

If another device is holding down the SCL bus line, the SBI waits until the SCL line is released.

After that, the SDA pin goes "High", causing the stop condition to be generated.

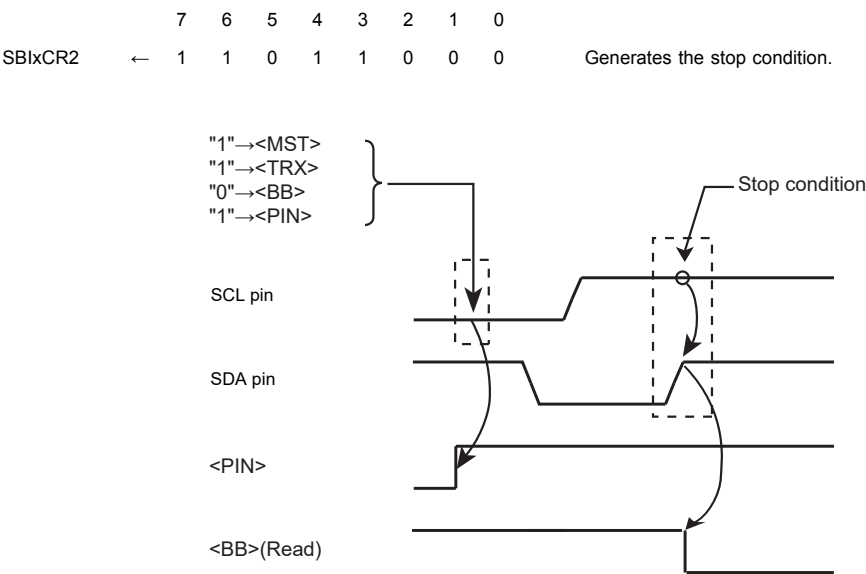

Figure 14-13 Generating the Stop Condition

14.6.5 Restart Procedure

Restart is used when a master device changes the data transfer direction without terminating the transfer to a slave device. The procedure of generating a restart in the master mode is described below.

First, write SBIxCR2<MST, TRX, BB> to "0" and write "1" to <PIN> to release the bus. At this time, the SDAx pin is held at the "High" level and the SCLx pin is released. Because no stop condition is generated on the bus, other devices recognize that the bus is busy.

Then, test SBIxSR<BB> and wait until it becomes "0" to ensure that the SCLx pin is released.

Next, test <LRB> and wait until it becomes "1" to ensure that no other device is pulling the SCLx bus line to the "Low" level.

Once the bus is determined to be free by following the above procedures, follow the procedures described in "14.6.2 Generating the Start Condition and a Slave Address" to generate the start condition.

To satisfy the setup time of restart, at least 4.7μs wait period (in the standard mode) must be created by the software after the bus is determined to be free.

Note 1: Do not write <MST> to "0" when it is "0". (Restart cannot be initiated.)

Note 2: When the master device is acting as a receiver, data transmission from the slave device which serves as a transmitter must be completed before generating a restart. To complete data transfer, slave device must receive a "High" level acknowledge signal. For this reason, <LBR> before generating a restart becomes "1", the rising edge of the SCL line is not detected even <LBR>=

"1" is confirmed by following the restart procedure. To check the status of the SCL line, read the port.

0	-	R/W	Make sure to write "0".

14.8 Control in SIO mode

14.8.1 Serial Clock

14.8.1.1 Clock source

Internal or external clocks can be selected by programming SBIxCR1<SCK[2:0]>.

(1) Internal clocks

In the internal clock mode, one of the seven frequencies can be selected as a serial clock, which is output to the outside through the SCKx pin.

At the beginning of a transfer, the SCKx pin output becomes the "High" level.

If the program cannot keep up with this serial clock rate in writing the transmit data or reading the received data, the SBI automatically enters a wait period. During this period, the serial clock is stopped automatically and the next shift operation is suspended until the processing is completed.

Figure 14-15 Automatic Wait

(2) External clock (<SCK[2:0]> = "111")

The SBI uses an external clock supplied from the outside to the SCKx pin as a serial clock.

For proper shift operations, the serial clock at the "High" and "Low" levels must have the pulse widths as shown below.

Figure 14-16 Maximum Transfer Frequency of External Clock Input

## 14.8.1.2 Shift Edge

Leading-edge shift is used in transmission. Trailing-edge shift is used in reception.

- Leading-edge shift

Data is shifted at the leading edge of the serial clock (or the falling edge of the SCKx pin input/output).

- Trailing-edge shift

Data is shifted at the trailing edge of the serial clock (or the rising edge of the SCKx pin input/output).

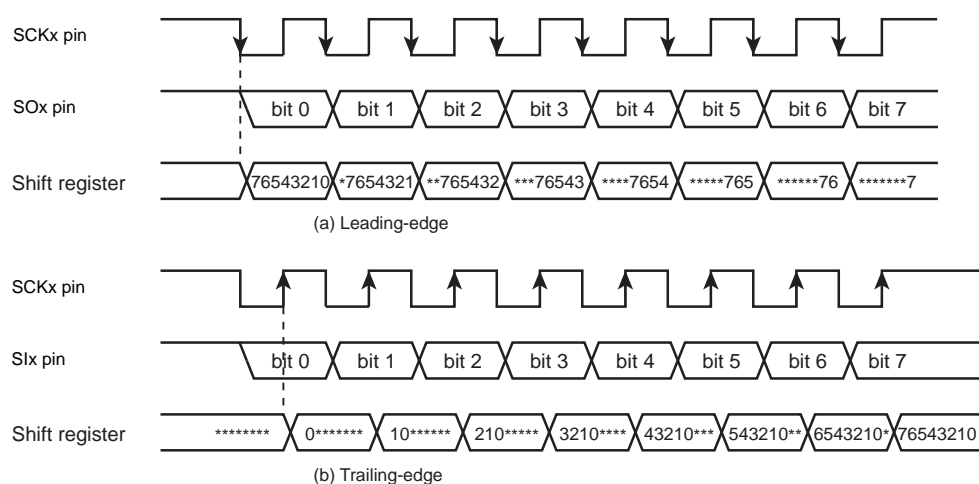

Figure 14-17 Shift Edge

14.8.2 Transfer Modes

The transmit mode, the receive mode or the transmit/receive mode can be selected by programming SBIxCR1<SIOM[1:0]>.

14.8.2.1 8-bit transmit mode

Set the control register to the transmit mode and write the transmit data to SBIxDBR.

After writing the transmit data, writing "1" to SBIxCR1<SIOS> starts the transmission. The transmit data is moved from SBIxDBR to a shift register and output to the SO pin, with the least-significant bit (LSB) first, in synchronization with the serial clock. Once the transmit data is transferred to the shift register, SBIxDBR becomes empty, and the INTSBIx (buffer-empty) interrupt is generated, requesting the next transmit data.

In the internal clock mode, the serial clock will be stopped and automatically enter the wait state, if next data is not loaded after the 8-bit data has been fully transmitted. The wait state will be cleared when SBIxDBR is loaded with the next transmit data.

In the external clock mode, SBIxDBR must be loaded with data before the next data shift operation is started. Therefore, the data transfer rate varies depending on the maximum latency between when the interrupt request is generated and when SBIxDBR is loaded with data in the interrupt service program.

At the beginning of transmission, the same value as in the last bit of the previously transmitted data is output in a period from setting SBIxSR<SIOF> to "1" to the falling edge of SCK.

Transmission can be terminated by clearing <SIOS> to "0" or setting <SIOINH> to "1" in the INTSBIx interrupt service program. If <SIOS> is cleared, remaining data is output before transmission ends. The program checks SBIxSR<SIOF> to determine whether transmission has come to an end. <SIOF> is cleared to "0" at the end of transmission. If <SIOINH> is set to "1", the transmission is aborted immediately and <SIOF> is cleared to "0".

When in the external clock mode, <SIOS> must be cleared to "0" before next data shifting. If <SIOS> does not be cleared to "0" before next data shifting, SBI output dummy data and stopped.

		7	6	5	4	3	2	1	0	
SBIxCR1	←	0	1	0	0	0	X	X	X	Selects the transmit mode.
SBIxDBR	←	X	X	X	X	X	X	X	X	Writes the transmit data.
SBIxCR1	←	1	0	0	0	0	X	X	X	Starts transmission.

---------	---	---	---	---	---	---	---	---	---	---------------------------

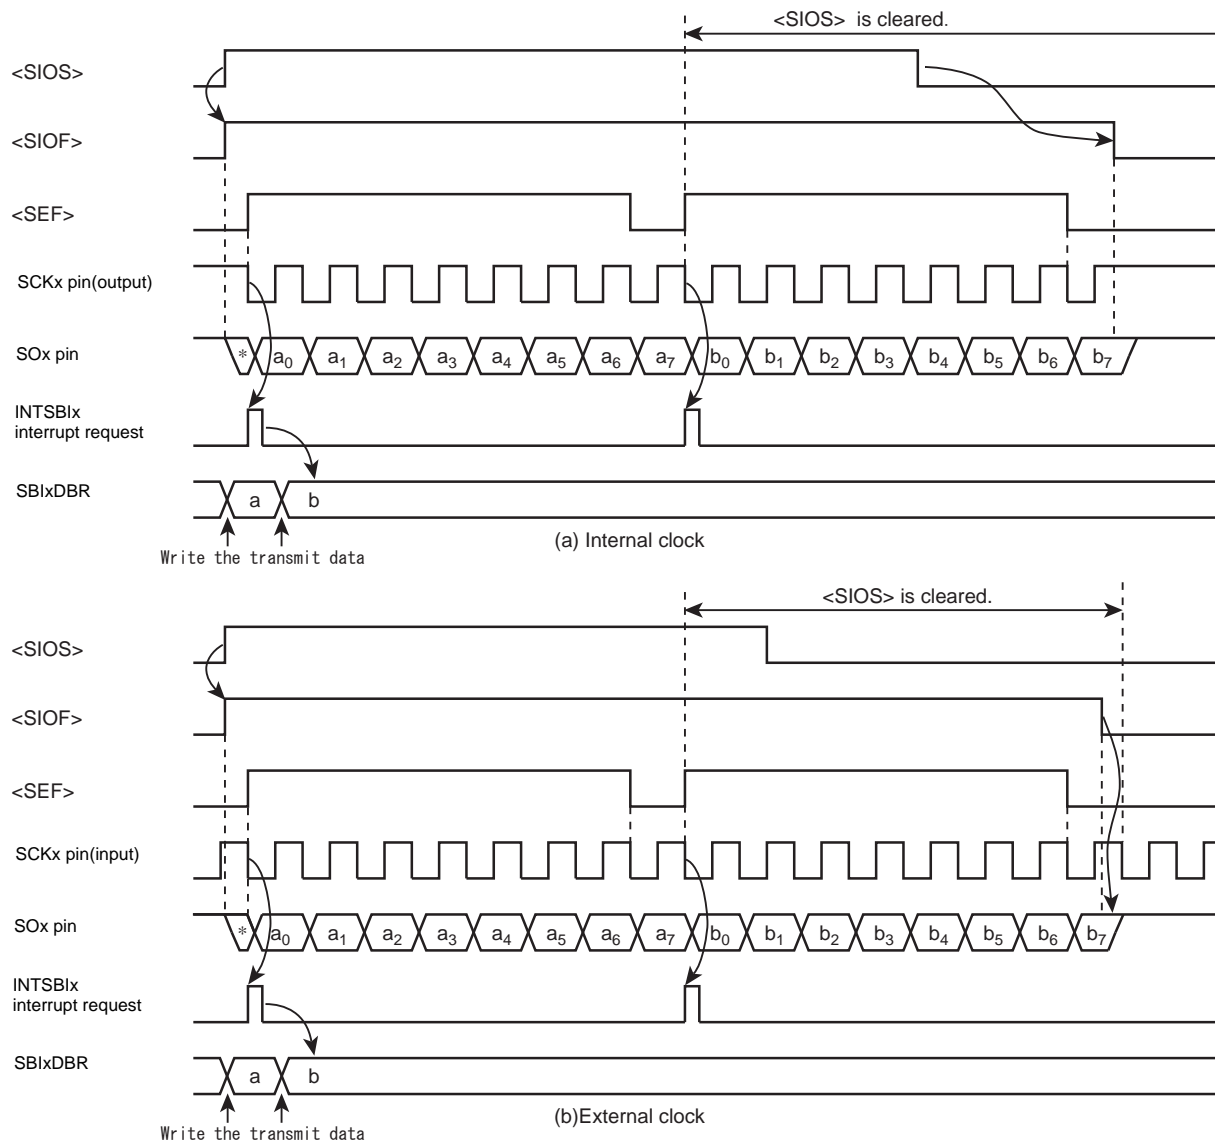

Figure 14-18 Transmit Mode

Example: Example of programming (external clock) to terminate transmission by <SIO>

14.8.2.2 8-bit receive mode

Set the control register to the receive mode. Then writing "1" to SBIxCR1<SIOS> enables reception. Data is taken into the shift register from the SI pin, with the least-significant bit (LSB) first, in synchronization with the serial clock. Once the shift register is loaded with the 8-bit data, it transfers the received data to SBIxDBR and the INTSBIx (buffer-full) interrupt request is generated to request reading the received data. The interrupt service program then reads the received data from SBIxDBR.

In the internal clock mode, the serial clock will be stopped and automatically be in the wait state until the received data is read from SBIxDBR.

In the external clock mode, shift operations are executed in synchronization with the external clock. The maximum data transfer rate varies, depending on the maximum latency between generating the interrupt request and reading the received data

Reception can be terminated by clearing <SIOS> to "0" or setting <SIOINH> to "1" in the INTSBIx interrupt service program. If <SIOS> is cleared, reception continues until all the bits of received data are written to SBIxDBR. The program checks SBIxSR<SIOF> to determine whether reception has come to an end.<SIOF> is cleared to "0" at the end of reception. After confirming the completion of the reception, last received data is read. If <SIOINH> is set to "1", the reception is aborted immediately and <SIOF> is cleared to "0". (The received data becomes invalid, and there is no need to read it out.)

**Note:**The contents of SBIxDBR will not be retained after the transfer mode is changed. The ongoing reception must be completed by clearing <SIOS> to "0" and the last received data must be read before the transfer mode is changed.

		7	6	5	4	3	2	1	0	
SBIxCR1	←	0	1	1	1	0	X	X	X	Selects the receive mode.
SBIxCR1	←	1	0	1	1	0	X	X	X	Starts reception.

INTSBIx interrupt

Reg.	←	SBIxDBR	Reads the received data.
------	---	---------	--------------------------

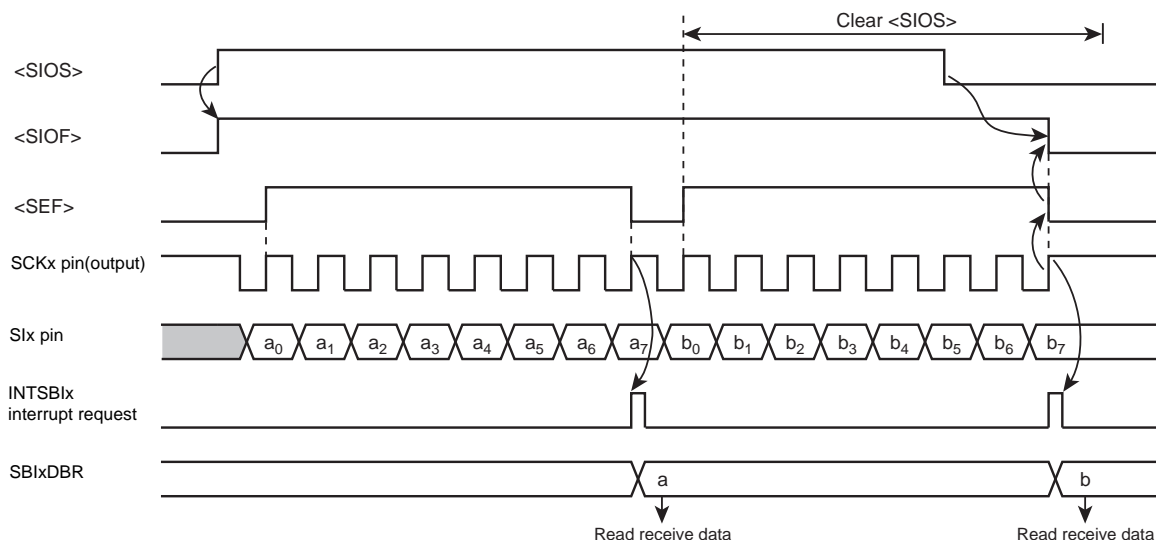

Figure 14-19 Receive Mode (Example: Internal Clock)

#### 14.8.2.3 8-bit transmit/receive mode

Set the control register to the transfer/receive mode. Then writing the transmit data to SBIxDBR and setting SBIxCR1<SIOF> to "1" enables transmission and reception. The transmit data is output through the SOx pin at the falling of the serial clock, and the received data is taken in through the SI pin at the rising of the serial clock, with the least-significant bit (LSB) first. Once the shift register is loaded with the 8-bit data, it transfers the received data to SBIxDBR and the INTSBIx interrupt request is generated. The interrupt service program reads the received data from the data buffer register and writes the next transmit data. Because SBIxDBR is shared between transmit and receive operations, the received data must be read before the next transmit data is written.

In the internal clock operation, the serial clock will be automatically in the wait state until the received data is read and the next transmit data is written.

In the external clock mode, shift operations are executed in synchronization with the external serial clock. Therefore, the received data must be read and the next transmit data must be written before the next shift operation is started. The maximum data transfer rate for the external clock operation varies depending on the maximum latency between when the interrupt request is generated and when the transmit data is written.

At the beginning of transmission, the same value as in the last bit of the previously transmitted data is output in a period from setting <SIOF> to "1" to the falling edge of SCK.

Transmission and reception can be terminated by clearing <SIOF> to "0" or setting SBIxCR1<SIOINH> to "1" in the INTSBIx interrupt service program. If <SIOF> is cleared, transmission and reception continue until the received data is fully transferred to SBIxDBR. The program checks SBIxSR<SIOF> to determine whether transmission and reception have come to an end. <SIOF> is cleared to "0" at the end of transmission and reception. If <SIOINH> is set to "1", the transmission and reception is aborted immediately and <SIOF> is cleared to "0".

**Note:** The contents of SBIxDBR will not be retained after the transfer mode is changed. The ongoing transmission and reception must be completed by clearing <SIOF> to "0" and the last received data must be read before the transfer mode is changed.

INTSBIx interrupt

Reg.	←	SBIxDBR	Reads the received data.
SBIxDBR	←	X X X X X X X X	Writes the transmit data.

14.8.2.4 Data retention time of the last bit at the end of transmission

Under the condition SBIxCR1<SIOF>= "0", the last bit of the transmitted data retains the data of SCK rising edge as shown below. Transmit mode and transmit/receive mode are the same.

Figure 14-21 Data retention time of the last bit at the end of transmission

## 15. Synchronous Serial Port (SSP)

### 15.1 Overview

This LSI contains the SSP (Synchronous Serial Port) with 3 channels. These channels have the following features.

Communication protocol		Three types of synchronous serial ports including the SPI <ul style="list-style-type: none"> <li>• Motorola SPI (SPI) frame format</li> <li>• TI synchronous (SSI) frame format</li> <li>• National Microwire (Microwire) frame format</li> </ul>
Operation mode		Master/slave mode
Transmit FIFO		16bits wide / 8 tiers deep
Receive FIFO		16bits wide / 8 tiers deep
Transmitted/received data size		4 to 16 bits
Interrupt type		Transmit interrupt Receive interrupt Receive overrun interrupt Time-out interrupt
Communication speed	In master mode	$f_{sys}/2$ to $f_{sys}/65024$
	In slave mode	$f_{sys}/12$ to $f_{sys}/65024$
DMA		Supported
Internal test function		The internal loopback test mode is available.
Control pin (x = 0 to 2)		SPxCLK, SPxFSS, SPxDO, SPxDI

## 15.3 Register

### 15.3.1 Register List

Channel x	Base Address
Channel0	0x4004_0000
Channel1	0x4004_1000
Channel2	0x4004_2000

Register Name(x=0~2)		Address (Base+)
Control register 0	SSPxCR0	0x0000
Control register 1	SSPxCR1	0x0004
Receive FIFO (read) and transmit FIFO (write) data register	SSPxDR	0x0008
Status register	SSPxSR	0x000C
Clock prescale register	SSPxCPSR	0x0010
Interrupt enable/disable register	SSPxIMSC	0x0014
Pre-enable interrupt status register	SSPxRIS	0x0018
Post-enable interrupt status register	SSPxMIS	0x001C
Interrupt clear register	SSPxICR	0x0020
DMA control register	SSPxDMACR	0x0024
Reserved	-	0x0028 to 0x0FFC

Note 1: These registers in the above table allows to access only word (32 bits) basis.

Note 2: Access to the "Reserved" area is prohibited.

15.3.2 SSPxCR0(Control register 0)

## 15.4 Overview of SSP

This LSI contains the SSP with 3channels.

The SSP is an interface that enables serial communications with the peripheral devices with three types of synchronous serial interface functions.

The SSP performs serial-parallel conversion of the data received from a peripheral device.

The transmit buffers data in the independent 16-bit wide and 8-layered transmit FIFO in the transmit mode, and the receive buffers data in the 16-bit wide and 8-layered receive FIFO in receive mode. Serial data is transmitted via SPxDO and received via SPxDI.

The SSP contains a programmable prescaler to generate the serial output clock SPxCLK from the input clock fsys. The operation mode, frame format, and data size of the SSP are programmed in the control registers SSPxCR0 and SSPxCR1.

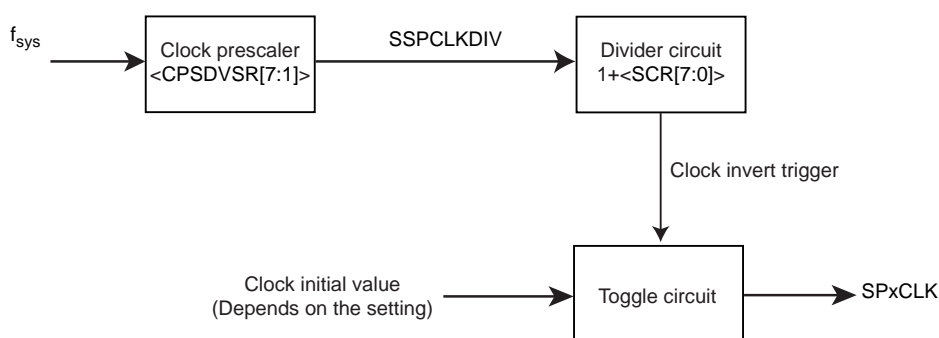

### 15.4.1 Clock prescaler

When configured as a master, a clock prescaler comprising two free-running serially linked counters is used to provide the serial output clock SPxCLK.

You can program the clock prescaler through the SSPxCPSR register, to divide fsys by a factor of 2 to 254 in steps of two. Because the least significant bit of the SSPxCPSR register is not used, division by an odd number is not possible.

The output of the prescaler is further divided by a factor of 1 to 256, which is obtained by adding 1 to the value programmed in the SSPxCR0 register, to give the master output clock SPxCLK.

$$\text{Bitrate} = f_{\text{sys}} / (<\text{CPSDVSR}> \times (1 + <\text{SCR}>))$$

### 15.4.2 Transmit FIFO

This is a 16-bit wide, 8-layered transmit FIFO buffer, which is shared in master and slave modes.

### 15.4.3 Receive FIFO

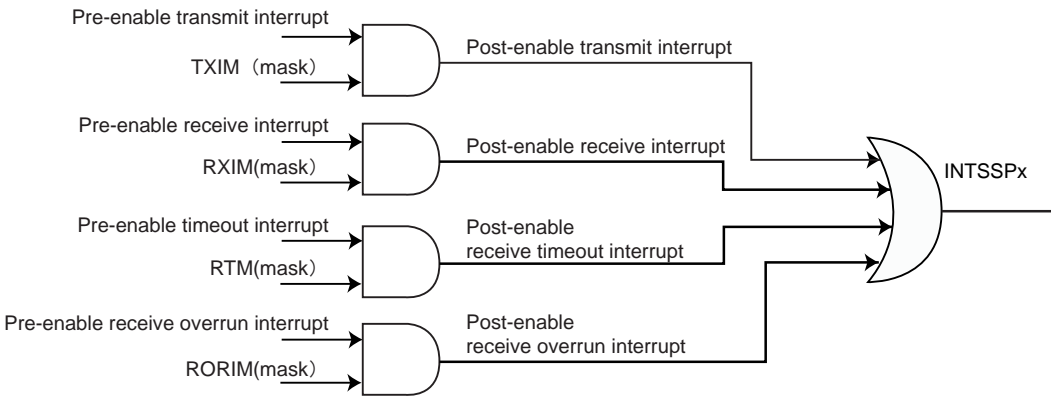

This is a 16-bit wide 8-layered receive FIFO buffer, which is shared in master and slave modes.

15.4.4 Interrupt generation logic

The interrupts, each of which can be masked separately, are generated.

Transmit interrupt	A conditional interrupt to occur when the transmit FIFO has free space more than (including half) of the entire capacity. (Number of valid data items in the transmit FIFO $\leq 4$ )
Receive interrupt	A conditional interrupt to occur when the receive FIFO has valid data more than half (including half) the entire capacity. (Number of valid data items in the receive FIFO $\geq 4$ )
Time-out interrupt	A conditional interrupt to indicate that the data exists in the receive FIFO to the time-out period.
Overrun interrupt	Conditional interrupts indicating that data is written to receive FIFO when it is full.

Also, The individual masked sources are combined into a single interrupt. When any of the above interrupts is asserted, the combined interrupt INTSSPx is asserted.

a. Transmit interrupt

The transmit interrupt is asserted when there are four or fewer valid entries in the transmit FIFO. The transmit interrupt is also generated when the SSP operation is disabled (SSPxCR1 <SSE> = "0").

The first transmitted data can be written in the FIFO by using this interrupt.

b. Receive interrupt

The receive interrupt is asserted when there are four or more valid entries in the receive FIFO.

c. Time-out interrupt

The time-out interrupt is asserted when the receive FIFO is not empty and the SSP has remained idle for a fixed 32-bit period (bit rate). This mechanism ensures that the user is aware that data is still present in the receive FIFO and requires servicing. This operation occurs in both master and slave modes. When the time-out interrupt is generated, read all data from the receive FIFO. Even if all the data is not read, data can be transmitted / received if the receive FIFO has a free space and the number of data to be transmitted does not exceed the free space of the receive FIFO. When transfer starts, the timeout interrupt will be cleared. If data is transmitted / received when the receive FIFO has no free space, the time-out interrupt will not be cleared and an overrun interrupt will be generated.

d.   Overrun interrupt

When the next data (9th data item) is received when the receive FIFO is already full, an overrun interrupt is generated immediately after transfer. The data received after the overrun interrupt is generated (including the 9th data item) will become invalid and be discarded. However, if data is read from the receive FIFO while the 9th data item is being received (before the interrupt is generated), the 9th received data will be written in the receive FIFO as valid data. To perform transfer properly when the overrun interrupt has been generated, write "1" to SSPxICR<RORIC> register, and then read all data from the receive FIFO. Even if all the data is not read, data can be transmitted / received if the receive FIFO has free space and the number of data to be transmitted does not exceed the free space of the receive FIFO. Note that if the receive FIFO is not read (provided that the receive FIFO is not empty) within a certain 32-bit period (bit rate) after the overrun interrupt is cleared, a time-out interrupt will be generated.

15.4.5   DMA interface

The DMA operation of the SSP is controlled through SSPxDMACR register.

When there are more data than the watermark level (half of the FIFO) in the receive FIFO, the receive DMA request is asserted.

When the amount of data left in the transmit FIFO is less than the watermark level (half of the FIFO), the transmit DMA request is asserted.

To clear the transmit/receive DMA request, an input pin for the transmit/receive DMA request clear signals, which are asserted by the DMA controller, is provided.

Set the DMA burst length to four words.

Note:For the remaining three words, the SSP does not assert the burst request.

Each request signal remains asserted until the relevant DMA clear signal is asserted. After the request clear signal is deasserted, a request signal can become active again, depending on the conditions described above. All request signals are deasserted if the SSP is disabled or the DMA enable signal is cleared.

The following table shows the trigger points for DMABREQ, for both the transmit and receive FIFOs.

Watermark level	Burst length	
	Transmit (number of empty locations)	Receive (number of filled locations)
1/2	4	4

## 15.5 SSP operation

### 15.5.1 Initial setting for SSP

Settings for the SSP communication protocol must be made with the SSP disabled.

Control registers SSPxCR0 and SSPxCR1 need to configure this SSP as a master or slave operating under one of the following protocols. In addition, make the settings related to the communication speed in the clock prescale registers SSPxCPSR and SSPxCR0 <SCR>.

This SSP supports the following protocols:

- SPI
- SSI
- Microwire

### 15.5.2 Enabling SSP

The transfer operation starts when the operation is enabled with the transmitted data written in the transmit FIFO, or when transmitted data is written in the transmit FIFO with the operation enabled.

However, if the transmit FIFO contains only four or fewer entries when the operation is enabled, a transmit interrupt will be generated. This interrupt can be used to write the initial data.

Note: When the SSP is in the SPI slave mode and the SPxFSS pin is not used, be sure to transmit data of one byte or more in the FIFO before enabling the operation. If the operation is enabled with the transmit FIFO empty, the transfer data will not be output correctly.

### 15.5.3 Clock ratios

When setting a frequency for  $f_{sys}$ , the following conditions must be met.

- In master mode
$$f_{SPxCLK} \text{ (maximum)} \rightarrow f_{sys} / 2$$
$$f_{SPxCLK} \text{ (minimum)} \rightarrow f_{sys} / (254 \times 256)$$
- In slave mode
$$f_{SPxCLK} \text{ (maximum)} \rightarrow f_{sys} / 12$$
$$f_{SPxCLK} \text{ (minimum)} \rightarrow f_{sys} / (254 \times 256)$$

## 15.6 Frame Format

Each frame format is between 4 and 16 bits wide depending on the size of data programmed, and is transmitted starting from the MSB.

- Serial clock (SPxCLK)

Signals remain "Low" in the SSI and Microwire formats and as inactive in the SPI format while the SSP is in the idle state. In addition, data is output at the set bit rate only during data transmission.

- Serial frame (SPxFSS)

In the SPI and Microwire frame formats, signals are set to "Low" active and always asserted to "Low" during frame transmission.

In the SSI frame format, signals are asserted only during 1 bit rate before each frame transmission. In this frame format, output data is transmitted at the rising edge of SPxCLK and the input data is received at its falling edge.

Refer to Section "15.6.1" to "15.6.3" for details of each frame format.

### 15.6.1 SSI frame format

In this mode, the SSP is in idle state, SPxCLK and SPxFSS are forcedly set to "Low", and the transmit data line SPxDO becomes Hi-Z. When data is written in the transmit FIFO, the master outputs "High" pulses of 1 SPxCLK to the SPxFSS line. The transmitted data will be transferred from the transmit FIFO to the transmit serial shift register. Data of 4 to 16 bits will be output from the SPxDO pin at the next rising edge of SPxCLK.

Likewise, the received data will be input starting from the MSB to the SPxDI pin at the falling edge of SPxCLK. The received data will be transferred from the serial shift register into the receive FIFO at the rising edge of SPxCLK after its LSB data is latched.

Figure 15-2 SSI frame format (transmission/reception during single transfer)

Figure 15-3 SSI frame format (transmission/reception during continuous transfer)

Note 1: When transmission is disable, SPxDO terminal doesn't output and is high impedance status. This terminal needs to add suitable pull-up/down resistance to valid the voltage level.

Note 2: SPxDI terminal is always input and internal gate is open. In case of transmission signal will be high impedance status, this terminal needs to add suitable pull-up/down resistance to valid the voltage level.

15.6.2 SPI frame format

The SPI interface has 4 lines. SPx~~F~~SS is used for slave selection. One of the main features of the SPI format is that the <SPO> and <SPH> bits in the SSPxCR0 register can be used to set the SPxCLK operation timing.

SSPxCR0 <SPO> is used to set the level at which SPxCLK in idle state is held.

SSPxCR0 <SPH> is used to select the clock edge at which data is latched.

	SSPxCR0<SPO>	SSPxCR0<SPH>
0	"Low" state	Capture data at the 1st clock edge.
1	"High" state	Capture data at the 2nd clock edge.

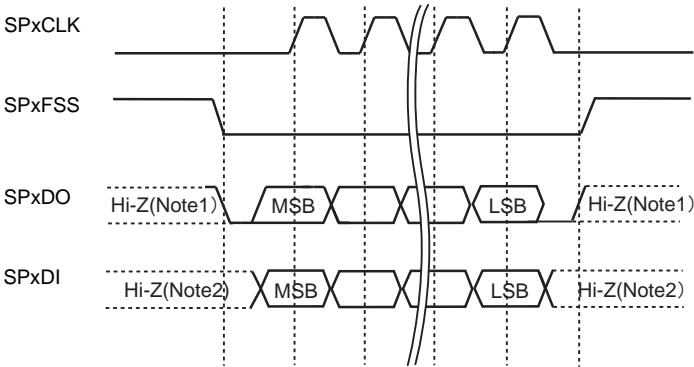

Figure 15-4 SPI frame format (single transfer, <SPO>="0" & <SPH>="0")

Figure 15-5 SPI frame format (continuous transfer, <SPO>="0" & <SPH>="0")

Note 1: When transmission is disable, SPxDO terminal doesn't output and is high impedance status. This terminal needs to add suitable pull-up/down resistance to valid the voltage level.

Note 2: SPxDI terminal is always input and internal gate is open. In case of transmission signal will be high impedance status, this terminal needs to add suitable pull-up/down resistance to valid the voltage level.

With this setting  $\langle SPO \rangle = "0"$ , during the idle period:

- The SPxCLK signal is set to "Low".
- SPxFSS is set to "High".
- The transmit data line SPxDO is set to "Low".

If the SSP is enabled and valid data exists in the transmit FIFO, the SPxFSS master signal driven by "Low" notifies of the start of transmission. This enables the slave data in the SPxDI input line of the master.

When a half of the SPxCLK period has passed, valid master data is transferred to the SPxDO pin. Both the master data and slave data are now set. When another half of SPxCLK has passed, the SPxCLK master clock pin becomes "High". After that, the data is captured at the rising edge of the SPxCLK signal and transmitted at its falling edge.

In the single transfer, the SPxFSS line will return to the idle "High" state when all the bits of that data word have been transferred, and then one cycle of SPxCLK has passed after the last bit was captured.

However, for continuous transfer, the SPxFSS signal must be pulsed at HIGH between individual data word transfers. This is because change is not enabled when the slave selection pin freezes data in its peripheral register and the  $\langle SPH \rangle$  bit is logical 0.

Therefore, to enable writing of serial peripheral data, the master device must drive the SPxFSS pin of the slave device between individual data transfers. When the continuous transfer is completed, the SPxFSS pin will return to the idle state when one cycle of SPxCLK has passed after the last bit is captured.

Figure 15-6 SPI frame format (Single & continuous transfer,  $\langle SPO \rangle = "0"$  &  $\langle SPH \rangle = "1"$ )

Figure 15-6 show the SPI frame format with  $\langle SPO \rangle = 0$  &  $\langle SPH \rangle = 1$ , which is covers both single and continuous transfer.

Note 1: When transmission is disable, SPxDO terminal doesn't output and is high impedance status. This terminal needs to add suitable pull-up/down resistance to valid the voltage level.

Note 2: SPxDI terminal is always input and internal gate is open. In case of transmission signal will be high impedance status, this terminal needs to add suitable pull-up/down resistance to valid the voltage level.

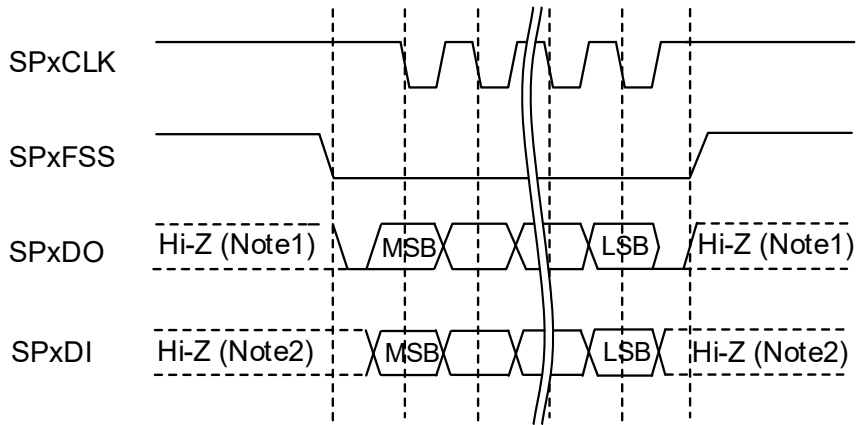

Figure 15-7 SPI frame format (single transfer, <SPO>="1" & <SPH>="0")

Figure 15-7 shows the SPI frame format with <SPO>=1 & <SPH>=0, which is for single transmission signal sequence.

Figure 15-8 SPI frame format (continuous transfer, <SPO>="1" & <SPH>="0")

Figure 15-8 shows the SPI frame format with <SPO>=1 & <SPH>=0, which is for continuous transmission signal sequence.

- Note 1: When transmission is disable, SPxDO terminal doesn't output and is high impedance status. This terminal needs to add suitable pull-up/down resistance to valid the voltage level.
- Note 2: SPxDI terminal is always input and internal gate is open. In case of transmission signal will be high impedance status, this terminal needs to add suitable pull-up/down resistance to valid the voltage level.

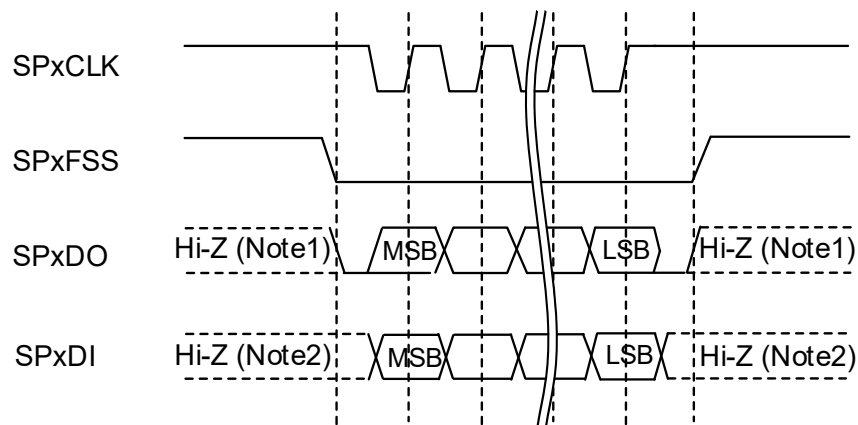

Figure 15-9 SPI frame format (Single & continuous transfer, <SPO>="1" & <SPH>="1")

Figure 15-9 show the SPI frame format with <SPO>=1 & <SPH>=1, which covers both single and continuous transfer.

Note 1: When transmission is disable, SPxDO terminal doesn't output and is high impedance status. This terminal needs to add suitable pull-up/down resistance to valid the voltage level.

Note 2: SPxDI terminal is always input and internal gate is open. In case of transmission signal will be high impedance status, this terminal needs to add suitable pull-up/down resistance to valid the voltage level.

### 15.6.3 Microwire frame format

The Microwire format uses a special master/slave messaging method, which operates in half-duplex mode. In this mode, when a frame begins, an 8-bit control message is transmitted to the slave. During this transmission, no incoming data is received by the SSP. After the message has been transmitted, the slave decodes it, and after waiting one serial clock after the last bit of the 8-bit control message has been sent, it responds with the requested data. The returned data can be 4 to 16 bits in length, making the total frame length anywhere from 13 to 25 bits.

Figure 15-10 Microwire frame format (single transfer)

Note 1: When transmission is disabled, SPxDO terminal doesn't output and is high impedance status. This terminal needs to add suitable pull-up/down resistance to fix the voltage level.

Note 2: SPxDI terminal is always input and internal gate is open. In case of transmission signal will be high impedance status, this terminal needs to add suitable pull-up/down resistance to fix the voltage level.

Though the Microwire format is similar to the SPI format, it uses the master/slave message transmission method for half-duplex communications. Each serial transmission is started by an 8-bit control word, which is sent to the off-chip slave device. During this transmission, the SSP does not receive input data. After the message has been transmitted, the off-chip slave decodes it, and after waiting one serial clock after the last bit of the 8-bit control message has been sent, responds with the requested data. The returned data can be 4 to 16 bits in length, making the total frame length anywhere from 13 to 25 bits. With this configuration, during the idle period:

- The SPxCLK signal is set to "Low".
- SPxFSS is set to "High".
- The transmit data line SPxDO is set to "Low".

A transmission is triggered by writing a control byte to the transmit FIFO. The falling edge of SPxFSS causes the value stored in the bottom entry of the transmit FIFO to be transferred to the serial shift register for the transmit logic, and the MSB of the 8-bit control frame to be shifted out onto the SPxDO pin.

SPxFSS remains "Low" and the SPxDI pin remains tristated during this transmission. The off-chip serial slave device latches each control bit into its serial shifter on the rising edge of each SPxCLK.

After the last bit is latched by the slave device, the control byte is decoded during a one clock wait-state, and the slave responds by transmitting data back to the SSP. Each bit is driven onto SPxDI line on the falling edge of SPxCLK.

The SSP in turn latches each bit on the rising edge of SPxCLK. At the end of the frame, for single transfers, the SPxFSS signal is pulled "High" one clock period after the last bit has been latched in the receive serial shifter, which causes the data to be transferred to the receive FIFO.

Note: The off-chip slave device can tristate the receive line either on the falling edge of SPxCLK after the LSB has been latched by the receive shifter, or when the SPxFSS pin goes "High".

Figure 15-11 Microwire frame format (continuous transfer)

Note 1: When transmission is disabled, SPxDO terminal doesn't output and is high impedance status. This terminal needs to add suitable pull-up/down resistance to fix the voltage level.

Note 2: SPxDI terminal is always input and internal gate is open. In case of transmission signal will be high impedance status, this terminal needs to add suitable pull-up/down resistance to fix the voltage level.

For continuous transfers, data transmission begins and ends in the same manner as a single transfer. However, the SPxFSS line is continuously asserted (held Low) and transmission of data occurs back to back.

The control byte of the next frame follows directly after the LSB of the received data from the current frame. Each of the received values is transferred from the receive shifter on the falling edge of SPxCLK, after the LSB of the frame has been latched into the SSP.

Note:[Example of connection] The SSP does not support dynamic switching between the master and slave in the system. Each sample SSP is configured and connected as either a master or slave.

## 16. USB Clock Control (USBPLLIF)

### 16.1 Features

The USBPLLIF block enables to set to enable/disable PLL for USB host and device, to stop/operate a 48MHz clock for USB host and device and to select a clock for USB among PLL or USB\_ECLK input.

When the USB function is not used, power consumption can be reduced by stopping each selection register.

## 16.2 Registers

### 16.2.1 Register List

The following table shows the PLL-related registers for USB and addresses.

Base Address = 0x400F\_3100

Register name		Address (Base+)
PLL control register for USB	USBPLLCR	0x0000
PLL enable register for USB	USBPLEN	0x0004
PLL select register for USB	USBPLLSEL	0x0008

## 16.2.2 USBPLLCR(PLL system control register for USB)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	-	-	USBPLLON
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-1	-	R	Reads as "0".
0	USBPLLON	R/W	Chooses USBPLL (multiplier circuit) operation 0: Stop 1: Oscillation After reset, the bit status is stop and is required to set.

16.2.3 USBPLEN (PLL enable register for USB)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	-	USBHEN	USBDEN
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-2	-	R	Reads as "0".
1	USBHEN	RW	Feeds 48MHz clock for USB host 0: Stop 1: Operation After reset, the bit status is stop and is required to set.
0	USBDEN	RW	Feeds 48MHz clock for USB device 0: Stop 1: Operation After reset, the bit status is stop and is required to set.

## 16.2.4 USBPLLSEL (PLL select register for USB)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	USBPLLSET							
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	USBPLLSET							USBPLLSEL
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-16	-	R	Reads as "0".
15-1	USBPLLSET [14:0]	R/W	Chooses a value of PLL multiplier for USB (Other than the below values are prohibited.) When USBCLK is selected using 0x0000:<USBPLLSEL> 0x5917:Input clock 8MHz, output clock 48MHz (6 times) 0x5A0F:Input clock 12MHz, output clock 48MHz (4 times) 0x720B:Input clock 16MHz, output clock 48MHz (3 times)
0	USBPLLSEL	R/W	Chooses a clock for USB host and device 0: USB_ECLK input 1: fusbpll After reset, an external USB clock is set to " USB_ECLK input ". If PLL clock for USB is used, set to "1".

Note 1: When a multiplying value of PLL is set, set USBPLLCR<USBPLLON> = "0" (PLL stops).

Note 2: After a multiplying value of PLL is set, PLL requires a time 100μs or more as initial stable time. Maintain the condition of USBPLLCR<USBPLLON>="0" (PLL stops) during the initial stable time.

Note 3: When returning from STOP1/2 mode, <USBPLLSEL> and <USBPLLON> are initialized.

Note 4: When an internal high-speed oscillator (IHOSC) is used as the system clock, do not use PLL for USB.

# 16.3 USB Clock Control

## 16.3.1 USB Clock Type

The following table shows a type of USB clock.

EHCLKIN	: External high-speed oscillation clock from X1 (clock inputs)
EHOSC	: External high-speed oscillation clock fromX1 and X2 (oscillator connected)
feosc	: Selected clock with CGOSCCR<EHOSCSEL>
fusbpll	: Multiplied clock by PLL for USB
fusbclk	: Multiplied clock by PLL for USB or USB_ECLK input
USBHCLK	: 48MHz clock for USB host
USBDCLK	: 48MHz clock for USB device

## 16.3.2 Initial Values after Reset

Reset operation initializes the clock configuration as follows.

External high-speed os- cillator	: Stop
PLL for USB (multiplier)	: Stop

### 16.3.3 USB System Diagram

Figure 16-1 shows a USB system diagram.

Among clocks inputting to the selector, an input with arrows described in the figure is chosen as the initial state after reset.

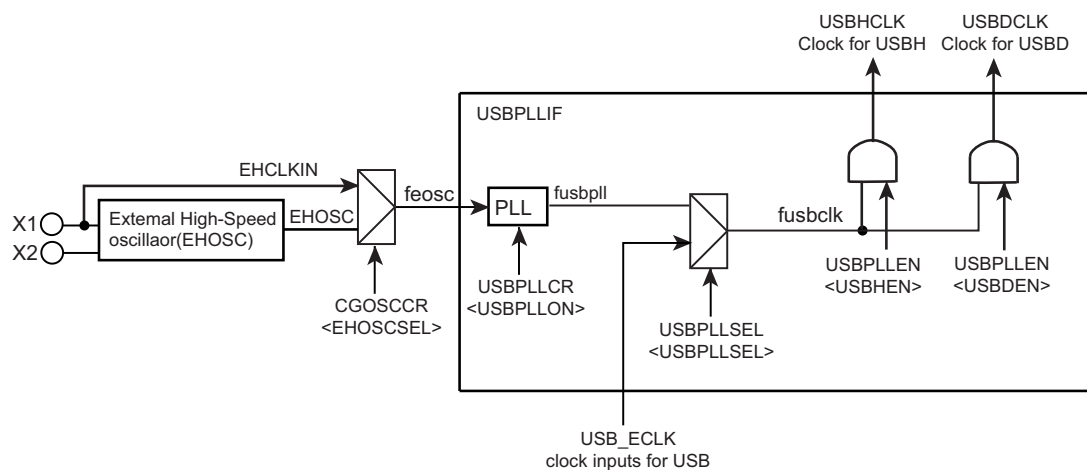

Figure 16-1 USB system diagram

## 16.3.4 Clock Multiplier circuit for USB (PLL for USB)

### 16.3.4.1 How to use

The PLL for USB is disabled after reset. To use the PLL, set as follows.

Set a multiplied value of USBPLLSEL<USBPLLSET> when USBPLLCR<PLLON> is "0" and wait for equal or more than approximate 100μs as the USB PLL stability time.

After this, set "1" to USBPLLCR<USBPLLON>.

After it takes equal or more than approximate 100μs as the lockup time, set "1" to USBPLLEN<USBHEN> and <USBDEN>. This generates a clock multiplied by feosc for USB clock.

Stable time is required until the PLL operation becomes stable using the warming-up function.

Note 1: When PLL starts operation, stable time is required approximately 100μs.

Note 2: For warming-up time setting, refer to Section "Clock / Mode control".

## 16.3.5 External Clock Input for USB

### 16.3.5.1 How to use

After reset, USB\_ECLK pin is used as port. After setting the register of port to use port as USB\_ECLK pin, setting "1" to USBPLLEN<USBHEN> and <USBDEN>, feeding clock for USB host and device is enabled.

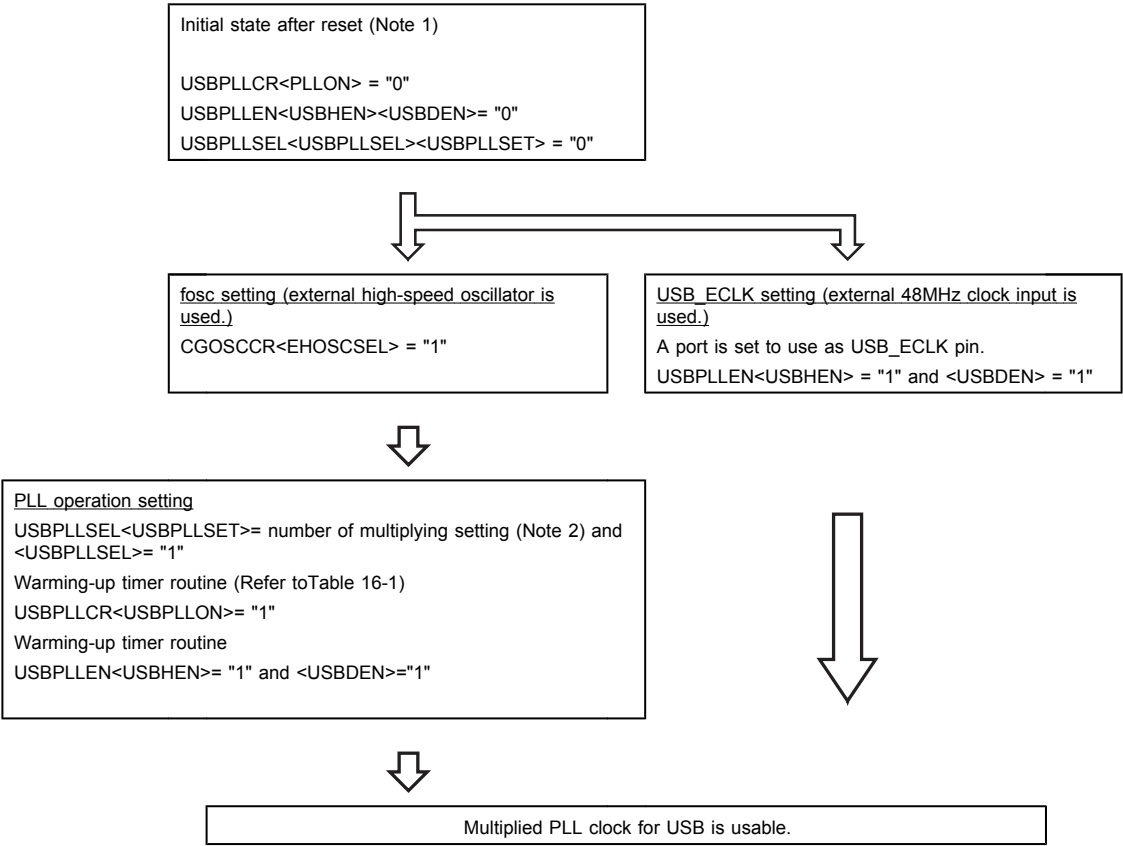

Note: When an external clock for USB is used, PLL for USB is prohibited.

16.3.6 A Clock setting sequence for USB

The following flowchart shows a clock setting sequence for USB after reset.

Clock for USB recognition sequence

Note 1: High-speed oscillator and supply voltage must be stable.  
Note 2: When the number of PLL multiplier is changed, stable time is required 100μs or more as initial stable time. During this period, maintains the condition of USBPLLCCR<USBPLLON>= "0"(PLL stops).

Table 16-1 Warming-up function setting

CGOSCCR<WUPT[11:0]> = "xxxx"	: Warming-up time setting
Reads CGOSCCR<WUPT[11:0]>	: Check if warming-up time is reflected. Repeat until "xxxx" is read.
CGOSCCR<XEN2> = "1"	: High-speed oscillator (fosc) is enabled.
CGOSCCR<WUEON> = "1"	: Start warming-up timer (WUP)
Reads CGOSCCR<WUEF>	: Waits until "0" is read. ( WUP is finished)

## 17. USB Device Controller (USBD)

This section describes about USB device controller.

An endpoint is described as EP in this section.

### 17.1 Outline

1. Conforming to Universal Serial Bus Specification Rev.2.0.
2. Supports Full-Speed (Low-Speed is not supported).
3. USB protocol processing
4. Detects SOF/USB\_RESET/SUSPEND/RESUME.
5. Generates and checks packet IDs.
6. Checks CRC5. Generates and checks CRC16.
7. Supports 4 transfer modes (Control/Interrupt /Bulk/ Isochronous).
8. Supports 8 EPs.

Table 17-1 Endpoints

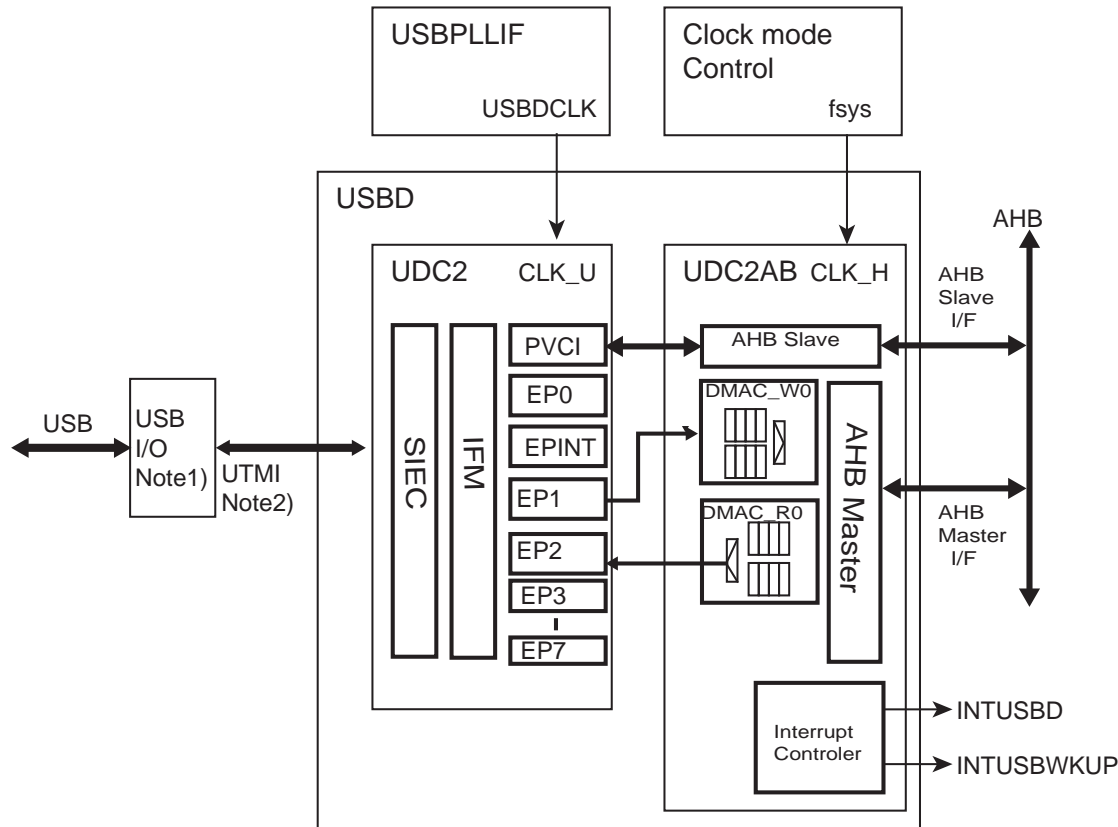

EP0:	Control	64byte × 1 FIFO
EP1:	Control / Interrupt / Bulk / Isochronous (IN)	64byte × 2 FIFO
EP2:	Control / Interrupt / Bulk / Isochronous (OUT)	64byte × 2 FIFO
EP3:	Control / Interrupt / Bulk / Isochronous (IN)	64byte × 2 FIFO
EP4:	Control / Interrupt / Bulk / Isochronous (OUT)	64byte × 2 FIFO
EP5:	Control / Interrupt / Bulk / Isochronous (IN)	64byte × 2 FIFO
EP6:	Control / Interrupt / Bulk / Isochronous (OUT)	64byte × 2 FIFO
EP7:	Control / Interrupt / Bulk / Isochronous (IN)	64byte × 2 FIFO

9. Supports Dual Packets Mode (except for EP 0)
10. Interrupt source signals to the interrupt controller: INTUSBD, INTUSBKUP

## 17.2 System Structure

The USB device controller consists of the USB-Spec2.0 device controller (hereinafter called UDC2) and the bus bridge (hereinafter called UDC2AB) which connects the UDC2 and the AHB bus.

In this section, "17.2.1 AHB Bus Bridge (UDC2AB)" describes the configuration of the UDC2AB, and "17.2.2 Toshiba USB-Spec2.0 Device Controller (UDC2)" describes that of the UDC2.

Note1) TMPM368FDXBG has USB I/O which can be used in Full Speed mode not Low Speed mode.  
In this section, "PHY" should be read as USB I/O.  
Note2) USB2.0 Transceiver Macrocell Interface

Figure 17-1 Block diagram of the USB device controller

### 17.2.1 AHB Bus Bridge (UDC2AB)

UDC2AB is the bus bridge between the Toshiba USB-Spec2.0 device controller (hereinafter called UDC2) and the AHB.

UDC2AB has the DMA controller that supports the AHB master transfer and controls transfer between the specified address on the AHB and the Endpoints-FIFO (EP I/F) in the UDC2.

Figure 17-2 UDC2AB Block Diagram

17.2.1.1 Functions and Features

UDC2AB has the following functions and features:

1. Connections with UDC2

There is no specific restriction on the EP configuration for the UDC2 to be connected. However, the DMA controller in UDC2AB (AHB master function) can be connected with one Rx-EP and one Tx-EP. Accesses to other EPs (including EP0) should be made through PPCI I/F of UDC2 using the AHB slave function. Please note the EPx\_FIFO register of a UDC2 EP in master transfer with the DMA controller cannot be accessed through PPCI I/F.

If the maximum packet size of the EP to be connected with the AHB master read function is an odd number, there are some restrictions on the usage. See "(3) Setting the maximum packet size in Master Read transfers" for more information.

2. AHB functions

AHB master and AHB slave functions are provided.

a. AHB master function

There are two DMA channels available for the USB device controller. One channel is allocated to the Rx-Ep and the Tx-Ep each.

Table 17-2 AHB Master Functions

Single Burst (INCR/INCR8) transactions	Supported
Split transaction	Supported
Little Endian	Supported
Protection Control	Supported
Early Burst Termination	Supported
Address bus width	32-bit
Data bus width	32-bit
Byte Word Transaction	Supported

The image of Endian conversion is as shown below.

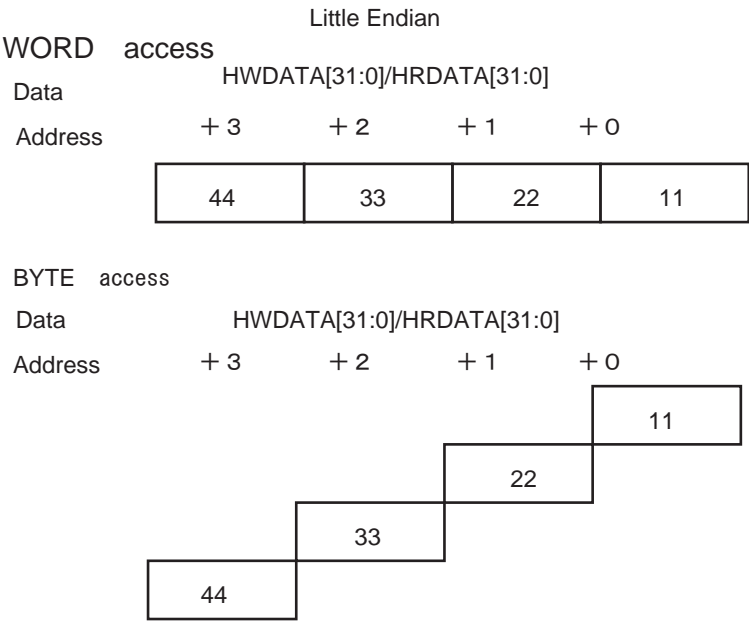

Figure 17-3 Image of Endian conversion in AHB Master function

b. AHB Slave Function

Specification of the AHB Slave function.

Little Endian	Supported
Single transaction	Supported
Address width	32-bit
Data width	32-bit
Transaction in bytes or words	Supported

The image of Endian conversion is as shown below.

Figure 17-4 Image of Endian conversion in AHB Slave function

17.2.1.2 Configuration

UDC2AB mainly consists of the AHB Slave function that controls the access to the UDC2AB internal registers and UDC2 registers (UDC2 PPCI I/F) and the AHB Master function that controls the DMA access to the UDC2 EP I/F.

The AHB Master function has two built-in channels; Master Read Channel (AHB to UDC2) and Master Write Channel (UDC2 to AHB), which enable DMA transfer between the EP I/F of Rx-EP and Tx-EP of UDC2. Each channel has two built-in 8-word buffers (four in total).

17.2.1.3 Clock Domain

fsys provided by the clock/mode control circuit is connected to CLK\_H of the UDC2AB. fsys stops or starts according to the low-power consumption mode of the TMPM368FDXBG.

Since CLK\_H is not provided during the fsys being stopped in the low-power consumption mode, INTUSBD will not be generated.

Therefore, to detect the connection and disconnection of the VBUS, an interrupt to used needs to be selected from INTUSBPOND generated by the USBPON pin and INTUSBD at the moment when CLK\_H starts or stops.

Refer to "17.5.5.2 Sequence of USB Bus Power (VBUS) Connection/Disconnection" for more information.

USBDCLK provided from USB clock control circuit is connected to CLK\_U of UDC2. USBDCLK stops or starts according to the register. To stop or start CLK\_U by detecting status such as suspend and resume, configure USB clock control circuit using software.

### 17.2.2 Toshiba USB-Spec2.0 Device Controller (UDC2)

UDC2 controls the connection of USB functions to the Universal Serial Bus. UDC2 automatically processes the USB protocol and its PHY-end interface can be accessed via UTMI.

1. SIEC (Serial Interface Engine Control) block

This block manages the protocol in USB. Its major functions are:

- Checks and generates PIDs
- Checks and generates CRCs
- Checks device addresses

2. IFM block

This block controls SIEC and EPs. Its major functions are:

- Writes the received data to the relevant EPs when received an OUT-Token.
- Reads the transmit data from the relevant EPs when an IN-Token is received.
- Controls and manages the status of UDC2.0.

3. PPCI-I/F block

This block controls reading and writing between IFM and external register access bus (PPCI).

PPCI bus accesses via UDC2AB.

4. EP0 block

This block controls sending and receiving data in Control transfers. When sending or receiving data with DATA-Stage of Control transfers, you should access the FIFO in this block via PPCI-I/F.

5. EPx block

This block controls sending and receiving data of EPx (x = 1 to 7). FIFO can be directly accessed via the EP-I/F. The EP-I/F can make burst transfers.

Please note there are two EPs; one for sending (EPTX) and another for receiving (EPRX). Direction of EPs (send/receive) will be fixed on a hardware basis.

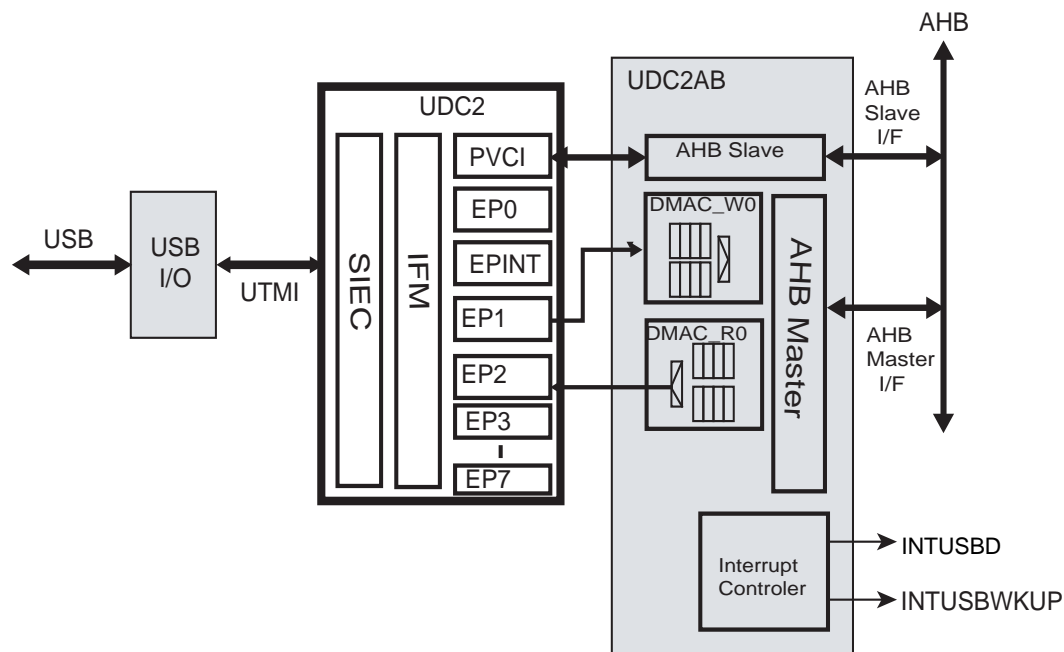

Figure 17-5 Block diagram of UDC2

#### 17.2.2.1 Features and Functions

The main features and functions are as follows:

1. Complies with Universal Serial Bus Specification Rev. 2.0.
2. Complies with Full-Speed (FS) (not complies with Low-Speed).
3. USB protocol processing
4. Detects SOF/USB\_RESET/SUSPEND/RESUME.
5. Generates and checks packet IDs.
6. Checks CRC5. Generates and checks CRC16.
7. Supports 4 transfer modes (Control/Interrupt/Bulk/Isochronous).
8. Supports up to 8 EPs.
9. Supports Dual Packet Mode ( EP 0 excluded)
10. EP 1 to 7 can directly access FIFO (EP-I/F)
11. Complies with USB 2.0 Transceiver Macrocell Interface (UTMI) (8 bits @ 48 MHz)

#### 17.2.2.2 Specifications of Flags

The UDC2 core outputs various events on USB as flags when they occur. This section discusses those flags.

### 1. USB\_RESET

Asserts "High" while receiving USB\_RESET. Since UDC2 returns to the Default-State by receiving USB\_RESET, the application also needs to return to the Default-State.

In Full-Speed operation, UDC2 asserts this flag when SE0 on the USB bus was recognized for 2.5 s or longer. Then, after UDC2 has driven Chirp-K for about 1.5 ms the flag will be deasserted when either one of the following states was recognized:

- a. Chirp from the host (K-J-K-J-K-J) was recognized.
- b. 2 ms or longer has passed without recognizing Chirp from the host (K-J-K-J-K-J).

**Note:** While the time when the host begins Chirp and the driving time of Chirp-K and Chirp-J depend on the host, asserting period of the USB\_RESET flag is around 1.74 ms to 3.5 ms.

### 2. INT\_SETUP

In Control transfers, asserts "High" after receiving the Setup-Token. When this interrupt is recognized, the software should read the Setup-Data storage register (8 bytes) to make judgment of request. This interrupt will be deasserted by writing 1 into the UDFS2INT<i\_setup>. UDFS2INT should be cleared at the point the interrupt was recognized.

### 3. INT\_STATUS\_NAK

In Control transfers, when the host proceeds to the STATUS-Stage and transmits packets while UDC2 is processing the DATA-Stage (before issuing the "Setup\_Fin" command), UDC2 will return "NAK" and asserts this flag to "High". When this interrupt is recognized, the software should issue the "Setup\_Fin" command from the Command register to make the STATUS-Stage of UDC2 end. This interrupt will be deasserted by writing 1 into the UDFS2INT<i\_status\_nak>. UDFS2INT should be cleared at the point the interrupt was recognized.

### 4. INT\_STATUS

In Control transfers, asserts "High" after finishing the STATUS-Stage normally. This interrupt will be deasserted by writing 1 into the UDFS2INT<i\_status>. UDFS2INT should be cleared at the point the interrupt was recognized.

### 5. INT\_EP0

In the DATA-Stage of Control transfers, asserts "High" when "ACK" was sent or received (when the transaction finished normally). This interrupt will be deasserted by writing 1 to the UDFS2INT<i\_ep0>. UDFS2INT should be cleared at the point the interrupt was recognized.

## 6. INT\_EP

In EPs other than EP 0, asserts "High" when "ACK" was sent or received (when the transaction finished normally). In that case, which EP the transfer was made can be identified by checking UDFS2INTEP. This interrupt will be deasserted by writing 1 into the UDFS2INT<i\_ep>, or by writing 1 into all bits set in UDFS2INTEP. UDFS2INT should be cleared at the point the interrupt was recognized.

## 7. INT\_RX\_ZERO

"High" is asserted when Zero-Length data is received. In Control transfers, however, "High" is asserted only when Zero-Length data is received in the DATA-Stage. It will not be asserted when Zero-Length data is received in the STATUS-Stage. Which EP has received the data can be identified by reading the UDFS2CMD<rx\_nulpkt\_ep> or checking UDFS2INTRX0. This interrupt will be deasserted by writing 1 into the UDFS2INT<i\_rx\_data0>, or by writing 1 into all bits set in UDFS2INTRX0. UDFS2INTRX0 should be cleared at the point the interrupt was recognized.

## 8. INT\_SOF

Asserts "High" when SOF was received. This interrupt will be deasserted by writing 1 into the UDFS2INT<i\_osf>. UDFS2INT should be cleared at the point the interrupt was recognized.

SOF is a packet indicating the start of a frame. It is transmitted from the host to devices every 1ms in the Full-Speed transfers.

## 9. INT\_NAK

In EPs other than EP 0, asserts "High" when NAK is transmitted. In that case, which EP has transmitted the NAK can be identified by checking UDFS2INTNAK. This interrupt will be deasserted by writing 1 into the UDFS2INT<i\_nak>, or by writing 1 into all bits set in UDFS2INTNAK. By default, this flag will not be asserted when NAK was transmitted. Therefore, you should write 0 into the relevant EP of UDFS2INTNAKMASK to release the mask in order to use this flag.

## 17.2.2.3 Commands to EP

This section describes about the commands to be issued by UDFS2CMD<com> for the EP specified by UDFS2CMD<ep>.

## 1. 0x0 : Reserved

Not to be specified.

## 2. 0x1 : Setup\_Fin

Should be issued only for EP0.

This is a command for setting the end of DATA-Stage in Control transfers. As UDC2 continues to send back "NAK" to the STATUS-Stage until this command is issued, the command should be issued when the DATA-Stage finishes or INT\_STATUS\_NAK was received.

Note: During Control-WR transfer, read all data received during the Data-Stage first, and then Issue the Setup-Fin command.

## 3. 0x2 : Set\_DATA0

Can be issued to EPs except EP0. Should not be issued to EP0.

A command for clearing toggling of EPs. While toggling is automatically updated by UDC2 in normal transfers, this command should be issued if it needs to be cleared by software.

#### 4. 0x03 : EP\_Reset

Can be issued to any EP.

A command for clearing the data and status of EPs. Issue this command when you want to reset an EP in such cases as setting EPs of Set\_Configuration and Set\_Interface or resetting the EP by Clear\_Feature. This command will reset the following 5 points:

- a. Clear the UDFS2EP0STS<toggle> / UDFS2EPxSTS<toggle> to DATA0.
- b. Clear the UDFS2EP0STS<status> / UDFS2EPxSTS<status> to Ready.
- c. Clear the UDFS2EP0MSZ<dset> / UDFS2EPxMSZ<dset> and the UDFS2EP0DSZ / UDFS2EPxDSZ.
- d. Clear UDFS2EP0MSZ<tx0\_data> / UDFS2EPxMSZ<tx\_0data>.
- e. Clear the UDFS2EPxSTS<disable>.

UDC2 makes toggling control by hardware for every transfer. If this command is issued when a transfer of EPs is in progress, toggling of the relevant EP will also be cleared which may cause the synchronization with the host be lost. As in the case of receiving requests as mentioned above, the command should be issued when it is possible to make synchronization with the host.

#### 5. 0x4 : EP\_Stall

Can be issued to EPs except EP0. Should not be issued to EP0.

A command for setting the status of EPs to "Stall". Issue this command when you want to set the status of an EP to "Stall" in such cases as stalling an EP by Set\_Feature. When this command is issued, "STALL" will be always sent back for the EP set. However, the Stall status of EP0 will be cleared when the Setup-Token is received.

This command should not be issued for EPs where Isochronous transfers are used, since transfers are made without Handshake in Isochronous transfers. Even if this command is issued for EPs where Isochronous transfers are set (by UDFS2EOxSTS<t\_type>), "STALL" will not be sent back.

#### 6. 0x5 : EP\_Invalid

Can be issued to EPs except EP0. Should not be issued to EP0.

A command for setting the status of EPs to "Invalid". Please issue this command when disabling EPs that will not be used when using Set\_Config or Set\_Interface to set EPs. When this command is issued, the EPs set will make no response. This command should not be issued while transfers of each EP are in progress.

#### 7. 0x6 : Reserved

Not to be specified.

#### 8. 0x7 : EP\_Disable

Can be issued to EPs except EP0. Should not be issued to EP0.

A command for making an EP disabled. When this command is issued, "NAK" will be always sent back from the EP set. This command should not be issued for EPs where Isochronous transfers are used, since transfers are made without Handshake in Isochronous transfers. Even if this command is issued for EPs where Isochronous transfers are set (by UDFS2EPxSTS<t\_type>), "NAK" will not be sent back.

#### 9. 0x8 : EP\_Enable

Can be issued to EPs except EP0. Should not be issued to EP0.

A command for making an EP enabled. Issue this command to cancel the disabled status set by "EP\_Disable" command.

10. 0x9 : All\_EP\_Invalid

Setting for EP is invalid.

A command for setting the status of all EPs other than EP0 to "Invalid". Issue this command when you want to apply the "EP\_Invalid" command for all EPs. Issue this command when processing Set\_Configuration and Set\_Interface like the "EP\_Invalid" command.

11. 0xA : USB\_Ready

Should be issued only for EP0.

A command for making connection with the USB cable. Issue this command at the point when communication with the host has become effective after confirming the connection with the cable. Pull-Up of USB-DDP will be made only after this command is issued, and the status of cable connection will be sent to the host.

Please note that the device state of UDC2 (UDFS2ADR<configured> <addressed> <default>) will be set to "Default" when this command was issued.

12. 0xB : Setup\_Received

Should be issued for EP0.

A command for informing UDC2 that the SETUP-Stage of a Control transfer was recognized. Issue this command after accepting the INT\_SETUP interrupt and the request code was recognized. As UDC2 continues to send back "NAK" to the DATA-Stage/STATUS-Stage until this command is issued, the command should be issued at the end of the INT\_SETUP interrupt processing routine.

13. 0xC : EP\_EOP

Can be issued to any EP.

A command for informing UDC2 that the transmit data has been written. Issue this command when transmitting data with byte size smaller than the maximum transfer bytes (FIFO capacity of the EP or MaxPacketSize, whichever smaller). Issuing this command will set the Data set flag and the data will be sent back to IN-Token from the host. It should not be used when setting Zero-Length data or data of MaxPacketSize.

14. 0xD : EP\_FIFO\_Clear

Can be issued to any EP.

A command for clearing the data of an EP. The UDFS2EPxMSZ<dset> and the UDFS2EPxDSZ will be cleared at the same time. Issue this command when you want to clear the data currently stored in the FIFO before transmitting the data to the host and set the latest data, for instance in Interrupt transfers. If this command is issued while accessing the EP-I/F, the FIFO of the EP will not be successfully cleared. When issuing this command, epx\_val of EP-I/F should be set to 0 before issuing.

15. 0xE : EP\_TX\_0DATA

Can be issued to any EP.

A command for setting Zero-Length data to an EP. Issue this command when you want to transmit Zero-Length data. In the case of transmitting Zero-Length data in Bulk-IN transfers and others to indicate the final transfer, read UDFS2EPxDSZ and confirm it is 0 (no data ex-

ists in the FIFO of EPx) before setting this command. In the case of writing data from EP-I/F, set this command after the data was written and `epx_val` became 0. When this command was set, `UDFS2EPxMS<tx_0data>` of the EP will be set.

Set the next data when the `UDFS2EPxMS<tx_0data>` is confirmed to be 0. During Isochronous-IN transfer, Zero -Length data is automatically transferred to the IN-Token if data is not set in the FIFO of EP. Do not issue this command.

#### 16. 0xF : Reserved

Not to be specified.

Settings for the following commands will be suspended when issued during a USB transfer, which will be executed after the USB transfer has finished. Suspension of the command will take place for each EP.

- 0x2: Set\_DATA0
- 0x3: EP\_Reset
- 0x4: EP\_Stall
- 0x5: EP\_Invalid
- 0x7: EP\_Disable
- 0x8: EP\_Enable
- 0x9: All\_EP\_Invalid
- 0xD: EP\_FIFO\_Clear
- 0xE: EP\_TX\_0DATA

Therefore, when commands were issued successively for the same EP while a USB transfer is in progress, commands will be overwritten and only the one last issued will be valid. If you need to issue commands to an EP successively, poll `UDFS2EPxSTS` / `UDFS2EPxDSZ` to confirm that the command has become valid before issuing next ones. Also, when making an access to the EP-I/F immediately after clearing the FIFO using the `EP_Reset`/`EP_FIFO_Clear` command, poll `UDFS2EPxDSZ` to confirm that the command has become valid before resuming the access to the EP-I/F.

For EP 0, the following commands will be invalid until the `Setup_Received` command is issued after receiving the Setup-Token:

- 0x1: Setup\_Fin
- 0x2: Set\_DATA0
- 0x3: EP\_Reset
- 0x4: EP\_Stall
- 0xC: EP\_EOP
- 0xD: EP\_FIFO\_Clear
- 0xE: EP\_TX\_0DATA

When the "EP\_Stall" command was set to EPx, "Stall" will be set to the `UDFS2EPxSTS<status>`. When `EP_Disable` was set, 1 will be set to the `UDFS2EPxSTS<disable>`. When these two commands (`EP_Stall` and `EP_Disable`) were set to the same EPx and the status becomes "Stall" with `UDFS2EPxSTS<disable> = 1`, "STALL" will be transmitted in the transfer.

When the "EP\_Invalid" command was set to EPx, "Invalid" will be set to the `UDFS2EPxSTS<status>`. When the two commands (`EP_Invalid` and `EP_Disable`) were set to the same EPx and the status becomes "Invalid" with `UDFS2EPxSTS<disable> = 1`, no response will be made in the transfer.

When `UDFS2EPxSTS<disable>` is 1 and `UDFS2EPxMSZ<tx_0data>` is 1, Zero-Length data will be transmitted once in the transfer. After the Zero-Length data was successfully transferred, "NAK" will be transmitted.

### 17.3 How to connect with the USB bus

The circuit below shows how to connect TMPM368FDXBG with the USB bus.

Input the VBUS signal to USBDPON pin to detect the connection of the USB power (VBUS).

The Pull-Up process using the pull-up resistor of the D+ and the in-line damping resistor to the D- are required. Also, a ON/OFF control using a port needs to be added to the pull-up resistor. The pull-up resistor should be disconnected when voltage is not applied to the VBUS.

If D+ and D- are unstable, we recommend to add a pull-down resistor to  $R_1$ .

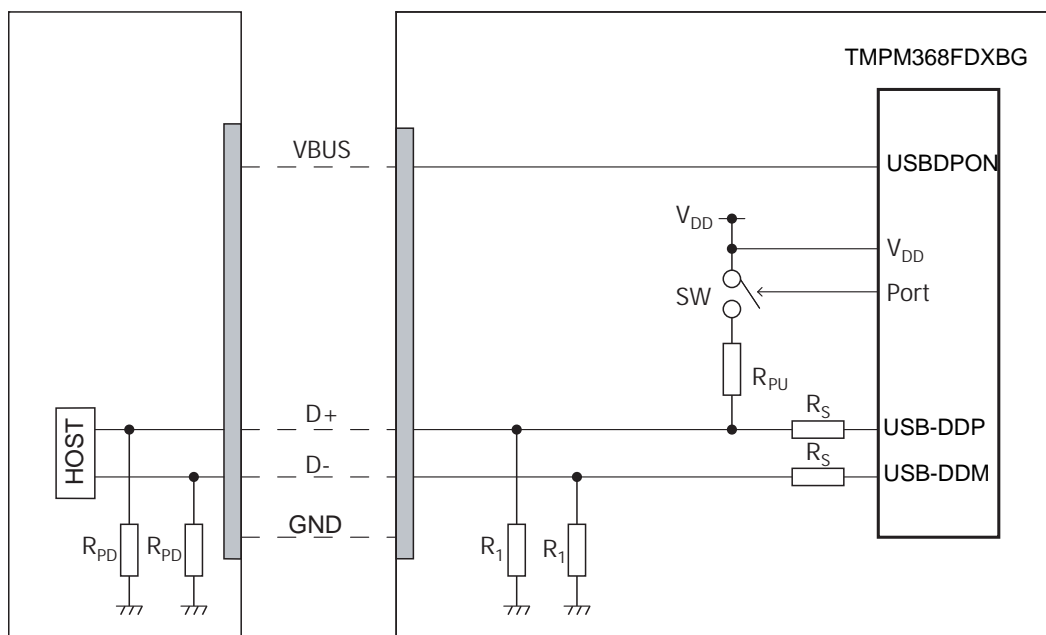

Figure 17-6 Connection example of the USB bus and TMPM368FDXBG.

Note:  $R_1=500k\Omega$  or higher (recommended value),  $R_S=33\Omega$  (recommended value),  $R_{PU}=1.5k\Omega$  (recommended value)

## 17.4 Registers

The register map of the USBD consists of registers for setting the UDC2AB and that for the UDC2.

When the registers for setting UDC2 are accessed, UDC2AB automatically accesses UDC2 via PPCI I/F.

The register for setting the UDC2AB is 32-bit width. The register for setting the UDC2 is 16-bit width, which is allocated to [15:0]. [31:16] is allocated to the read-only, for indefinite values.

### 17.4.1 UDC2AB Register

#### 17.4.1.1 UDC2AB Register list

BaseAddress=0x4000\_8000

Register name		Address(Base+)
Interrupt Status Register	UDFSINTSTS	0x0000
Interrupt Enable Register	UDFSINTENB	0x0004
Master Write Timeout Register	UDFSMWTOUT	0x0008
UDC2 Setting Register	UDFSC2STSET	0x000C
DMAC Setting register	UDFSMSTSET	0x0010
DMAC Read Request Register	UDFSDMACRDREQ	0x0014
DMAC Read Value Register	UDFSDMACRDVL	0x0018
UDC2 Read Request Register	UDFSUDC2RDREQ	0x001C
UDC2 Read Value Register	UDFSUDC2RDVL	0x0020
-	Reserved	0x0024 to 0x0038 (note 2)
Arbiter Setting Register	UDFSARBTSET	0x003C
Master Write Start Address Register	UDFSMWSADR	0x0040
Master Write End Address Register	UDFSMWEADR	0x0044
Master Write Current Address Register	UDFSMWCADR	0x0048 (note 1)
Master Write AHB Address Register	UDFSMWAHBADR	0x004C
Master Read Start Address Register	UDFSMRSADR	0x0050
Master Read End Address Register	UDFSMREADR	0x0054
Master Read Current Address Register	UDFSMRCADR	0x0058 (note 1)
Master Read AHB Address Register	UDFSMRAHBADR	0x005C
-	Reserved	0x0060 to 0x007C (note 2)
Power Detect Control Register	UDFSPWCTL	0x0080
Master Status Register	UDFSMSTSTS	0x0084
Timeout Count Register	UDFSTOUTCNT	0x0088 (note 1)
-	Reserved	0x008C to 0x1FC

Note 1: Be sure to make Read accesses via UDFSDMACRDREQ.

Note 2: Those shown as "Reserved" above are prohibited to access. Read / Write is prohibited to those "Reserved" areas.

## 17.4.1.2 UDFSINTSTS (Interrupt Status Register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	int_mw_rerror	int_ powerdetect	-	-	int_dmac_ reg_rd	int_udc2_ reg_rd
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	int_mr_ahberr	int_mr_ep_ dset	int_mr_end_ add	int_mw_ ahberr	int_mw_ timeout	int_mw_end_ add	int_mw_set_ add	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	int_usb_ reset_end	int_usb_reset	int_suspend_ resume
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	int_nak	int_ep	int_ep0	int_sof	int_rx_zero	int_status	int_status_ nak	int_setup
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-30	-	R	Read as undefined.
29	int_mw_rerror	R/W	Will be set to 1 when the access to the EP has started Master Write transfer during the setting of common bus access (UDFS2EPxSTS<bus_sel> is 0).(UDFS2EPxSTS<bus_sel> is 0) 0: Not detected 1: EP read error occurred during master write.
28	int_ powerdetect	R/W	When the status of VBUSPOWER input of UDC2AB changed, it is set to "1". 0:No changed 1:Status changed
27-26	-	R	Read as undefined.
25	int_dmac_ reg_rd	R/W	Will be set to 1 when the register access executed by the setting of UDFS2MACRDREQ is completed and the value read to UDFS2MACRDVL is set. 0: Not detected. 1:Register read completed.
24	int_udc2_reg_ rd	R/W	Will be set to 1 when the UDC2 access executed by the setting of UDFS2MACRDREQ is completed and the value read to UDFS2MACRDVL is set. Also set to 1 when Write access to the internal register of UDC2 is completed. 0: Not detected. 1: Register read/write completed.
23	int_mr_ahberr	R/W	This status will be set to 1 when the AHB error has occurred during the operation of Master Read transfer. After this interrupt has occurred, the Master Read transfer block needs to be reset by the UDFS2MSTSET<mr_reset >. 0: Not detected. 1: AHB error occurred.
22	int_mr_ep_dset	R/W	Will be set to 1 when the FIFO of EP for UDC2 Tx to be used for Master Read transfer becomes writable (not full). 0: FIFO is not writable 1: FIFO is writable
21	int_mr_end_ add	R/W	Will be set to 1 when the Master Read transfer has finished. 0: Not detected 1: Master Read transfer finished
20	int_mw_ahberr	R/W	This status will be set to 1 when the AHB error has occurred during the operation of Master Write transfer. After this interrupt has occurred, the Master Write transfer block needs to be reset by UDFS2MSTSET<mw_reset>. 0: Not detected. 1: AHB error occurred.

Bit	Bit Symbol	Type	Function
19	int_mw_timeout	R/W	This status will be set to 1 when time-out has occurred during the operation of Master Write transfer. 0: Not detected. 1: Master Write transfer timed out.
18	int_mw_end_add	R/W	Will be set to 1 when the Master Write transfer has finished. 0: Not detected. 1: Master Write transfer timed out.
17	int_mw_set_add	R/W	Will be set to 1 when the data to be sent by Master Write transfer is set to the corresponding EP of Rx while the Master Write transfer is disabled. 0: Not detected. 1: Master Write Transfer address request.
16-11	-	R	Read as undefined.
10	int_usb_reset_end	R/W	Indicates whether UDC2 has deasserted the usb_reset signal. The timing in which UDC2 sets the UDC2 register to the initial value after USB_RESET is after the usb_reset signal is deasserted. To detect this timing, use this bit. The status of the usb_reset signal can be checked using UDFSPWCTL<usb_reset>. 0: UDC2 has not deasserted the usb_reset signal after this bit was cleared. 1: Indicates UDC2 has deasserted the usb_reset signal.
9	int_usb_reset	R/W	Indicates whether UDC2 has asserted the usb_reset signal. The status of the usb_reset signal can be checked using UDFSPWCTL<usb_reset>. 0: UDC2 has not asserted the usb_reset signal after this bit was cleared. 1: Indicates UDC2 has asserted the usb_reset signal.
8	int_suspend_resume	R/W	Asserts 1 each time the suspend_x signal of UDC2 changes. The status can be checked using the UDFSPWCTL<suspend_x>. 0: Status has not changed. 1: Status has changed.
7	int_nak	R	The int_nak signal of UDC2 can be directly read. To clear it, clear the corresponding bit of UDFS2INT or UDFS2INTNAK of UDC2.
6	int_ep	R	The int_ep signal of UDC2 can be directly read. To clear it, clear the corresponding bit of UDFS2INT or UDFS2INTEP.
5	int_ep0	R	The int_ep0 signal of UDC2 can be directly read. To clear it, clear the corresponding bit of UDFS2INT.
4	int_sof	R	The int_ep0 signal of UDC2 can be directly read. To clear it, clear the corresponding bit of UDFS2INT.
3	int_rx_zero	R	The int_rx_zero signal of UDC2 can be directly read. To clear it, clear the corresponding bit of UDFS2INT or UDFS2INTRX0.
2	int_status	R	The int_status signal of UDC2 can be directly read. To clear it, clear the corresponding bit of UDFS2INT.
1	int_status_nak	R	The int_status_nak signal of UDC2 can be directly read. To clear it, clear the corresponding bit of UDFS2INT.
0	int_setup	R	The int_setup signal of UDC2 can be directly read. To clear it, clear the corresponding bit of UDFS2INT.

The connection between the output signals of UDC2 and the bits [10:9] and [7:0]of this register is shown below.

Figure 17-7 Connection between the flag output signals and interrupt bits.

## 17.4.1.3 UDFSINTENB(Interrupt Enable Register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	mw_rerror_en	power_detect_en	-	-	dmac_reg_rd_en	udc2_reg_rd_en
After reset	0	0	0	0	0	0	0	0

bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-30	-	R	Read as undefined.
29	mw_rerror_en	R/W	Controls the mw_rerror interrupt. 0: Disable 1: Enable
28	power_detect_en	R/W	Controls the power_detect interrupt. 0: Disable 1: Enable
27-26	-	R	Read as undefined.
25	dmac_reg_rd_en	R/W	Controls the dmac_reg_rd interrupt. 0: Disable 1: Enable
24	udc2_reg_rd_en	R/W	Controls the udc2_reg_rd interrupt. 0: Disable 1: Enable
23	mr_ahberr_en	R/W	Controls the mw_ahberr interrupt. 0: Disable 1: Enable
22	mr_ep_dset_en	R/W	Controls the mr_ep_dset interrupt. 0: Disable 1: Enable
21	mr_end_add_en	R/W	Controls the mr_end_add interrupt. 0: Disable 1: Enable
20	mw_ahberr_en	R/W	Controls the mw_ahberr interrupt. 0: Disable 1: Enable
19	mw_timeout_en	R/W	Controls the mw_timeout interrupt. 0: Disable 1: Enable
18	mw_end_add_en	R/W	mw_end_add interrupt. 0: Disable 1: Enable
17	mw_set_add_en	R/W	mw_set_add interrupt. 0: Disable 1: Enable
16-11	-	R	Read as undefined.

Bit	Bit Symbol	Type	Function
10	usb_reset_end_en	R/W	usb_reset_end interrupt. 0: Disable 1: Enable
9	usb_reset_en	R/W	usb_reset interrupt. 0: Disable 1: Enable
8	suspend_resume_en	R/W	suspend_resume interrupt. 0: Disable 1: Enable
7-0	-	R	Read as undefined.

17.4.1.4 UDFSMWTOUT(Master Write Timeout Register)

	31	30	29	28	27	26	25	24
bit symbol	timeoutset							
After reset	1	1	1	1	1	1	1	1
	23	22	21	20	19	18	17	16
bit symbol	timeoutset							
After reset	1	1	1	1	1	1	1	1
	15	14	13	12	11	10	9	8
bit symbol	timeoutset							
After reset	1	1	1	1	1	1	1	1
	7	6	5	4	3	2	1	0
bit symbol	timeoutset							timeout_en
After reset	1	1	1	1	1	1	1	1

Bit	Bit Symbol	Type	Function
31-1	timeoutset	R/W	<p>The setting should not be changed during the Master Write transfer. Timeout occurs when the number of times CLK_U was set is counted after the data of Master Write (Rx) EP is exhausted.</p> <p>The timeout counter comprises 32 bits of which upper 31 bits can be set by timeoutset [31:1] of this register, while the lowest bit of the counter is set to 1.</p> <p>As CLK_U is 48 MHz, approximately 20 [ns] to 89 [s] can be set as a timeout value.</p> <p>While CLK_U stopped (PHY is being suspended and so on), no timeout interrupt will occur as the counter does not work.</p>
0	timeout_en	R/W	<p>Used to enable Master Write timeout. It is set to Enable by default.</p> <p>The setting should not be changed during the Master Write transfer.</p> <p>0: Disable</p> <p>1: Enable</p>

## 17.4.1.5 UDFSC2STSET(UDC2 Setting Register)

	31	30	29	28	27	26	25	24
bit symbol	-							
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-							
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-							
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-			eopb_enable	-	-	-	tx0
After reset	0	0	0	1	0	0	0	0

Bit	Bit Symbol	Type	Function
31-5	-	R	Read as undefined.
4	eopb_enable	R/W	Used to enable Master Read EOP. It is set to Enable by default. The setting should not be changed during the Master Read transfer. If this bit is 0, the final data transfer to UDC2 will not take place when the last word is 1 byte. If the last word is 2 bytes, the final data transfer to UDC2 will take place when epx_w_eop = 0. If this bit is 1, the final data transfer to UDC2 will take place when epx_w_eop = 1 regardless of byte number of the last word. Note: See the section "17.5.4.1 Master Read transfer" for more information. 0: Master Read EOP Disabled. 1: Master Read EOP Enabled.
3-1	-	R	Read as undefined.
0	tx0	R/W	Used to transmit NULL packets at an EP connected to the Master Read operation side. Only valid when the UDFSMSTSTS<mrepempty> is 1, otherwise this bit is ignored. It will be automatically cleared to 0 after writing. Setting 1 to this bit will assert the epx_tx0data signal of the UDC2 EP-I/F and the value of 1 is retained during the transmission of NULL packets. After this bit is set, next data setting for Tx-EP should not be made until it is cleared. 0: No operation 1: Transmits NULL packets.

17.4.1.6 UDFSMSTSET(DMAC Setting Register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	m_burst_type
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	mr_reset	mr_abort	mr_enable	-	mw_reset	mw_abort	mw_enable
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-9	–	R	Read as undefined.
8	m_burst_type	R/W	<p>Selects the type of HBURST[2:0] when making a burst transfer in Master Write/Read transfers. The type of burst transfer made by UDC2AB is INCR8 (burst of 8 beat increment type). Accordingly, 0 (initial value) should be set in normal situation. However, in case INCR can only be used as the type of burst transfer based on the AHB specification of the system, set 1 to this bit. In that case, UDC2AB will make INCR transfer of 8 beat.</p> <p>Please note the number of beat in burst transfers cannot be changed.</p> <p>Setting of this bit should be made in the initial setting of UDC2AB. The setting should not be changed after the Master Write/Read transfers started.</p> <p>Note: UDC2AB does not make burst transfers only in Master Write/Read transfers. It combines burst transfers and single transfers. This bit affects the execution of burst transfers only.</p> <p>0: INCR8 1: INCR</p>
7	–	R	Read as undefined.
6	mr_reset	R/W	<p>Initializes the Master Read transfer block of UDC2AB. However, as the FIFOs of EPs are not initialized, you need to access the UDFS2CMD of UDC2 to initialize the corresponding EP separately from this reset.</p> <p>This reset should be used after stopping the Master operation.</p> <p>This bit will be automatically cleared to 0 after being set to 1. Subsequent Master Read transfers should not be made until it is cleared.</p> <p>0: No operation 1: Reset</p>
5	mr_abort	W	<p>Controls Master Read transfers. Master Read operations can be stopped by setting 1 to this bit.</p> <p>When aborted during transfers, transfer of buffers for Master Read to UDC2 is interrupted and the &lt;mr_enable&gt; bit is cleared, stopping the Master Read transfer.</p> <p>Aborting completes when the &lt;mr_enable&gt; bit is disabled to 0 after setting this bit to 1.</p> <p>0: No operation 1: Abort</p>
4	mr_enable	R/W	<p>Controls Master Read transfers. Enabling should be made when setting the transfer address is completed. It will be automatically disabled as the master transfer finishes. Since Master Read operations cannot be disabled with this register, use the &lt;mr_abort&gt; bit if the Master Read transfer should be stopped.</p> <p>0: Disable 1: Enable</p>
3	–	R	Read as undefined.
2	mw_reset	R/W	<p>Initializes the Master Write transfer block. However, as the FIFOs of EPs are not initialized, you need to access the UDFS2CMD of UDC2 to initialize the corresponding EP separately from this reset.</p> <p>This reset should be used after stopping the Master operation.</p> <p>This bit will be automatically cleared to 0 after being set to 1. Subsequent Master Write transfers should not be made until it is cleared.</p> <p>0: No operation 1: Reset</p>
1	mw_abort	W	<p>Controls Master Write transfers. Master Write operations can be stopped by setting 1 to this bit.</p> <p>When aborted during transfers, transfer of buffers for Master Write from UDC2 is interrupted and the &lt;mw_enable&gt; bit is cleared, stopping the Master Write transfer. Aborting completes when the &lt;mw_enable&gt; bit is disabled to 0 after setting this bit to 1.</p> <p>0: No operation 1: Abort</p>
0	mw_enable	R/W	<p>Controls Master Write transfers. Enabling should be made when setting the transfer address is completed. It will be automatically disabled as the master transfer finishes. Since Master Write operations cannot be disabled with this register, use the &lt;mw_abort&gt; bit if the Master Write transfer should be stopped.</p> <p>0: Disable 1: Enable</p>

## 17.4.1.7 UDFSDMACRDREQ(DMAC Read Request Register)

	31	30	29	28	27	26	25	24
bit symbol	dmardreq	dmardclr	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	dmardadr						-	-
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31	dmardreq	R/W	The bit for requesting read access to the DMAC registers. Setting this bit to 1 will make a read access to the address specified by <dmardadr>. When the read access is complete and the read value is stored in the UDFSDMACRDVL, this bit will be automatically cleared and the UDFSINTSTS<dmac_reg_rd> will be set to 1. 0: No operation 1: Issue a read request
30	dmardclr	R/W	The bit for forcibly clearing the register read access request associated with DMAC. Setting this bit to 1 will forcibly stop the register read access request by <dmardreq> and the value of <dmardreq> will be cleared to 0. After the forced clearing completes, this bit will be automatically cleared. 0: No operation 1: Issue forced clearing
29-8	-	R	Read as undefined.
7-2	dmardadr[5:0]	R/W	Sets the address of the register (upper 6 bits) to be read. It should be set in combination with the <dmardreq> mentioned above. Any one of the following addresses should be set: 0x48: Read the UDFSMWCADR. 0x58: Read the UDFSMRCADR. 0x88: read the UDFSTOUTCNT.
1-0	-	R	Read as undefined.

## 17.4.1.8 UDFSDMACRDVL(DMAC Read Value Register)

	31	30	29	28	27	26	25	24
bit symbol	dmardata							
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	dmardata							
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	dmardata							
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	dmardata							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-0	dmardata[31:0]	R	This register stores the data requested by UDFSDMACRDREQ. This register should not be accessed when the UDFSDMACRDREQ<dmardreq> is set to 1.

17.4.1.9 UDFSUDC2RDREQ(UDC2 Read Request Register)

	31	30	29	28	27	26	25	24
bit symbol	udc2rdreq	udc2rdclr	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	udc2rdadr	
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	udc2rdadr						-	-
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31	udc2rdreq	R/W	<p>The bit for requesting read access to the UDC2 registers. Setting this bit to 1 will make a read access to the address set in the udc2rdadr bit. When the read access is complete and the read value is set to UDFSDMACRDVL, this bit will be automatically cleared and the UDINTSTS&lt;int_udc2_reg_rd&gt; bit of Interrupt Status register will be set to 1.</p> <p>During a write access to UDC2 registers, it works as a status bit which indicates the access being made to display the value of 1. Subsequent accesses to UDC2 registers should not be made while this bit is set to 1.</p> <p>0: No operation 1: Issue a read request</p>
30	udc2rdclr	R/W	<p>The bit for forcibly clearing the read/write access request of UDC2 registers. Setting this bit to 1 will forcibly stop the register read request/UDC2 write access by udc2rdreq and the value of udc2rdreq will be 0. After the forced clearing completes, this bit will be automatically cleared to 0. When interrupted, the read and write values during the access will not be secured.</p> <p>0 : No operation 1 : Issue forced clearing</p>
29-10	-	R	Read as undefined.
9-2	udc2rdadr[7:0]	R/W	<p>Set the address of the UDC2 register [9:2] to be read. Refer to "17.4.1.1 UDC2AB Register list" for information about the register address of the UDC2. The offset addresses in the above register table (0x0200 to 0x0334) are relevant. Set it with the above udc2rdreq.</p>
1-0	-	R	Read as undefined.

## 17.4.1.10 UDFSUDC2RDVL(UDC2 Read Value Register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	udc2rdata							
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	udc2rdata							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-16	–	R	Read as undefined.
15-0	udc2rdata[15:0]	R	This register stores the data requested by UDFSUDC2RDREQ. This register should not be accessed when the UDFSUDC2RDREQ <udc2rdreq> is set to 1.

## 17.4.1.11 UDFSARBTSET(Arbiter Setting Register)

	31	30	29	28	27	26	25	24
bit symbol	abt_en	-	-	abtmod	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	abtpri_w1		-	-	abtpri_w0	
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	abtpri_r1		-	-	abtpri_r0	
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31	abt_en	R/W	Enables the arbiter operation when making an access between DMAC and AHB. 0 should be set to this bit when setting the <abtmod>, <abtpri_w1>, <abtpri_w0>, <abtpri_r1> and <abtpri_r0> of this register. Be sure to set this bit to 1 before starting a DMA access. 0: Disable (DMA access not allowed) 1: Enable
30-29	-	R	Read as undefined.
28	abdmod	R/W	Sets the mode of arbiter. Write access is only available when the <abt_en> bit is set to 0. If 0 is set to this bit, access rights to the AHB bus will be given in a round-robin fashion regardless of the values set to each <abtpri_w1>, <abtpri_w0>, <abtpri_r1> and <abtpri_r0> bit. If 1 is set to this bit, access rights to the AHB bus will be given in accordance with the access priority based on the values set to each <abtpri_w1>, <abtpri_w0>, <abtpri_r1> and <abtpri_r0> bit. 0: Round-robin 1: Fixed-priority
27-14	-	R	Read as undefined.
13-12	abtpri_w1	R/W	Set the priority of DMA accesses for Master Write 1 when the fixed priority mode is selected. Write access is only available when the <abt_en> bit is set to 0. Priority ranges from 00 (highest) to 11 (lowest).
11-10	-	R	Read as undefined.
9-8	abtpri_w0	R/W	Set the priority of DMA accesses for Master Write 0 when the fixed priority mode is selected. Write access is only available when the <abt_en> bit is set to 0. Priority ranges from 00 (highest) to 11 (lowest).
7-6	-	R	Read as undefined.
5-4	abtpri_r1	R	Set the priority of DMA accesses for Master Read 1 when the fixed priority mode is selected. Write access is only available when the <abt_en> bit is set to 0. Priority ranges from 00 (highest) to 11 (lowest).
3-2	-	R	Read as undefined.
1-0	abtpri_r0	R/W	Set the priority of DMA accesses for Master Read 0 when the fixed priority mode is selected. Write access is only available when the <abt_en> bit is set to 0. Priority ranges from 00 (highest) to 11 (lowest).

Note: Be sure to set different priority values for the <abtpri\_w1>, <abtpri\_w0>, <abtpri\_r1>, and <abtpri\_r0> bits. If the same priority values are set, you will not be able to set 1 to <abt\_en>.

#### (1) Relationship of DMAC and the priority area of the Arbiter setting register

Current UDC2AB specification supports one DMAC for Master Write (DMAC\_W0) and one DMAC for Master Read (DMAC\_R0). The second DMAC for Master Write (DMAC\_W1) and the second DMAC for Master Read (DMAC\_R1) are not supported.

Accordingly, setting priority for DMAC\_W1 and DMAC\_R1 has virtually no meaning, but you should be sure to set different priority values for the abtpri\_w1, abtpri\_w0, abtpri\_r1, and abtpri\_r0 bits as mentioned above.

There will be no problem to set values for the corresponding register areas of an unpackaged DMAC. The priority areas of Arbiter Setting register correspond with DMAC as shown below.

Figure 17-8 Relationship between DMAC and priority areas

## 17.4.1.12 UDFSMWSADR(Master Write Start Address Register)

	31	30	29	28	27	26	25	24
bit symbol	mwsadr							
After reset	1	1	1	1	1	1	1	1
	23	22	21	20	19	18	17	16
bit symbol	mwsadr							
After reset	1	1	1	1	1	1	1	1
	15	14	13	12	11	10	9	8
bit symbol	mwsadr							
After reset	1	1	1	1	1	1	1	1
	7	6	5	4	3	2	1	0
bit symbol	mwsadr							
After reset	1	1	1	1	1	1	1	1

Bit	Bit Symbol	Type	Function
31-0	mwsadr[31:0]	R/W	Set the start address of Master Write transfer. However, as this master operation only supports address increments, values lower than the UDFSMWEADR should be set.

## 17.4.1.13 UDFSMWEADR(Master Write End Address Register)

	31	30	29	28	27	26	25	24
bit symbol	mweadr							
After reset	1	1	1	1	1	1	1	1
	23	22	21	20	19	18	17	16
bit symbol	mweadr							
After reset	1	1	1	1	1	1	1	1
	15	14	13	12	11	10	9	8
bit symbol	mweadr							
After reset	1	1	1	1	1	1	1	1
	7	6	5	4	3	2	1	0
bit symbol	mweadr							
After reset	1	1	1	1	1	1	1	1

Bit	Bit Symbol	Type	Function
31-0	mweadr[31:0]	R/W	Set the end address of Master Write transfer. However, as this master only supports address increments, values above the UDFSMWSADR should be set.

## 17.4.1.14 UDFSMWCADR(Master Write Current Address Register)

	31	30	29	28	27	26	25	24
bit symbol	mwcaadr							
After reset	1	1	1	1	1	1	1	1
	23	22	21	20	19	18	17	16
bit symbol	mwcaadr							
After reset	1	1	1	1	1	1	1	1
	15	14	13	12	11	10	9	8
bit symbol	mwcaadr							
After reset	1	1	1	1	1	1	1	1
	7	6	5	4	3	2	1	0
bit symbol	mwcaadr							
After reset	1	1	1	1	1	1	1	1

Bit	Bit Symbol	Type	Function
31-0	mwcaadr[31:0]	R	Displays the addresses to which transfers from EPs to the Master Write buffers have been currently completed in Master Write transfers. This can be used in case a timeout interrupt has occurred or an error occurred during the transfer process.  This address is incremented at the point when the data is set from the EP to the Master Write buffer, while the data will reside inside the target device or the Master Write buffer during the Master Write transfer process until the displayed address.

## 17.4.1.15 UDFSMWAHBADR(Master Write AHB Address Register)

	31	30	29	28	27	26	25	24
bit symbol	mrsadr							
After reset	1	1	1	1	1	1	1	1
	23	22	21	20	19	18	17	16
bit symbol	mrsadr							
After reset	1	1	1	1	1	1	1	1
	15	14	13	12	11	10	9	8
bit symbol	mrsadr							
After reset	1	1	1	1	1	1	1	1
	7	6	5	4	3	2	1	0
bit symbol	mrsadr							
After reset	1	1	1	1	1	1	1	1

Bit	Bit Symbol	Type	Function
31-0	mrsadr[31:0]	R	Displays the address where the transfer to the target device has completed in Master Write transfer. This can be used in case a timeout interrupt has occurred or an error occurred during the transfer process.  This address is incremented at the point when the data is set to the target device, while the data will reside inside the target device or during the Master Write transfer process until the displayed address.

## 17.4.1.16 UDFSMRSADR(Master Read Start Address Register)

	31	30	29	28	27	26	25	24
bit symbol	mrsadr							
After reset	1	1	1	1	1	1	1	1
	23	22	21	20	19	18	17	16
bit symbol	mrsadr							
After reset	1	1	1	1	1	1	1	1
	15	14	13	12	11	10	9	8
bit symbol	mrsadr							
After reset	1	1	1	1	1	1	1	1
	7	6	5	4	3	2	1	0
bit symbol	mrsadr							
After reset	1	1	1	1	1	1	1	1

Bit	Bit Symbol	Type	Function
31-0	mrsadr[31:0]	R/W	Set the start address of Master Read transfer. However, as this master only supports address increments, values lower than the UDFSMWEADR should be set.

## 17.4.1.17 UDFSMREADR(Master Read End Address Register)

	31	30	29	28	27	26	25	24
bit symbol	mreadr							
After reset	1	1	1	1	1	1	1	1
	23	22	21	20	19	18	17	16
bit symbol	mreadr							
After reset	1	1	1	1	1	1	1	1
	15	14	13	12	11	10	9	8
bit symbol	mreadr							
After reset	1	1	1	1	1	1	1	1
	7	6	5	4	3	2	1	0
bit symbol	mreadr							
After reset	1	1	1	1	1	1	1	1

Bit	Bit Symbol	Type	Function
31-0	mreadr[31:0]	R/W	Set the end address of Master Read transfer. However, as this master only supports address increments, values above the UDFSMRSADR should be set.

## 17.4.1.18 UDFSMRCADR(Master Read Current Address Register)

	31	30	29	28	27	26	25	24
bit symbol	mrcadr							
After reset	1	1	1	1	1	1	1	1
	23	22	21	20	19	18	17	16
bit symbol	mrcadr							
After reset	1	1	1	1	1	1	1	1
	15	14	13	12	11	10	9	8
bit symbol	mrcadr							
After reset	1	1	1	1	1	1	1	1
	7	6	5	4	3	2	1	0
bit symbol	mrcadr							
After reset	1	1	1	1	1	1	1	1

Bit	Bit Symbol	Type	Function
31-0	mrcadr[31:0]	R	Displays the address to which transfers from the target device to the EP have been currently completed in Master Read transfers. This address is incremented at the point when the data is set from the Master Read buffer to the EP, while the data will reside inside the FIFO for the EP during the Master Read transfer process until the displayed address.

## 17.4.1.19 UDFSMRAHBADR(Master Read AHB Address Register)

	31	30	29	28	27	26	25	24
bit symbol	mrahbadr							
After reset	1	1	1	1	1	1	1	1
	23	22	21	20	19	18	17	16
bit symbol	mrahbadr							
After reset	1	1	1	1	1	1	1	1
	15	14	13	12	11	10	9	8
bit symbol	mrahbadr							
After reset	1	1	1	1	1	1	1	1
	7	6	5	4	3	2	1	0
bit symbol	mrahbadr							
After reset	1	1	1	1	1	1	1	1

Bit	Bit Symbol	Type	Function
31-0	mrahbadr[31:0]	R	Displays the address where the transfer from the target device to UDC2AB has completed in Master Read transfer. This address is incremented at the point when the data is set from the target device, while the data will reside inside the buffer or the FIFO for the EP during the Master Read transfer process until the displayed address.

17.4.1.20 UDFSPWCTL(Power Detect Control Register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	wakeup_en	phy_re- mote_wkup	phy_resetb	suspend_x	phy_suspend	pw_detect	pw_resetb	usb_reset
After reset	0	0	1	1	0	0	1	0

Bit	Bit Symbol	Type	Function
31-8	–	R	Read as 0.
7	wakeup_en	R/W	<p>Set this bit to '1' if you want to shift the TMPM368FDXBG to low-power consumption mode to stop CLK_H when the USB is suspended.</p> <p>If this bit is set to '1', the <math>\overline{\text{WAKEUP}}</math> signal will be asserted to 0 asynchronously when the suspended status (<math>\text{&lt;suspend\_x&gt;=1}</math>) is cancelled. This allows TMPM368FDXBG to resume from the low-power consumption mode using INTUSBWKUP.</p> <p>Refer to "17.5.7 Suspend / Resume" for more information about how to use this bit.</p> <p>0: Do not assert the <math>\overline{\text{WAKEUP}}</math> signal. 1: Assert the <math>\overline{\text{WAKEUP}}</math> signal.</p>
6	phy_remo-to_wkup	R/W	<p>This bit is used to perform the remote wakeup function of USB. Setting this bit to 1 makes it possible to assert the udc2_wakeup output signal (wakeup input pin of UDC2) to 1. However, since setting this bit to 1 while no suspension is detected by UDC2 (when <math>\text{suspend\_x} = 1</math>) will be ignored (not to be set to 1), be sure to set it only when suspension is detected. It will be automatically cleared to 0 when resuming the USB is completed (when <math>\text{suspend\_x}</math> is deasserted). See also "1.3.24.8 Suspend / Resume" for more information on using this bit.</p> <p>Refer to "17.5.7 Suspend / Resume" for more information about how to use this bit.</p> <p>0: No operation 1: Wakeup</p>
5	phy_resetb	R/W	<p>Setting this bit to 0 will make the PHYRESET output signal asserted to 1. The PHYRESET signal can be used to reset PHY. Since this bit will not be automatically released, be sure to clear it to 1 after the specified reset time of PHY.</p> <p>0: Reset asserted 1: Reset deasserted</p>
4	suspend_x	R	<p>Detects the suspend signal (a value of the <math>\text{suspend\_x}</math> signal from UDC2 synchronized).</p> <p>0: Suspended (<math>\text{&lt;suspend\_x&gt; = 0}</math>) 1: Unsuspended (<math>\text{&lt;suspend\_x&gt; = 1}</math>)</p>
3	phy_suspend	R/W	<p>Setting this bit to 1 will make the <math>\overline{\text{PHYSUSPEND}}</math> output signal asserted to 0 (CLK_H synchronization). It can be used as a pin for suspending PHY.</p> <p>Setting this bit to 1 makes the UDC2 register and UDFSDMACRDREQ not accessible.</p> <p>It will be automatically cleared to 0 when resumed (when <math>\text{suspend\_x}</math> of UDC2 is deasserted).</p> <p>Refer to "17.5.7 Suspend / Resume" for more information about how to use this bit.</p> <p>0: Not suspended. 1: Suspended</p>
2	pw_detect	R	<p>Indicates the status of the VBUSPOWER input of the UDC2AB.</p> <p>0: USB bus disconnected (VBUSPOWER = 0) 1: USB bus connected (VBUSPOWER = 1)</p>
1	pw_resetb	R/W	<p>Software reset for UDC2AB(See "17.5.1 Reset" for details). Setting this bit to 0 will make the PW_RESETB output pin asserted to 0.</p> <p>Resetting should be made while the master operation is stopped.</p> <p>Since this bit will not be automatically released, be sure to clear it.</p> <p>0: Reset asserted. 1: Rest deasserted.</p>
0	usb_reset	R	<p>The value of the <math>\text{usb\_reset}</math> signal from the UDC2 synchronized.</p> <p>0: <math>\text{usb\_reset} = 0</math> 1: <math>\text{usb\_reset} = 1</math></p>

## 17.4.1.21 UDFSMSTSTS(Master Status Register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	mrepempty	mrbfemp	mwbfemp	mrepdset	mwpdset
After reset	0	0	0	1	1	1	0	0

Bit	Bit Symbol	Type	Function
31-5	-	R	Reset as undefined.
4	mrepempty	R	This is a register that indicates the EP for UDC2Rx is empty. Ensure that this bit is set to 1 when sending a NULL packet using the UDFSC2STSET<tx0>. (This bit is the eptx_empty input signal with CLK_H synchronization.) 0: Indicates the EP contains some data. 1: Indicates the EP is empty.
3	mrbfemp	R	Indicates whether or not the buffer for the Master Read DMA in UDC2AB is empty. 0: Indicates the buffer for the Master Read DMA contains some data. 1: Indicates the buffer for the Master Read DMA is empty.
2	mwbfemp	R	Indicates whether or not the buffer for the Master Write DMA in UDC2AB is empty. 0: Indicates the buffer for the Master Write DMA contains some data. 1: Indicates the buffer for the Master Write DMA is empty.
1	mrepdset	R	This bit will be set to 1 when the data to be transmitted is set to the Tx-EP of UDC2 by Master Read DMA transfer, making no room to write in the EP. It will turn to 0 when the data is transferred from UDC2 by the IN-Token from the host. While this bit is set to 0, DMA transfers to the EP can be made. (This bit is the eptx_dataset input signal with CLK_H synchronization.) 0: Data can be transferred into the EP. 1: There is no space to transfer data in the EP.
0	mwpdset	R	This bit will be set to 1 when the data received is set to the Rx-EP of UDC2. It will turn to 0 when the entire data was read by the DMA for Master Write. (This bit is the eprx_dataset input signal with CLK_H synchronization.) 0: No data exists in the EP. 1: There is some data to be read in the EP.

## 17.4.1.22 UDFSTOUTCNT(Timeout Count Register)

	31	30	29	28	27	26	25	24
bit symbol	tmoutcnt							
After reset	1	1	1	1	1	1	1	1
	23	22	21	20	19	18	17	16
bit symbol	tmoutcnt							
After reset	1	1	1	1	1	1	1	1
	15	14	13	12	11	10	9	8
bit symbol	tmoutcnt							
After reset	1	1	1	1	1	1	1	1
	7	6	5	4	3	2	1	0
bit symbol	tmoutcnt							
After reset	1	1	1	1	1	1	1	1

Bit	Bit Symbol	Type	Function
31-0	tmoutcnt[31:0]	R	<p>This is used for debugging. Values of the timer can be read when the UDFSMWTOUT&lt;timeout_en&gt; is enabled. It will be decremented each time CLK_U is counted after the EP for Master Write (Rx-EP) becomes empty.</p> <p>This register cannot be read by directly specifying the address. In order to read it, set a value to the UDFSD-MACRDREQ and then read the value from UDFSDMACRDVL.</p>

Note 1: Those shown as "Reserved" above and the area from 0x0400 to 0x0FFF are prohibited to access. Read / Write is prohibited to these areas.

Note 2: The registers are initialized by reset\_x or USB\_reset.

### 17.4.2.2 How to access the UDC2 register

The bits 15-0 of the AHB data bus of UDC2AB are connected to the UDC data bus.

The bit31-16 are read-only (read value: undefined).

Make a WORD (32-bit) access for both write and read. (However, a BYTE (8-bit) access may be made for Write accesses to the EPx\_FIFO register. Details will be described later).

It will take some time to complete an access for both write and read.

Be sure to begin subsequent accesses after the previous UDC2 register access is completed, using the `int_udc2_reg_rd` interrupt. (You can also use the `UDFSUDC2RDREQ`<`udc2rdreq`> to confirm the access status when reading.)

- Write access

When making a write access to the UDC2 register, write it directly in the relevant address.

- Read access

When making a read access to the UDC2 register, use `UDFSUDC2RDREQ` and `UDFSUDC2RDVL`.

First, you set the address to access to the `UDFSUDC2RDREQ` and then read the data from the `UDFSUDC2RDVL` for reading. You cannot read the data directly from the address shown in the "17.4.2.1 UDC2 Registers".

- EPx\_FIFO register

When making a write access to the EPx\_FIFO register, a lower 1-byte access may be required in UDC2 PSCI I/F. In such a case, make a BYTE access to the lower 1 byte for UDC2AB.

If a lower 1-byte access is required when making a read access, make an access via `UDFSUDC2RDREQ` as usual and read the data from `UDFSUDC2RDVL`. In that case, the access to `UDFSUDC2RDVL` can be either by WORD or BYTE.

- Reserved Register in UDC2

Do not make any access to registers of EPs not supported by UDC2 to be connected and to "Reserved" registers. (In case those registers are accessed, the access from UDC2AB to UDC2 itself will take place. It will be a Dummy write to UDC2 in case of write accesses. In case of read accesses, the read data from UDC2 (`udc2_rdata`) will be an indefinite value and the indefinite value will be set to the `UDFSUDC2RDVL`.)

- Accesses when UDC2 is suspended

When UDC2 is in the suspended status, register accesses to UDC2 become unavailable if the clock (= `CLK_U`) supply from USB clock control circuit is stopped. Make no register accesses to UDC2 in such cases. If the UDC2 register is accessed when the `UDFSPWCTL`<`phy_suspend`> is set to 1, an AHB error will be returned.

Access flow diagram for UDC2 register is shown below.

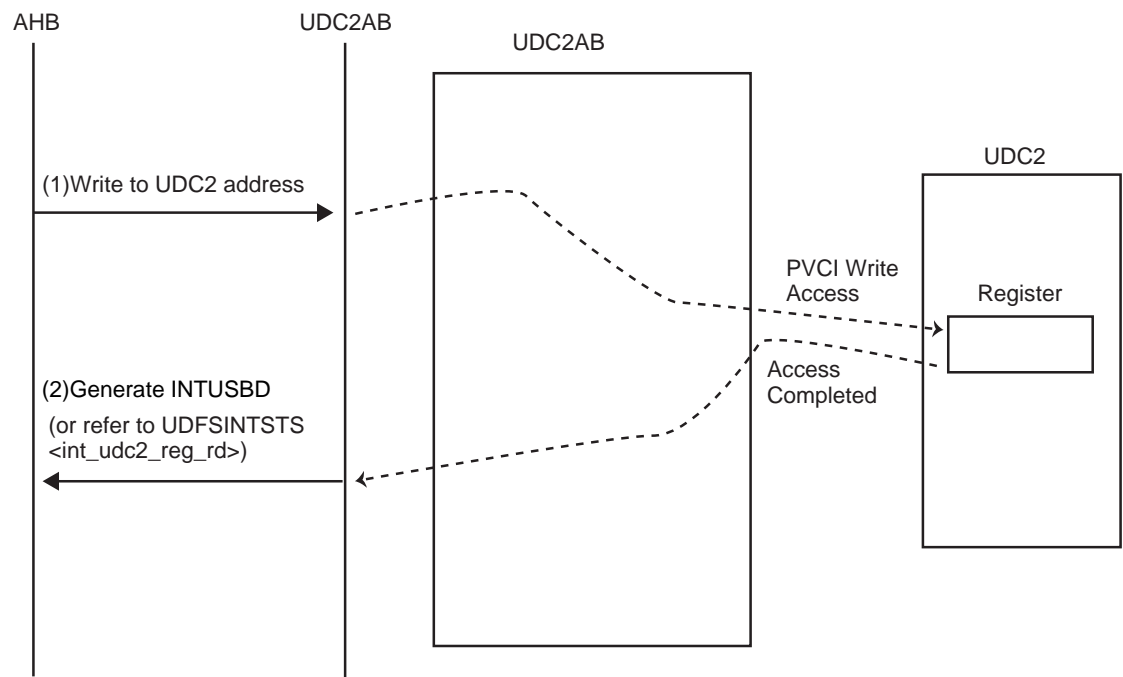

Figure 17-9 Write Access Flow Diagram of the UDC2 Register

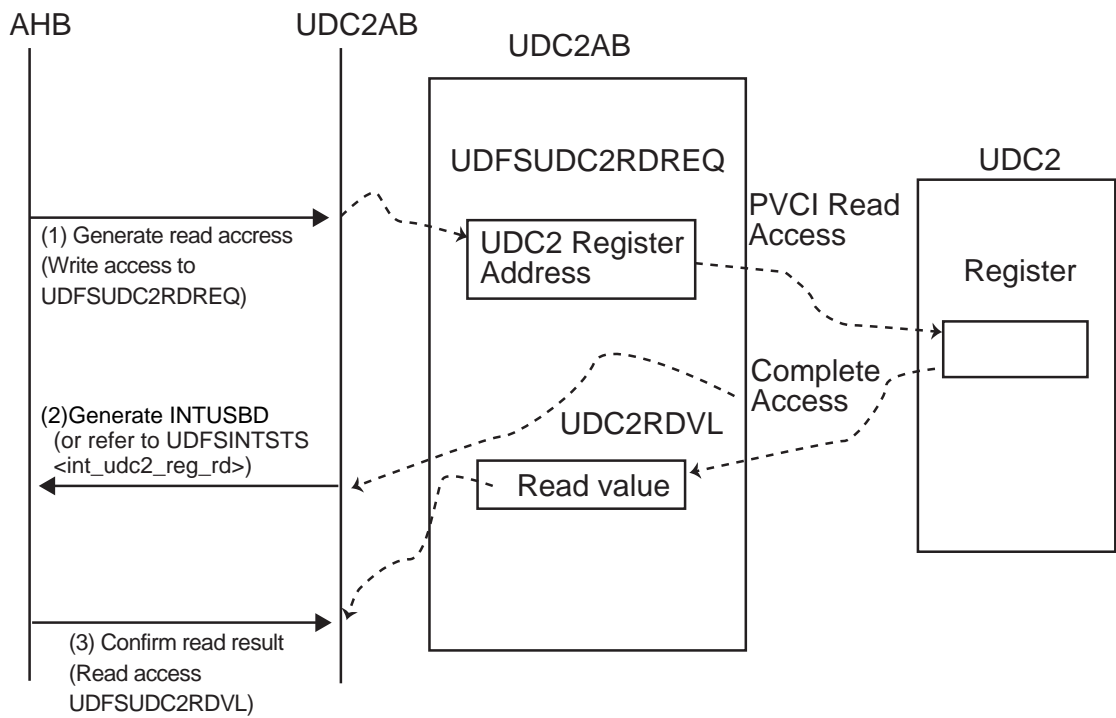

Figure 17-10 Read Access Flow Diagram of the UDC2 Register

## 17.4.2.3 UDFS2ADR(Address-State register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	stage_err	ep_bi_mode	cur_speed		suspend	configured	addressed	default
After reset	0	0	0	0	0	0	0	1
	7	6	5	4	3	2	1	0
bit symbol	-	dev_adr						
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-16	-	R	Read as undefined.
15	stage_err	R/W	Indicates whether Control transfers finished normally up to the STATUS-Stage. 1 will be set when the Setup-Token is received in DATA-Stage/STATUS-Stage or in the case of "STALL" transmission. When set, it will be cleared when the next Control transfer has been finished normally. 0: Other than above conditions. 1: Received the Setup-Token in DATA-Stage/STATUS-Stage or "STALL" transmission.
14	ep_bi_mode	R/W	Selects whether to use the EP bidirectionally as a driver. Setting this bit to 1 will enable an EP number to be used bidirectionally in USB communication. 0: Single direction 1: Dual direction
13-12	cur_speed[1:0]	R	Indicates the present transfer mode on the USB bus. 00: Reserved 01: Full-Speed 10: Reserved 11: Reserved
11	suspend	R	Indicates whether or not UDC2 is in suspended state. 0: Normal 1: Suspend
10	configured	R/W	Set the present device state of UDC2. This should be set in accordance with the request received from the host. Please note that you should not set 1 to more than one bit. 001: default (to be set when the DeviceAddress = 0 was specified by the Set_address request in Default / Address state (this will be set by the hardware when USB_RESET is received)) 010: addressed (to be set when ConfigurationValue = 0 was specified by the Set_configuration request after the Set_address request finished normally and in the Address/Configured state). 100: configured (to be set when the Set_configuration request is received).
9	addressed	R/W	
8	default	R/W	
7	-	R	Read as undefined.
6-0	dev_adr[6:0]	R/W	Sets the device address assigned by the host. The device address should be set after Set_address has finished normally (after STATUS-Stage finished normally).

17.4.2.4 UDFS2FRM(Frame register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	create_sof	-	f_status		-	frame		
After reset	0	0	1	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	frame							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-16	-	R	Read as undefined.
15	create_sof	R/W	Sets whether to generate the SOF flag internally when the SOF from the host is unavailable due to a bus error. This should be set if you wish to synchronize frames by SOF in Isochronous transfers. If enabled, the internal frame time counter will operate and the SOF flag will be output even when the SOF-Token could not be received successfully. 0: Generates no flag 1: Generates a flag
14	-	R	read as undefined.
13-12	f_status[1:0]	R	Indicates the status of the frame number.  00: Before: Will be set if the Micro SOF/SOF was not received when 1frame-time (Full-Speed:1 ms) has passed after receiving the Micro SOF/SOF when <create_sof> is enabled. In the Frame register, the frame number received in the last Micro SOF/SOF has been set.  01: Valid: Will be set when the Micro SOF/SOF was received. Indicates a valid frame number is set in the Frame register.  10: Lost: Indicates that the frame number maintained by the host is not synchronized with the value of UDFS2FRM. Accordingly, this will be set in the following cases: 1. When the system was reset or suspended. 2. If the next Micro SOF/SOF was not received when 2 frame-time (Full-Speed: 1 x 2 ms) has passed after receiving the previous Micro SOF/SOF when <create_sof> is enabled. Also note that transition to the Lost status only happens after the system was reset or when it is suspended if <create_sof> is disabled.
11	-	R	Read as undefined.
10-0	frame[10:0]	R	Indicates the frame number when SOF is received. This will be valid when <f_status> is "Valid". Should not be used if <f_status> is "Before" or "Lost" as correct values are not set.

## 17.4.2.5 UDFS2CMD(Command register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	int_toggle	-	-	-	rx_nulpkt_ep			
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	ep				com			
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-16	-	R	Read as undefined.
15	int_toggle	R/W	Makes the DATA-PID toggle when Handshake is not received in Interrupt-IN transfers. 0: Do not toggle when not received 1: Toggle when not received as well
14-12	-	R	Read as undefined.
11-8	rx_nulpkt_ep [3:0]	R	Indicates the receiving EP when Zero-Length data is received. When the INT_RX_ZERO flag is asserted, read this bit to check to which EP it was asserted. Once Zero-Length data is received and the EP number is retained, the value of this register will be retained until Zero-Length data is received next time or hardware reset is made. If there is more than one EP of OUT direction, this bit will be renewed each time Zero-Length data is received. In that case, UDFS2INTRX0 can be used to identify which EP has received the data.
7-4	ep[3:0]	R/W	Sets the EP where the command to be issued will be valid. (Do not specify an EP not existing.)
3-0	com[3:0]	R/W	Sets the command to be issued for the EP selected in ep[3:0]. Refer to "17.2.2.3 Commands to EP" for more information. 0x0: Reserved 0x1: Setup_Fin 0x2: Set_DATA0 0x3: EP_Reset 0x4: EP_Stall 0x5: EP_Invalid 0x6: Reserved 0x7: EP_Disable 0x8: EP_Enable 0x9: All_EP_Invalid 0xA: USB_Ready 0xB: Setup_Received 0xC: EP_EOP 0xD: EP_FIFO_Clear 0xE: EP_TX_0DATA 0xF: Reserved

## 17.4.2.6 UDFS2BRQ(bRequest-bmRequest Type register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-

After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-16	-	R	Read as undefined
15-8	request[7:0]	R	Indicates the data of the second byte received with the Setup-Token (bRequest field).
7	dir	R	Indicates the data of the first byte received with the Setup-Token (bmRequestType field). Direction of Control transfers. 0: Control-WR transfer 1: Control-RD transfer
6-5	req_type[1:0]	R	Type of requests 00: Standard request 01: Class request 10: Vendor request 11: Reserved
4-0	recipient[4:0]	R	Requests are received by 0_0000: Device 0_0001: Interface 0_0010: EP 0_0011: etc. 0_0100-1_1111: Reserved

## 17.4.2.7 UDFS2WVL(wValue register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	value							
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	value							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-16	–	R	Read as undefined.
15-8	value[15:8]	R	Indicates the data of the fourth byte received with the Setup-Token (wValue (High) field).
7-0	value[7:0]	R	Indicates the data of the third byte received with the Setup-Token (wValue (Low) field).

17.4.2.8 UDFS2WIDX(wIndex register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	index							
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	index							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-16	–	R	Read as undefined
15-8	index[15:8]	R	Indicates the data of the sixth byte received with the Setup-Token (wIndex (High) field).
7-0	index[7:0]	R	Indicates the data of the fifth byte received with the Setup-Token (wIndex (Low) field).

## 17.4.2.9 UDFS2WLGTH(wLength register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	length							
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	length							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-16	-	R	Read as undefined
15-8	length[15:8]	R	Indicates the data of the eighth byte received with the Setup-Token (wLength (High) field).
7-0	length[7:0]	R	Indicates the data of the seventh byte received with the Setup-Token (wLength (Low) field).

## 17.4.2.10 UDFS2INT(INT register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	m_nak	m_ep	m_ep0	m_sof	m_rx_data0	m_status	m_status_nak	m_setup
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	i_nak	i_ep	i_ep0	i_sof	i_rx_data0	i_status	i_status_nak	i_setup
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-16	-	R	Read as undefined.
15	m_nak	R/W	Sets whether or not to output <i_nak> to the INT_NAK pin. 0: output 1: no output
14	m_ep	R/W	Sets whether or not to output <i_ep> to INT_EP pin. 0: output 1: no output
13	m_ep0	R/W	Sets whether or not to output <i_ep0> to INT_EP0 pin. 0: output 1: no output
12	m_sof	R/W	Sets whether or not to output <i_sof> to INT_SOF pin. 0: output 1: no output
11	m_rx_data0	R/W	Sets whether or not to output <i_rx_data0> to INT_RX_ZERO pin. 0: output 1: no output
10	m_status	R/W	Sets whether or not to output <i_status> to INT_STATUS pin. 0: output 1: no output
9	m_status_nak	R/W	Sets whether or not to output <i_status_nak> to INT_STATUS_NAK pin. 0: output 1: no output
8	m_setup	R/W	Sets whether or not to output <i_setup> to INT_SETUP pin. 0: output 1: no output
7	i_nak	R/W	This will be set to 1 when NAK is transmitted by EPs except EP0. (EPs to which you wish to output the INT_NAK flag can be selected using UDFS2INTNAKMASK). Writing 1 to this bit will make each bit of UDFS2INTNAK cleared to 0.
6	i_ep	R/W	This will be set to 1 when transfers to EPs other than EP0 have successfully finished (EPs to which you wish to output the flag can be selected using UDFS2INTNAKMASK). Writing 1 to this bit will make each bit of UDFS2INTEP cleared to 0.
5	i_ep0	R/W	This will be set to 1 when the transfer to EP0 has successfully finished.
4	i_sof	R/W	This will be set to 1 when the SOF-token is received or after 1 frame-time was counted in the create_sof mode.
3	i_rx_data0	R/W	This will be set to 1 when Zero-Length data is received. (EPs to which you wish to output the flag can be selected using UDFS2INTNAKMASK). Writing 1 to this bit will make each bit of UDFSINTTRX0 cleared to 0. This will not be set to 1 when Zero-Length data is received in the STATUS-Stage of Control-RD transfers.

Bit	Bit Symbol	Type	Function
2	i_status	R/W	This will be set to 1 when the STATUS-Stage has successfully finished in Control transfers at EP0. (This will be set to 1 when Zero-Length data is received in the STATUS-Stage and successfully finished in Control-RD transfers, and when Zero-Length data is transmitted in the STATUS-Stage and successfully finished in Control-WR transfers.)
1	i_status_nak	R/W	This will be set to 1 when the packet of STATUS-Stage is received in the Control-RD transfers at EP0. When this bit was set which means the DATA-Stage has finished, set the "Setup-Fin" command by the UDFS2CMD to make the stage of UDC2 proceed to the STATUS-Stage. When receiving the data having the size of an integral multiple of MaxPacketSize (64 bytes) in the DATA-Stage of Control-WR transfers, Zero-Length data may be received to indicate the end of the DATA-Stage. After that, as the end of the DATA-Stage can be recognized by this i_status_nak when receiving the In-token in the STATUS-Stage, make UDC2 proceed to the STATUS-Stage.
0	i_setup	R/W	This will be set to 1 when the Setup-Token was received in Control transfers at EP0.

## 17.4.2.11 UDFS2INTEP(INT\_EP register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	i_ep7	i_ep6	i_ep5	i_ep4	i_ep3	i_ep2	i_ep1	-
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-16	-	R	Read as undefined.
15-8	Reserved	R/W	Write as "0".
7-1	i_ep7 to i_ep1	R/W	Flags to indicate the transmitting/receiving status of EPs (except for EP0). The relevant bit will be set to 1 when the transfer to EPs other than EP0 has successfully finished. (EPs to which you wish to output the int_ep flag can be selected using UDFS2INTEPMSK.). 0: No data transmitted/received. 1: Some data transmitted/received
0	-	R/W	Read as undefined.

## 17.4.2.12 UDFS2INTEPMSK(INT\_EP\_MASK register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	m_ep7	m_ep6	m_ep5	m_ep4	m_ep3	m_ep2	m_ep1	m_ep0
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-16	-	R	Read as undefined.
15-8	Reserved	R/W	Write as "0".
7-0	m_ep7 to m_ep0	R/W	Mask control of flag output. 0 : output 1: no output  Sets whether or not to output flags of UDFS2INTEP and UDFS2INTRX0 to the int_ep pin and the int_rx_zero pin respectively. When an EP is masked, each bit of UDFS2INTEP will be set when the transfer of the relevant EP has successfully finished, but the int_ep pin will not be asserted. Similarly, when an EP is masked, each bit of UDFS2INTRX0 will be set when Zero-Length data is received at the relevant EP, but the int_rx_zero pin will not be asserted. However, bit 0 is only valid for UDFS2INTRX0.

## (1) How to use UDFS2INT / UDFS2INTEP / UDFS2INTEPMSK

An example of using UDFS2INT / UDFS2INTEP / UDFS2INTEPMSK is provided for EP1 to 3.

## 1. When using EP 1 and EP 2 with DMA (EP I/F) and using only EP3 via PSCI-I/F

UDFS2INT	<i_ep>	Used as the interrupt source of EP3. This bit is also used when clearing.
	<m_ep>	Used as the mask of the interrupt source of EP3.
UDFS2INTEP	<i_ep1>	Don't care
	<i_ep2>	Don't care
	<i_ep3>	Don't care
UDFS2INTEPMSK	<m_ep1>	Set 1 to mask the bit.
	<m_ep2>	Set 1 to mask the bit.
	<m_ep3>	Write 0.

## 2. When using EP2 and EP3 via PSCI-I/F and using EP1 with DMA

After initialization, set 1 to UDFS2INTEPMSK of the EP to be used with DMA to mask it. When making interrupt responses for more than one EPs, be sure to use UDFS2INTEP. Ignore UDFS2INT<i\_ep> and always enable <m\_ep> as 0.

Do not clear the source using UDFS2INT<i\_ep>. After the interrupt has occurred, you need to check UDFS2INT and UDFS2INTEP to determine the source. When clearing the source, use each source bit of UDFS2INT interrupt to clear it.

UDFS2INT	<i_ep>	Write as 0.
	<m_ep>	Write as 0.
UDFS2INTEP	<i_ep1>	Don't care
	<i_ep2>	Used as the interrupt source of EP2. This bit is also used when clearing.
	<i_ep3>	Used as the interrupt source of EP3. This bit is also used when clearing.
UDFS2INTEPMSK	<m_ep1>	Set 1 to mask the bit.
	<m_ep2>	Used as the mask of the interrupt source of EP2. Write as "0".
	<m_ep3>	Used as the mask of the interrupt source of EP3. Write as "0".

## 17.4.2.13 UDFS2INTRX0(INT\_RX\_DATA0 register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0

After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	max_pkt							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-16	-	R	Read as undefined.
15	tx_0data	R	When the "EPx_TX_0DATA" command is issued to EPx by UDFS2CMD or Zero-Length data has been set at EP-I/F, this bit will be set to 1. It will be cleared to 0 after the Zero-Length data has been transmitted.
14-13	-	R	Read as undefined.
12	dset	R	Indicates the status of EPx_FIFO. 0: No valid data exists 1: Valid data exists
11	-	R	Read as undefined.
10-0	max_pkt[10:0]	R/W	Sets MaxPacketSize of EPx. Set this when configuring the EP when Set_Configuration and Set_Interface are received. Set an even number for a transmit EP. On USB, when MaxPacketSize of a transmit EP is an odd number, set an even number to max_pkt and make the odd number of accesses to the EP. (For instance, set 1024 to max_pkt when the MaxPacketSize should be 1023 bytes.) Note: For details, refer to "17.9.2 Appendix B About Setting an Odd Number of Bytes as MaxPacketSize".

Note 1: The initial value of <dset> after reset is 1 when the EPx is a transmit EP, while it is 0 when the EPx is a receive EP.

Note 2: The initial value of <dset > after USB\_RESET is 1 when the EPx is a transmit EP, while it is "Retain" when the EPx is a receive EP.

Note 3: x=1 to 7

## 17.4.2.21 UDFS2EPxSTS(EPx\_Status register)

	31	30	29	28	27	26	25	24

## 17.5 Description of UDC2AB operation

### 17.5.1 Reset

UDC2AB supports software reset by the UDFSPWCTL<pw\_resetb>.

It also supports master channel reset (UDFSMSTSET<mr\_reset>/<mw\_reset>) for DMAC master transfers.

- Software reset (UDFSPWCTL<pw\_resetb>)

Some bits of each register are initialized by hardware reset but not initialized by software reset with the values retained. As details are provided in the descriptions of each register, refer to "17.4.1.1 UDC2AB Register list".

When the USB bus power is detected, make software reset as initialization is needed.

- Master channel reset (UDFSMSTSET<mr\_reset><mw\_reset>)

While the <mw\_reset> bit is provided for the Master Write transfer block and the <mr\_reset> bit for the Master Read transfer block, only the relevant master blocks are initialized and the UDC2AB register will not be initialized. For more information on using each reset, see "17.4.1.6 UDFSMSTSET(DMAC Setting Register)".

17.5.2 Interrupt Signals

There are two interrupt output signals of UDC2AB, INTUSBD and INTUSBWKUP.

17.5.2.1 INTUSBD Interrupt Signal

Interrupt output signal of INTUSBD consists of interrupts generated by UDC2 and that generated by other sources.

Once the interrupt condition is met, UDC2AB sets the corresponding bit of its UDFSINTSTS. When that bit is set, INTUSBD will be asserted if the relevant bit of UDFSINTENB has been set to "Enable."

When the relevant bit of UDFSINTENB has been set to "Disable," 1 will be set to the corresponding bit of UDFSINTSTS while INTUSBD will not be asserted.

When the relevant bit of UDFSINTENB is set to "Enable" with UDFSINTSTS set, INTUSBD will be asserted immediately after the setting is made.

Initial values for UDFSINTENB are all 0 (Disable).

Interrupt output signal of INTUSBD will not be generated while CLK\_H is stopped.

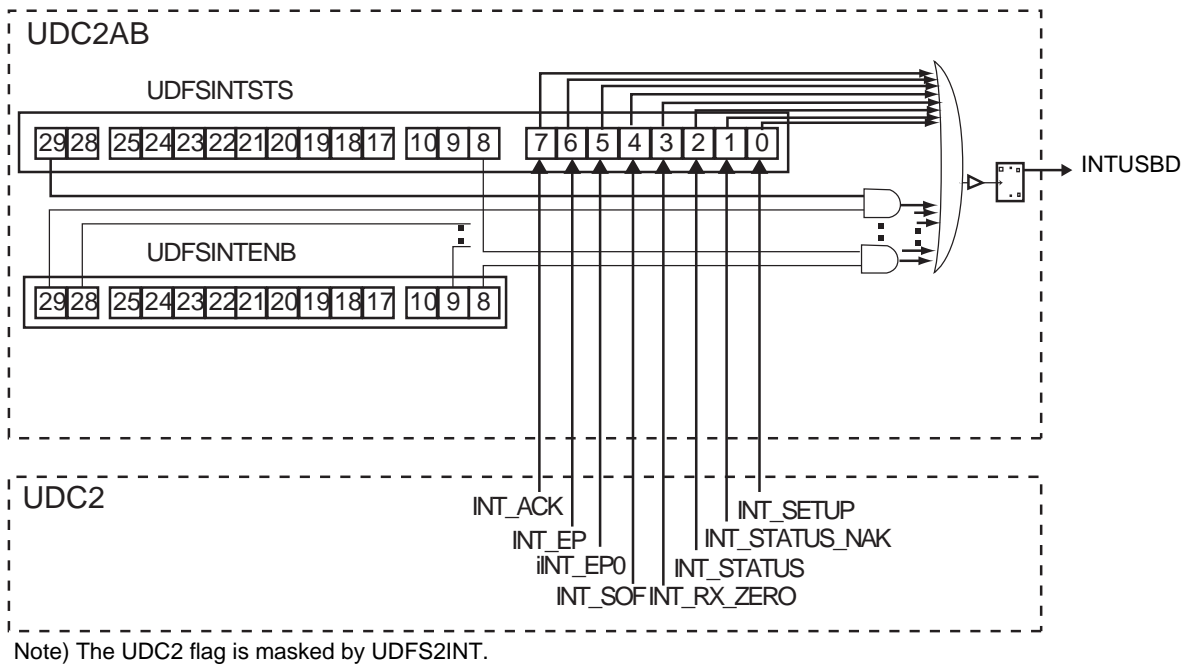

Figure 17-13 Relationship of INTUSBD and registers

#### 17.5.2.2 INTUSBWKUP Interrupt

INTUSBWKUP interrupt occurs at the falling edge of the  $\overline{\text{WAKEUP}}$  output signal.

WAKEUP will be asserted when the following conditions match: UDFSPWCTL<wakeup\_en> is 1 and the suspended condition is cancelled (UDFSPWCTL<suspend\_x>=1). WAKEUP will be asserted when VBUS is disconnected (VBUSPOWER=0) as well.

INTUSBWKUP interrupt occurs regardless of the status of CLK\_H.

### 17.5.3 Operation Sequence

The operation sequence of UDC2AB is as follows:

1. Hardware reset
2. Set the interrupt signal  
Configure the INTUSBD interrupt, the INTUSBWKUP interrupt and the USBDPON interrupt.
3. VBUS detection (connect) and reset  
Refer to "17.5.5.2 Sequence of USB Bus Power (VBUS) Connection/Disconnection" and "17.5.1 Reset" for details.
4. USB enumeration response  
Refer to "17.6 USB Device Response" for details.
5. Master Read / Master Write transfer
  - a. Master Read transfer  
Make a Master Read transfer corresponding to the receiving request from the USB host. Refer to "17.5.4.1 Master Read transfer" for details.
  - b. Master Write transfer  
Make a Master Write transfer corresponding to the sending request from the USB host. Refer to "17.5.4.2 Master Write transfer" for details.
6. VBUS detection (disconnect)  
The USB bus power supply may be disconnected at any time.  
Refer to "17.5.5.2 Sequence of USB Bus Power (VBUS) Connection/Disconnection" for details.

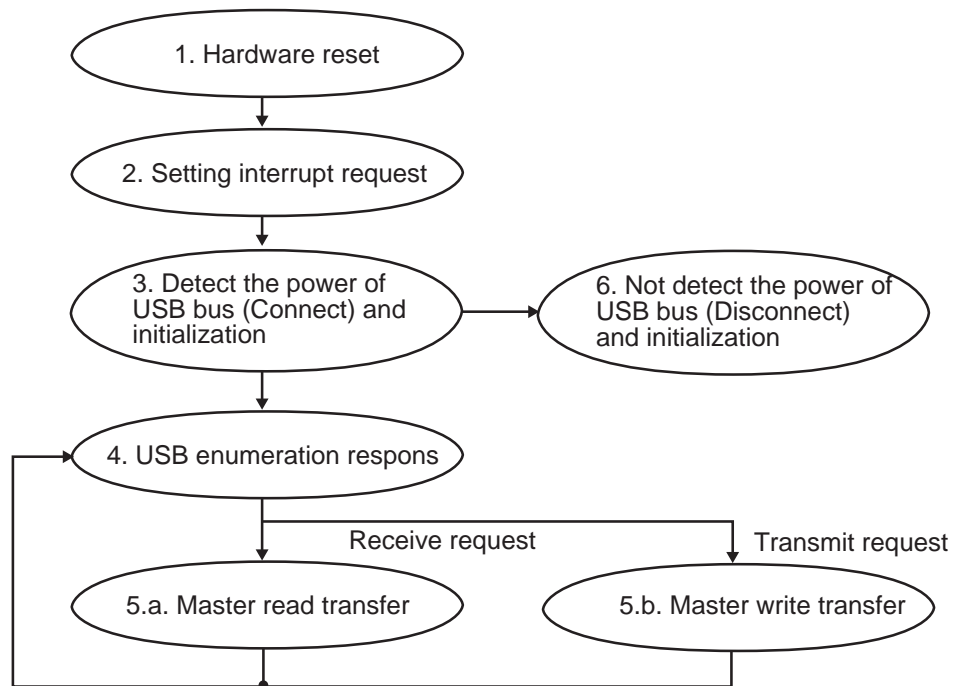

Figure 17-14 Operation Sequence

17.5.4 Master Transfer Operation

This section describes the master transfer operation of UDC2AB.

When you start a master transfer, be sure to set the transfer setting of the relevant EP of UDC2 (UDFS2EPxSTS<bus\_sel>) to the direct access mode. It is prohibited to start DMAC when it is set to "Common bus access."

17.5.4.1 Master Read transfer

(1) Master Read mode

There are two modes of the master read mode: EOP enable mode and EOP disable mode.

(a) EOP enable mode

Master Read transfers when UDC2STSET<eopb\_enable> is set to 1 (Master Read EOP enable) are described here. Master Read operations will be as follows:

1. Set UDFSMWSADR and UDFSMWEADR.

2. Set the bits associated to the master read operation of UDFSMSTSET and set 1 to <mr\_enable>.

3. UDC2AB starts the data transfer to the EP of UDC2. UDC2 transfers the data to the IN token from the USB host.

4. When the Master Read transfer reaches the Master Read end address, UDC2AB asserts the mr\_end\_add interrupt.

5. After the handling by the software ended, return to 1.

• About Short packets

If the transfer size (Master Read End Address - Master Read Start Address ÷ 1) is not the same size as the Max packet size, the last IN transfer will be the transfer of short packets.

Example: In case Master Read transfer size 139 bytes and the Max packet size 64 bytes.

Transfer will take place in:

• About mr\_end\_add interrupt

The mr\_end\_add interrupt occurs when the data transfer to the UDC2 EP is finished. In order to confirm whether the entire data has been transferred from UDC2 to the USB host, check the UDFSMSTSTS<mrepempty>.

(b) EOP Disable mode

Master Read transfers when UDC2STSET<eopb\_enable > is set to 0 (Master Read EOP disable) are described here. Master Read operations will be as follows:

1. Set the register associated to the UDFSMWSADR and UDFSMWEADR.
2. Set the bits associated to the Master Read operation of UDFSMSTSET and set 1 to the <mr\_enable>.
3. UDC2AB starts the data transfer to the EP of UDC2. UDC2 transfers the data to the IN token from the USB host.
4. When the Master Read transfer reaches the Master Read end address, UDC2AB asserts the mr\_end\_add interrupt. If the FIFO of the EP has reached the MAX packet size during Master Read transfer, UDC2 transfers the data to the IN token from the USB host. However, if it has not reached yet, data will remain in the FIFO to the next transfer.
5. After the handling by the software ended, return to 1.

Note: When UDC2AB is used in the EOP Disable mode, short packets will not be sent out even if the data string to be sent has been transferred. EOP Disable mode should be used only in case the size of the data string is a multiple of the maximum packet size.

The mode can be used if the total size of data string is a multiple of the maximum packet size. For example, the following transfer may be allowed:

Example:

Size of the first Master Read transfer	:100 bytes
Size of the second Master Read transfer	:28 bytes (total of first and second transfer = 128bytes)
Max packet size	:64 bytes

A transfer of 64 bytes will be made twice for the IN transfer.

## (2) Aborting of Master Read transfer

You can abort Master Read transfers with the following operation.

1. Use UDC2 Command register to set the status of the relevant EP to Disabled (EP\_Disable). (If aborted without making the EP disabled, unintended data may be sent to the USB host.)
2. In order to stop the Master Read transfer, set 1 (Abort) to UDFSMSTSET <mr\_abort>.
3. In order to confirm that the transfer is aborted, check that the UDFSMSTSET<mr\_enable> was disabled to 0. Subsequent operations should not be made while the mr\_enable bit is 1.  
(Information on the address where the transfer ended when aborted can be confirmed with Master Read Current Address and Master Read AHB Address registers.)
4. In order to initialize the Master Read transfer block, set 1 (Reset) to UDFSMSTSET<mr\_reset>.
5. Use the Command register (EP\_FIFO\_Clear) to initialize the FIFO for the relevant EP.
6. Use the Command register (EP\_Enable) to enable the relevant EP.

### (3) Setting the maximum packet size in Master Read transfers

If the maximum packet size of the EP to be connected with the Master Read function of UDC2AB will be an odd number, there will be following restrictions to which you should pay attention:

- Even if the maximum packet size of the EP should be handled as an odd number, the setting of the UDFS2EPxMSZ<max\_pkt> should be an even number.

Note: Refer to the "17.9.2 Appendix B About Setting an Odd Number of Bytes as MaxPacketSize" for details.

- Set the UDC2STSET<eopb\_enable> to 1 (Master Read EOP enable).
- Make the transfer size to be specified for one Master Read transfer (Master Read End Address - Master Read Start Address + 1) not exceed the maximum packet size of an odd number.

Example:

Set the maximum packet size of EP (value to pass to the USB host) to be 63bytes.

Make the setting of the UDFS2EPxMSZ<max\_pkt> to be 64 bytes.

Keep the transfer size to be specified for one Master Read transfer to 63 bytes or less.

#### 17.5.4.2 Master Write transfer

##### (1) Master Write Transfer Sequence

Master Write operations will be as follows:

1. Set UDFSMWSADR and UDFSMWEADR.
2. Set the bits associated to the UDFSMSTSET and set 1 to the <mw\_enable>.
3. UDC2AB makes a Master Write transfer to the data in the EP received from the USB host.
4. Since the mw\_end\_add interrupt will be asserted when the writing ended to reach the Master Write End Address (with no timeout processed), you should make necessary arrangement with the software. UDC2 will return to 1 after receiving the correct packet.

Note: UDC2AB will assert the mw\_set\_add interrupt when the packet is received normally from the USB host with the UDFSMSTSET<mw\_enable disabled>.

##### (2) Timeout

Master Write transfers would not finish if the OUT transfer from the USB host should stagnate before reaching the Master Write End Address during the transfer. In order to cope with such circumstances, you can set the timeout function.

When this timeout function is used, all data stored in the buffer in UDC2AB at the point of timeout will be transferred to AHB.

Timeout can be processed with the following operation.

1. Make an access to the UDFSMWTOUT before starting a Master Write transfer and set timeoutset (timeout time) to make <timeout\_en> enabled 1.
2. Start the Master Write transfer in accordance with the instruction in the preceding section.

3. When the timeout has occurred, the mw\_timeout interrupt will be asserted. (The mw\_end\_add interrupt will not be asserted.) In that case, the Master Write transfer is not completed to reach the Master Write End Address. UDC2AB clears the UDFSMSTSET<mw\_enable> to 0.
4. In UDFSMWCADR, the address to which the transfer has completed to the AHB end can be confirmed.

Please note that the timeout counter advances during the Master Write transfer with the timeout function enabled, but the counter will be reset to the preset value when the OUT transfer from the USB host to the relevant EP is received and begin recounting (see the Figure 17-15). It means that the time until timeout is "from the point when the last transfer from the USB host to the relevant EP has occurred during the Master Write transfer to the preset time," rather than "from the point when the Master Write transfer has begun to the preset time."

If you do not use the timeout function, be sure to set the UDFSMWTOUT<timeout\_en> to "Disable 0" before starting the Master Write transfer. In that case, the transfer will not finish until reaching the preset Master Write End Address.

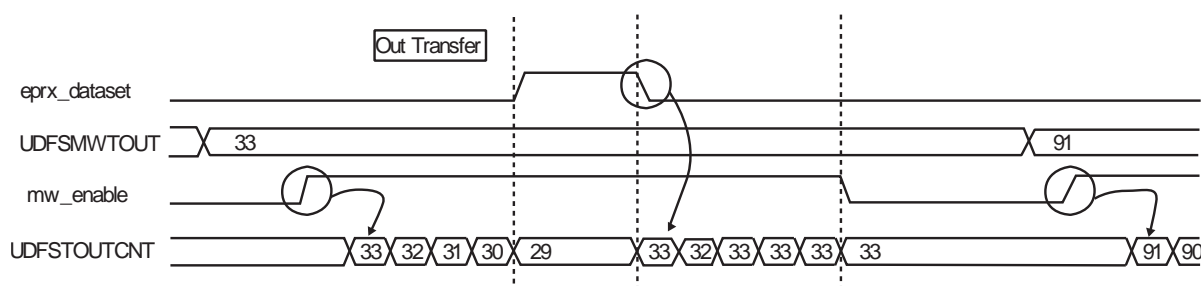

Figure 17-15 Example of MW timeout count

### (3) Aborting of Master Write transfers

You can abort Master Write transfers with the following operation.

1. Use UDFS2CMD to set the status of the relevant EP to Disable (EP\_Disable).
2. In order to stop the Master Write transfer, set 1 (Abort) to the UDFSMSTSET<mw\_abort>.
3. In order to confirm the transfer is aborted, check the UDFSMSTSET<mw\_enable> was disabled to 0. Subsequent operations should not be made while the <mw\_enable> is 1. (Information on the address where the transfer ended when aborted can be confirmed with Master Write Current Address and Master Write AHB Address registers.)
4. In order to initialize the Master Write transfer block, set 1 (Reset) to the UDFSMSTSET<mw\_reset>.
5. Use UDFS2CMD (EP\_FIFO\_Clear) to initialize the FIFO for the relevant EP.
6. Use UDFS2CMD to set the status of the relevant EP to Enable (EP\_Enable).

17.5.5 USB Power Management Control

In USB, operations related to power management including detection of USB bus power supply, suspending and resuming are also prescribed in addition to normal packet transfers. This section discusses about how to control those operations.

Note: Be sure to see the USB 2.0 Specification for details of operations.

17.5.5.1 Connection Diagram of Power Management Control Signal

Below is a connection diagram of signals related to power management control.

Figure 17-16 Connection Diagram of Power Management Control Signal

### 17.5.5.2 Sequence of USB Bus Power (VBUS) Connection/Disconnection

#### (1) Connect

If CLK\_H is operating, the USB bus power (VBUS) connection is detected using the INTUSBD (powerdetect) interrupt and UDFSPWCTL<pw\_detect>. If UCLK\_H is stopped, the USB power connection (VBUS) is detected using the INTUSBDPON interrupt signal.

After detecting bus power (VBUS), initialize UDC2AB and UDC2 following sequence.

1. Use the UDFSPWCTL<pw\_resetb> to make software reset. (The <pw\_resetb> bit is not automatically released and should be cleared by software.).
2. Make an access to UDC2AB and UDC2 registers to make necessary initial settings.
3. Use UDFS2CMD to issue the USB Ready command. UDC2 notifies the USB host of the connection via PHY. This condition enables UDC2 to accept USB\_RESET from the USB host.
4. Once USB\_RESET from the USB host is detected, UDC2 initializes the registers inside UDC2 and enumeration with the USB host becomes available. When USB\_RESET is detected, the usb\_reset / usb\_reset\_end interrupt occurs.

#### (2) Disconnect

If CLK\_H is operating, the USB bus power (VBUS) disconnection is detected using the INTUSBD(powerdetect) interrupt and UDFSPWCTL<pw\_detect>. If CLK\_H is stopped, the USB power (VBUS) disconnection is detected using the INTUSBWKUP interrupt.

When the disconnection of the USB bus power (VBUS) is detected, each master transfer will not automatically stop. Then use the pw\_resetb bit of Power Detect Control register to make software reset.

### 17.5.6 USB Reset

USB\_RESET may be received not only when the USB host is connected but also at any timing.

UDC2AB asserts the usb\_reset / usb\_reset\_end interrupt when UDC2 has received USB\_RESET and returns to the default state. At this time, master transfers will not automatically stop. Use the abort function to end the transfers. Values are initialized by USB\_RESET for some registers of UDC2, while they are retained for other registers (refer to the section of UDC2).

Resetting of UDC2 registers when USB\_RESET is recognized should be made after the usb\_reset\_end interrupt has occurred. This is because UDC2 initializes UDC2 registers at the time it deasserts the usb\_reset signal.

## 17.5.7 Suspend / Resume

### 17.5.7.1 Shift to the suspended state

UDC2AB makes notification of detecting the suspended state of UDC2 by the INTUSBD (suspend\_resume) interrupt and the UDFSPWCTL<suspend\_x>.

Since master transfers will not automatically stop in this circumstance, you should use the aborting function of each master transfer to make forcible termination if needed.

In case PHY needs to be suspended (clock stop) after the necessary processes finished by software, you can set the UDFSPWCTL<phy\_suspend> to make UDC2AB assert PHYSUSPEND which will put PHY in suspended state.

### 17.5.7.2 Resuming from suspended state (resuming from the USB host)

The procedures to resume from the suspended state is performed based on the condition of the CLK\_H.

When resuming is recognized, make settings again for restarting master transfers.

#### 1. Stopping the CLK\_H

The procedures to stop the CLK\_H and the signal variation are as shown below.

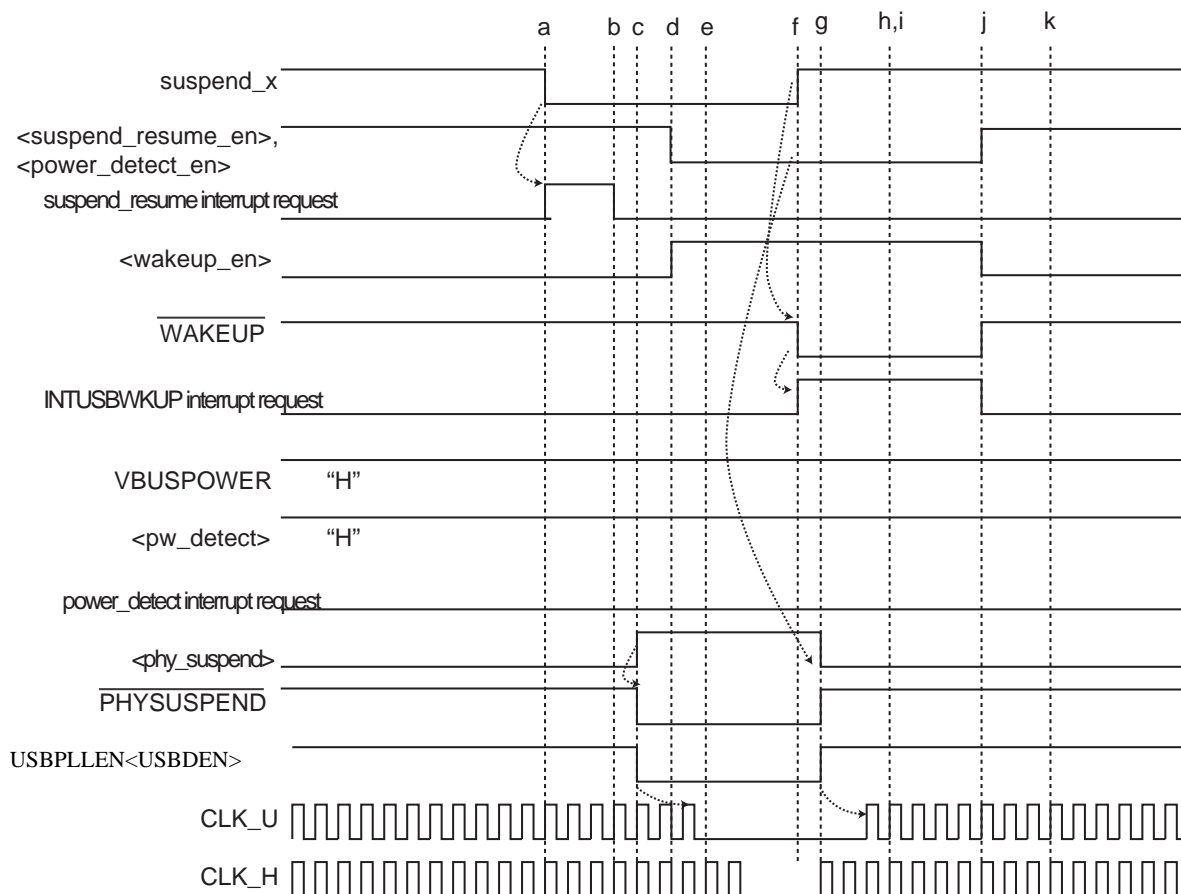

Figure 17-17 Signal operations when suspended and resumed (when CLK\_H is stopped)

- The suspend\_x of the UDC2 is asserted to zero by detecting the suspend state on the USB bus, and the INTUSBD(suspend\_resume) interrupt occurs.
- The service routine of the INTUSBD(suspend\_resume) interrupt clears the interrupt factor.
- Set the UDFSPWCTL<phy\_suspend> to "1". Setting the <phy\_suspend> to "1" asserts the PHYSUSPEND output signal to "0".  
Zero clear the USBPLEN<USB DEN> of the USB clock control circuit to stop the CLK\_U.
- Set the UDFSPWCTL<wakeup\_en> to "1". Zero clear the UDFSINTENB<power\_detect\_en><suspend\_resume\_en> not to generate the INTUSBD(power\_detect, suspend\_resume) interrupt.
- With the INTUSBWKUP interrupt, the operation mode moves into the low-power consumption mode and stops the CLK\_H.

- 
- f. By detecting Resume on the USB bus, the  $\overline{\text{WAKEUP}}$  output signal will be asserted to 0 asynchronously. By  $\overline{\text{WAKEUP}}$  output signal, INTUSBWKUP occurs and the low-power consumption mode is cancelled. Then, supply of CLK\_H starts.
  - g. With the supply of CLK\_H,  $\overline{\text{PHYSUSPEND}}$  output signal is automatically asserted to "1", and <phy\_suspend> is zero-cleared.  
Set USBPLEN<USBDEN> of the USB clock control circuit to "1" to activate the CLK\_U.
  - h. 2.5 s after the interrupt is asserted (time required for the signal to stabilize when VBUS is disconnected) and check UDFSPWCTL<pw\_detect>. If the UDFSPWCTL<pw\_detect> is "1",  $\overline{\text{WAKEUP}}$  is asserted by Resume. If UDFSPWCTL<pw\_detect> is "0",  $\overline{\text{WAKEUP}}$  is asserted by disconnection of the VBUS.
  - i. To resume, perform the sequences below. To disconnect, perform the sequences of the "17.5.7.3 Resuming from the suspend state (disconnect)".
  - j. Clears the interrupt factor and <wakeup\_en> to deassert the  $\overline{\text{WAKEUP}}$  output signal. Set <suspend\_resume\_en> to "1".
  - k. Resumes from the suspended state.

## 2. For CLK\_H to work

The procedures to get the CLK\_H work and the signal changes are shown as below.

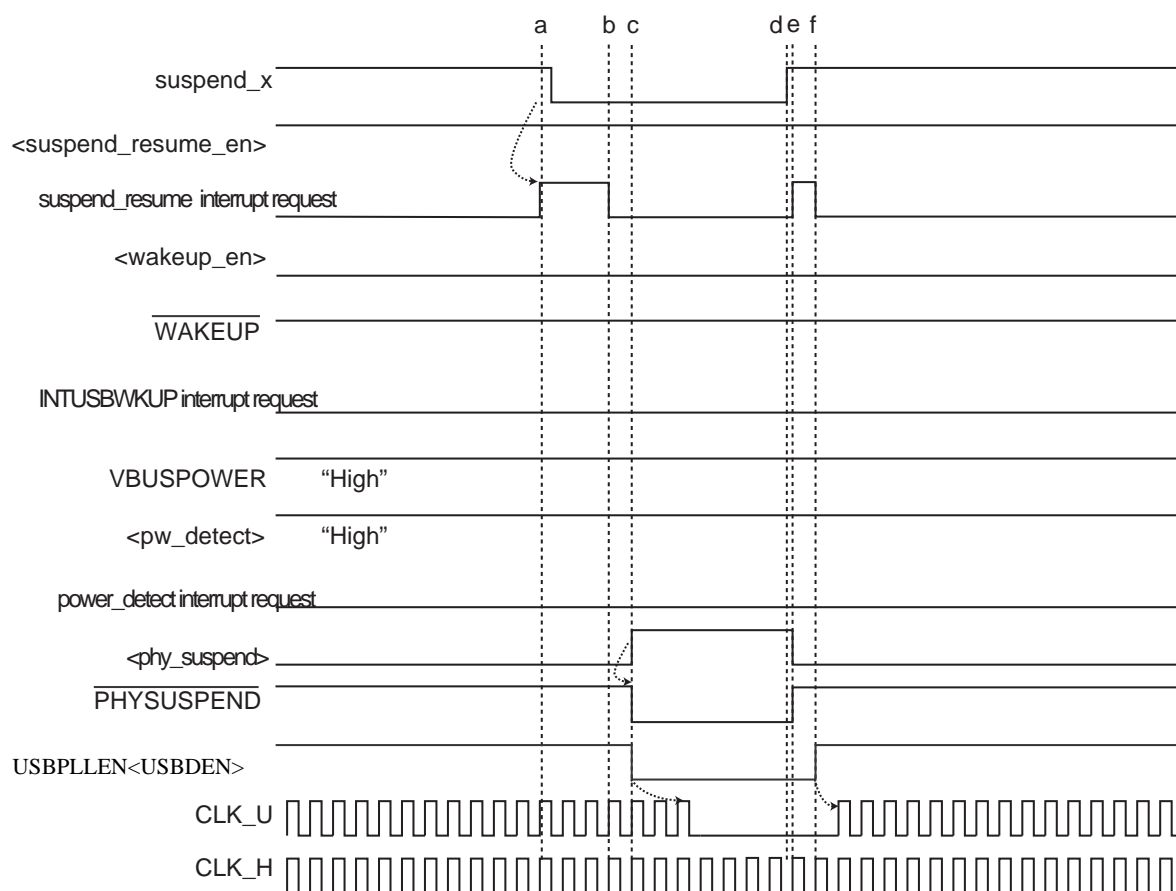

Figure 17-18 Operation of suspend/resume signals (to get the CLK\_H work)

- a. INTUSBD(suspend\_resume) interrupt occurs by detecting the suspended state on the USB bus.
- b. Clears the interrupt source in the INTUSBD(suspend\_resume) interrupt service routine.
- c. Set "1" to UDFSPWCTL<phy\_suspend>. Setting <phy\_suspend> to "1" asserts the  $\overline{\text{PHYSUSPEND}}$  output signal to "0".  
Set USBPLEN<USBDEN> of the USB clock control circuit to "0" to stop the CLK\_U.
- d. The suspend\_x becomes "1" by detecting resume on the USB bus.  
Also,  $\overline{\text{PHYSUSPEND}}$  output signal is deasserted to "1" by detecting the rising edge of the suspend\_x.
- e. INTUSBD(suspend\_resume) interrupt occurs.
- f. Interrupt source is zero cleared in the service routine of the INTUSBD(suspend\_resume).  
Set USBPLEN<USBDEN> of the USB clock control circuit to "1" to get CLK\_U work.
- g. Deasserting the  $\overline{\text{PHYSUSPEND}}$  output signal will resume the supply of the CLK\_U.
- h. Resumes from the suspend state.

### 17.5.7.3 Resuming from the suspend state (disconnect)

The procedures to resume from the suspended state (disconnection) and the signal change are shown as below.

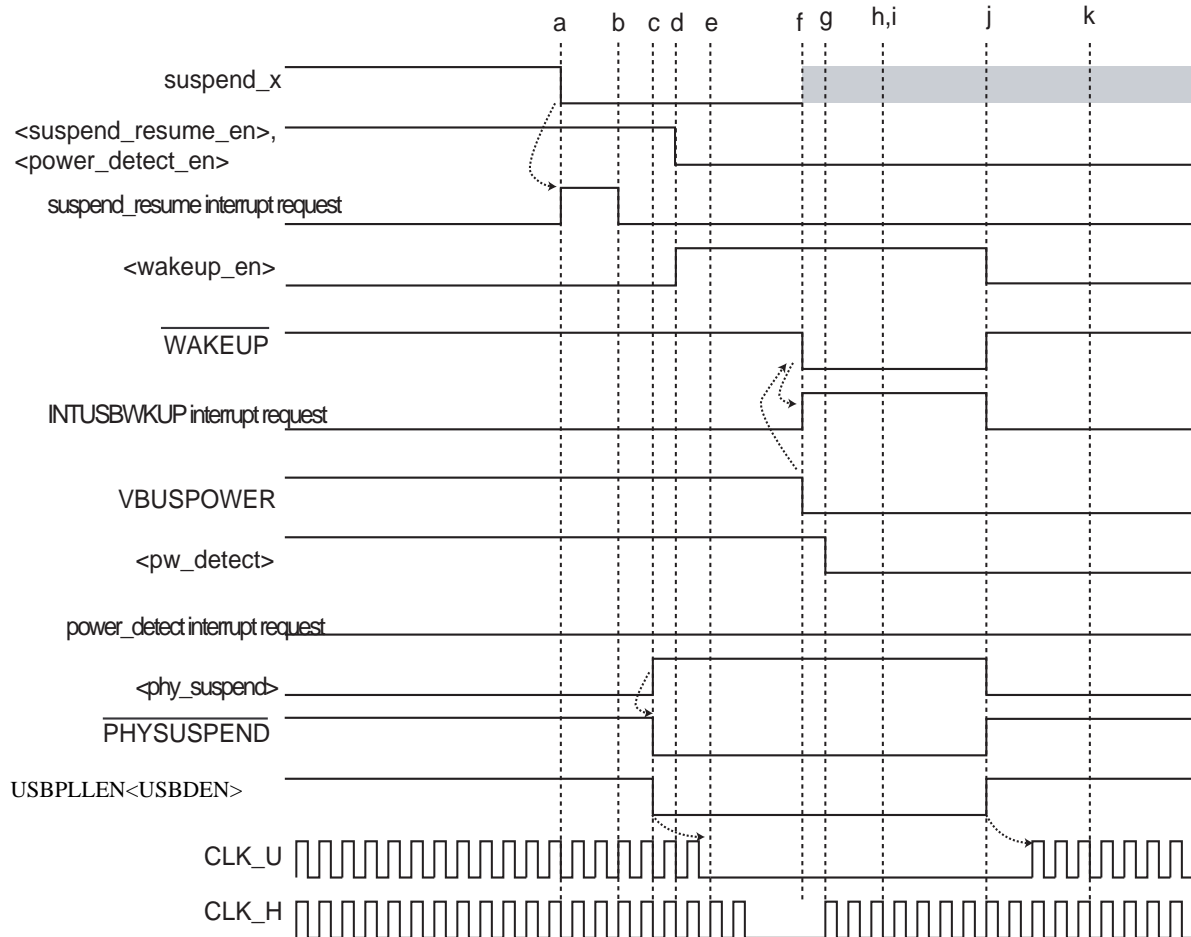

Figure 17-19 Operation of suspend/disconnect signals (to stop CLK\_H)

- 0 is asserted to the suspend\_x of the UDC2 by detecting the suspend state on the USB bus and this generates the INTUSBD(suspend\_resume) interrupt.
- Interrupt source is cleared by the service routine of the INTUSBD(suspend\_resume) interrupt.
- Set UDFSPWCTL<phy\_suspend> to "1". Setting the <phy\_suspend> to "1" asserts the PHYSUSPEND output signal to "0".  
 Set USBPLEN<USBDEN> of the USB clock control circuit to "0" to stop the CLK\_U.
- Set the UDFSPWCTL<wakeup\_en> to "1". Zero clear the UDFSINTENB<power\_detect\_en><suspend\_resume\_en> not to generate INTUSBD(power\_detect, suspend\_resume) interrupt.
- With the INTUSBWKUP interrupt, the operating mode moves into the low-power consumption mode to stop the CLK\_H.
- If disconnection is detected on the USB bus, the VBUSPOWER pin becomes "0" and the WAKEUP output signal will be asynchronously asserted to "0".
- INTUSBWKUP interrupt is generated by the WAKEUP output signal and low-power consumption mode is cancelled. The supply of CLK\_H starts.

- h. 2.5 s after the interrupt is asserted (time required for the signal to stabilize when VBUS is disconnected), check the UDFSPWCTL<pw\_detect>. If UDFSPWCTL<pw\_detect> is "1", WAKEUP is asserted by resume. If UDFSPWCTL<pw\_detect> is "0", WAKEUP is asserted by disconnection of VBUS.
- i. If the factor is the resume, perform the sequence written in the "17.5.7.2 Resuming from suspended state (resuming from the USB host)". If the factor is disconnection, perform the sequence below.
- j. Zero clear the <phy\_suspend> to deassert the PHYSUSPEND output signal.  
Set the USBPLEN<USBDEN> of the USB clock control circuit to "1" to get the CLK\_U work. Clear the interrupt factor and <wakeup\_en> to deassert the WAKEUP output signal.
- k. Set UDFSPWCTL<pw\_resetb> using software, initialize the UDC2AB.

#### 17.5.7.4 Remote wakeup from the suspended state

The procedure of remote wakeup from the suspended state and the signal change are shown below.

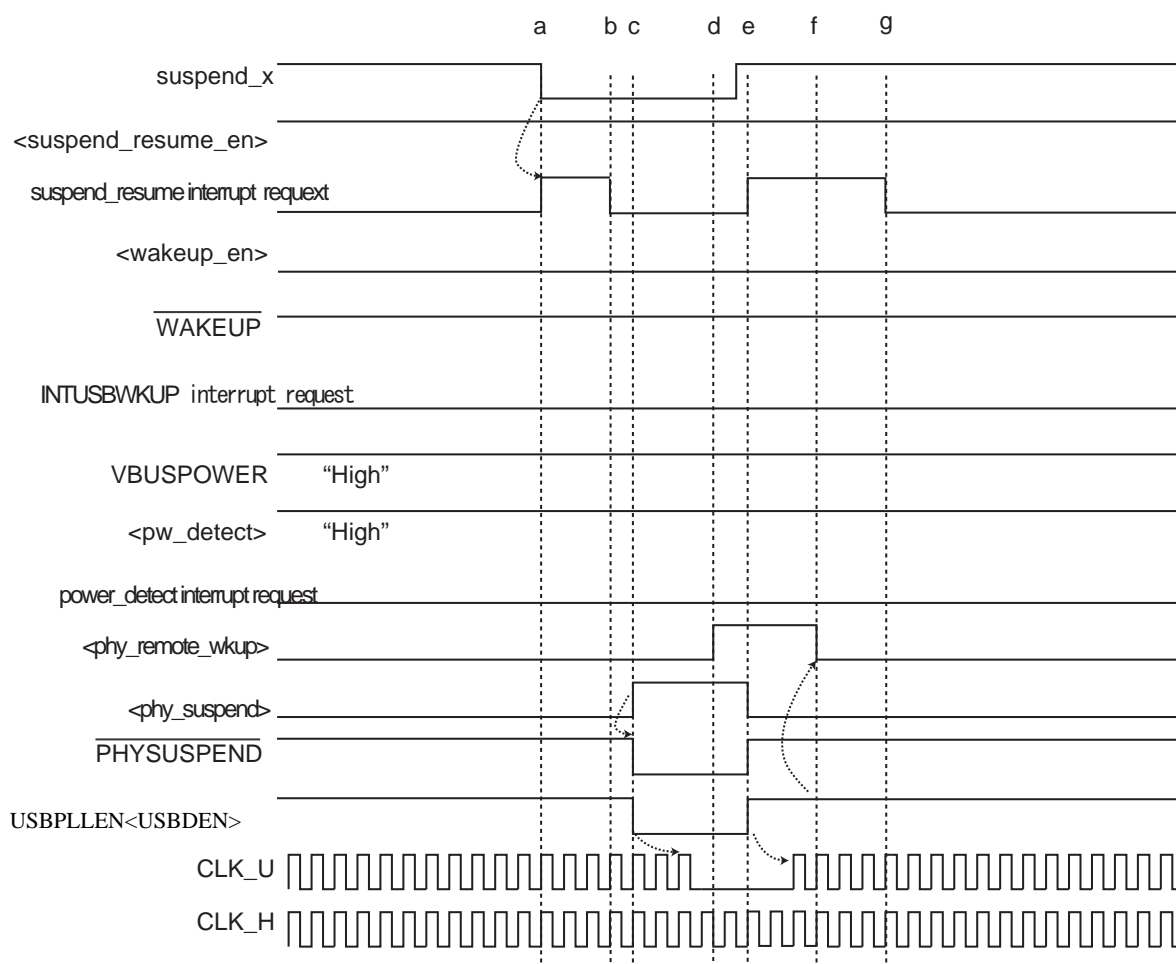

Figure 17-20 Operation of suspend/remote wakeup signals

- a. suspend\_x of the UDC2 is asserted to 0 by detecting the suspended state on the USB bus and the INTUSBD(suspend\_resume) interrupt occurs.
- b. Clears the interrupt source in the service routine of the INTUSBD(suspend\_resume) interrupt.
- c. Set the UDFSPWCTL<phy\_suspend> to "1". PHYSUSPEND output signal is asserted to "0" by setting <phy\_suspend> to "1"

Set the USBPLEN<USBDEN> of the USB clock control circuit to "0" to stop the CLK\_U.

- d. When requesting remote wakeup, set the UDFSPWCTL<phy\_remote\_wkup> to 1. Setting the <phy\_remote\_wkup> to "1" will cause the UDC2 to make a remote wakeup request on the USB bus. Also, <suspend\_x> will be deasserted to 1 asynchronously.
- e. Deasserting <suspend\_x> will cause the INTUSBD(suspend\_resume) interrupt to occur and the PHYSUSPEND output signal to be deasserted to 1.
- f. Set the USBPLEN<USBDEN> of the USB clock control circuit to "1" to get the CLK\_U work.

When the CLK\_U starts operating, <phy\_remote\_wkup> is automatically cleared to "0".

- g. Clear the interrupt source.

## 17.6 USB Device Response

UDC2 initializes the inside of UDC2 and sets various registers when hardware reset is detected, USB\_RESET is detected, and an enumeration response is made. This section discusses the operations of UDC2 in each status as well as how to control them externally.

### 1. When hardware reset is detected

Be sure to reset hardware for UDC2 after the power-on operation. After the hardware reset, UDC2 initializes internal registers and all EPs are in the invalid status, which means the device itself is "Disconnected."

In order to make the status of UDC2 to "Default," issue the "USB\_Ready" command. Issuing this command will put UDC2 in the "Full-Speed" mode, enable the Pull-Up resistance of USB-DDP and notify the host of "Connect".

In this status, only the USB\_RESET signal is accepted from the host.

### 2. When USB\_RESET is detected

UDC2 initializes internal registers when Bus Reset (USB\_RESET) is detected on the USB signal, putting the device in the "Default" status. In this status only EP 0 gets "Ready" enabling enumeration with the host.

### 3. When "Set\_address" request is received

By setting 010 to the UDFS2ADR<configured> <addressed> <default> and the received address value to the <dev\_adr> after receiving the "Set\_address" request, UDC2 will be in the "Addressed" status. Setting for this register should be made after the Control transfer has successfully finished (after the STATUS-Stage has ended).

Transfers to EPs other than EP 0 cannot be made in this status.

4. When "Set\_configuration" and "Set\_interface" requests are received
- By setting 100 to the UDFS2ADR<configured> <addressed> <default> after receiving the "Set\_configuration" and "Set\_interface" requests, UDC2 will be in the "Configured" status.
- In the "Configured" status, you can make transfers to the EP to which status settings have been made.
- In order to make the EP "Ready," the following settings should be made:
- Set the maximum packet size to UDFS2EPxMSZ
  - Set the transfer mode to UDFS2EPxSTS
  - Issue the EP\_Reset command to UDFS2CMD
- EPs will be available for transmitting and receiving data after these settings have been made.
- Figure 17-21 shows the "Device State Diagram".

Figure 17-21 Device state diagram

## 17.7 Flow of Control in Transfer of EPs

### 17.7.1 EP0

EP0 supports Control transfer and is used as device control for enumeration. EP0 supports only Single packet mode.

Control transfers have SETUP-Stage, DATA-Stage and STATUS-Stage

The types of transfer are categorized into the following major types:

- Control-RD transfer
- Control-WR transfer (without DATA-Stage)
- Control-WR transfer (with DATA-Stage)

UDC2 makes control of those three stages by hardware. Flows in each type of transfer are described below.

#### 17.7.1.1 Control-RD transfer

The flow of control in Control-RD transfers is shown below.

Figure 17-22 Flow of the control in Control-RD transfer

The following description is based on the assumption that the UDFS2EP0MSZ<dset> is set to "EP0\_DATASET flag".

#### (1) SETUP-Stage

UDC2 asserts the INT\_SETUP flag when it has received the Setup-Token. This flag can be cleared by writing 1 into the UDFS2INT<i\_setup>. In case flags are combined externally, read the UDFS2INT to confirm which flag is asserted and write "1" into the relevant bit.

Then read Setup-Data storage registers (bRequest-bmRequestType, wValue, wIndex, and wLength registers) to determine the request.

Finally, issue the "Setup\_Received" command to inform UDC2 that the SETUP-Stage has finished. Since UDC2 does not allow writing data into the EP0-FIFO before this command is issued, it will keep returning "NAK" to the IN-Token from the host until the command is issued.

(2) DATA-Stage

Write the data to be transmitted to the IN-Token into the EP0-FIFO. If the byte size of the data to send is larger than the MaxPacketSize, divide them into groups of MaxPacketSize before writing. When the number of data reached the MaxPacketSize, the EP0\_DATASET flag is asserted.

When the data have been transmitted to the IN-Token from the host with no problem, UDC2 deasserts the EP0\_DATASET flag and asserts INT\_EP0. Any data remaining to be transmitted should be written into the EP0-FIFO.

If the size of the data to be written is smaller than the MaxPacketSize, issue the "EP\_EOP" command to EP0 to inform UDC2 that it is a short packet. With this command, UDC2 recognizes the end of the packet and transmits the short packet data.

Finally, issue the "Setup\_Fin" command to inform UDC2 that the DATA-Stage has finished.

(3) STATUS-Stage

When the "Setup\_Fin" command is issued, UDC2 will automatically make Handshake for the STATUS-Stage. When the STATUS-Stage finished with no problem, the INT\_STATUS flag is asserted. When received a packet of STATUS-Stage from the host before the "Setup\_Fin" command is issued, UDC2 will return "NAK" and asserts the INT\_STATUS\_NAK flag. Therefore, if this flag is asserted, be sure to issue the "Setup\_Fin" command.

17.7.1.2 Control-WR transfer (without DATA-Stage)

The flow of control in Control-WR transfer (without DATA-Stage) is shown below.

Figure 17-23 Flow of control in Control-WR transfer (without DATA-Stage)

## (1) SETUP-Stage

Perform the same procedure described in "17.7.1.1 Control-RD transfer".

## (2) STATUS-Stage

After issuing the "Setup\_Received" command, make register accesses to UDC2 based on each request. Issue the "Setup\_Fin" command when all the register accesses to UDC2 have finished. Subsequent processes are basically the same as the STATUS-Stage described in "17.7.1.1 Control-RD transfer". UDC2 will keep on returning "NAK" until the "Setup\_Fin" command is issued.

Note: While register accesses required for each request are made to UDC2 between 'Issuing the "Setup\_Received" command' and 'Issuing the "Setup\_Fin" command', register accesses are needed after the end of STATUS-Stage in some cases such as Set Address request and Set Feature (TEST\_MODE). Processes required for the standard requests are described in "17.7.1.5 Processing when standard request".

## 17.7.1.3 Control-WR transfer (with DATA-Stage)

The flow of control in Control-WR transfer (with DATA-Stage) is shown below.

Figure 17-24 Flow of control in Control-WR transfers (with DATA-Stage)

## (1) SETUP-Stage

To be processed in the same way of SETUP-Stage as described in "17.7.1.1 Control-RD transfer".

## (2) DATA-Stage

When the data is received from the host with no problem, UDC2 asserts the EP0\_DATASET flag and asserts the INT\_EP0 flag. When this flag is asserted, read the data from EP0\_FIFO after confirming the received data size in the UDFS2EP0FIFO, or read the data from EP0\_FIFO polling the EP0\_DATASET flag.

When the byte size of received data has been read, UDC2 deasserts the EP0\_DATASET flag.

(3) STATUS-Stage

To be processed in the same way as in the STATUS-Stage described in "17.7.1.1 Control-RD transfer".

17.7.1.4 Example of using the INT\_STATUS\_NAK flag

When processing requests without DATA-Stage, the INT\_STATUS\_NAK flag may get asserted by receiving STATUS-Stage from the host before clearing the INT\_SETUP flag after it has been asserted, especially in High-Speed transfers. In case such multiple interrupts should be avoided as much as possible, you can use a method to mask the INT\_STATUS\_NAK flag for request having no DATA-Stage. In such case, basically set 1 to UDFS2INT<m\_status\_nak>, while 0 should be set only when requests having DATA-Stage are received. (An example for Control-RD transfers is provided below.)

Figure 17-25 Example of using the INT\_STATUS\_NAK flag in Control-RD transfers

(1) SETUP-Stage

After the INT\_SETUP flag was asserted, clear the UDFS2INT<i\_setup> is set to 1, it should be also cleared.

Then, if the request was judged to have DATA-Stage by reading Setup-Data storage registers, set the UDFS2INT<m\_status\_nak> to 0. Then issue the "Setup\_Received" command.

(2) DATA-Stage→STATUS-Stage

When the INT\_STATUS\_NAK flag was asserted, the device should also proceed to the STATUS-Stage. Clear the UDFS2INT<i\_status\_nak> and then issue the "Setup\_Fin" command. Also, set 1 to the UDFS2INT<m\_status\_nak> in order to get ready for subsequent transfers.

17.7.1.5 Processing when standard request

Examples of making register accesses to UDC when standard requests are received are provided below. Descriptions of each request are basically provided for each state of the device (Default, Address, and Configured).

For the information on register accesses common to each request, see 17.7.1.1 , 17.7.1.2 and 17.7.1.3.

You should note, however, descriptions provided below do not include the entire details of standard requests in USB 2.0. Since methods to access registers may vary depending on each user's usage, be sure to refer to the USB 2.0 specifications. You should also refer to the USB 2.0 specifications for "Recipient," "Descriptor Types," "Standard Feature Selectors," "Test Mode Selectors" and other terms appear in the descriptions below.

- Standard requests for "17.7.1.1 Control-RD transfer".
  - Get Status Get Description Get Configuration
  - Get Interface Get Frame
- Standard requests for "17.7.1.2 Control-WR transfer (without DATA-Stage)".
  - Clear Feature Set Feature Set Address
  - Set Configuration Set Interface
- Standard requests for "17.7.1.3 Control-WR transfer (with DATA-Stage)"
  - Set Description

Note 1: Descriptions with double underlines refer to register accessed to UDC2.

Note 2: Writing accesses to UDFS2CMD are described in the following manner for simplicity:

(Example 1) When writing 0x0 to UDFS2CMD<ep> and 0x4 to <com>

→Issue the EP-Stall command to EP0

(Example 2) When writing the relevant EP to UDFS2CMD<ep> and 0x5 to <com>

→Issue the EP-Invalid command to the relevant EP

#### (1) Get Status Request

To meet this request, the status of the specified receiving end (recipient) is returned.

bmRequestType	bRequest	wValue	wIndex	wLength	Data
1000_0000 1000_0001 1000_0010	GET_STATUS	Zero	Zero Interface EP	Two	Device Interface, or EP Status

- Common to all states:
  - If the EP/Interface specified by wIndex does not exist, issue the EP-Stall command to EP0.
- Default state:
  - Nothing is specified for the operation of devices by the USB 2.0 specifications.
- Address state:

<recipient> = Device : Write the information on the device (Table 17-3) to UDFS2EP0FIFO.

<recipient> = Interface: Issue the EP-Stall command to EP0

<recipient> = EP : If wIndex=0(EP0), write the information on EP0 (Table 17-5) to UDFS2EP0FIFO. If wIndex≠0(EPx), issue the EP-Stall command to EP0.

- Configured state:

<recipient> = Device : Write the information on the device (Table 17-3) to UDFS2EP0FIFO.  
 <recipient> = Interface: If the interface specified by `lwIndex`, write the information on the interface (Table 17-4) to UDFS2EP0FIFO.  
 <recipient> = EP : If the EP specified by `wIndex`, write the information on the relevant EP (Table 17-5) to UDFS2EP0FIFO.

Table 17-3 Information on the device to be returned by Get Status request

D15	D14	D13	D12	D11	D10	D9	D8
0	0	0	0	0	0	0	0
D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	0	0	Remote Wakeup	Self Powered

RemoteWakeup 0 indicates the bus power while 1 indicates the selfpower.  
 (D1)  
 SelfPowered 0 indicates the remote wakeup function is disabled while 1 indicates it is enabled.  
 (D0)

Table 17-4 Information on the interface to be returned by Get Status

D15	D14	D13	D12	D11	D10	D9	D8
0	0	0	0	0	0	0	0
D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	0	0	0	0

Please note that all bits are 0.

Table 17-5 Information on the EP to be returned by Get Status request

D15	D14	D13	D12	D11	D10	D9	D8
0	0	0	0	0	0	0	0
D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	0	0	0	Halt

Halt If this bit is 1, it indicates that the relevant EP is in the "Halt" state.  
 (D1)

## (2) Clear Feature Request

To meet this request, the particular functions are cleared and disabled.

bmRequesType	bRequest	wValue	wIndex	wLength	Data
1000_0000 1000_0001 1000_0010	CLEAR_FEATURE	Feature Selector	Zero Interface EP	Zero	None

- Common to all states:

If Feature Selector (wValue) which cannot be cleared (disabled) or does not exist is specified, issue the EP-Stall command to EP0.

If the EP/Interface specified by wIndex does not exist, issue the EP-Stall command to EP0.

- Default state:

Nothing is specified for the operation of devices by the USB 2.0 specifications.

- Address state:

<recipient> = Device : If wValue=1, disable the DEVICE\_REMOTE\_WAKEUP function at the user program. No register access to UDC2 is required.

<recipient> = Interface: Issue the EP-Stall command to EP0.

<recipient> = EP : If wIndex≠0(EPx), issue the EP-Stall command to EP0.

If wValue=0 and wIndex=0(EP0), clear the Halt state of EP0 but no register access to UDC2 is required.

- Configured state:

<recipient> = Device : If wValue=1, disable the DEVICE\_REMOTE\_WAKEUP function at the user program. No register access to UDC2 is required.

<recipient> = Interface: Issue the EP-Stall command to EP0.(note)

<recipient> = EP : If wValue=0 and wIndex=0(EPx), issue the EP-Reset command to the relevant command. If wValue=0 and wIndex=0(EP0), clear the Halt state of EP0 but no register access to UDC2 is required.

Note: EP 0 is to be stalled based on the interpretation of the USB 2.0 specifications that "No Feature Selector exists for Interface" here. For more information, see the USB Specification.

(3) Set Feature Request

To meet this request, the specific functions are set or enabled.

BmRequesetType	BRequesdt	wValue	wIndex		wLength	Data
1000_0000 1000_0001 1000_0010	SET_FEATURE	Feature Selector	Zero Interface EP	Test Selector	Zero	None

- Common to all state:  
If Feature Selector (wValue) which cannot be set (enabled) or does not exist is specified, Issue the EP-Stall command to the EP0.  
If the EP/Interface specified by the lower byte of wIndex does not exist, issue the EP-Stall command to EP0.

Note: When using a vendor-specific nonstandard Test Selector, the appropriate operation should be made.

- Default state:  
Nothing is specified for the operation of devices by the USB 2.0 specifications except for the above-mentioned TEST\_MODE.
- Address state:  
  
    <recipient> = Device : If wValue=1, disable the DEVICE\_REMOTE\_WAKEUP function at the userAfs end.  
    No register access to UDC2 is required.  
    <recipient> = Interface: Issue the EP-Stall command to EP0.  
    <recipient> = EP : If the lower byte of wIndex ≠0 (EPx), issue the EP-Stall to EP0.  
    If wValue=0 and the lower byte of wIndex=0 (EP0), make EP0 to Halt state. (note 2)
- Configured state:  
  
    <recipient> = Device : If wValue=1, enable the DEVICE\_REMOTE\_WAKEUP function at the userAfs end.  
    No register access to UDC2 is required.  
    <recipient> = Interface: Issue the EP-Stall command to EP0.(note 1)  
    <recipient> = EP : If wValue=0 and the lower byte of wIndex≠0(EPx), issue the EP-Stall command to EP0.  
    If wValue=0 and the lower byte of wIndex=0(EP0), make EP0 to Halt state.(note 2)

Note 1: EP 0 is to be stalled based on the interpretation of the USB specifications that "No Feature Selector exists for Interface" here. For more information, see the USB specifications.

Note 2: USB 2.0 specifications include such description that "Performing the Halt function for EP 0 is neither necessary nor recommended." Accordingly, it can be interpreted that it is not necessary to set UDC2 to the Stall state in this case.

In order to actually make EP 0 be in the Halt state, users have to manage the "Halt state.

Then, when a request is received in the "Halt state", such processes as to issue the EP-Stall command to EP0 in DATA-Stage/STATUS-Stage will be required. (Even if EP0 is set to the Stall state, UDC2 will cancel the Stall state when the Setup-Token is received and will return "ACK.")

As such, the process when SetFeature/ClearFeature is received for EP 0 varies depending on user's usage.

## (4) Set Address Request

To meet this request, device addresses are set.

BmRequesetType	BRequest	wValue	wIndex	wLength	Data
0000_0000	SET_ADDRESS	Device Address	Zero	Zero	None

For this request, make register accesses shown below within 2 ms after the STATUS-Stage has ended.

(The device address should not be changed before the Setup\_Fin command is issued.)

- Default state:

wValue=0: Keep the default state. No register access to UDC2 is required.

wValue≠0: Set wValue to UDFS2ADR<dev\_adr> and set 010 to <configured>, <addressed> and <default>. UDC2 will be put in the address state.

- Address state:

wValue=0: Set 0x00 to UDFS2ADR<dev\_adr> and 010 to <configured>, <addressed> and <default>. UDC2 will be put in the default state.

wValue≠0: Set wValue to UDFS2ADR<dev\_adr>. UDC2 will be set to a new device address.

- Configured state:

Nothing is specified for the operation of devices by the USB 2.0 specification.

(5) Get Descriptor Request

To this request, the specified descriptor is returned.

BmRequestType	BRequest	wValue	wIndex	wLength	Data
1000_0000	GET_DESCRIPTOR	Descriptor Type and Descriptor Index	Zero or Language ID	Descriptor Length	Descriptor

Common to all states:

Write the descriptor information specified by wValue to UDFS2EP0FIFO for the byte size specified by wLength. If the byte size to write is larger than the MaxPacketSize of EP 0, you need to divide the data to write it several times (refer to "17.7.1.1 Control-RD transfer"for details). (If the length of the descriptor is longer than wLength, write the information for wLength bytes from the beginning of the descriptor. If the length of the descriptor is shorter than wLength, write the full information for the descriptor.)

If the descriptor specified by wValue is not supported by the user, issue the EP-Stall command to EP0.

## (6) Set Descriptor Request

BmRequestType	BRequest	wValue	wIndex	wLength	Data
0000_0000	SET_DESCRIPTOR	Device Type and Descriptor Index	Language ID or Zero	Descriptor Length	Descriptor

- Common to all states:

When this request is not supported, issue the EP-Stall command to EP0.

- Default state:

Nothing is specified for the operation of devices by the USB 2.0 specifications.

- Address state & Configured state:

Read the information on the description received by UDC2 from UDFS2EP0FIFO.

(7) Get Configuration Request

BmRequestType	BRequestd	wValue	wIndex	wLength	Data
1000 0000	GET_CONFIGURATION	Zero	Zero	One	Configuration Value

- Default state:  
To this request, the Configuration value of the current device is returned.
- Address state:  
Write 0x00 to UDFS2EP0FIFO. As this is not configured, 0 should be returned.
- Configured state:  
Write the current configuration value to the UDFS2EP0FIFO.  
Since this has been configured, values other than 0 should be returned.

## (8) Set Configuration Request

To meet this request, Device Configuration is set.

BmRequestType	BRequest	wValue	wIndex	wLength	Data
0000 0000	SET_CONFIGURATION	Configuration Value	Zero	Zero	None

- Default state:

Nothing is specified for the operation of devices by the USB 2.0 specifications.

- Address state:

When wValue = 0:

- Keeps the address state. No register access to UDC2 is required.

When wValue≠0 and the wValue is a Configuration value matching the descriptor :

- Set 100 to UDFS2ADR<configured> <addressed> <default>.

<For EPs to use>

- Set MaxPacketSize to UDFS2EPxMSZ<max\_pkt>.
- Set respective values to UDFS2EPxSTS<pkt\_mode>, <bus\_sel>, <dir>, <t\_type> and <num\_mf>.
- Issue the EP-Reset command to the relevant EPs.

When wValue≠0 and the wValue is a Configuration value not matching the descriptor:

- Issue the EP-Stall command to EP0.

- Configured state:

When wValue = 0:

- Set 010 to UDFS2ADR<configured> <addressed> <default>.
- Issue the All-EP-Invalid command.

When Value≠0 and it is a Configuration value matching the descriptor:

<For EPs to use>

- Set the MaxPacketSize to UDFS2EPxMSZ<max\_pkt>.
- Set respective values to UDFS2EPxSTS<pkt\_mode>, <bus\_sel>, <dir>, <t\_type> and <num\_mf>.
- Issue the EP-Reset command to the relevant EPs.

<For EPs to become unused>

- Issue the EP-Invalid command to the relevant EPs.

When wValue≠0 and the wValue is a Configuration value not matching the descriptor :

- Issue the EP-Stall command to EP0.

(9) Get Interface Request

To meet this request, the AlternateSetting value set by the specified interface is returned.

BmRequestType	BRequest	wValue	wIndex	wLength	Data
1000_0001	GET_INTERFACE	Zero	Interface	One	Alternate Setting

- Common to all states:  
If the interface specified by wIndex, issue the EP-Stall command to EP0.
- Default state:  
Nothing is specified for the operation of devices by the USB 2.0 specifications.
- Address state:  
Issue the EP-Stall to EP0.
- Configured state:  
Write the current alternate setting value of the interface specified by the wIndex to UDFS2EP0FIFO.

## (10) Set Interface Request

To meet this request, the Alternate Setting value of the specified interface is set.

BmRequestType	BRequest	wValue	wIndex	wLength	Data
0000_0001	SET_INTERFACE	Alternate Setting	Interface	Zero	None

- Common to all states:

If the interface specified by wIndex does not exist or if the Alternate Setting specified by wValue does not exist, issue the EP-Stall command to EP0.

- Default state:

Nothing is specified for the operation of devices by the USB 2.0 specifications.

- Address state:

Issue the EP-Stall command to EP0.

- Configured state:

<For the EPs to use in Alternate Setting of the specified interface>

- Set MaxPacketSize to UDFS2EPxMSZ<max\_pkt>.
- Set respective values to UDFS2EPxSTS<pkt\_mode>, <bus\_sel>, <dir>, <t\_type> and <num\_mf>.
- EP-Reset Issue the EP-Reset command to the relevant EPs.

<For EPs to become unused>

- Issue the EP-Invalid command to the relevant EPs.

## (11) Synch Frame Request

To meet this request, the Synch Frame of the EP is returned.

BmRequestType	BRequest	wValue	wIndex	wLength	Data
1000 0010	SYNCH_FRAME	Zero	EP	Two	Frame Number

- Common to all states:

If this request is not supported by the EP specified by wIndex, issue the EP-Stall command to EP0.

- Default state:

Nothing is specified for the operation of devices by the USB 2.0 specifications.

- Address state:

Issue the EP-Stall command to EP0.

- Configured state:

Write the Frame Number of the EP specified by wIndex to UDFS2EP0FIFO.

## 17.7.2 EPs other than EP0

EPs other than EP 0 support Bulk (send/receive), Interrupt (send/receive), and Isochronous (send/receive) transfers and are used to transmit and receive data. They also support the Dual Packet mode which enables high-speed data communication.

## 17.8 Suspend/Resume State

UDC2 enters into a suspended state based on the signal condition from the host. It also returns from the suspended state by resuming operation by the host or UDC2.

Shifting between the states is described below.

### 17.8.1 Shift to the suspended state

Though the host issues SOF with given intervals (FS: 1 ms) in the normal state, it will stop issuing this SOF to the device when it tries to make the device suspended and the data on the USB signal line will be unchanged keeping the idle state. UDC2 is always monitoring the "line\_state" from PHY and makes judgment of whether it is in the suspended state or USB\_RESET when the idle state is detected for 3 ms or longer. If judged to be in the suspended state, it will assert "suspend\_x" to "Low" and enter in the suspended state.

Please note accesses to registers will be unavailable while UDC2 is suspended, since supply of CLK from USB clock control circuit.

### 17.8.2 Resuming from suspended state

Resuming from the suspended state can be made in two ways; by outputting a resuming state from the host and by way of remote wakeup from UDC2 (outputting a resuming state).

Resuming process in each case is described below.

#### 17.8.2.1 Resuming by an output from the host

When a resuming state is output by the host, UDC2 deasserts suspend\_x to "High" to declare resuming from the suspend state.

#### 17.8.2.2 Resuming by way remote wakeup from UDC2

The remote wakeup function may not be supported by some applications, and it needs to be permitted by the USB host at the time of bus enumeration. You should not assert "wakeup" unless permitted by the system.

If permitted by the system, asserting the "wakeup" pin will make UDC2 output a resuming state to the host to start resuming. Please note that the clock supply from USB clock control circuit is stopped when UDC2 is suspended, so you should keep asserting wakeup until it resumes. The remote wakeup should be operated after 2 ms or more has passed after suspend\_x was asserted to "Low".

## 17.9 USB-Spec2.0 Device Controller Appendix

### 17.9.1 Appendix A System Power Management

In USB, operations related to the enumeration and power control signals (USB-DDP/USB-DDM) for reset and suspend from the host are also prescribed, in addition to normal transfer operations. This Appendix provides information about the specifications of USB 2.0 PHY to be connected and clock control on the system level required for processes related to the USB-DDP/USB-DDM signals. For details of each process, please be sure to check the USB Specification Revision 2.0, USB-I/O specification.

The words in Appendix A are described below.

1. Reset:

The operation of the USB-DDP/USB-DDM signals for initializing the USB device (hereafter called "the device") from the USB host (hereafter called "the host"). After reset, enumeration is performed and then normal transfer operations such as Bulk transfers begin. Upon being connected, the device is always reset. The device also needs to support reset operation at any other arbitrary timing.

2. Suspend

If no bus activity on the USB-DDP/USB-DDM lines including SOF is initiated by the host for 3 ms or longer, the device needs to be put in the suspend mode to reduce power consumption. In this case, the device is required to perform certain operations such as stopping the clock.

3. Resume

The operation of the USB-DDP/USB-DDM signals for resuming normal operation from the suspend mode. Resume operation can be initiated either by the host or the device. Resume operation from the device is called "remote wakeup".

The each operation is described below. The time in ( ) is value in the USB 2.0 Specification.

17.9.1.1 Connect / Disconnect Operations

(1) Connect Operation

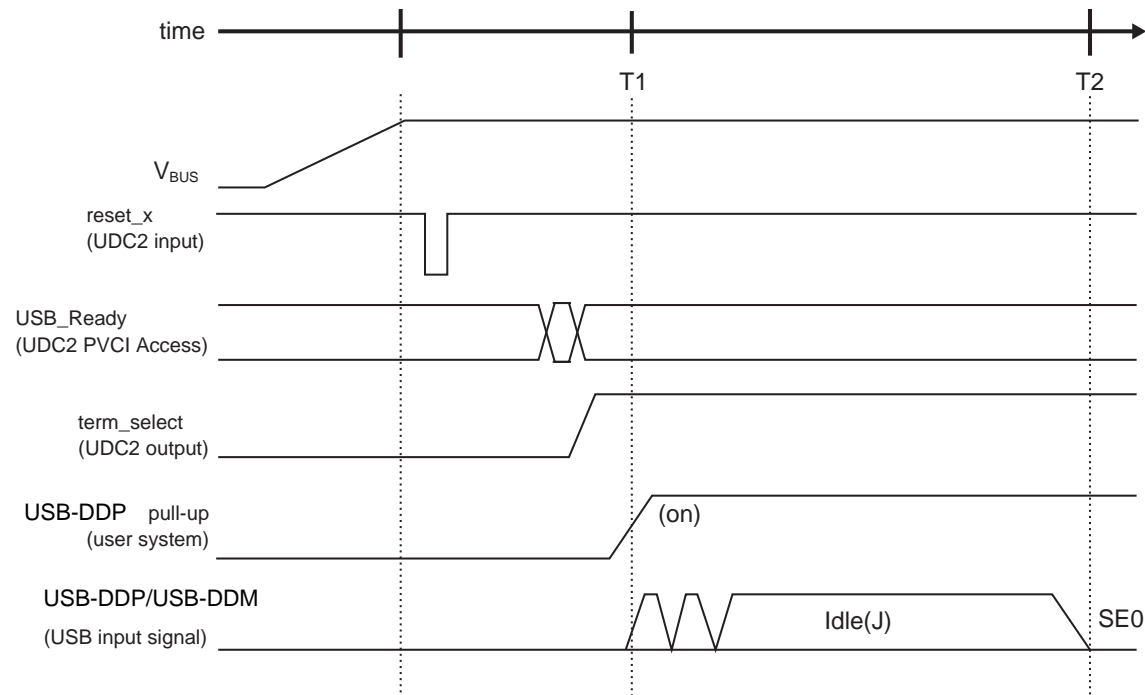

Figure 17-26 Connect operation timing

- T0: VBUS detection  
When Vbus is detected, a system reset (reset\_x input) should be applied to UDC2.  
xcvr\_select is "High" and term\_select is "Low".
- T1: Device connect (no later than 100ms after T0)  
The device must enable USB-DDP no later than 100 ms after Vbus detection (T0) to notify the host of the connected state. Therefore, when Vbus is detected and the device is ready to communicate with the host, the system should access the UDFS2CMD in UDC2 to set the USB\_Ready command. After that, the user system sets the port using software to enable the USB-DDP pull-up.
- T2:USB Reset Start (more than 100ms after 100ms)

(2) Disconnect Operation

When a disconnected state is detected, it is recommended to apply a system reset to UDC2.

### 17.9.1.2 Reset Operation

The "reset" here refers to the "Reset Signaling" defined in the USB 2.0 Specification, not the system reset (reset\_x) to UDC2.

#### (1) When Operation in FS Mode after Reset

Figure 17-27 Reset Operation Timing

- T0: Reset start  
Upon recognizing SE0 from the host, UDC2 starts counting to recognize the reset.
- T1: Reset recognition (more than 2.5  $\mu$ s after T0)  
When UDC2 detects SE0 for more than approximately 68  $\mu$ s after T0, it recognizes the reset from the host and drives usb\_reset "High".
- T2: deassert of USB reset  
At this point, usb\_reset is driven "Low" more than 3.5ms from T1.
- T3: Reset end (more than 10ms after T0)  
When SE0 from the host finishes and the device enters an idle state, it indicates the end of reset operation. The reset period from the host lasts a minimum of 10 ms.

#### (2) Notes on Reset Operation

- Initialization of registers after reset  
When the reset from the host is completed (when usb\_reset changes from "High" to "Low"), all the internal registers of UDC2 are initialized (For the initial value of each register, refer to "17.4 Registers").  
Note that registers that are set while usb\_reset is "High" are also initialized. Therefore, the UDC2 registers should be set after the reset period is completed.
- DMA transfer (EP-I/F access) after reset  
When a reset from the host occurs during DMA transfer, the UDFS2EPxSTS is initialized and the bus access mode is set to "common bus access". Therefore, DMA transfer cannot be continued properly. When a reset occurs, the DMA controller must also be initialized.  
In the enumeration operation after reset, configure each EP and then initialize the EPs by setting the EP\_Reset command in the UDFS2CMD.

17.9.1.3 Suspend Operation

(1) Suspend operation

Figure 17-28 Suspend operation timing

- T0: End of bus activity  
When the end of bus activity from the host (the end of packet) is detected, UDC2 starts counting to recognize suspend.
- T1: Recognition of suspend (3 ms after T0)  
When the "FS-J" is detected for more than 3 ms after T0, UDC2 recognizes suspend and drives suspend\_x "Low".
- T2: Remote wakeup start enable (5 ms after T0)  
Resume operation from the device (remote wakeup) is enabled 5 ms after T0.
- T3: Transition to suspend state (10 ms after T0)  
The device must enter the suspend state no later than 10 ms after T0. Processes required of the device system to enter the suspend state, such as stopping the CLK\_U, must be performed during this period.  
It is necessary to control USB clock control circuit to stop the CLK\_U to UDC2.

(2) Notes on Suspend Operation

- Internal registers during the suspend state  
During the suspend state, UDC2 retains the internal register values, the contents of FIFOs, and the state of each flag. These values and states are also retained after the suspend state is exited by resume operation.  
When the CLK\_H to UDC2 is stopped, the internal registers in UDC2 cannot be accessed via PVC-I/F and EP-I/F.

## 17.9.1.4 Resume Operation

## (1) Resume Operation by the Host

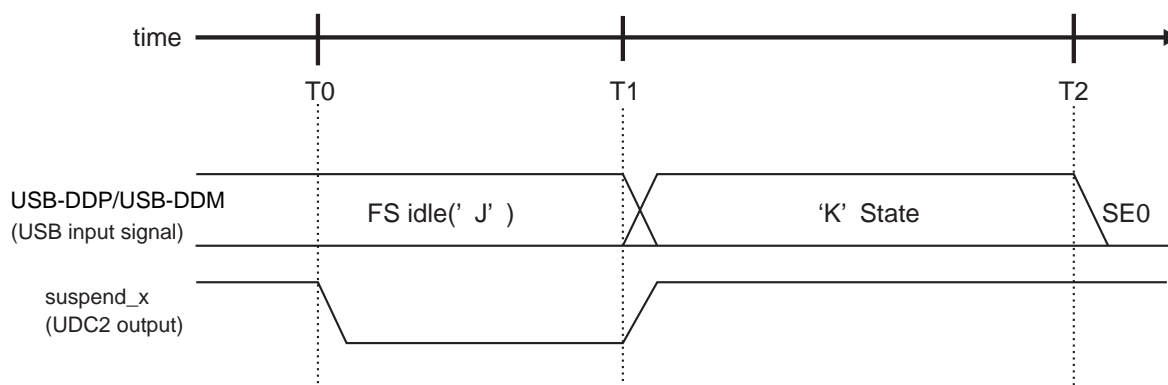

Figure 17-29 Resume operation timing by the host

- T0: suspend\_x output of UDC2 is "Low".
- T1: Start of host resume (No timing specifications)

The host starts resume operation ("FS-K") at arbitrary timing to wake up the device from the suspend state. At this point, UDC2 sets suspend\_x to "High". (Even if the CLK\_U to UDC2 is stopped, suspend\_x becomes "High").

During suspend, when CLK\_H to UDC2 stops, resume the CLK\_H by controlling USB clock control circuit.

When CLK to UDC2 is stopped, it is necessary to control clk\_em.

- T2: End of host resume (more than 20 ms after T1)

The host resume operation ("FS-K") lasts for more than 20 ms, and completes after "SE0".

## (2) Resume Operation by the Device (Remote Wakeup)

Figure 17-30 Remote wakeup operation timing

- T0: suspend\_x output of UDC2 is "Low".
- T1: Remote wakeup start enable (more than 2 ms after T0)

The device can be brought out of the suspend state by using the wakeup input of UDC2. Note that the USB specification prohibits remote wakeup for 5 ms after start of the suspend state. The wakeup signal should be set to "High" a minimum of 2 ms after T0 as 3 ms have already elapsed from the start of suspend operation to T0.

- T2: Wakeup input to UDC2 is "High" (after T1)

Set the wakeup signal to "High". No timing requirements are specified for this operation. At this point, UDC2 sets suspend\_x to "High". (Even if the CLK\_H input to UDC2 is stopped, suspend\_x becomes "High".) UDC2 requires the clock input to start resume operation ("FSK"). Then, keep wakeup at "High" until clock supply is resumed.

- T3: Start of device resume

When the CLK\_H input to UDC2 is resumed, UDC2 starts the device resume ("FS-K"). The device resume period is approximately 2 ms. After confirming the device resume, the host starts the host resume operation.

- T4: End of host resume (more than 20 ms after T3)

The host resume operation ("FS-K") lasts for more than 20 ms, and completes after "SE0".

### (3) Notes on Resume Operation

The restriction on use of remote wakeup are shown as follows.

To support remote wakeup as the device system, the device must notify the host in the Configuration descriptor that the remote wakeup function is enabled. Even if remote wakeup is supported, it is disabled by default. Remote wakeup can only be used after it is enabled by a request from the host. Use of remote wakeup using the wakeup input is allowed only when these conditions are satisfied.

When using this function, be sure to refer to 17.8 of the USB 2.0 Specification which offers detailed description.

## 17.9.2 Appendix B About Setting an Odd Number of Bytes as MaxPacketSize

### 17.9.2.1 Setting an odd number in the UDFS2EPxMSZ

The USB specification allows MaxPacketSize (hereafter referred to as MPS) of each EP to be set as either an odd or even number of bytes for Isochronous and Interrupt transfers. (For Control and Bulk transfers, only an even number can be set.)

In UDC2, MPS is set through UDFS2EPxMSZ<max\_pkt>. The EP FIFOs of UDC2 only support even numbers of bytes. It is therefore recommended that MPS be set as an even number of bytes as a general rule.

When using MPS by odd bytes, it is possible to make <max\_pkt> into odd number. However, there are restrictions shown in Table 17-6 by the access method of a bus. In the case of EP direct access, an odd number cannot be set in <max\_pkt> for a transmit EP. In this case, an even number should be set in <max\_pkt> and write accesses to the EP FIFO should be controlled to implement an odd number of maximum write bytes. (For example, when MPS is 1023 bytes, <max\_pkt> should be set to 1024 bytes.)

Table 17-6 Restrictions on the setting of max\_pkt

	Receive EP	Transmit EP
Common bus access (PVC1-IF)	An odd or even number can be set	An odd or even number can be set
EP direct access (EP-I/F)	An odd or even number can be set	Only an even number can be set.

Based on the above, the following pages describe how to set an odd number of bytes as MPS for each bus access method.

#### (1) Receive EP and common bus access

Either an odd or even number of bytes can be set in <max\_pkt>. The access method is the same for both cases.

#### (2) Transmit EP and common bus access

Either an odd or even number of bytes can be set in <max\_pkt>.

However, the following points must be observed in making common bus accesses for writing the maximum number of bytes with max\_pkt = odd number.

The following shows an example in which <max\_pkt> = 5 and the maximum number of bytes (5 bytes) are to be written.

- In the last access (5th byte), make sure that udc\_be = 01.
- Because it is access of MPS, Do not issue the EP\_EOP command in the UDFS2CMD.

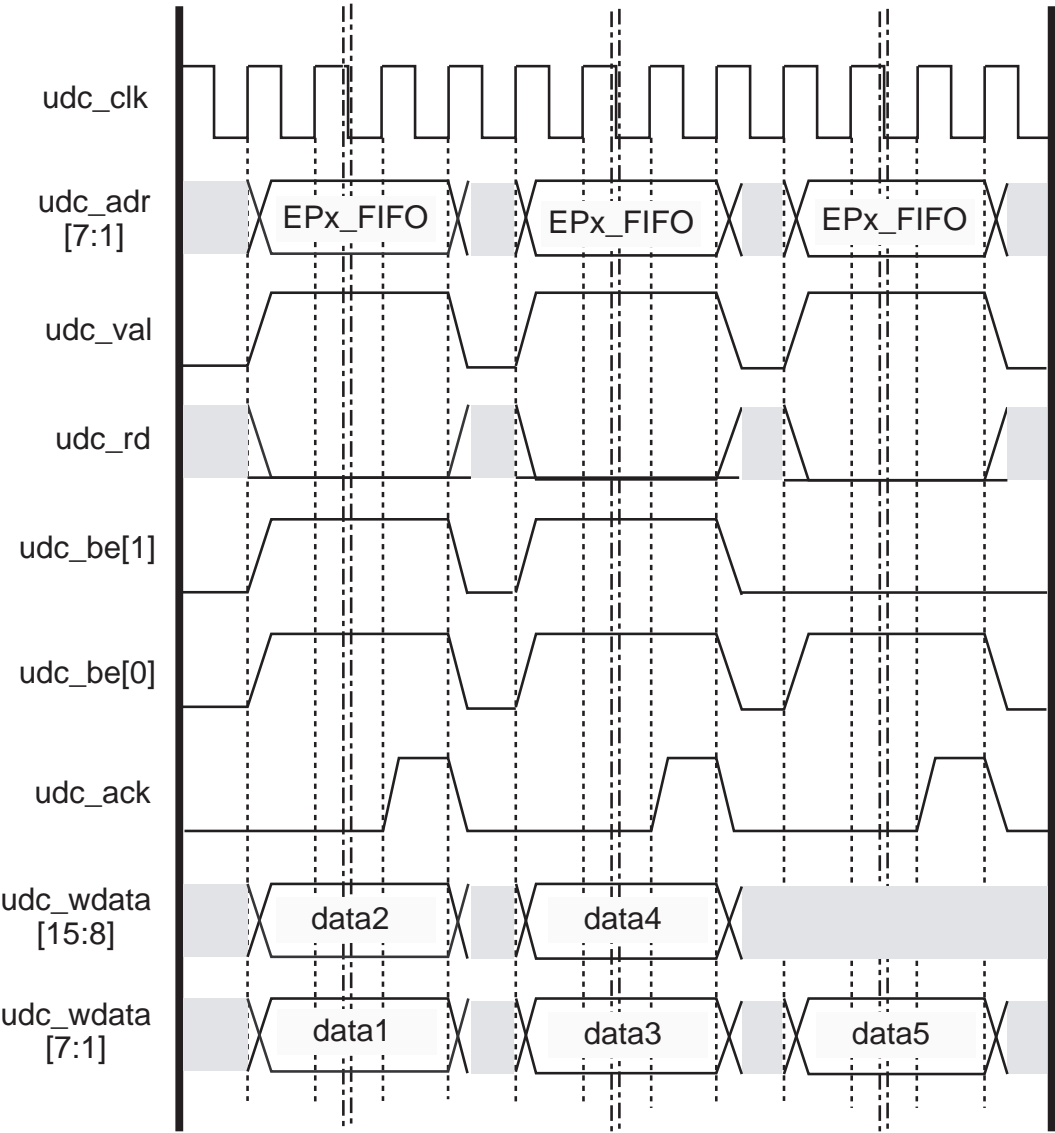

Figure 17-31 MPS write access with max\_pkt = odd number (common bus access)

(3) Receive EP and EP direct access

Either an odd or even number can be set in <max\_pkt>. The access method is the same for both cases.

(4) Transmit EP and EP direct access

Only an even number of bytes can be set in <max\_pkt>. To use an odd number of bytes as MPS for a transmit EP, the following settings are required.

- When MPS is 1023
  - Set <max\_pkt> is 1024.
  - The maximum number of bytes that can be written to the EP is 1023 bytes. (It is not allowed to write the 1024th byte.)
  - "wMaxPacketSize" of the EP descriptor to be managed by firmware should be set to 1023. (This is the value to be sent to the USB host by the Get Descriptor request.)

The following shows an example in which max\_pkt = 1024 and the maximum number of bytes (1023 bytes) are to be written.

- In the last access (1023rd byte), make sure that `epx_w_be = 01`.

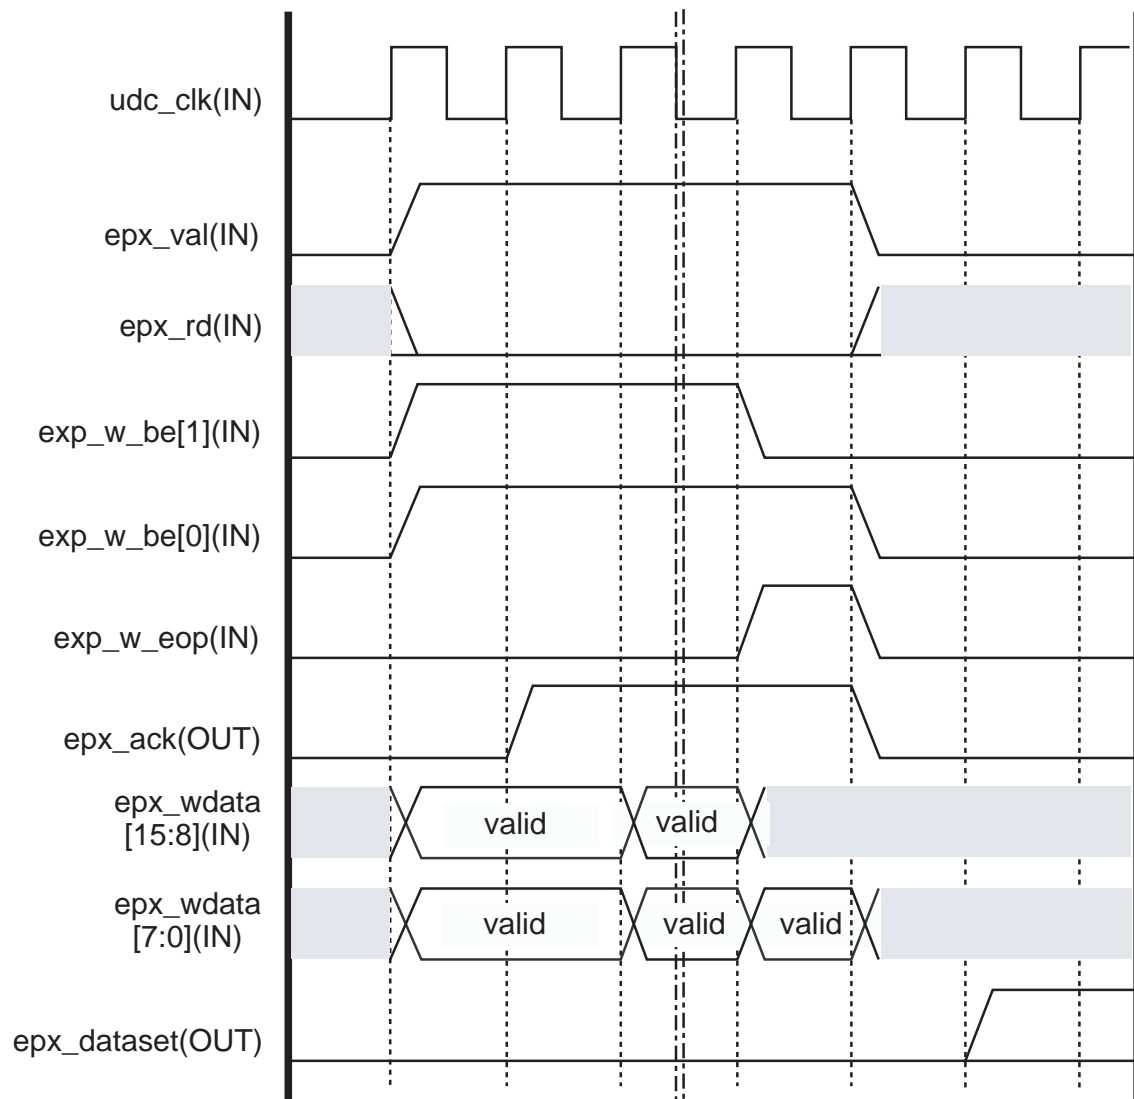

Figure 17-32 MPS (odd number) write access with `max_pkt` = even number (EP direct access)

### 17.9.3 Appendix C Isochronous Translator

In Isochronous transfers, the isochronism of data is critical and transfers occur per frame. Therefore, accesses to an EP (FIFO) using Isochronous transfers require a certain level of performance (speed). In UDC2, the access method to each EP can be selected from PPCI-I/F and EP-I/F. The FIFO configuration can be selected from Single mode and Dual mode. However, for an EP using Isochronous transfers, it is recommended to use EP-IF and Dual mode.

#### 17.9.3.1 Accessing an EP using Isochronous transfer

The maximum data payload size is 1023 bytes in FS mode. To transfer 1023 bytes using Dual mode, 2048 bytes of RAM are required. Transfers are performed per frame (1 ms) in FS mode. In FS mode, One transactions can be made in one frame.

(Information such as the payload size and the number of transactions must be set in the relevant UDC2 register. This information must also be managed by software as the EP descriptor information to be sent to the host.)

#### 17.9.3.2 Restrictions on command usage to EP when using Isochronous transfer

Compared to other transfers, Isochronous transfers have certain restrictions on handshake, toggle, the number of transactions in a frame, etc., limiting the types of commands that can be used. As a general rule, commands must not be issued to EPs during Isochronous transfers. While a request is being processed, the EP\_Reset or EP\_Invalid command may be used as necessary.

(When using PPCI-I/F as the EP access method, use the EP\_EOP command.)

(About the Appendix)

For descriptions concerning the USB Specification, be sure to check the USB Specification (revision 2.0).

## 18. USB Host Controller Ver.B (USBH)

The USB Host Controller (USBHC) is compliant with the USB Specification Revision 2.0 and the Open HCI Specification Release 1.0a, and supports USB transfers at 12 Mbps (full-speed). The USBHC is connected to the CPU via bus bridge logic.

The USCHC is subject to some restrictions. For details, See "18.8 Restrictions on Using the USB Host Controller".

### 18.1 System Overview

The key features of the USBHC are as follows :

1. Supports full-speed (12 Mbps) USB devices.  
Low-speed (1.5 Mbps) USB devices are not supported.
2. Supports control, bulk, interrupt and isochronous transfers (There are some restrictions. Refer to "18.8 Restrictions on Using the USB Host Controller").
3. Contains two 16-byte FIFO buffers (IN and OUT) in the bus bridge logic for connecting with the CPU, allowing up to 16 bytes of burst transfers.
4. Supports data transfers between the FIFO buffers in the bus bridge logic and the on-chip SRAM. Accessible SRAM is RAM2(0x2001\_0000 to 0x2001\_3FFF).

Note: **While USBHC accesses to RAM2, if CPU or DMA accesses to RAM2, CPU and DMA have priority. For detail, refer to "18.7.4 Competing access to the RAM2".**

## 18.2 System Configuration

The USBHC consists of the following three blocks :

- 1. USBHC core (OHCI)
- 2. USB transceiver
- 3. CPU bus bridge logic

Figure 18-1 USB Host Controller Block Diagram

## 18.3 Interrupt

The USBHC generates the following interrupts :

- Scheduling Overrun
- HcDoneHead Write back
- Start of Frame
- Resume Detect
- Unrecoverable Error
- Frame Number Overflow
- Root Hub Status Change
- Ownership Change

When an event that causes an interrupt occurs, the USBHC sets the corresponding bit in the HcInterruptStatus register. At this time, if the MasterInterruptEnable (MIE) bit is enabled and the corresponding bit in the HcInterruptEnable register is enabled, a USB interrupt (INTSUBH) is generated.

The USBHS driver software can clear each bit in the HcInterruptStatus register by writing a 1 to it. (The driver software cannot set these bits, and the USBHC cannot clear these bits.)

## 18.4 Reset

The USBHC is initialized by a hardware or software reset.

### 18.4.1 Hardware reset

A hardware reset is generated by an external reset pin or internal reset.

- All registers are initialized.
- The reset signal is output on the bus by an external pull-down resistor. (USB-HDP = USB-HDM = 0)  
(The USB transceiver is in the SUSPEND state.)
- The USB state changes to the USBRESET state.
- List processing and SOF token generation are disabled.
- The FrameNumber field of the HcFmNumber register is not increased.

### 18.4.2 Software reset

A software reset is generated when a "1" is written to the HostControllerReset bit in the HcCommandStatus register.

- All OHCI registers are initialized except the following :
  - - The RemoteWakeupConnected and InterruptRouting bits in the HcControl register remain the same.
  - - The HcBCR0 register is not initialized.
- The USBHC outputs the reset signal on the USB bus (USB-HDP = USB-HDM = 0)
- The USB state changes to the USBSUSPEND state.  
(The FunctionalState bit in the HcControl register is set to 0x03 to transition to the USBSUSPEND state.)

## 18.5 Bus Power Control

The USBHC has a control signal for the external Vbus power IC. This signal is controlled by the USBHPON pin.

To use port as the USBHPON pin, the function register must be set appropriately. Then, setting the LPSC bit of the HcRhStatus register in the OCI register to "1" makes the USBHPON pin output "High" level.

The  $\overline{\text{USBOC}}$  pin is used to detect overcurrent conditions. When low level is detected on this pin, the USBHC sets the OCI bit in the HcRhStatus register to "1". (To use port as the  $\overline{\text{USBOC}}$  pin, the function register must be set appropriately.)

## 18.6 Register

The USBHC contains a set of control registers compliant with the Open HCI Specification which are mapped in to the memory space. The bus bridge logic for connecting with the CPU also includes control registers.

These registers are directly accessible from the CPU via a 32-bit bus.

Base Address = 0x4000\_3000

Register name		Address(Base+)
Hc Revision Register	HcRevision	0x0000

Hc Root hub Status Register	HcRhStatus	0x0050
Hc Root hub Port Status Register	HcRhPortStatus1	0x0054
Hc BCR0 Register	HcBCR0	0x0080

Note 1: The Open HCI Specification Release 1.0a specifies the FrameRemaining (FR) and FrameRemainingToggle (FRT) bits in the HcFmRemaining register and the FramNumber (FN) bit in the HcFmNumber register as read-only to the Host Control Driver (HCD). However, the USBHC allows write accesses to these registers by the HCD for debug purposes. If the HCD writes to these registers, undefined results will occur. These bits must not be written by the HCD.

Note 2: The explanation of "18.6.1 HcRevision Register" to "18.6.23 HcBCR0 Register" are references. About the explanation based on OHCI, refer to "Open HCI Specification Release 1.0a" specification.

For example, a value of 0x11 corresponds to version 1.1. All of the HC implementations that are compliant with this specification will have a value of 0x10.

## 18.6.2 HcControl Register

The HcControl register defines the operating modes for the Host Controller. Most of the fields in this register are modified only by the Host Controller Driver, except HostControllerFunctionalState and RemoteWakeupConnected.

	31	30	29	28	27	26	25	24

After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type (HCD)	Type (HC)	Function
31-11	-	-	-	Reserved
10	RWE	R/W	R	Filed name:Remote Walk-up Enable This bit is used by HCD to enable or disable the remote walk-up feature upon the detection of upstream resume signaling. When this bit is set and the ResumeDetected bit in HcInterruptStatus is set, a remote walk-up is signaled to the host system. Setting this bit has no impact on the generation of hardware interrupt.
9	RWC	R/W	R/W	Filed name:Remote Walk-up Connected This bit indicates whether HC supports remote walk-up signaling. If remote walk-up is supported and used by the system, it is the responsibility of system firmware to set this bit during POST. HC clears the bit upon a hardware reset but does not alter it upon a software reset.
8	IR	R/W	R	Filed name:Interrupt Routing This bit determines the routing of interrupts generated by events registered in HcInterruptStatus. If clear, all interrupts are routed to the normal host bus interrupt mechanism. If set, interrupts are routed to the System Management Interrupt. HCD clears this bit upon a hardware reset, but it does not alter this bit upon a software reset. HCD uses this bit as a tag to indicate the ownership of HC.
7-6	HCFS[1:0]	R/W	R/W	Filed name:Host Controller Functional State For USB 00 : USBRESET 01 : USBRESUME 10 : USBOPERATIONAL 11 : USBSUSPEND  A transition to USBOPERATIONAL from another state causes SOF generation to begin 1 ms later. HCD may determine whether HC has begun sending SOFs by reading the StartofFrame field of HcInterruptStatus.  This field may be changed by HC only when in the USBSUSPEND state. HC may move from the USBSUSPEND state to the USBRESUME state after detecting the resume signaling from a downstream port.  HC enters USBSUSPEND after a software reset, whereas it enters USBRESET after a hardware reset. The latter also resets the Root Hub and asserts subsequent reset signaling to downstream ports.
5	BLE	R/W	R	Filed name:Bulk List Enable This bit is set to enable the processing of the Bulk list in the next Frame. If cleared by HCD, processing of the Bulk list does not occur after the next SOF. HC checks this bit whenever it determines to process the list. When disabled, HCD may modify the list. If HcBulkCurrentED is pointing to an ED to be removed, HCD must advance the pointer by updating HcBulkCurrentED before re-enabling processing of the list.

Bit	Bit Symbol	Type (HCD)	Type (HC)	Function																												
4	CLE	R/W	R	<p>Filed name:Control List Enable</p> <p>This bit is set to enable the processing of the Control list in the next Frame. If cleared by HCD, processing of the Control list does not occur after the next SOF. HC must check this bit whenever it determines to process the list. When disabled, HCD may modify the list. If HcControlCurrentED is pointing to an ED to be removed, HCD must advance the pointer by updating HcControlCurrentED before re-enabling processing of the list.</p>																												
3	IE	R/W	R	<p>Filed name:Isochronous Enable</p> <p>This bit is used by HCD to enable/disable processing of isochronous EDs. While processing the periodic list in a Frame, HC checks the status of this bit when it finds an Isochronous ED (F=1). If set (enabled), HC continues processing the EDs. If cleared (disabled), HC halts processing of the periodic list (which now contains only isochronous EDs) and begins processing the Bulk/Control lists. Setting this bit is guaranteed to take effect in the next Frame (not the current Frame).</p> <p>* This product has some restrictions on isochronous transfers.</p>																												
2	PLE	R/W	R	<p>Filed name:Periodic List Enable</p> <p>This bit is set to enable the processing of the periodic list in the next Frame. ### 18.6.3 HcCommandStatus Register

The HcCommandStatus register is used by the Host Controller to receive commands issued by the Host Controller Driver, as well as reflecting the current status of the Host Controller. To the Host Controller Driver, it appears to be a "write to set" register. The Host Controller must ensure that bits written as "1" are set in the register while bits written as "0" remain unchanged in the register. The Host Controller Driver may issue multiple distinct commands to the Host Controller without concern for corrupting previously issued commands. The Host Controller Driver has normal read access to all bits.

The SchedulingOverrunCount field indicates the number of frames with which the Host Controller has detected the scheduling overrun error. This occurs when the Periodic list does not complete before EOF. When a scheduling overrun error is detected, the Host Controller increments the counter and sets the SchedulingOverrun field in the HcInterruptStatus register.

This is used by HCD to monitor any persistent scheduling problems.</p>
15-4	-	-	-	Reserved
3	OCR	R/W	R/W	<p>Filed name:Ownership Change Request</p> <p>This bit is set by an OS HCD to request a change of control of the HC. When set HC will set the OwnershipChange field in HcInterruptStatus. After the changeover, this bit is cleared and remains so until the next request from OS HCD.</p>
2	BLF	R/W	R/W	<p>Filed name:Bulk List Filled</p> <p>This bit is used to indicate whether there are any TDs on the Bulk list. It is set by HCD whenever it adds a TD to an ED in the Bulk list.</p> <p>When HC begins to process the head of the Bulk list, it checks BF. As long as BulkListFilled is 0, HC will not start processing the Bulk list. If BulkListFilled is 1, HC will start processing the Bulk list and will set BF to 0. If HC finds a TD on the list, then HC will set BulkListFilled to 1 causing the Bulk list processing to continue. If no TD is found on the Bulk list, and if HCD does not set BulkListFilled, then BulkListFilled will still be 0 when HC completes processing the Bulk list and Bulk list processing will stop.</p>
1	CLF	R/W	R/W	<p>Filed name:Control List Filled</p> <p>This bit is used to indicate whether there are any TDs on the Control list. It is set by HCD whenever it adds a TD to an ED in the Control list.</p> <p>When HC begins to process the head of the Control list, it checks CLF. As long as ControlListFilled is 0, HC will not start processing the Control list. If CF is 1, HC will start processing the Control list and will set ControlListFilled to 0. If HC finds a TD on the list, then HC will set ControlListFilled to 1 causing the Control list processing to continue. If no TD is found on the Control list, and if the HCD does not set ControlListFilled, then ControlListFilled will still be 0 when HC completes processing the Control list and Control list processing will stop.</p>
0	HCR	R/W	R/W	<p>Filed name:Host Controller Reset</p> <p>This bit is set by HCD to initiate a software reset of HC. Regardless of the functional state of HC, it moves to the USBSUSPEND state in which most of the operational registers are reset except those stated otherwise; e.g., the InterruptRouting field of HcControl, and no Host bus accesses are allowed. This bit is cleared by HC upon the completion of the reset operation. The reset operation must be completed within 10 s. This bit, when set, should not cause a reset to the Root Hub and no subsequent reset signaling should be asserted to its downstream ports.</p>

### 18.6.4 HcInterruptStatus Register

This register provides status on various events that cause hardware interrupts. When an event occurs, the Host Controller sets the corresponding bit in this register. When the bit is set, a hardware interrupt is generated if the interrupt is enabled in the HcInterruptEnable register and the MasterInterruptEnable bit is set. The Host Controller Driver may clear specific bits in this register by writing "1" to bit positions to be cleared. The Host Controller Driver may not set any of these bits. The Host Controller will never clear the bit.

	31	30	29	28	27	26	25	24
bit symbol	-	OC	-	-	-	-	-	-
After reset		0

After reset								
	7	6	5	4	3	2	1	0
bit symbol	-	RHSC	FNO	UE	RD	SF	WDH	SO
After reset		0	0	0	0	0	0	0

Bit	Bit Symbol	Type (HCD)	Type (HC)	Function
31	-	-	-	Reserved
30	OC	R/W	R/W	Filed name:Ownership Change This bit is set by HC when HCD sets the OwnershipChangeRequest field in HcCommandStatus. This event, when unmasked, will always generate an System Management Interrupt (SMI) immediately. This bit is tied to 0 when the SMI pin is not implemented.
29-7	-	-	-	Reserved
6	RHSC	R/W	R/W	Filed name:Root Hub Status Change This bit is set when the content of HcRhStatus or the content of any of HcRhPortStatus[NumberOfDownstreamPort] has changed.
5	FNO	R/W	R/W	Filed name:Frame Number Overflow This bit is set when the MSB of HcFmNumber (bit 15) changes value, from 0 to 1 or from 1 to 0, and after HccaFrameNumber has been updated.
4	UE	R/W	R/W	Filed name:Unrecoverable Error This bit is set when HC detects a system error not related to USB. HC should not proceed with any processing nor signaling before the system error has been corrected. HCD clears this bit after HC has been reset.
3	RD	R/W	R/W	Filed name:Resume Detected This bit is set when HC detects that a device on the USB is asserting resume signaling. It is the transition from no resume signaling to resume signaling causing this bit to be set. This bit is not set when HCD sets the USBRESUME state.
2	SF	R/W	R/W	Filed name:Startof Frame This bit is set by HC at each start of a frame and after the update of HccaFrameNumber. HC also generates a SOF token at the same time
1	WDH	R/W	R/W	Filed name:Writeback Done Head This bit is set immediately after HC has written HcDoneHead to HccaDoneHead. Further updates of the HccaDoneHead will not occur until this bit has been cleared. HCD should only clear this bit after it has saved the content of HccaDoneHead.
0	SO	R/W	R/W	Filed name:Scheduling Overrun This bit is set when the USB schedule for the current Frame overruns and after the update of HccaFrameNumber. A scheduling overrun will also cause the SchedulingOverrunCount of HcCommandStatus to be incremented.

### 18.6.5 HcInterruptEnable Register

Each enable bit in the HcInterruptEnable register corresponds to an associated interrupt bit in the HcInterruptStatus register. The HcInterruptEnable register is used to control which events generate a hardware interrupt. When a bit is set in the HcInterruptStatus register and the corresponding bit in the HcInterruptEnable register is set and the MasterInterruptEnable bit is set, then a hardware interrupt is requested on the host bus.

Writing a "1" to a bit in this register sets the corresponding bit, whereas writing a "0" to a bit in this register leaves the corresponding bit unchanged. On read, the current value of this register is returned.

	31	30	29	28	27	26	25	24

### 18.6.6 HcInterruptDisable Register

Each disable bit in the HcInterruptDisable register corresponds to an associated interrupt bit in the HcInterruptStatus register. The HcInterruptDisable register is coupled with the HcInterruptEnable register. Thus, writing a "1" to a bit in this register clears the corresponding bit in the HcInterruptEnable register, whereas writing a "0" to a bit in this register leaves the corresponding bit in the HcInterruptEnable register unchanged. On read, the current value of the HcInterruptEnable register is returned.

0	SO	R/W	R	Filed name:Scheduling Overrun 0: Ignore 1: Disable interrupt generation due to SchedulingOverrun.

18.6.7 HcHCCA Register

The HcHCCA register contains the physical address of the Host Controller Communication Area. The Host Controller Driver determines the alignment restrictions by writing all 1s to HcHCCA and reading the content of HcHCCA. The alignment is evaluated by examining the number of zeroes in the lower order bits. The minimum alignment is 256 bytes; therefore, bits 0 through 7 must always return "0" when read. This area is used to hold the control structures and the Interrupt table that are accessed by both the Host Controller and the Host Controller Driver.

Bit	Bit Symbol	Type (HCD)	Type (HC)	Function
31-4	BCED[27:0]	R/W	R/W	Filed name: Bulk Current ED This is advanced to the next ED after the HC has served the present one. HC continues processing the list from where it left off in the last Frame. When it reaches the end of the Bulk list, HC checks the ControlListFilled field of HcControl. If set, HC copies the content of HcBulkHeadED to HcBulkCurrentED and clears the bit. If it is not set, HC does nothing. HCD is only allowed to modify this register when the BulkListEnable of HcControl is cleared. When set, the HCD only reads the instantaneous value of this register. This is initially set to zero to indicate the end of the Bulk list.
3-0	-	-	-	Reserved

18.6.13 HcDoneHead Register

The HcDoneHead register contains the physical address of the last completed Transfer Descriptor that was added to the Done queue. In normal operation, the Host Controller Driver should not need to read this register as its content is periodically written to the HCCA.

	31	30	29	28	27	26	25	24
bit symbol	DH							
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	DH

	15	14	13	12	11	10	9	8
bit symbol	DH							
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	DH				-	-	-	-
After reset	0	0	0	0				

Bit	Bit Symbol	Type (HCD)	Type (HC)	Function
31-4	DH[27:0]	R	R/W	Filed name:Done Head When a TD is completed, HC writes the content of HcDoneHead to the NextTD field of the TD. HC then overwrites the content of HcDoneHead with the address of this TD. This is set to zero whenever HC writes the content of this register to HCCA. It also sets the Write-backDoneHead of HcInterruptStatus.
3-0	-	-	-	Reserved

## 18.6.14 HcFmInterval Register

The HcFmInterval register contains a 14-bit value which indicates the bit time interval in a Frame, (i.e., between two consecutive SOFs), and a 15-bit value indicating the Full Speed maximum packet size that the Host Controller may transmit or receive without causing scheduling overrun. The Host Controller Driver may carry out minor adjustment on the FrameInterval by writing a new value over the present one at each SOF. This provides the programmability necessary for the Host Controller to synchronize with an external clocking resource and to adjust any unknown local clock offset.

	31	30	29	28	27	26	25	24
bit symbol	FIT		FSMPS					
After reset	0	0	0	0	0	0	0	0

After reset	1	1	0	1	1	1	1	1

Bit	Bit Symbol	Type (HCD)	Type (HC)	Function
31	FIT	R/W	R	Filed name:Frame Interval Toggle HCD toggles this bit whenever it loads a new value to FrameInterval.
30-16	FSMPS[14:0]	R/W	R	Filed name:FS Largest data Packet This field specifies a value which is loaded into the Largest Data Packet Counter at the beginning of each frame. The counter value represents the largest amount of data in bits which can be sent or received by the HC in a single transaction at any given time without causing scheduling overrun. The field value is calculated by the HCD.
15-14	-	-	-	Reserved
13-0	FI[13:0]	R/W	R	Filed name:Frame Interval This specifies the interval between two consecutive SOFs in bit times. The nominal value is set to be 11,999. HCD should store the current value of this field before resetting HC. By setting the HostController-Reset field of HcCommandStatus as this will cause the HC to reset this field to its nominal value. HCD may choose to restore the stored value upon the completion of the Reset sequence.

18.6.15 HcFmRemaining Register

The HcFmRemaining register is a 14-bit down counter showing the bit time remaining in the current Frame.

	31	30	29	28	27	26	25	24
bit symbol	FRT	-	-	-	-	-	-	-
After reset	0							
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-

	15	14	13	12	11	10	9	8
bit symbol	-	-	FR					
After reset			0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	FR							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type (HCD)	Type (HC)	Function
31	FRT	R	R/W	Filed name:Frame Remaining Toggle This bit is loaded from the FrameIntervalToggle field of HcFmInterval whenever FrameRemaining reaches 0. This bit is used by HCD for the synchronization between FrameInterval and FrameRemaining.
30-14	-	-	-	Reserved
13-0	FR[13:0]	R	R/W	Filed name:Frame Remaining This counter is decremented at each bit time. When it reaches zero, it is reset by loading the FrameInterval value specified in HcFmInterval at the next bit time boundary. When entering the USBOPERATIONAL state, HC re-loads the content with the FrameInterval of HcFmInterval and uses the updated value from the next SOF.

## 18.6.16 HcFmNumber Register

The HcFmNumber register is a 16-bit counter. It provides a timing reference among events happening in the Host Controller and the Host Controller Driver. The Host Controller Driver may use the 16-bit value specified in this register and generate a 32-bit frame number without requiring frequent access to the register.

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset								
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset								
	15	14	13	12	11	10	9	8
bit symbol	FN							
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	FN							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type (HCD)	Type (HC)	Function
31-16	-	-	-	Reserved
15-0	FN[15:0]	R	R/W	Filed name:Frame Number This is increased when HcFmRemaining is re-loaded. It will be rolled over to 0x0000 after 0xffff. When entering the USBOPERATIONAL state, this will be increased automatically. The content will be written to HCCA after HC has increased the FrameNumber at each frame boundary and sent a SOF but before HC reads the first ED in that Frame. After writing to HCCA, HC will set the StartoffFrame in HcInterruptStatus.

18.6.17 HcPeriodicStart Register

The HcPeriodicStart register has a 14-bit programmable value which determines the earliest time when HC should start processing the periodic list

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset								
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset								
	15	14	13	12	11	10	9	8
bit symbol	-	-	PS					
After reset			0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	PS							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type (HCD)	Type (HC)	Function
31-14	-	-	-	Reserved
13-0	PS[13:0]	R/W	R	Filed name:Periodic Start After a hardware reset, this field is cleared. This is then set by HCD during the HC initialization. The value is calculated roughly as 10% off from HcFmInterval. A typical value will be 3E67h. When HcFmRemaining reaches to the value specified, processing of the periodic lists will have priority over Control/Bulk processing. HC will therefore start processing the Interrupt list after completing the current Control or Bulk transaction that is in progress.

### 18.6.18 HcLSThreshold Register

The HcLSThreshold register contains an 12-bit value used by the Host Controller to determine whether to commit to the transfer of a maximum of 8-byte LS packet before EOF. Neither the Host Controller nor the Host Controller Driver are allowed to change this value.

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset								
	23	22	21	20	19	18	17	16

After reset	0	0	1	0	1	0	0	0

Bit	Bit Symbol	Type (HCD)	Type (HC)	Function
31-12	-	-	-	Reserved
11-0	LST[11:0]	R/W	R	Filed name:LS Threshold This field contains a value which is compared to the FrameRemaining field prior to initiating a Low Speed transaction. The transaction is started only if FrameRemaining this field. The value is calculated by HCD with the consideration of transmission and setup overhead.

18.6.19 HcRhDescriptorA Register

The HcRhDescriptorA register is one of two registers describing the characteristics of the Root Hub. Reset values are implementation-specific. The descriptor length, descriptor type, and hub controller current fields of the hub Class Descriptor are emulated by the HCD. All other fields are located in the HcRhDescriptorA and HcRhDescriptorB registers.

Bit	Bit Symbol	Type (HCD)	Type (HC)	Function
31-24	POTPGT[7:0]	R/W	R	<p>Filed name:Power On To Power Good Time</p> <p>This byte specifies the duration HCD has to wait before accessing a powered-on port of the Root Hub. It is implementation-specific. The unit of time is 2 ms. The duration is calculated as POTPGT×2 ms.</p>
23-13	–	–	–	Reserved
12	NOCP	R/W	R	<p>Filed name:No Over Current Protection</p> <p>This bit describes how the overcurrent status for the Root Hub ports are reported. When this bit is cleared, the OverCurrentProtectionMode field specifies global or per-port reporting.</p> <p>0: Over-current status is reported collectively for all downstream ports. 1: No overcurrent protection supported.</p>
11	OCPM	R/W	R	<p>Filed name:Over Current Protection Mode</p> <p>This bit describes how the overcurrent status for the Root Hub ports are reported. At reset, this fields should reflect the same mode as PowerSwitchingMode. This field is valid only if the NoOver-CurrentProtection field is cleared.</p> <p>0: Over-current status is reported collectively for all downstream ports. 1: Over-current status is reported on a per-port basis.</p>
10	DT	R	R	<p>Device Type</p> <p>This bit specifies that the Root Hub is not a compound device. The Root Hub is not permitted to be a compound device. This field should always read/write 0.</p>
9	NPS	R/W	R	<p>Filed name:No Power Switching</p> <p>These bits are used to specify whether power switching is supported or ports are always powered. It is implementation- specific. When this bit is cleared, the PowerSwitchingMode specifies global or per-port switching.</p> <p>0: Ports are power switched. 1: Ports are always powered on when the HC is powered on.</p>
8	PSM	R/W	R	<p>Filed name:Power Switching Mode</p> <p>This bit is used to specify how the power switching of the Root Hub ports is controlled. It is implementation-specific. This field is only valid if the NoPowerSwitching field is cleared.</p> <p>0: All ports are powered at the same time. 1: Each port is powered individually. This mode allows port power to be controlled by either the global switch or per-port switching. If the PortPowerControlMask bit is set, the port responds only to port power commands (Set/ClearPortPower). If the port mask is cleared, then the port is controlled only by the global power switch (Set/ClearGlobalPower).</p>
7-0	NDP[7:0]	R	R	<p>Filed name:Number Downstream Ports</p> <p>These bits specify the number of downstream ports supported by the Root Hub. It is implementation-specific. This module has one port, so "0x01" is read.</p>

18.6.20 HcRhDescriptorB Register

The HcRhDescriptorB register is one of two registers describing the characteristics of the Root Hub. These fields are written during initialization to correspond with the system implementation. Reset values are implementation-specific.

Note:Since this host controller does not have Port#2 to Port#15, write "0" to the corresponding bit.

## 18.6.21 HcRhStatus Register

The HcRhStatus register is divided into two parts. The lower word of a Dword represents the Hub Status field and the upper word represents the Hub Status Change field. Reserved bits should always be written "0".

	31	30	29	28	27	26	25	24
bit symbol	CRWE	-	-	-	-	-	-	-
After reset	Undefined							
	23	22	21	20	19	18	17	16

After reset							0	0

Bit	Bit Symbol	Type (HCD)	Type (HC)	Function
31	CRWE	W	R	Filed name:Clear Remote Wakeup Enable Writing a "1" clears DeviceRemoveWakeupEnable. Writing a "0" has no effect.
30-18	-	-	-	Reserved
17	OCIC	R/W	R/W	Filed name:Over Current Indicator Change This bit is set by hardware when a change has occurred to the OCI field of this register. The HCD clears this bit by writing a "1". Writing a "0" has no effect.
16	LPSC	R/W	R	Filed name:Local Power Status Change (read)LocalPowerStatusChange The Root Hub does not support the local power status feature; thus, this bit is always read as "0".  (write)SetGlobalPower In global power mode (PowerSwitchingMode="0"), This bit is written to "1" to turn on power to all ports (set PortPowerStatus). In per-port power mode, it sets PortPowerStatus only on ports whose PortPowerControlMask bit is not set. Writing a "0" has no effect.
15	DRWE	R/W	R	Filed name:Device Remote Walk-up Enable (read)DeviceRemoteWakeupEnable This bit enables a ConnectStatusChange bit as a resume event, causing a USBSUSPEND to USBRESUME state transition and setting the ResumeDetected interrupt. 0: ConnectStatusChange is not a remote wakeup event. 1: ConnectStatusChange is a remote wakeup event. (write) Writing a "1" sets DeviceRemoveWakeupEnable. Writing a "0" has no effect.  (Refer to "18.8 Restrictions on Using the USB Host Controller")
14-2	-	-	-	Reserved
1	OCI	R	R/W	Filed name:Over Current Indicator This bit reports overcurrent conditions when the global reporting is implemented. When set, an over-current condition exists. When cleared, all power operations are normal. If per-port overcurrent protection is implemented, this bit is always "0".
0	LPS	R/W	R	Filed name:Local Power Status (read)LocalPowerStatus The Root Hub does not support the local power status feature; thus, this bit is always read as "0". (write)ClearGlobalPower In global power mode (PowerSwitchingMode=0), this bit is written to "1" to turn off power to all ports (clear PortPowerStatus). In per-port power mode, it clears PortPowerStatus only on ports whose PortPowerControlMask bit is not set. Writing a "0" has no effect.

## 18.6.22 HcRhPortStatus1 Register

The HcRhPortStatus1 register is used to control and report port events on a per-port basis. NumberDownstreamPorts represents the number of HcRhPortStatus registers that are implemented in hardware. The lower word is used to reflect the port status, whereas the upper word reflects the status change bits. Some status bits are implemented with special write behavior (see below). If a transaction (token through handshake) is in progress when a write to change port status occurs, the resulting port status change must be postponed until the transaction is complete. Reserved bits should always be written "0".

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset								
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	PRSC	OCIC	PSSC	PESC	CSC

After reset							Undefined	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	PRS	POCI	PSS	PES	CCS
After reset				0	0	0	0	0

Bit	Bit Symbol	Type (HCD)	Type (HC)	Function
31-21	-	-	-	Reserved
20	PRSC	R/W	R/W	Filed name:Port Reset Status Change This bit is set at the end of the 10 ms port reset signal. The HCD writes a "1" to clear this bit. Writing a "0" has no effect. 0: port reset is not complete. 1: port reset is complete.
19	OCIC	R/W	R/W	Filed name:Port Over Current Indicator Change This bit is valid only if overcurrent conditions are reported on a per-port basis. This bit is set when Root Hub changes the PortOverCurrentIndicator bit. The HCD writes a "1" to clear this bit. Writing a "0" has no effect. 0: No change in PortOverCurrentIndicator 1: PortOverCurrentIndicator has changed.
18	PSSC	R/W	R/W	Filed name:Port Suspend Status Change This bit is set when the full resume sequence has been completed. This sequence includes the 20 s resume pulse, LS EOP, and 3 ms resynchronization delay. The HCD writes a "1" to clear this bit. Writing a "0" has no effect. This bit is also cleared when ResetStatusChange is set. 0: Resume is not complete. 1: Resume is complete.
17	PESC	R/W	R/W	Filed name:Port Enable Status Change This bit is set when hardware events cause the PortEnableStatus bit to be cleared. Changes from HCD writing do not set this bit. The HCD writes a "1" to clear this bit. Writing a "0" has no effect. 0: No change in PortEnableStatus. 1: Change in PortEnableStatus.
16	CSC	R/W	R/W	Filed name:Connect Status Change This bit is set whenever a connect or disconnect event occurs. The HCD writes a "1" to clear this bit. Writing a "0" has no effect. If CurrentConnectStatus is cleared when a SetPortReset, SetPortEnable, or SetPortSuspend write occurs, this bit is set to force the driver to re-evaluate the connection status since these writes should not occur if the port is disconnected. 0: No change in CurrentConnectStatus. 1: Change in CurrentConnectStatus (Note) If the DeviceRemovable[NDP] bit is set, this bit informs to set only a Root Hub reset while the device is attached to the system.
15-10	-	-	-	Reserved

Bit	Bit Symbol	Type (HCD)	Type (HC)	Function
9	LSDA	R/W	R/W	<p>(read)Low Speed Device Attached</p> <p>This bit indicates the speed of the device attached to this port. When set, a Low Speed device is attached to this port. When clear, a Full Speed device is attached to this port. This field is valid only when the CurrentConnectStatus is set.</p> <p>0: Full speed device attached.</p> <p>1: Low speed device attached.</p> <p>(write)Clear Port Power</p> <p>The HCD clears the PortPowerStatus bit by writing a "1" to this bit. Writing a "0" has no effect.</p>
8	PPS	R/W	R/W	<p>(read)Port Power Status</p> <p>This bit reflects the port's power status, regardless of the type of power switching implemented. This bit is cleared if an overcurrent condition is detected. HCD sets this bit by writing SetPortPower or SetGlobalPower. HCD clears this bit by writing ClearPortPower or ClearGlobalPower. Which power control switches are enabled is determined by PowerSwitchingMode and PortPortControlMask[NDP]. In global switching mode (PowerSwitchingMode="0"), only Set/ClearGlobalPower controls this bit. In per-port power switching (PowerSwitchingMode="1"), if the PortPowerControlMask[NDP] bit for the port is set, only Set/ClearPortPower commands are enabled. If the mask is not set, only Set/ClearGlobalPower commands are enabled. When port power is disabled, CurrentConnectStatus, PortEnableStatus, PortSuspendStatus, and PortResetStatus should be reset.</p> <p>0: Port power off</p> <p>1: Port power on</p> <p>(write)Set Port Power</p> <p>The HCD writes a '1' to set the PortPowerStatus bit. Writing a '0' has no effect.</p> <p>(Note)</p> <p>This bit is always reads "1" if power switching is not supported.</p>
7-5	–	–	–	Reserved
4	PRS	R/W	R/W	<p>(read)Port Reset Status</p> <p>When this bit is set by a write to SetPortReset, port reset signaling is asserted. When reset is completed, this bit is cleared when PortResetStatusChange is set. This bit cannot be set if CurrentConnectStatus is cleared.</p> <p>0: Port reset signal is not active</p> <p>1: Port reset signal is active</p> <p>(write)Set Port Reset</p> <p>The HCD sets the port reset signaling by writing a "1" to this bit. Writing a "0" has no effect. If CurrentConnectStatus is cleared, this write does not set PortResetStatus, but instead sets ConnectStatusChange. This informs the driver that it attempted to reset a disconnected port.</p>
3	POCI	R/W	R/W	<p>(read)Port Over Current Indicator</p> <p>This bit is only valid when the Root Hub is configured in such a way that overcurrent conditions are reported on a per-port basis. If per-port overcurrent reporting is not supported, this bit is set to "0". If cleared, all power operations are normal for this port. If set, an overcurrent condition exists on this port. This bit always reflects the overcurrent input signal</p> <p>0: No overcurrent condition</p> <p>1: Overcurrent condition detected</p> <p>(write)ClearSuspendStatus</p> <p>The HCD writes a "1" to initiate a resume. Writing a "0" has no effect. A resume is initiated only if PortSuspendStatus is set.</p>
2	PSS	R/W	R/W	<p>(read)Port Suspend Status</p> <p>This bit indicates the port is suspended or in the resume sequence. It is set by a SetSuspend-State write and cleared when PortSuspendStatusChange is set at the end of the resume interval. This bit cannot be set if CurrentConnectStatus is cleared. This bit is also cleared when PortResetStatusChange is set at the end of the port reset or when the HC is placed in the USBRESUME state. If an upstream resume is in progress, it should propagate to the HC.</p> <p>0: Port is not suspended.</p> <p>1: Port is suspended.</p> <p>(write)Set Port Suspend</p> <p>The HCD sets the PortSuspendStatus bit by writing a "1" to this bit. Writing a "0" has no effect. If CurrentConnectStatus is cleared, this write does not set PortSuspendStatus; instead it sets ConnectStatusChange. This informs the driver that it attempted to suspend a disconnected port.</p>

Bit	Bit Symbol	Type (HCD)	Type (HC)	Function
1	PES	R/W	R/W	<p>(read)Port Enable Status</p> <p>This bit indicates whether the port is enabled or disabled. The Root Hub may clear this bit when an overcurrent condition, disconnect event, switched-off power, or operational bus error such as babble is detected. This change also causes PortEnabledStatusChange to be set. HCD sets this bit by writing SetPortEnable and clears it by writing ClearPortEnable. This bit cannot be set when CurrentConnectStatus is cleared. This bit is also set, if not already, at the completion of a port re-set when ResetStatusChange is set or port suspend when SuspendStatusChange is set.</p> <p>0: Port is disabled. 1: Port is enabled.</p> <p>(write)Set Port Enable</p> <p>The HCD sets PortEnableStatus by writing a "1". Writing a "0" has no effect. If CurrentConnectStatus is cleared, this write does not set PortEnableStatus, but instead sets ConnectStatusChange. This informs the driver that it attempted to enable a disconnected port.</p>
0	CCS	R/W	R/W	<p>(read)Current Connect Status</p> <p>This bit reflects the current state of the downstream port.</p> <p>0: No device connected 1: Device connected</p> <p>(write)Clear Port Enable</p> <p>The HCD writes a "1" to this bit to clear the PortEnableStatus bit. Writing a "0" has no effect. The CurrentConnectStatus is not affected by any write.</p> <p>(Note)</p> <p>This bit is always read as '1' when the attached device is nonremovable (DeviceRemoveable[NDP]).</p>

### 18.6.23 HcBCR0 Register

The HcBCR0 register controls over current input of enable or disable to the USBHC and the SUSPEND state of the USB transceiver.

The USBHC is not active in Low Power Consumption Modes. Therefore, before entering Low Power Consumption Modes, place the USBHC and the USB transceiver in the SUSPEND state.

## 18.7 Notes on Using the USB Host Controller

### 18.7.1 Oscillator Recommendation

To generate a clock for the USBHC, we recommend using a 12MHz crystal oscillator with an accuracy of  $\pm 50\text{ppm}$  or less to comply with the USB specification.

Note that a USB clock generated by the on-chip PLL may not satisfy the requirements of the USB specification depending on the implementation environment, conditions and variations.

### 18.7.2 Entering Low Power Consumption Modes

Before entering Low Power Consumption Modes, the USBHC must be placed in the SUSPEND state. Then turn off Vbus.

(Example Software setting)				
1	Disable interrupt			
2	HcCommandStatus	<HCR>	= 1	(Write) : Software reset of the USB host controller
3	HcControl	<HCFS>	= 1 1	(Read) : Check the transition to the SUSPEND state.
4	HcBCR0	<TRANS_SUSP>	= 1	(Write) : Change the state of the USB-HDP and USB-HDM pin to the SUSPEND state
5	Output "0" to USBHPON pin			: Vbus OFF
6	Setup to shifting low power consumption mode.			: Stop of peripheral function, port setting, warm up setting and so on.
7	Stop PLL			
8	Execute WFI instruction			

### 18.7.3 When not using USB

The USB-HDP and USB-HDM pins must be pulled-down.

### 18.7.4 Competing access to the RAM2

If the CPU/DMA accesses the RAM2 when the USBHC is already accessing it, the USBHC connection is discontinued and the CPU/DMA has higher priority for access. The USBHC is reconnected when the CPU/DMA access is completed. Note that if the disconnection of the USBHC caused by the CPU/DMA takes long, it may cause problems in USB transfer. Specifically, in case IN transfer, the CPU/DMA must complete to access in the period where the 64-byte FIFO contained in the USBHC becomes full (within 42.66 $\mu\text{s}$ ).

## 18.8 Restrictions on Using the USB Host Controller

1. For an isochronous transfer, a Frame number to be transferred is defined in an Isochronous Transfer Descriptor (ITD). However, Frame numbers are not synchronized between the Host and software. If a descriptor to be executed in a previous Frame is scheduled later, the Host determines that a time error has occurred and writes back DATAOVERRUN to the CC field of the ITD. At this time, if the following conditions are met, the Host will write back inappropriate status (NOERROR).

<Conditions>

The above problem occurs if transfers are scheduled in a way the following two conditions both true:

- 1 ITD.FC[2:0] = R[2:0]
- 2 ITD.FC[2:0] < R[15:0]

Where ITD.FC indicates the number of times an ITD is executed and R = HcFmNumber (current Frame number) - ITD.SF (transfer start Frame number).

Make sure that each ITD is synchronized to the current Frame number. If not, this ITD should not be linked.

2. If a fatal error occurs on the USB system and the Host detects this error, the OHCI core sets HcInterruptStatus.UE[4].

At this time, if the HcInterruptEnable.UE[4] register has been set additionally, a hardware interrupt is generated. After this interrupt is detected, a software reset (HcCommandStatus.HCR[0] = "1") is required to recover from the Unrecoverable Error state and the Host then moves to the SUSPEND state.

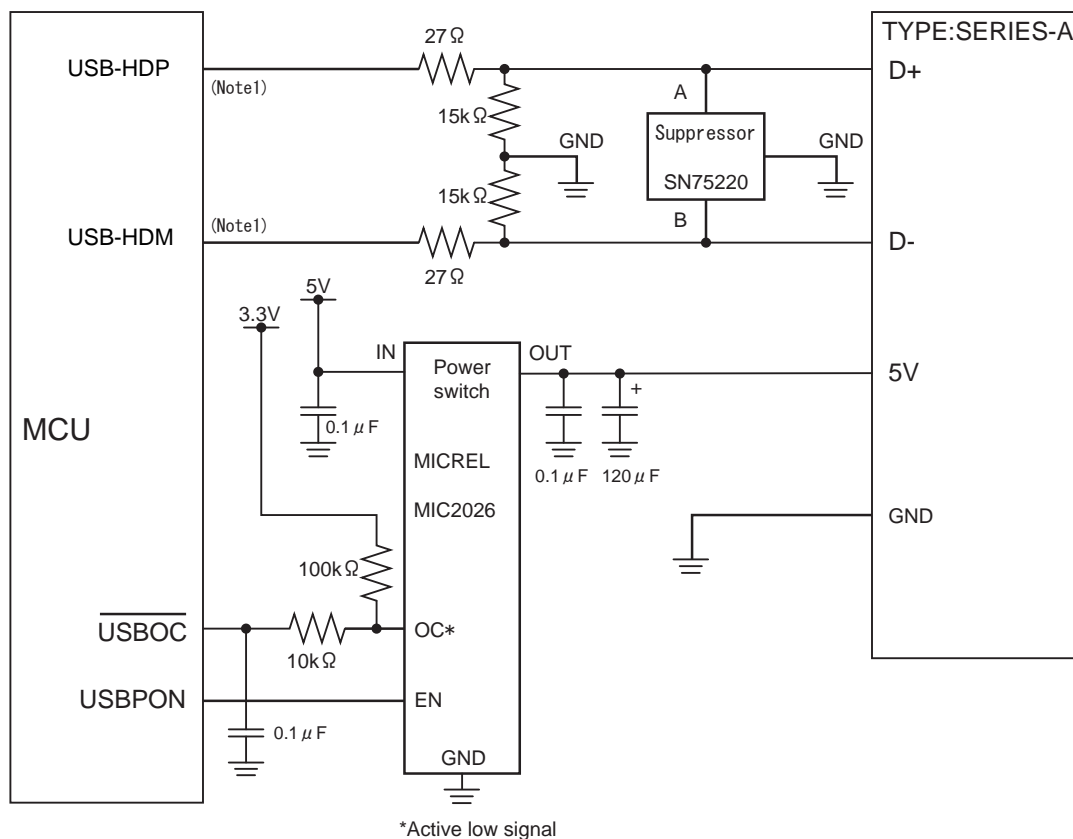

3. After the software reset, OHCI registers are initialized. If a remote wakeup from the device occurs, the Host remains in the SUSPEND state. When the remote wakeup function is used, a program for recovering from the SUSPEND state must be prepared.
4. When an overcurrent error occurs, if the HcRhDescriptorA.NPS[9] register has been set to "1", the HcRhPortStatus1.PRS[4] and HcRhPortStatus1.PSS[2] bits are not cleared. Therefore, do not set the HcRhDescriptorA.NPS[9] to "1" and the HcRhDescriptorB.DR[Port No] to "1".
5. When the HcRhStatus.DRWE [15] is set to "1", a remote wakeup event does not cause a USBSUSPEND to USBRESUME transition. When remote wakeup events are used, causing state transition by monitoring to the HcInterruptStatus.RD[3] by the HCD. And when remote wakeup events are not used, do not set the HcRhStatus.DRWE [15] to "1".
6. In a system supporting overcurrent conditions, set the HcRhDescriptorA.NOCP [12] to "0".

7. When Port Reset is executed while generating Babble, Port keep disable state. Port Reset sequence is below.

```
(Example)
1  HcRhPortStatus1 <PRS>      =  1    (Write)   : Excute port reset
2  Detect of HW interrupt
3  HcRhPortStatus1 <PRSC>     =  1    (Read)    : Port is an invalid state.
   HcRhPortStatus1 <PES>      =  0
   HcRhPortStatus1 <CCS>      =  1
4  Clear of HW interrupt
5  HcRhPortStatus1 <PRS>      =  1    (Write)   : Retry port reset
6  Detect if HW interrupt
7  HcRhPortStatus1 <PRSC>     =  1    (Read)    : Port is a valid state.
   HcRhPortStatus1 <PES>      =  1
   HcRhPortStatus1 <CCS>      =  1
```

8. When Scheduling Overrun is occurred while executing Full-Speed Isochronous transfer, It may be generated the Unrecoverable Error. When Unrecoverable Error was generated, recover from Unrecoverable Error by software reset.

Bus power switch device	: TPS2052 (Texas Instruments)
	: MIC2026-1BM (MICREL)
	: MIC2026-1BN (MICREL)
Transient voltage suppressor device	: SN75240 (Texas Instruments)
Resistance precision	: 5%
Resistance rating	: 1/2W for 27Ω recommended
Capacitor	: Low ESR type 120μF capacitor (OS-CON, etc.) recommended

Note 3: **No suppressor device is required in the USB specification.**

## 19. CAN Controller (CAN)

This product includes one channel of CAN controller.

### 19.1 Overview

- Compliant with CAN version 2.0 B (active)
- Standard and extended formats supported
- Data frames and remote frames supported for each format
- 32 Mailboxes (31 receive and transmit, 1 receive only)
- CAN bus baud rate up to 1 Mbps (with a system clock of at least 48 MHz)
- Bit timing parameter equivalent to Intel 82527 <sup>TM</sup>
- Baud rate prescaler built in
- The order in which messages are transmitted can be selected from the following two types of internal arbitrations :
  - The mailbox with the lower number will be sent first
  - The mailbox with the higher priority identifier will be sent first
- Time stamp function for receive and transmit messages
- Operation modes

Normal operation mode	
Configuration mode	
Sleep mode	CAN walk-up with CAN bus active state detection (at CANMCR<WUBA>="1") or a write access to the master control register MCR
Suspend mode	Inactive state on the CAN bus
Test loop back mode	Self acknowledge
Test error mode	Writable error counters

- Message receive mask function for two systems
  - Programmable global receive mask (common to mailboxes 0 to 31)
  - Programmable local receive mask (for mailbox 31 only)
- Receive mask bit for ID extension bit
- Interrupt signal

INTCANRX	: CAN receive completion interrupt
INTCANTX	: CAN transmit completion interrupt
INTCANGB	: CAN global interrupt Interrupt from eight causes including warning level, error passive and bus-off interrupts)

## 19.2 Block Diagram

Figure 19-1 shown the block diagram for the CAN controller.

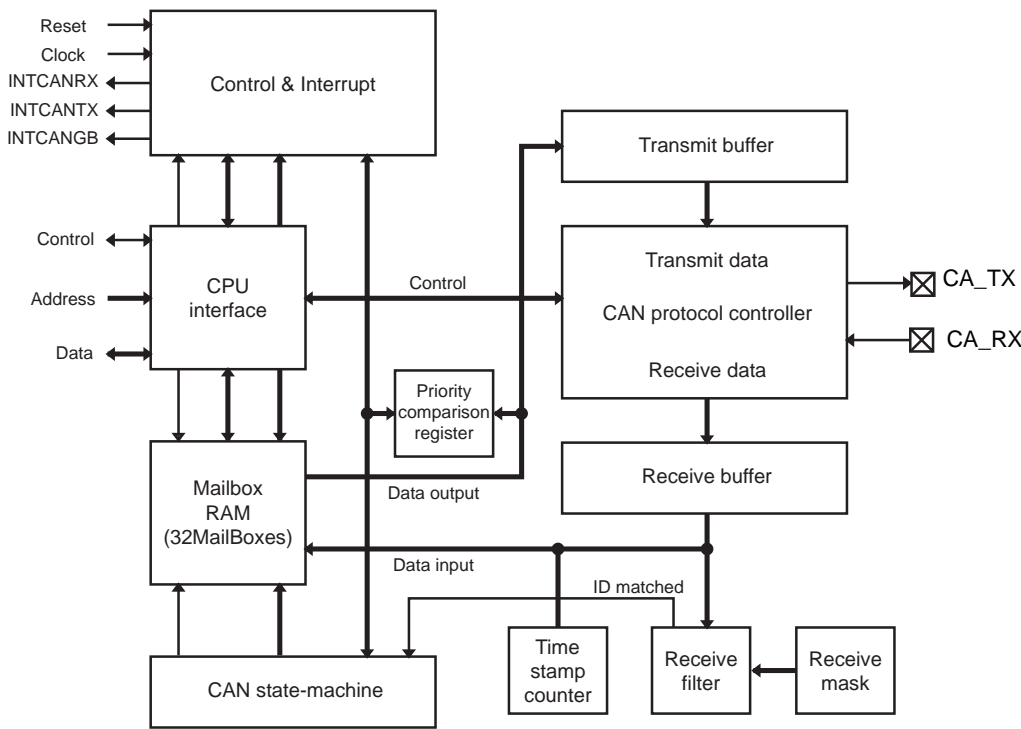

Figure 19-1 Block Diagram of CAN controller

## 19.3 CAN Interface

The interface to the CAN bus is an input pin CA\_RX and an output pin CA\_TX. Connect these pins via the CAN bus transceiver (ISO / DIS 11898 compliant).

High speed and low speed transceivers are differentiated. When this IP care must be taken that the electrical characteristics (e.g. , 3.3 V to 5 V) of these pins at chip level satisfy the needs of the transceiver.

## 19.4.2 CANMBxID (Message ID Field Register)

	31	30	29	28	27	26	25	24
bit symbol	IDE	GAME/LAME	RFH	ID				
After reset								
	23	22	21	20	19	18	17	16
bit symbol	ID							
After reset								
	15	14	13	12	11	10	9	8
bit symbol	ID							
After reset								
	7	6	5	4	3	2	1	0
bit symbol	ID							
After reset								

Bit	Bit Symbol	Type	Function
31	IDE	R/W	<p>ID Extension bit</p> <p>0: Standard format (11-bit ID) from &lt;ID28&gt; to &lt;ID18&gt; used</p> <p>1: Extended format (29-bit ID) from &lt;ID28&gt; to &lt;ID0&gt; used</p> <p>Sets the mailbox by selecting whether to receive or transmit the extended format (&lt;IDE&gt;="1") or the standard format (&lt;IDE&gt;="0").</p>
30	GAME / LAME	R/W	<p>Global (GAME) / Local (LAME) acceptance mask enable bit</p> <p>0: Receive mask is not used for receive filtering.</p> <p>1: Receive mask is used for receive filtering.</p> <p>&lt;GAME&gt; is the enable bit for the global acceptance mask GAM shared in mailboxes 0 to 30, and &lt;LAME&gt; is the enable bit for the local acceptance mask LAM used only for mailbox 31.</p> <p>When &lt;GAME&gt;=0 or &lt;LAME&gt;=0, the received message are stored in the mailbox only when the receive message ID is the same as the mailbox ID.</p> <p>For transmit mailboxes, the acceptance mask function is not applied. In such case, always set &lt;GAME&gt; to "0".</p>
29	RFH	R/W	<p>Remote frame handling bit (only for transmit mailboxes)</p> <p>0: Transmit mailboxes do not respond to remote frames. Software must handle remote frames.</p> <p>1: Transmit mailboxes respond to remote frames. (The &lt;TRS&gt; bit is set.)</p> <p>&lt;RFH&gt; determines whether a mailbox configured as a transmit mailbox will automatically respond to remote frame reception.</p> <p>When the ID of the received remote frame matches the ID of the transmit mailbox where &lt;RFH&gt;="1" and &lt;GAME&gt;="1", this mailbox ID is overwritten with the remote ID, and the mailbox automatically responds the remote frame using the overwritten ID.</p> <p>Handled as data frames in the case of receive mailboxes. (The &lt;RMP&gt; bit and the &lt;RFP&gt; bit are set.)</p>
28-0	ID[28:0]	R/W	<p>Message ID</p> <p>Standard format (11-bit ID) : From &lt;ID28&gt; to &lt;ID18&gt; are used.</p> <p>Extended format (29-bit ID) : From &lt;ID28&gt; to &lt;ID0&gt; are used.</p> <p>For the priority of message IDs, the message ID having most "0"s consecutively starting from the ID's highest bit (&lt;ID28&gt; bit) has the higher priority.</p>

Register the mailbox IDs at the time of initial setup. To change the message ID field or a mailbox after the mailbox is enabled, clear the <MCx> bit in the CANMC register corresponding to the mailbox to "0", and then disable the mailbox for the CAN controller before writing a new ID.

19.4.3 CANMBxTSVMCF (Time Stamp Values / Message Control Field Register)

	31	30	29	28	27	26	25	24
bit symbol	TSV							
After reset								
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset								
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset								
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	RTR	DLC			
After reset								

Bit	Bit Symbol	Type	Function																														
31-16	TSV[15:0]	R/W	Time stamp counter value The 16-bit time stamp counter values read when message have been successfully received or transmitted are stored. No value is set when message reception or transmission fails. For the details of the entire time stamp counter function, Refer to "19.5.6 Time Stamp Function".																														
15-5	–	R	Read undefined. Write as "0".																														
4	RTR	R/W	Remote frame transmit request bit. 0:Data frame 1:Remote frame																														
3-0	DLC[3:0]	R/W	Data length code Sets the data length (number of bytes) of messages <table><tr><th>&lt;DLC[3:0]&gt;</th><th>Number of bytes</th><th>Corresponding data</th></tr><tr><td>0000</td><td>0 byte</td><td>None</td></tr><tr><td>0001</td><td>1 byte</td><td>D0</td></tr><tr><td>0010</td><td>2 bytes</td><td>D0,D1</td></tr><tr><td>0011</td><td>3 bytes</td><td>D0,D1,D2</td></tr><tr><td>0100</td><td>4 bytes</td><td>D0,D1,D2,D3</td></tr><tr><td>0101</td><td>5 bytes</td><td>D0,D1,D2,D3,D4</td></tr><tr><td>0110</td><td>6 bytes</td><td>D0,D1,D2,D3,D4,D5</td></tr><tr><td>0111</td><td>7 bytes</td><td>D0,D1,D2,D3,D4,D5,D6</td></tr><tr><td>1000</td><td>8 bytes</td><td>D0,D1,D2,D3,D4,D5,D6,D7</td></tr></table> When <DLC3:0>="1001" or more is set, data length is processed as 8 bytes.	<DLC[3:0]>	Number of bytes	Corresponding data	0000	0 byte	None	0001	1 byte	D0	0010	2 bytes	D0,D1	0011	3 bytes	D0,D1,D2	0100	4 bytes	D0,D1,D2,D3	0101	5 bytes	D0,D1,D2,D3,D4	0110	6 bytes	D0,D1,D2,D3,D4,D5	0111	7 bytes	D0,D1,D2,D3,D4,D5,D6	1000	8 bytes	D0,D1,D2,D3,D4,D5,D6,D7
<DLC[3:0]>	Number of bytes	Corresponding data																															
0000	0 byte	None																															
0001	1 byte	D0																															
0010	2 bytes	D0,D1																															
0011	3 bytes	D0,D1,D2																															
0100	4 bytes	D0,D1,D2,D3																															
0101	5 bytes	D0,D1,D2,D3,D4																															
0110	6 bytes	D0,D1,D2,D3,D4,D5																															
0111	7 bytes	D0,D1,D2,D3,D4,D5,D6																															
1000	8 bytes	D0,D1,D2,D3,D4,D5,D6,D7																															

The time stamp values do not need to be initially set.

The message control field needs no initial programming in the case of receive mailboxes. When a received message is stored in the mailbox, <RTR> and <DLC[3:0]> are also stored in the message control field at the same time. The transmit mailboxes need initial setting.

To change the message control field of a transmit mailbox (which is set to <RFH>="1") after enabling the mailbox, clear the CANMC<MCx> bit to "0" and then disable the mailbox for the CAN controller before writing a new <RTR> and <DLC[3:0]>. The message control field of the transmit mailbox set to <RFH>="0" can be changed irrespective of the CANMC<MCx> bit setting, but the user needs to check that the CANTRS<TRSx> bit is "0" before writing a new <RTR> and <DLC[3:0]>.

#### 19.4.4 CANMBxDL/CANMBxDH (Data fields Register)

For transmission, data is transmitted according to the data byte count set in the <DLC[3:0]> of the mailbox.

For reception, the data length code in the received message is copied to the <DLC[3:0]> of the mailbox, and the data byte count only set in the <DLC[3:0]> is made valid.

Mailboxes are readable and writable, but do not write data fields for receive mailboxes. If data fields are written, a mismatch may occur in received data.

To update the data field of a transmit mailbox set to <RFH>="1", set "1" in CANCDR<CDR> and suspend transmit requests temporarily before writing new data. To update the data field of a transmit mailbox set to <RFH>="0", check that the CANTRS<TRS> bit is "0" before writing new data.

bit symbol	MC7	MC6	MC5	MC4	MC3	MC2	MC1	MC0
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function				
31-0	MC31 to MC0	R/W	Access configuration to mailbox (Each bit corresponds with mailboxes 31 to 0)				
			0:The corresponding mailbox MBx is disabled for the CAN controller.				
			1:The corresponding mailbox MBx is enabled for the CAN controller.				
			Write access from CPU				
				ID field	Transmit mailbox with <RFH>="1"	Data field	Control field
			<MCx>=0	Enabled	Enabled	Enabled	Enabled
			<MCx>=1	Disabled	Disabled	Enabled	Enabled

Note:Following care is required during reprogramming of a CANMC in operation.

Receive: For a receive mailbox it needs to be ensured that the mailbox is not being disabled while reception for this mailbox is ongoing. If a mailbox is disabled or reconfigured during an ongoing reception, the current frame might be received.

Transmit: When the CAN controller is transmitting data (CANTRS<TRSx>="1"), Clear <MCx> to "0" after the transmission is completed (CANTRS<TRSx>="0").

19.4.6 CANMD (Mailbox Direction Register)

	31	30	29	28	27	26	25	24
bit symbol	MD31	MD30	MD29	MD28	MD27	MD26	MD25	MD24
After reset	1	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	MD23	MD22	MD21	MD20	MD19	MD18	MD17	MD16
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	MD15	MD14	MD13	MD12	MD11	MD10	MD9	MD8
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	MD7	MD6	MD5	MD4	MD3	MD2	MD1	MD0
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31	MD31	R	Mailbox direction : Mailbox 31 Mailbox 31 is the receive-only mailbox. This is always set to "1" and can not be changed.
30-0	MD30 to MD0	R/W	Mailbox direction : Mailboxes 30 to 0 (Each bit corresponds with mailboxes 30 to 0.) 0:Set as a transmit mailbox. 1:Set as a receive mailbox.  Each mailbox can be set as a transmit or receive mailbox.

Set the CANMD register at the initial setup. The directions of mailboxes cannot be changed when operation is ongoing. To change CANMD register settings, set the corresponding CANMC<MCx> bit to "0" before making changes.

## 19.4.7 CANTRS (Transmission Request Register)

	31	30	29	28	27	26	25	24
bit symbol	-	TRS30	TRS29	TRS28	TRS27	TRS26	TRS25	TRS24
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	TRS23	TRS22	TRS21	TRS20	TRS19	TRS18	TRS17	TRS16
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	TRS15	TRS14	TRS13	TRS12	TRS11	TRS10	TRS9	TRS8
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	TRS7	TRS6	TRS5	TRS4	TRS3	TRS2	TRS1	TRS0
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31	-	R	Read : Read as "0". Write : Write as "0".
30-0	TRS30 to TRS0	R/W	Transmit request set (Each bit corresponds with mailboxes 30 to 0.) Set <TRSx> requests the message transmission of corresponding mailbox x.  When transmission is requested for multiple mailboxes, the message are transmitted in accordance with the priority corresponding to the MCR<MTOS> bit.  A write of "1" from the CPU to mailbox x configured as transmit mailbox can set the bit. A write of "0" from the CPU is invalid.

Note: Mailbox 31 is receive-only mailbox.

The transmission request set register can be set by a write of "1" from the CPU to only the CANTRS<TRSx> bits of the mailboxes configured for transmission. The CANTRS<TRSx> bits of the mailboxes configured for reception cannot be set.

The CANTRS<TRSx> bit is cleared to "0" when the message has been successfully transmitted or the transmit request is reset by setting the CANTRR<TRRx> bit to "1."

When transmission fails, the transmission process is repeated until it succeeds or the transmit request is reset by setting the CANTRR<TRRx> bit to "1."

When the CANTRS<TRSx> bit is "1", do not write to mailbox x.

## 19.4.8 CANTRR (Transmission Request Register)

	31	30	29	28	27	26	25	24
bit symbol	-	TRR30	TRR29	TRR28	TRR27	TRR26	TRR25	TRR24
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	TRR23	TRR22	TRR21	TRR20	TRR19	TRR18	TRR17	TRR16
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	TRR15	TRR14	TRR13	TRR12	TRR11	TRR10	TRR9	TRR8
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	TRR7	TRR6	TRR5	TRR4	TRR3	TRR2	TRR1	TRR0
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31	-	R	Read : Read as "0". Write : Write as "0".
30-0	TRR30 to TRR0	R/W	Transmit request reset (Each bit corresponds with mailboxes 30 to 0.)  Setting <TRRx> cancels the message transmission of corresponding mailbox x.  A write of "1" from the CPU to mailbox x configured as transmit mailbox can set the bit. Write of "0" from the CPU is invalid.

Note: Mailbox 31 is receive-only mailbox.

The transmission request reset register can be set by a write of "1" from the CPU to only the CANTRR<TRRx> bits of the mailboxes configured for transmission. The CANTRR<TRRx> bits of the mailboxes configured for reception cannot be set.

The CANTRR<TRRx> bit is cleared to "0" by the internal logic when the message has been successfully transmitted or the transmission is aborted. A write of "0" from the CPU is invalid.

When the CANTRR<TRRx> bit is "1," do not write to mailbox x.

Setting the CANTRR<TRRx> bit cancels the message transmission of mailbox x set by the CANTRS<TRSx> bit, where the operation executed will be any of the following three sequences:

- A transmission request of a message has not yet been transmitted.  
A transmission request of a message will be cleared immediately.  
(CANTRS<TRSx> = 0, CANTRR<TRRx> = 0, CANAA<AAx> = 1)
- A transmission request of a message is currently being transmitted and an arbitration lost error occurs or an error is detected on the CAN bus.  
A transmission request of a message will be cleared and the transmission will be canceled.  
(CANTRS<TRSx> = 0, CANTRR<TRRx> = 0, CANAA<AAx> = 1)
- A transmission request of a message is currently being transmitted and no arbitration lost error occurs or no error is detected on the CAN bus.  
A transmission request of a message will not be cleared and the transmission will be completed.  
(CANTRS<TRSx> = 0, CANTRR<TRRx> = 0, CANTA<TAx> = 1)

## 19.4.9 CANTA (Transmission Acknowledge Register)

	31	30	29	28	27	26	25	24
bit symbol	-	TA30	TA29	TA28	TA27	TA26	TA25	TA24
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	TA23	TA22	TA21	TA20	TA19	TA18	TA17	TA16
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	TA15	TA14	TA13	TA12	TA11	TA10	TA9	TA8
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	TA7	TA6	TA5	TA4	TA3	TA2	TA1	TA0
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31	-	R	Read : Read as "0". Write : Write as "0".
30-0	TA30 to TA0	R/W	Transmission acknowledge (Each bit corresponds with mailboxes 30 to 0)  When the message in mailbox x has been successfully transmitted, the <TAx> bit is set to "1".  The <TAx> bit can be cleared by a write of "1" from the CPU to the <TAx> bit or the TRS<TRSx> bit.

Note: Mailbox 31 is receive-only mailbox.

The CANTA<TAx> bit is set to "1" when a message in mailbox x has been successfully transmitted. When the mailbox interrupt is enabled by setting the corresponding <MBIMx> bit in the mailbox interrupt mask register CANMBIM to "1", the <MBTIFx> bit of the mailbox transmit interrupt flag register CAN-MBTIF is set to "1" and the CAN transmit completion interrupt INTCANTX occurs.

A write of "1" to the <TAx> bit or the CANTRS<TRSx> bit from the CPU can clear the <TAx> bit. A write of "0" to the <TAx> bit or the CANTRS<TRSx> bit from the CPU is invalid.

## 19.4.10 CANAA (Abort Acknowledge Register)

	31	30	29	28	27	26	25	24
bit symbol	-	AA30	AA29	AA28	AA27	AA26	AA25	AA24
After reset	0	0	0	0	0	0	0	0

bit symbol	AA7	AA6	AA5	AA4	AA3	AA2	AA1	AA0
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31	-	R	Read : Read as "0". Write : Write as "0".
30-0	AA30 to AA0	R/W	Abort acknowledge (Each bit corresponds with mailboxes 30 to 0.)  When the message in mailbox x has not been successfully transmitted, the <AAx> bit is set to "1".  The <AAx> bit can be cleared by a write of "1" from CPU to the <AAx> bit or the CANTRS<TRSx> bit.

Note: Mailbox 31 is receive-only mailbox.

The CANAA<AAx> bit is set to "1" when a message in mailbox x has not been successfully transmitted. When CANGIF<TRMABF> bit in the global interrupt flag register is also set to "1", and the transmit abort interrupt is enabled by setting the CANGIM<TRAMABM> bit in the global interrupt mask register to "1", the CAN global interrupt INTCANGB occurs.

A write of "1" to the <AAx> bit or the CANTRS<TRSx> bit from the CPU can clear the <AAx> bit. A write of "0" to the <AAx> bit or the CANTRS<TRSx> bit from the CPU is invalid.

## 19.4.11 CANRMP (Receive Message Pending Register)

After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-0	RMP31 to RMP0	R/W	<p>Receive message pending (Each bit corresponds with mailboxes 31 to 0.)</p> <p>After a message is received and the content of the received message is written in mailbox x, the &lt;RMPx&gt; bits set to "1".</p> <p>After received data is read, a write of "1" to the &lt;RMPx&gt; bit can clear the &lt;RMPx&gt; bit.</p>

Note: This register can not use read-modify-write instruction.

The CANRMP<RMPx> bit is set to "1" when a message in mailbox x has been successfully received. When the mailbox interrupt is enabled by setting the corresponding <MBIMx> bit in the mailbox interrupt mask register CANMBIM to "1", the <MBRIFx> bit of the mailbox receive interrupt flag register CAN-MBRIF is set to "1" and the CAN receive completion interrupt INTCANRX occurs.

To clear the <RMPx> bit, write "1" to the <RMPx> bit from the CPU. A write of "0" to the <RMPx> bit from the CPU is invalid.

## 19.4.12 CANRML (Receive Message Lost Register)

	31	30	29	28	27	26	25	24
bit symbol	RML31	RML30	RML29	RML28	RML27	RML26	RML25	RML24
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	RML23	RML22	RML21	RML20	RML19	RML18	RML17	RML16
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	RML15	RML14	RML13	RML12	RML11	RML10	RML9	RML8
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	RML7	RML6	RML5	RML4	RML3	RML2	RML1	RML0
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-0	RML31 to RML0	R/W	<p>Receive message lost (Each bit corresponds with mailboxes 31 to 0.)</p> <p>When mailbox x for which the &lt;RMPx&gt; bit is set to "1" receives the next message, the content of the received message is overwritten to the mailbox x, and the &lt;RMLx&gt; bit is set to "1".</p> <p>A write of "1" to the &lt;RMPx&gt; bit can clear the &lt;RMLx&gt; bit.</p>

The CANRML<RMLx> bit is set by the internal logic and can be cleared with a write of "1" to the CANRMP<RMPx> bit from the CPU. The <RMPx> bit is also cleared at the same time. A write of "1" or "0" to the <RMLx> bit from the CPU is invalid.

With the CANRMP<RMPx> bit set to "1", if mailbox x receives the next message, the corresponding <RMLx> bit in the receive message lost register CANRML is set to "1". In this case, mailbox x is overwritten with the new received message.

When the <TRMABF> bit in the global interrupt flag register CANGIF is also set to "1", and the transmit abort interrupt is enabled by setting the <TRMABM> bit in the global interrupt mask register CANGIM to "1", the CAN global interrupt INTCANGB occurs.

When the receive message lost interrupt is enabled by setting the <RMLIM> bit in the global interrupt mask register CANGIM to "1", the CAN global interrupt INTCANGB occurs.

Table 19-1 shows the changes of the CANRMP and CANRML registers before and after a message is received.

Table 19-1 Change of RMP and RML Registers Before / After a Message i Received

ID	Before Reception		After reception		Operation
	<RMPx>	<RMLx>	<RMPx>	<RMLx>	
No match	Don't care	Don't care	Don't care	Don't care	Received message are not stored in any mailboxes.
Match	0	0	1	0	The received message is stored in mailbox x with a matching ID.
	1	0	1	1	The received message is overwritten in mailbox x with a matching ID. This shows that the previous message was lost.
	1	1	1	1	

### 19.4.13 CANLAM (Local Acceptance Mask Register)

The local acceptance mask register CANLAM will only be used for filtering of the receiving message ID for mailbox 31. This feature allows locally masking to any ID bits of the receiving message for mailbox 31.

	31	30	29	28	27	26	25	24
bit symbol	LAMI	-	-	LAM				
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	LAM							
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	LAM							
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	LAM							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31	LAMI	R/W	Mask of the <IDE> bit of mailbox 31 0:Not masked 1:Masked  In case of <LAMI>="0", the message in the standard or the extended format is received, according to the <IDE> bit of the mailbox 31. In case of <LAMI>="1", the message in the standard and the extended format is received, regardless of the <IDE> bit of the mailbox 31.
30-29	-	R	Read : Read as "0". Write : Write as "0".
28-0	LAM[28:0]	R/W	Mask of receive message ID 0:Not masked The reception message is received when the corresponding bit of reception message ID is the same as mailbox ID. 1:Masked The reception message is received regardless of the value of the corresponding bit of reception message.

In the extended format, < ID[28:0] > and < LAM[28:0] > are used to filtering.

In the standard format, < ID[28:18] > and < LAM[28:18] > are used to filtering.

When the message in a standard format is received, the part of the extended ID (<ID[17:0]>) will become an undefined value. Therefore, the standard and the extended format cannot be recommended to be received in alternately the same mailbox.

Please set CANLAM when initialization (At the configuration mode) and do not change the setting while operating. When the setting is changed while receiving the message, the CANLAM value on the way of the setting change is used to filtering of reception message ID.

19.4.14 CANGAM (Global Acceptance Mask Register)

The global acceptance mask register CANGAM will be used for filtering of the receiving message ID for mailbox 0 to 30. This feature allows to globally masking any ID bits of the receiving message for mailbox 0 to 30.

	31	30	29	28	27	26	25	24
bit symbol	GAMI	-	-	GAM				
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	GAM							
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	GAM							
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	GAM							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31	GAMI	R/W	Mask of the <IDE> bit of mailboxes 0 to 30 0:Not masked 1:masked  In case if <GAMI> =" 0", the message of the standard or the extended format is received, according to the <IDE> bit of the mailboxes 0 to 30. In case of <GAMI> = "1", the message of the standard and the extended format is received, regardless of the <IDE> bit of the mailboxes 0 to 30.
30-29	-	R	Read : Read as "0". Write : Write as "0".
28-0	GAM[28:0]	R/W	Mask of receive message ID 0:Not masked The reception message is received when the corresponding bit of reception message ID is the same as mailbox ID. 1:Masked The reception message is received regardless of the value of the corresponding bit of reception message.

In the extended format, < ID[28:0] > and < GAM[28:0] > are used for filtering.

In the standard format, < ID[28:18] > and < GAM[28:18] > are used for filtering.

When the message in the standard format is received, the part of the extended ID (<ID[17:0]>) will become an undefined value. Therefore, the standard and the extended format cannot be recommended to be received in alternately the same mailbox.

Please set CANGAM during the initialization (At the configuration mode) and do not change the setting during the operation. When the setting is changed while receiving the message, the CANGAM value on the way of the setting change is used for filtering of reception message ID.

## 19.4.15 CANMCR (Master Control Register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0

After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	CCR	SMR	-	WUBA	MTOS	-	TSCC	SRES
After reset	1	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-12	-	R	Read : Read as "0". Write : Write as "0".
11	SUR	R/W	Suspend mode request 0: Cancels suspend mode (normal operation) 1: Request suspend mode
10	-	R	Read : Read as "0". Write : Write as "0".
9	TSTLB	R/W	Test loop back 0:Cancels test loop back mode (normal operation) 1:Request test loop back mode (This mode supports stand-alone operation.)
8	TSTERR	R/W	Test error 0:Cancels test error mode (normal operation) 1:Request test error mode (In this mode, it is possible to write the CAN error counter register (CANCEC)).
7	CCR	R/W	Change configuration request 0:Cancels configuration mode (normal operation) 1:Request configuration mode (In this mode, it possible to write the bit configuration registers, CANBCR1 and CANBCR2.)
6	SMR	R/W	Sleep mode request 0:Cancels sleep mode (normal operation) 1:Request sleep mode (In this mode, the clock of the CAN controller stops and the error counters and transmit requests are reset.)
5	-	R	Read : Read as "0". Write : Write as "0".
4	WUBA	R/W	Walk-up on bus activity 0: Wakes up only by a write access to the CAMCR register. 1:Wakes up by detecting a bus active state or a write access to the CAMCR.
3	MTOS	R/W	Mailbox transmission order select 0:Messages are transmitted in ascending order of mailbox number. 1:Messages in mailboxes are transmitted in descending order of message ID priority.
2	-	R	Read : Read as "0". Write : Write as "0".
1	TSCC	R/W	Time stamp counter clear 0: Disable 1:Clears the time stamp counter to "0". (Note1)  This bit is for write only and is read as always "0".

Bit	Bit Symbol	Type	Function
0	SRES (Note2)	R/W	Software reset 0:Disable 1:Resets the CAN controller by software.  This bit is for write only and is read as always "0".

- Note 1: The time stamp counter is also cleared by a write to the CANTSP register and a write of "0" to the CANTSC register.
- Note 2: After software reset, all registers in CAN must be access after the following time.
- (1) When communication by CAN bus is not performed, please wait more than 16 CPU clocks.
  - (2) When communication by CAN bus is performed, please wait more than 88 CPU clocks.

## 19.4.16 CANGSR (Global Status Register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-

After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-10	-	R	Read : Read as "0". Write : Write as "0".
9-8	SJW[1:0]	R/W	Resynchronization jump width. 00 : 1 × TQ 01 : 2 × TQ 10 : 3 × TQ 11 : 4 × TQ
7	SAM	R/W	Setting sampling count 0:Single sampling 1 Triple sampling
6-4	TSEG2[2:0]	R/W	Setting of bit time after sample point 000 : Reserved      100 : 5 × TQ 001 : 2 × TQ      101 : 6 × TQ 010 : 3 × TQ      110 : 7 × TQ 011 : 4 × TQ      111 : 8 × TQ
3-0	TSEG1[3:0]	R/W	Setting of bit time before sample point (except SYNCSEG). 0000 : Reserved      1000 : 9 × TQ 0001 : 2 × TQ      1001 : 10 × TQ 0010 : 3 × TQ      1010 : 11 × TQ 0011 : 4 × TQ      1011 : 12 × TQ 0100 : 5 × TQ      1100 : 13 × TQ 0101 : 6 × TQ      1101 : 14 × TQ 0110 : 7 × TQ      1110 : 15 × TQ 0111 : 8 × TQ      1111 : 16 × TQ

## 19.4.19 CANGIF (Global Interrupt Flag Register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	RFPF	WUIF	RMLIF	TRMABF	TSOIF	BOIF	EPIF	WLIF
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read : Read as "0". Write : Write as "0".
7	RFPF	R/W	Remote frame pending flag 0:No remote frame has been received. 1:Remote frames have been received. (in the receive mailbox) This bit will not be set when matching with the transmit mailbox for which the <TFH> bit is "1".
6	WUIF	R/W	Walk-up interrupt flag 0:In sleep mode or normal operation mode 1:Sleep mode has been canceled.
5	RMLIF	R/W	Receive message lost interrupt flag 0:No receive message lost error has occurred. 1:A receive message lost error has occurred in at least one mailbox configured as a receive mailbox.
4	TRMABF	R/W	Transmission abort flag 0:No transport abort has occurred. 1:Transport abort has occurred. (At least one bit in the CANAA register is set.)
3	TSOIF	R/W	Time stamp counter overflow interrupt flag 0:No overflow has occurred in the time stamp counter after this bit was last cleared. 1:There was at least one overflow of the time stamp counter after this bit was last cleared.
2	BOIF	R/W	Bus off interrupt flag 0: The CAN controller is in bus on mode. 1: The CAN controller is in bus off mode.
1	EPIF	R/W	Error passive interrupt flag 0: The CAN controller is in error active mode. 1: The CAN controller is in error passive mode.
0	WLIF	R/W	Warning level interrupt flag 0:None of the error counters have reached the warning level. 1: At least one of the error counters has reached the warning level.

Each interrupt flag of the global interrupt flag register (CANGIF) will be set to "1" if the corresponding global interrupt condition has met. When the global interrupt flag is set to "1", if the corresponding bit in the global interrupt mask register (CANGIM) is "1" (interrupt enabled), the CAN global interrupt (INTCANGB) will be "High".

The CANGIF register can be cleared by writing "1" to the corresponding bit in the CANGIF register. A write of "0" is invalid.

## 19.4.20 CANGIM (Global Interrupt Mask Register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	RFPFM	WUIM	RMLIM	TRMABF	TSOIM	BOIM	EPIM	WLIM
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read : Read as "0". Write : Write as "0".
7	RFPFM	R/W	Remote frame pending interrupt mask 0:Interrupt disable 1:Interrupt enable
6	WUIM	R/W	Walk-up interrupt mask 0:Interrupt disable 1:Interrupt enable
5	RMLIM	R/W	Receive message lost interrupt mask 0:Interrupt disable 1:Interrupt enable
4	TRMABF	R/W	Transmit abort interrupt mask 0:Interrupt disable 1:Interrupt enable
3	TSOIM	R/W	Time stamp counter overflow interrupt mask 0:Interrupt disable 1:Interrupt enable
2	BOIM	R/W	Bus off interrupt mask 0:Interrupt disable 1:Interrupt enable
1	EPIM	R/W	Error passive interrupt mask 0:Interrupt disable 1:Interrupt enable
0	WLIM	R/W	Warning level interrupt mask 0:Interrupt disable 1:Interrupt enable

The global interrupt mask register (CANGIM) controls whether to enable or disable a global interrupt correspondingly to each interrupt condition of the CANGIF register. When the bit in the CANGIF register is "0", the corresponding CAN global interrupt (INTCANGB) is disabled. When the bit in the CANGIF register is "1", the corresponding CAN global interrupt (INTCANGB) is enabled.

Reset operation clears all bits in the CANGIM register to "0", disabling global interrupts.

## 19.4.21 CANMBTIF (Mailbox Transmit Interrupt Flag Register)

	31	30	29	28	27	26	25	24
bit symbol	-	MBTIF30	MBTIF29	MBTIF28	MBTIF27	MBTIF26	MBTIF25	MBTIF24
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	MBTIF23	MBTIF22	MBTIF21	MBTIF20	MBTIF19	MBTIF18	MBTIF17	MBTIF16
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	MBTIF15	MBTIF14	MBTIF13	MBTIF12	MBTIF11	MBTIF10	MBTIF9	MBTIF8
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	MBTIF7	MBTIF6	MBTIF5	MBTIF4	MBTIF3	MBTIF2	MBTIF1	MBTIF0
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31	-	R	Read : Read as "0". Write : Write as "0".
30-0	MBTIF30 to MBTIF0	R/W	Mailbox transmit interrupt flag (Each bit corresponds with mailboxes 30 to 0.) When the message in mailbox x has been successfully transmitted and the interrupt mask of the CAN-MBIM register is enabled (<MBIMx>="1"), the <MBTIFx> bit is set to "1" and the transmit completion interrupt (INTCANTX) becomes the "High" level. When CANMBIM<MBIMx> bit is "0", the <MBTIFx> bit is not set and INTCANTX stays at the "Low" level. Transmission completion is checked by reading the CANTA register. If even one bit in the CANMBTIF register is "1", INTCANTX is the "High" level. The <MBTIFx> bit is cleared by a write of "1" to the <MBTIFx> bit from the CPU. A write of "0" is invalid.

When the mailbox is set to receive, the corresponding bit in the CANMBTIF register is read as "0". When the mailbox is set to transmit, the corresponding bit in the CANMBRIF register is read as "0".

## 19.4.22 CANMBRIF (Mailbox Receive Interrupt Flag Register)

	31	30	29	28	27	26	25	24
bit symbol	MBRIF31	MBRIF30	MBRIF29	MBRIF28	MBRIF27	MBRIF26	MBRIF25	MBRIF24
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	MBRIF23	MBRIF22	MBRIF21	MBRIF20	MBRIF19	MBRIF18	MBRIF17	MBRIF16
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	MBRIF15	MBRIF14	MBRIF13	MBRIF12	MBRIF11	MBRIF10	MBRIF9	MBRIF8
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	MBRIF7	MBRIF6	MBRIF5	MBRIF4	MBRIF3	MBRIF2	MBRIF1	MBRIF0
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-0	MBRIF31 to MBRIF0	R/W	<p>Mailbox receive interrupt flag (Each bit corresponds with mailboxes 31 to 0.)</p> <p>When mailbox x has successfully received the message and the interrupt mask of the CANMBIM register is enabled (&lt;MBIMx&gt; = "1"), the &lt;MBRIFx&gt; bit is set to "1" and the receive completion interrupt (INTRX) becomes the "High" level.</p> <p>When the &lt;MBIMx&gt; bit in the MBIM register is "0", the &lt;MBRIFx&gt; bit is not set and INTRX stays at the "Low" level. Receive completion is checked by reading the CANRMP register.</p> <p>If even one bit in the CANMBRIF register is "1", INTCANRX is the "High" level. The &lt;MBRIFx&gt; bit is cleared by a write of "1" to the &lt;MBRIFx&gt; bit from the CPU.</p> <p>A write of "0" is invalid.</p>

## 19.4.23 CANMBIM (Mailbox Interrupt Mask Register)

	31	30	29	28	27	26	25	24
bit symbol	MBIM31	MBIM30	MBIM29	MBIM28	MBIM27	MBIM26	MBIM25	MBIM24
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	MBIM23	MBIM22	MBIM21	MBIM20	MBIM19	MBIM18	MBIM17	MBIM16
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	MBIM15	MBIM14	MBIM13	MBIM12	MBIM11	MBIM10	MBIM9	MBIM8
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	MBIM7	MBIM6	MBIM5	MBIM4	MBIM3	MBIM2	MBIM1	MBIM0
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-0	MBIM31 to MBIM0	R/W	Mailbox interrupt mask 0:Interrupt disabled for corresponding mailbox 1:Interrupt enabled for corresponding mailbox

The settings in CANMBIM determine, for which mailbox the interrupt generation is enabled or disabled. If a bit in CANMBIM is "0", the interrupt generation for the corresponding mailbox is disabled and if it is "1", the interrupt generation is enabled. Reset value of CANMBIM is "0".

## 19.4.24 CANCDR (Change Data Request Register)

	31	30	29	28	27	26	25	24
bit symbol	-	CDR30	CDR29	CDR28	CDR27	CDR26	CDR25	CDR24
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	CDR23	CDR22	CDR21	CDR20	CDR19	CDR18	CDR17	CDR16
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	CDR15	CDR14	CDR13	CDR12	CDR11	CDR10	CDR9	CDR8
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	CDR7	CDR6	CDR5	CDR4	CDR3	CDR2	CDR1	CDR0
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31	-	R	Read : Read as "0". Write : Write as "0".
30-0	CDR30 to CDR0	R/W	Change data request (Each bit corresponds with mailboxes 30 to 0.)  When the <CDRx> bit of transmit mailbox x is set to "1", the transmit request of this mailbox x is ignored.  It means mailbox x for which the CANTRS<TRs> bit and the <CDRx> bit are set will be excluded from the internal arbitration range and will not be transmitted if transmission has not started. After the <CDRx> bit is cleared to "0", mailbox x is back to be included in the internal arbitration range.

Note: Mailbox 31 is receive-only mailbox.

The change data request register CANCDR is effective when updating the data field of transmit mailbox x where auto acknowledgement of remote frames is enabled (CANMBnID<RFH>="1"). Mailbox x enabling automatic acknowledgement starts message transmission automatically responding to received remote frames and so may update the data field during message transmission (In such cases, updated data is output midway through transmission). The update of the data field can be avoided by setting the <CDRx> bit to "1" and temporarily suspending data transmission.

## 19.4.25 CANRFP (Remote Frame Pending Register)

	31	30	29	28	27	26	25	24
bit symbol	RFP31	RFP30	RFP29	RFP28	RFP27	RFP26	RFP25	RFP24
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	RFP23	RFP22	RFP21	RFP20	RFP19	RFP18	RFP17	RFP16
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	RFP15	RFP14	RFP13	RFP12	RFP11	RFP10	RFP9	RFP8
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	RFP7	RFP6	RFP5	RFP4	RFP3	RFP2	RFP1	RFP0
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-0	RFP31 to RFP0	R/W	<p>Remote frame pending (Each bit corresponds with mailboxes 31 to 0.)</p> <p>When mailbox x configured as receive mailbox receives a remote frame, the &lt;RFPx&gt; bit and CANRMP&lt;RMPx&gt; bit are set to "1".</p> <p>The &lt;RFPx&gt; bit can be cleared by a write of "1" to the CANRMP&lt;RMPx&gt; bit.</p>

The CANRFP<RFPx> bit is set by the internal logic and can be cleared with a write of "1" to the CANRMP<RMPx> bit from the CPU. The <RMPx> bit is also cleared at the same time. A write of "0" to the <RMPx> bit and a write of "1" or "0" to the <RFPx> bit from the CPU are invalid.

Even when mailbox x with <RFPx>="1" is overwritten by data frame reception, the <RFPx> bit is cleared.

When the remote frame pending interrupt is enabled by setting the <RFPM> bit in the global interrupt mask register CANGIM to "1", the CAN global interrupt INTCANGB occurs.

## 19.4.26 CANCEC (Error Counter Register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	TEC							
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	REC							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-16	-	R	Read : Read as "0". Write : Write as "0".
15-8	TEC[7:0]	R	8-bit transit error counter (After reset release)
		R/W	8-bit transit error counter (CANMCR<TSTERR>="1")
7-0	REC[7:0]	R	8-bit receive error counter (After reset release)
		R/W	8-bit receive error counter (CANMCR<TSTERR>="1")

The CAN controller contains two error counters : the receive error counter <REC> and the transmit error counter <TEC>. The value of both counters can be read from the CPU. A write access to the error counters is only possible in test error mode (The <TSTERR> bit in the CANMCR register is "1"). In the case of a write to the CANCEC register, the write data to the lower 8 bits <REC> is written also to the higher 8 bits (TEC).

The CAN error counters count up or down according to the CAN Specification 2.0B.

The <REC> is not increased after exceeding the error passive limit (128). When <REC>=128, after the correct reception of a message, the <REC> is set to a value between 119 and 127. After reaching the "bus off" status, the error counters are undefined.

If the status "bus off" is reached, the receive error counter is incremented after 11 consecutive recessive bits on the bus. If the counter reaches the count 128, the module changes automatically to the status error active. All internal flags are reset and the error counters will be cleared to "0". The configuration registers keep the programmed values. The values of the counters are undefined during "bus off" status.

When CAN enters configuration mode, the error counters will be cleared.

## 19.4.27 CANTSP (Time Stamp Counter Prescaler Register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	TSP			
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-4	-	R	Read : Read as "0". Write : Write as "0".
3-0	TSP[3:0]	R/W	Time stamp counter prescaler Sets the value to be loaded to the prescaler for the 4-bit TSC.

To ensure that the value of the CANTSC will not change during the write cycle to the mailbox, a hold register is implemented. The value of the CANTSC will be copied to the hold register and then written to the mailbox from the hold register if a message has been received or transmitted successfully. The reception is successful for the receiver, if there is no error but the last one bit of End-of-frame. Transmission is successful for the transmitter if there is no error until the last bit of End-of-frame. (Refer to the CAN specification 2.0B).

## 19.4.28 CANTSC (Time Stamp Counter Register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	TSC							
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	TSC							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-16	-	R	Read : Read as "0". Write : Write as "0".
15-0	TSC[15:0]	R/W	Time stamp counter Free-running 16-bit counter

Overflow of the CANTSC can be detected by the time stamp counter overflow interrupt flag <TSOIF> of the global interrupt flag register (CANGIF), and the time stamp counter overflow flag <TSO> of the global status register (CANGSR). Both flags can be cleared by writing "1" to <TSOIF> in the CANGIF register.

There is a 4-bit prescaler for the CANTSC. After power-up the time stamp counter is driven directly from the bit clock (<TSP[3:0]>="0"). The period  $T_{TSC}$  for the time stamp counter will be calculated with the following formula :

$$T_{TSC} = T_{BIT} \times (TSP + 1)$$

## 19.5 Operation explain of each circuit

### 19.5.1 Mailbox

The mailboxes consist of a single port RAM (accessible from the internal CAN core and the CPU). The CPU controls the CAN controller by changing the settings of the mailboxes and control registers. The settings of the mailboxes and control registers are used for such processes as reception filtering, message transmission, and interrupt processing.

To start transmission, set the transmit request bit corresponding to the mailbox to transmit messages to. After the bit has been set, all transmission procedures and error processes (when errors occur) are executed without CPU involvement. When the mailbox is set to receive, the CPU reads the mailbox data using read instructions. The user can also set it so that an interrupt will be issued to the CPU every time a message has been successfully received or transmitted.

In total, 32 mailboxes are provided, each of which consists of 8 byte data, 29 bit IDs, and several control bits. The mailboxes (except mailbox 31) can be set to either transmission or reception. Mailbox 31 is the receive-only mailbox. Mailbox 31 is designed so that it can receive different message ID groups using other receive masks than mailboxes 0 to 30.

Figure 19-2 shows the configuration of the mailboxes.

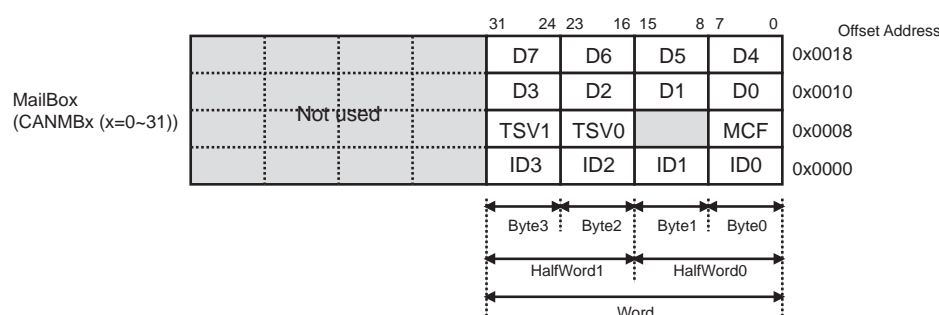

Figure 19-2 Configuration of Mailboxes

1. Message ID field (ID3 to ID0)
  - ID extension bit <IDE>
  - Global / local acceptance mask enable bit <GAME / LAME>
  - Remote frame handling bit <RFH>
  - 29-bit message ID <ID[28:0]>
2. Message control field (MCF)
  - Remote frame transmit request bit <RTR>
  - Data length of 4 bits <DLC[3:0]>
3. Time stamp value (TSV1, TSV0)
 

Stores time stamp counter value during receiving / transmitting message. (TSV[15:0])
4. Data field (D7 to D0)
 

Data of 8 bytes <D7[7:0]> to <D0[7:0]>

### 19.5.2 Transmit Control Register

Transmission control consists of two registers. One is the transmission request set register CANTRS, and the other is the transmission request reset register CANTRR. Therefore it is possible to clear the transmission request without generating a conflict in the handling of the transmit mailboxes in the state-machine. This mechanism also prevents clearing the transmission request of a mailbox to which transmission is already in progress.

When a write of data and the ID to mailbox x configured as a transmit mailbox (CANMD<MDx>="0") is performed and access to mailbox x is enabled (CANMC<MCx>="1"), setting the CANTRS<TRSx> bit to "1" causes the messages in mailbox x to be transmitted.

If there is more than one mailbox configured as a transmit mailbox and more than one corresponding TRS bit is set, then the messages will be sent in the selected order. The order of transmission depends on the <MTOS> bit in the master control register CANMCR.

If the CANMCR<MTOS> bit is "0", the mailbox with the lower number has the higher priority. For example, if the mailboxes CANMB0, CANMB2, and CANMB5 are configured as transmit mailboxes and the corresponding CANTRS<TRSx> bits are set to "1", then the messages will be transmitted in the following order: CANMB0, CANMB2, and CANMB5. If a new transmission request is set for CANMB0 during processing of the CANMB2 message, then in the next internal arbitration-run, CANMB0 is selected for the next transmit message and transmission of the CANMB0 message starts after CANMB2 transmission is completed. This will also happen when an arbitration lost error occurs when the CANMB2 message is being transmitted. The CANMB0 message will be sent instead of the CANMB2 lost in arbitration.

If the CANMCR<MTOS> bit is "1", the mailbox with the highest priority ID among those mailboxes for which transmission is requested will be transmitted. In a transmission after an arbitration lost error occurred also, the message in the mailbox with the highest priority ID among those mailboxes for which transmission is requested at the time will be transmitted.

19.5.3 Receive Control Register

The ID of a received message is compared to the ID of the mailbox set as the receive mailbox. The comparison of the IDs depends on the <GAME> / <LAME> values of the global/local acceptance mask enable bit MBnID3 in the mailbox and the data held in the global/local acceptance mask registers GAM / LAM.

When a match is detected, the ID of the received message, the control bits, and data bytes are written in the matching mailbox. At the same time, when the corresponding receive message pending bit CANRMP<RMPx> is set to "1" and the mailbox interrupt is enabled (CANMBIM<MBIMx>="1"), the CAN receive completion interrupt INTCANRX occurs. After a match is detected, no further ID comparison takes place.

If the ID of the received message does not match with any of the mailboxes 0 to 30, the ID is compared to the ID of the receive-only mailbox 31. When a match is detected, the settings of the received message are written in receive-only mailbox 31.

If no match is detected, the received message will not be stored in the mailbox and no change occurs in the mailbox.

The <RMPx> bit must be cleared by the CPU after data is read. With the <RMPx> bit set to "1", if the next message to this mailbox x is received, the corresponding receive message lost bit <RMLx> is set to "1". In this case, mailbox x is overwritten with the new message.

Figure 19-3 shows timing when a receive message lost occurs.

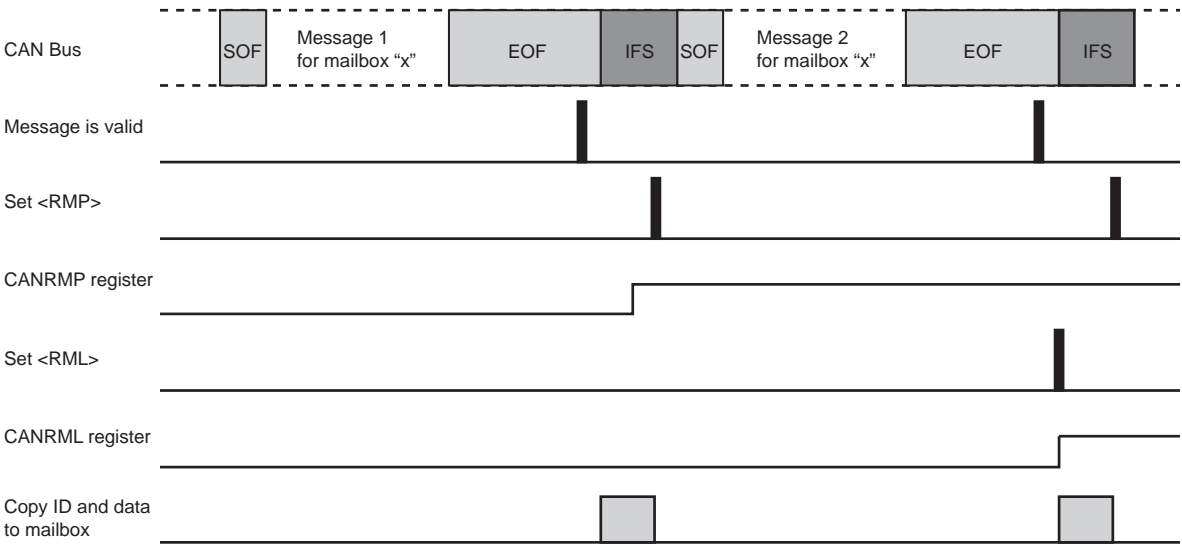

Figure 19-3 Timing when a Receive Message Lost Occurs

#### 19.5.4 Remote Frame Control Register

After a remote frame is received, the remote frame ID is compared to the mailbox ID. The comparison of the IDs depends on the <GAME> / <LAME> values of the global / local acceptance mask enable bit CAN-MBxID in the mailbox and the data held in the global/local acceptance mask registers GAM/LAM.

After an ID match is detected, no further comparison takes place.

When the remote frame ID matches with the ID of transmit mailbox n where the remote frame handling bit CANMBxID<RFH> is set to "1", the CANTRS<TRSx> bit will be set to "1" so that the message is transmitted responding to the remote frame. For a transmit mailbox where the CANMBxID<RFH> bit is set to "0", the mailbox does not respond to the remote frame even when the ID matches.

If the ID matches with the ID of receive mailbox n, the received message is handled same as a data frame, and this sets the CANRMP<RMPx> bit and the CANRFP<RFPx> bit to "1".

When the remote frame ID matches with the ID of mailbox n where both the CANMBxID<RFH> bit and the <GAME> bit are set to "1", the ID of mailbox x is overwritten with the remote frame ID, and the mailbox will automatically respond to the remote frame using the ID (The <TRSx> bit is set to transmit a data frame). Therefore, when the global acceptance mask register CANGAM is used, one mailbox x may respond to multiple remote frame IDs depending on the mask value.

### 19.5.5 Receive Filtering

For mailboxes 0 to 30, the global acceptance mask register CANGAM will be used if the bit <GAME> in the mailbox is set. The receiving message will be stored in the first mailbox with a matching ID. Only if there is no matching ID in the mailboxes 0 to 30, the receiving message will be compared to the receive-only mailbox (mailbox 31). If the <LAME> bit in mailbox 31 is set, the local acceptance mask register CAN-LAM will be used.

Figure 19-4 shows receive filtering.

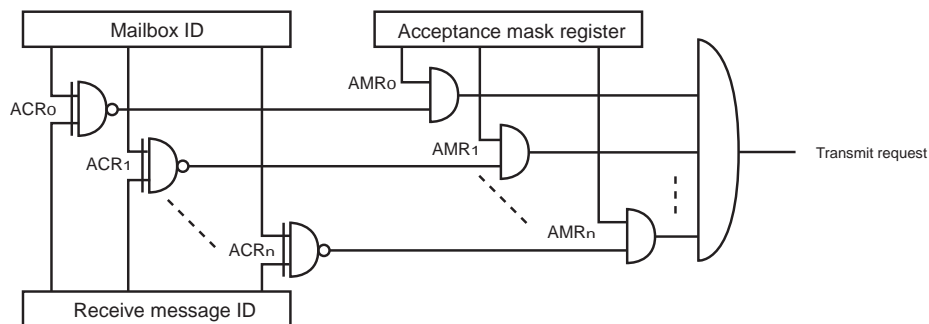

Figure 19-4 Receive filtering

### 19.5.6 Time Stamp Function

There is a free-running 16-bit time stamp counter (CANTSC) implemented in the CAN controller to show the time of message reception and transmission. The content of the CANTSC is written into the time stamp value (TSV) of the corresponding mailbox when a received message has been stored or a message has been transmitted.

The CANTSC is driven by the bit clock of the CAN bus line. When the operation mode of the CAN is in configuration mode or in sleep mode, the CANTSC will be stopped. After power-up reset, a write to the time stamp counter prescaler register (CANTSP) clears the CANTSC to "0". The CANTSC is readable and writable from the CPU both in configuration mode and normal operation mode.

Figure 19-5 shows the structure of the time stamp counter.

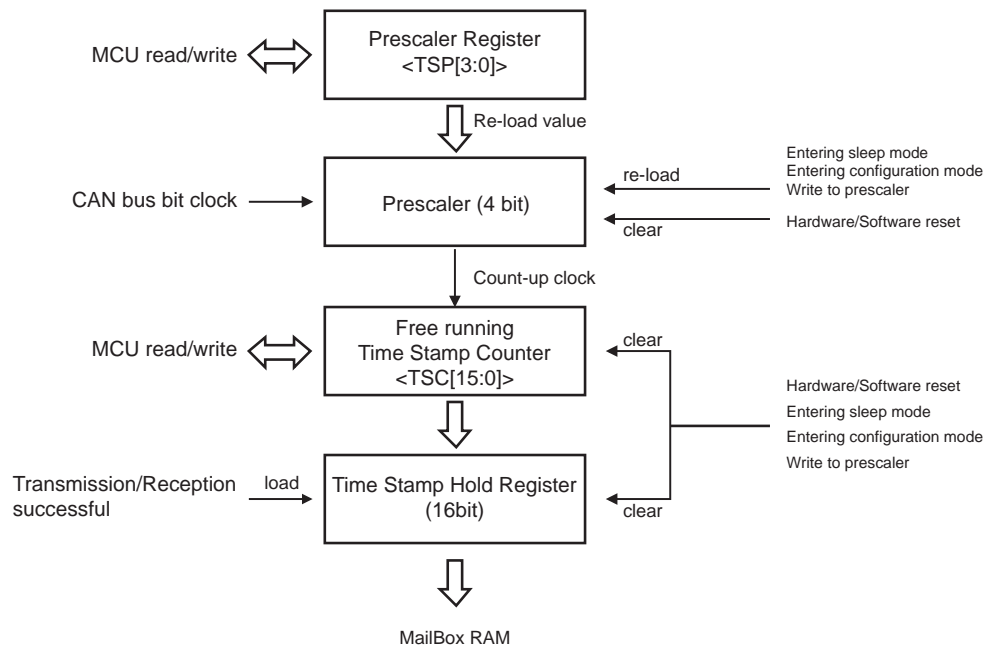

Figure 19-5 Timer Stamp Counter

The free running time stamp counter and the time stamp hold register will be cleared in the following cases:

- After reset (Power on reset or software reset)
- When the controller enters into configuration mode
- When the controller enters into sleep mode
- When a write access is performed to the CANTSP register.

### 19.5.7 Interrupt Control

The CAN controller has the following interrupt sources. And these interrupt sources are divided into three groups and each group has one interrupt output.

- CAN transmit completion interrupt (INTCANTX)

It occurs at the completion of transmission

- CAN receive completion interrupt (INTCANRX)

It occurs at the completion of reception

- CAN Global interrupt (INTCANGB)

It occurs by eight sources other than those above.

Sources		Group
Transmit interrupt	:a message has been transmitted successfully.	INTCANTX
Receive interrupt	:a message has been received successfully.	INTCANRX
Warning level interrupt	: at least one of the two error counters is greater than or equal to 97.	INTCANGB
Error passive interrupt	:CAN enters the error passive mode.	
Bus off interrupt	:CAN enters the bus off mode.	
Time stamp overflow interrupt		
Transmit abort interrupt		
Receive message lost interrupt		
Walk-up interrupt	:after walk-up from sleep mode, this interrupt will be generated.	
Remote frame receive interrupt		

For mailbox interrupts, there are two interrupt output lines separated from global interrupts. These are the mailbox receive completion interrupt (INTCANRX) and the mailbox transmit completion interrupt (INTCANTX), which are dependent on mailbox settings.

There are two interrupt flag registers and one interrupt mask register. One interrupt flag register is for the mailbox receive interrupt flag register (CANMBRIF) and one for the mailbox transmit interrupt flag register (CANMBTIF). In addition, there is the mailbox interrupt mask register (CANMBIM) for setting whether to enable or disable each mailbox interrupt. The CANMBIM register is used both for transmit and receive mailboxes.

Figure 19-6 shows the block diagram of CAN interrupt signal.

Figure 19-6 Block Diagram of CAN interrupt signals

The CAN receive completion interrupt signal INTRX is the OR of the signal for which the 32 sources issued by the mailbox receive interrupt flag register CANMBRIF that are ANDed with each bit of the mailbox interrupt mask register CANMBIM.

The CAN transmit completion interrupt signal INTTX is the OR of the signal for which the 31 sources issued by the mailbox transmit interrupt flag register CANMBTIF that are ANDed with each bit of the mailbox interrupt mask register CANMBIM.

The CAN global interrupt signal INTGB is the OR of the signal for which the 8 sources issued by the global interrupt flag register CANGIF that are ANDed with each bit of the global interrupt mask register CANGIM.

## 19.6 Operation Mode

### 19.6.1 Configuration Mode

The CAN controller needs initial setup before starting operation (setting of the bit configuration registers, CANBCR1 and CANBCR2). Writes to the CANBCR1 and CANBCR2 are possible only when the CAN controller is in configuration mode.

After reset, the CANMCR<CCR> and the CANGSR<CCE> are set to "1" and the configuration mode is set. A write of "0" to the <CCR> bit sets the CAN controller to normal operation mode. After leaving configuration mode, the <CCE> bit is cleared to "0" and the power-up sequence starts. The power-up sequence detects 11 consecutive recessive bits on the CAN bus line. After detection, the CAN controller is bus on and ready for operation.

A write of "1" to the <CCR> bit sets the CAN controller to enter configuration mode from normal operation mode. After the CAN controller has entered configuration mode, the <CCE> bit is set to "1".

Figure 19-7 shows the flowchart of the initial setup of the CAN controller.

When the CAN controller enters into configuration mode, the CAN error counter (CANCEC), the time stamp counter (CANTSC), and the time stamp hold registers will be cleared.

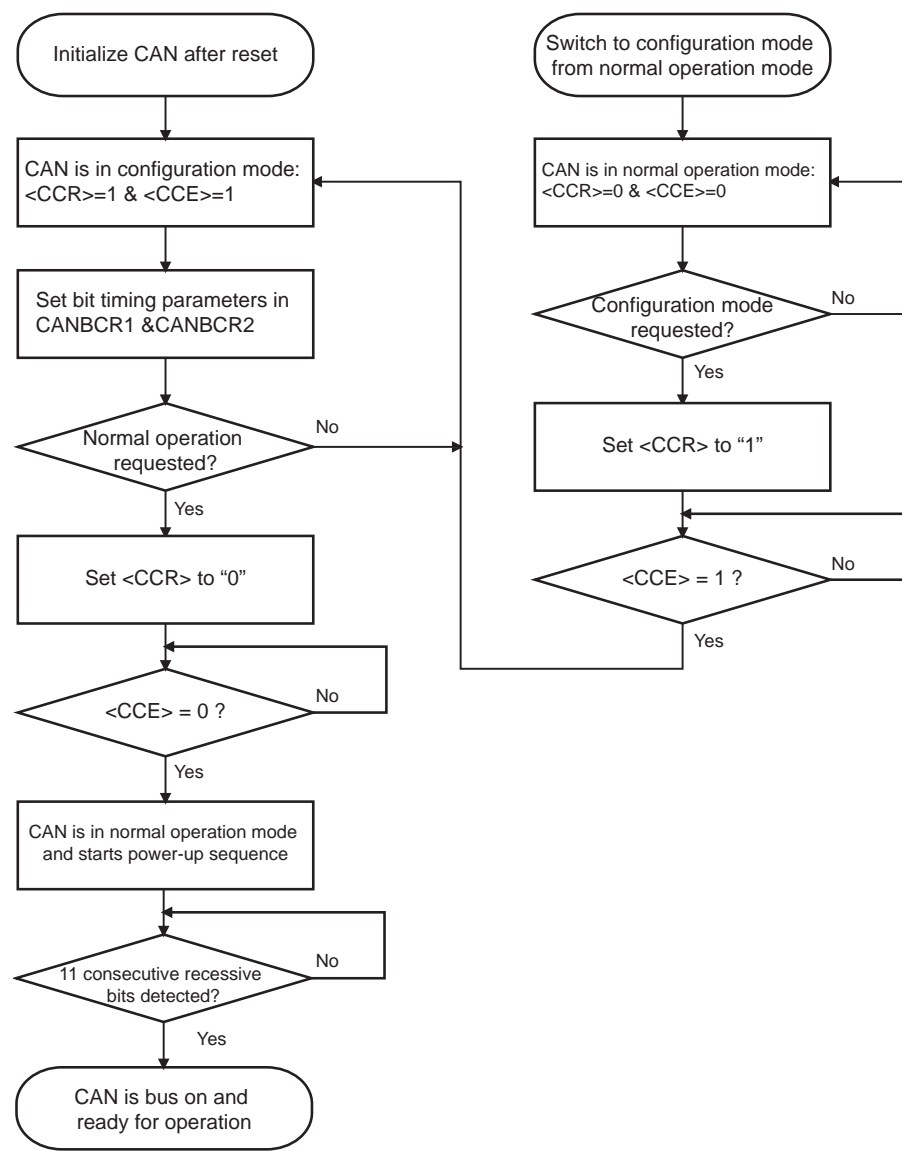

Figure 19-7 Flowchart of Initial Setup of CAN Controller

### 19.6.2 Sleep Mode

Sleep mode is requested by a write of "1" to the <SMR> bit in the CANMCR register. After the CAN controller has entered into sleep mode, the CANGSR<SMA> bit is set to "1".

The read value of the CANGSR register is 0xF040. This means that there is no message in the transmit buffer and sleep mode is active where the <SMA> bit is "1". Read values to all other registers deliver the value 0x0000. Write accesses to all registers, except the CANMCR register, will be denied.

The CAN controller cancels sleep mode (wakes up) and starts the power-up sequence if a write access to the CANMCR register is detected, or there is any bus activity detected on the CAN bus with the CANMCR <WUBA> bit set to "1". The CAN controller waits until detecting 11 consecutive recessive bits on the CANRX input terminal, after it goes into bus active state. The walk-up message is invalid.

In sleep mode, the CAN error counters and all transmission request set CANTRS<TRsX> bits and transmission request reset CANTRR<TRRrX> bits are cleared. The <SMR> bit and the <SMA> bit are cleared after the CAN controller leaves sleep mode.

If sleep mode is requested while the CAN controller is transmitting a message (CANMCR<SMR>="1"), the CAN controller enters sleep mode after any of the following occurs:

- The message has been successfully transmitted.
- The message has been successfully transmitted after an arbitration lost error.
- The message has been successfully received after an arbitration lost error.

### 19.6.3 Suspend Mode

The suspend mode is requested by writing "1" to the CANMCR<SUR> bit. If the CAN bus line is not idle, the current message transmission/reception is completed before suspend mode is activated. After the CAN controller has entered suspend mode, the CANGSR<SUA> bit is set to "1".

In suspend mode, the CAN controller is not active on the CAN bus line. That means neither error frames nor acknowledgement will be sent. The error counters and the CANGSR<EP> bit will not be cleared either.

If suspend mode is requested during the bus off recovery sequence execution, the CAN controller enters suspend mode after the bus off recovery sequence is finished.

To restart the CAN controller, the <SUR> bit needs to be programmed to "0". After leaving the bus off state or the inactive state, the CAN controller restarts the bus off recovery sequence.

The CAN controller cancels suspend mode with a write of "0" to the <SUR> bit.

19.6.4 Test Loop Back Mode

In test loop back mode, the CAN controller can receive its own transmitted message and generates its own acknowledge bit. No other CAN node is necessary for the operation.

The test loop back mode can be enabled or disabled only when the CAN controller is in suspend mode. In test loop back mode, the CAN controller can transmit a message from a mailbox and receive it in another mailbox. The setup for mailboxes is the same as in normal operation mode.

19.6.5 Test Error Mode

In test error mode, writes to the CAN error counter register (CANCEC) are possible. The values of the lower 8 bits are concurrently written to both the transmit error counter (CANTEC) and the receive error counter (CANREC). The maximum value that can be written into the error counters is 255. The error counter value of 256 which forces the CAN controller into bus off mode can not be written.

The test error mode can be enabled or disabled only when the CAN controller is in suspend mode.

Figure 19-8 shows the flowchart of the setup of test loop back mode and test error mode.

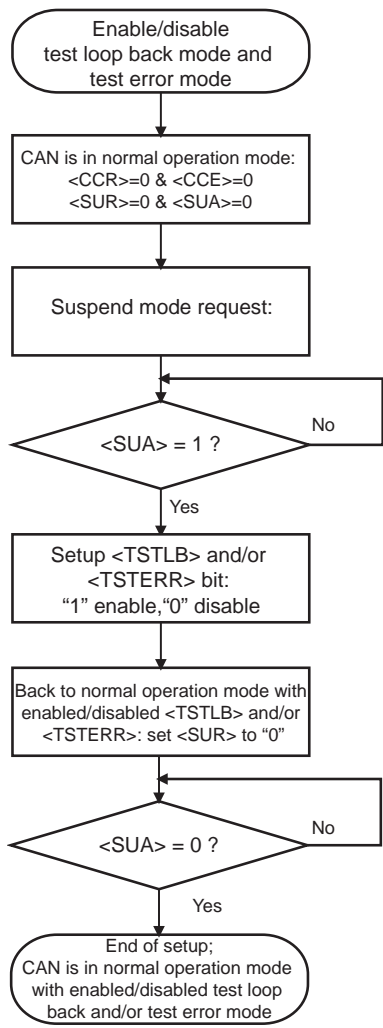

Figure 19-8 Flowchart of Setup of Test Loop Back Mode and Test Error Mode

## 19.7 Description of Operation

### 19.7.1 Receive Messages

Figure 19-9 shows an example flowchart of message reception using the CAN receive completion interrupt (INTCANRX).

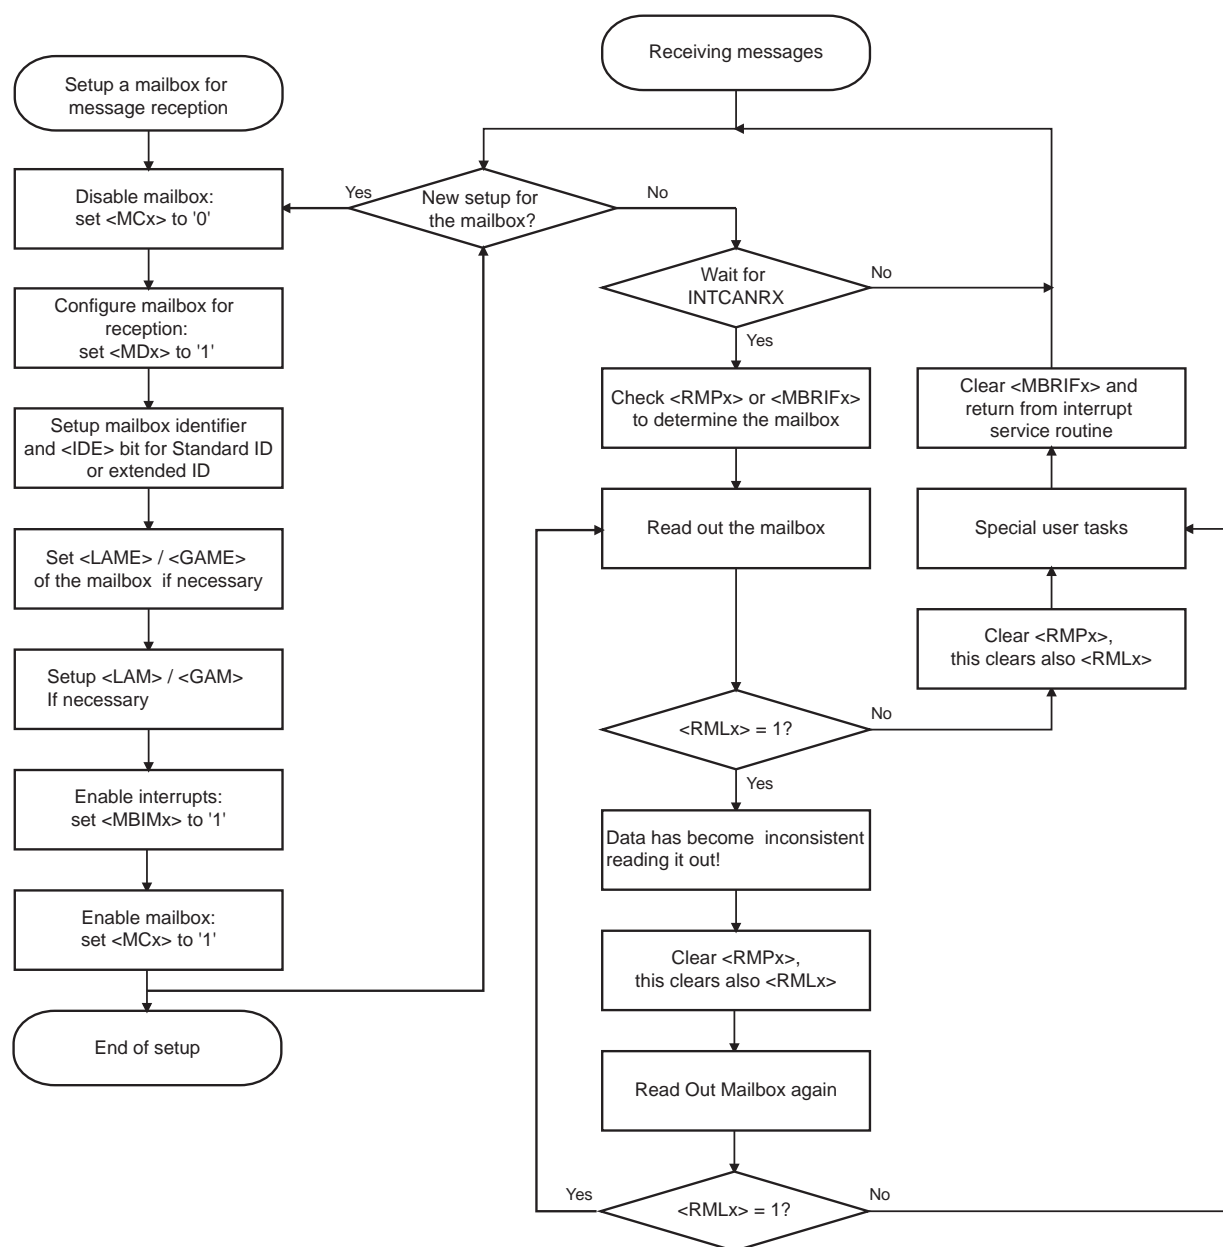

Figure 19-9 Flowchart of Message Reception

It is also possible to use polling instead of receive interrupts. In this case, the "waiting for INCANRX" in above flowchart must be replaced by polling CANRMP. Further, enabling interrupts and clearing CAN-MBRIF must be removed from the flow.

19.7.2 Transmitting Message

Figure 19-10 shows an example flowchart of message transmission using the CAN transmit completion interrupt (INTCANTX).

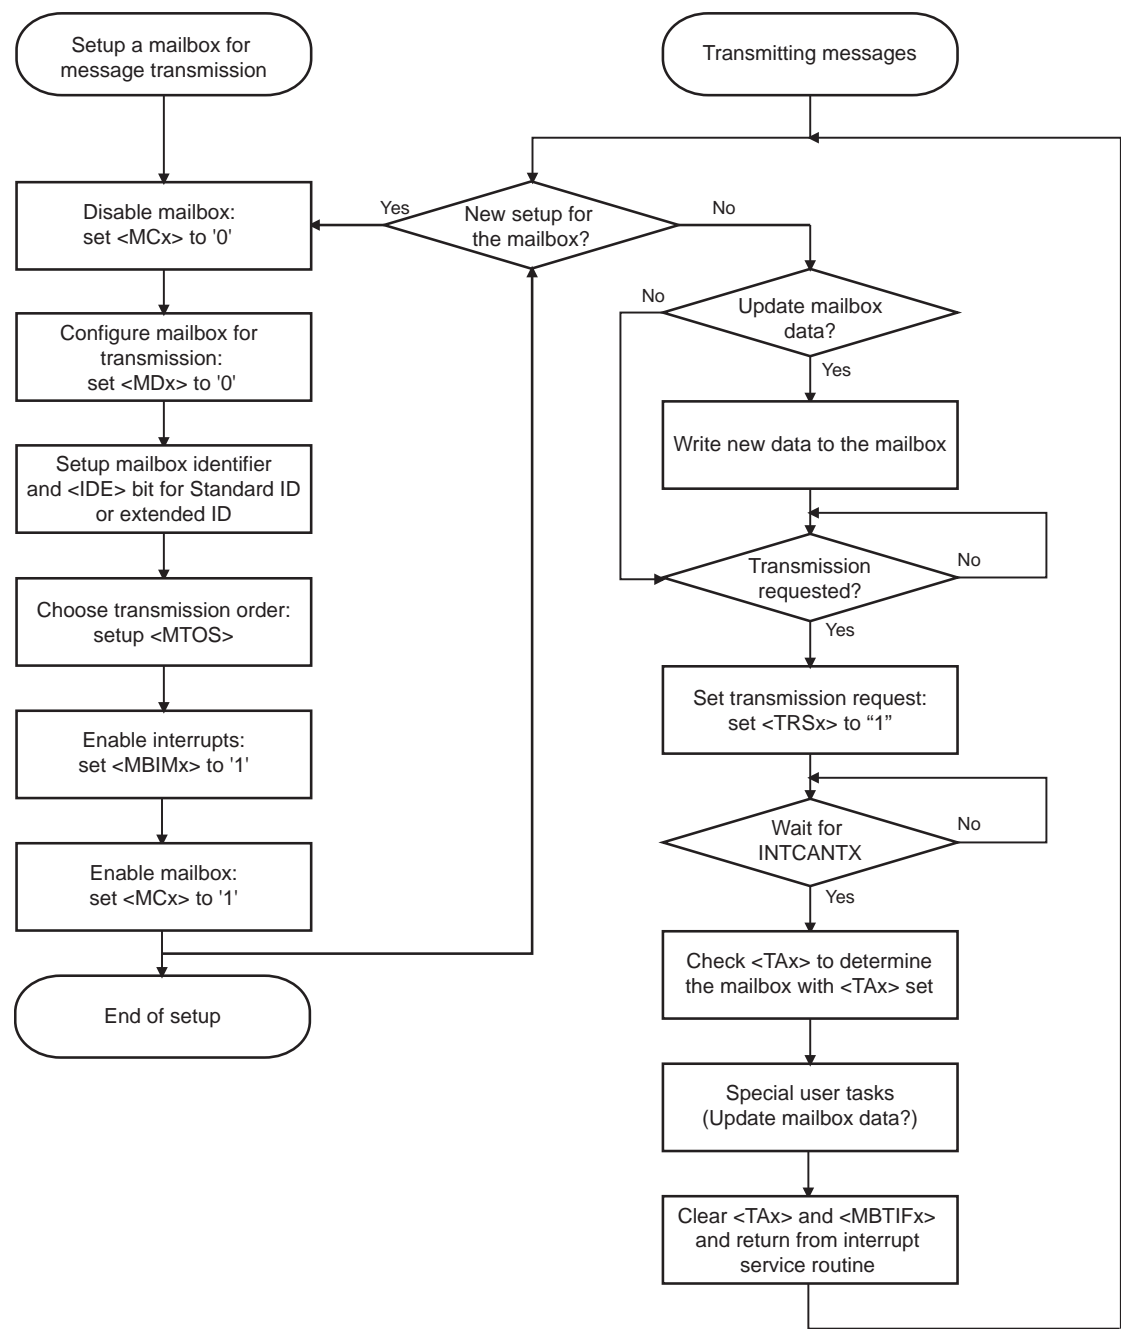

Figure 19-10 Flowchart of Message Transmission

It is also possible to use polling instead of transmit interrupts. In this case, the "waiting for INTCANTX" in above flowchart must be replaced by polling TA. Further, enabling interrupts and clearing CANMBTIF must be removed from the flow.

### 19.7.3 Remote Frame Handling

Figure 19-11 shows an example flowchart of remote frame handling by using the automatic reply feature. This feature is available when the <RFH> bit of the transmit mailbox is set to "1". To avoid data inconsistency when updating the mailbox data, the CANCDR register controls transmission during data update of the mailbox.

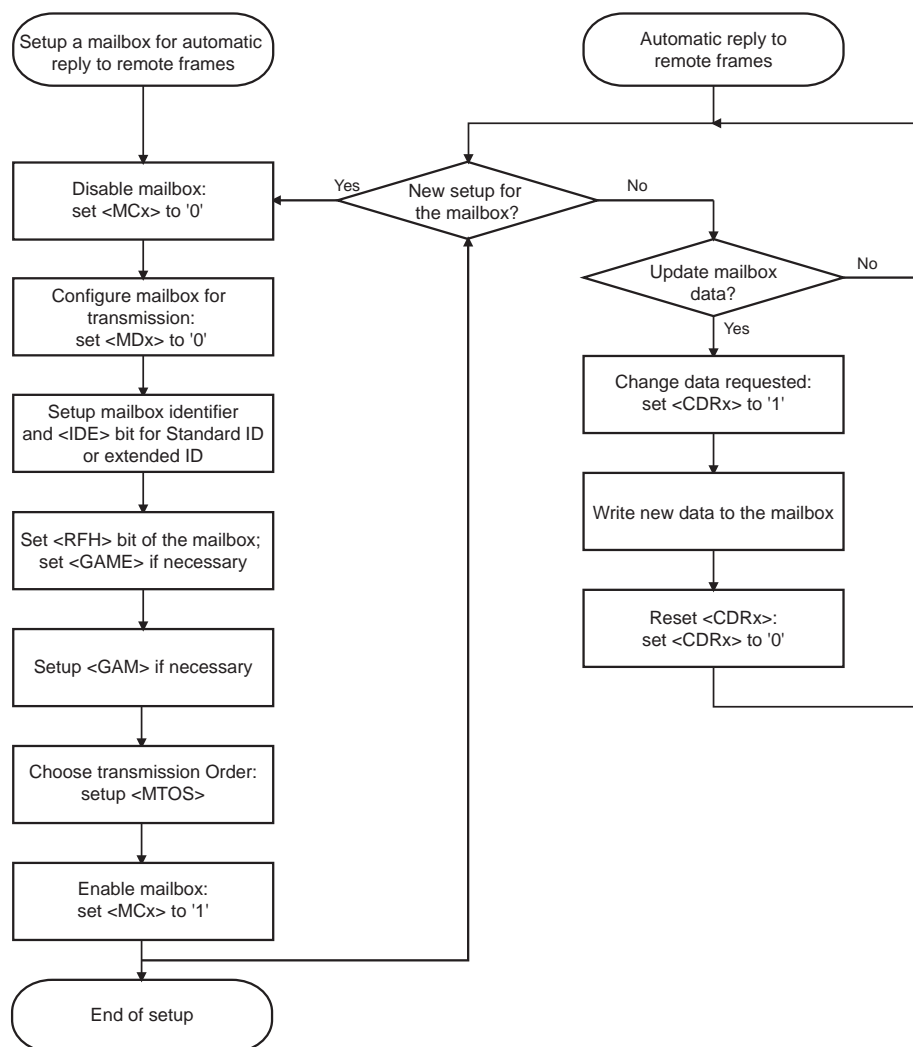

Figure 19-11 Flowchart of Remote Frame Handling Using the Automatic Reply Feature

## 19.8 Bit Configuration

The length of a bit is determined by the parameters TSEG1, TSEG2, and BRP. All controllers on the CAN bus must have the same baud rate and bit length. At different clock frequencies of the individual controllers, the baud rate has to be adjusted by the above-mentioned parameters. In the bit timing logic, the conversion of the parameters to the required bit timing is implemented. The configuration registers CANBCR1 and CANBCR2 contain the data about bit timing. Its definition corresponds to the CAN specification 2 (equivalent to Intel 82527).

Figure 19-12 shows CAN bit timing.

Figure 19-12 CAN Bit Timing

$T_{SCL}$  (CAN system clock) is defined by :

$$T_{SCL} = \frac{\langle BRP[9:0] \rangle + 1}{f_{CANOSC}}$$

$$1 \times T_{SCL} = 1 \times T_Q \text{ (} T_Q : \text{time quantum)}$$

$f_{CANOSC}$  is the clock for CAN baud rate generation. The clock obtained by dividing the system clock  $f_{SYS}$  by 4 is supplied as the clock for CAN baud rate generation. If  $f_{SYS} = 48\text{MHz}$  then  $f_{CANOSC} = 12\text{MHz}$ .

The synchronization segment SYNCSEG always has the length of one  $T_Q$ .

The baud rate is defined by :

$$BR = \frac{1}{((\langle TSEG1[13:0] \rangle + 1) + (\langle TSEG2[2:0] \rangle + 1) + 1) \times T_{SCL}}$$

Note:  $\langle TSEG1[3:0] \rangle$  and  $\langle TSEG2[2:0] \rangle$  are values of the CANBCR2 register. It is not  $T_{Qunit}$  value.

Information processing time (IPT) is the time segment starting with the sample point reserved for processing of the sampled bit level. The information processing time is equal to three CAN system clock cycles.

<SJW[1:0]> indicates how much the time quantum ( $T_Q$ ) value in bit length is allowed to be lengthened or shortened when resynchronizing. Values between "1" (<SJW[1:0]> 00) and "4" (<SJW[1:0]> 11) are adjustable. The bus line is sampled and synchronization is performed at each falling edge of the bus signal within a bit grid. For <SJW[1:0]>, set a value equal to or smaller than <TSEG2[2:0]>.

Setting the <SAM> bit enables the multiple sampling of the bus line. The level is determined by the result from the majority decision of three sampling values. Sampling is taken at the sample point and the previous last two CAN system clock points. When <BRP[9:0]> is smaller than 4, the sampling performed is always once regardless of the value set in the <SAM> bit.

Table 19-2 shows the restrictions when the baud rate is set.

Table 19-2 Restrictions when Setting the Baud Rate

<BRP[9:0]>	$T_Q$ length (number of CAN clock cycles)	IPT length (number of CAN clock cycles)	Minimum TSEG2 length ( $T_Q$ unit)
0	1	3	3
1	2	3	2
> 1	<BRP[9:0]>+1	3	2

- Restrictions for TSEG1

$TSEG1 \geq TSEG2$  : The length of TSEG1 should be equal to or greater than the length of TSEG2.

- Restrictions for SJW

$SJW \leq TSEG2$  : For the synchronization jump width, set a value equal to or smaller than TSEG2.

- Restrictions for SAM

The three-time sampling is not allowed under the condition that <BRP[9:0]> is smaller than 4. For the condition that <BRP[9:0]> < 4, a one-time sampling will always be performed regardless of the value of SAM.

Example : For 500 Kbit/s

A bit has a length of  $2\mu s$ . If  $f_{OSC} = 12\text{ MHz}$ , the baud rate prescaler is set to "1". That means a bit for this data transmission rate has to be programmed with a length of  $12T_Q$ . According to the above formula, the values to be programmed always are smaller by one than the calculated values:

<BRP[9:0]> = 00\_0000\_0001

<TSEG1[3:0]> = 0110 (7  $T_Q$ )

<TSEG2[2:0]> = 011 (4  $T_Q$ )

In this case, the sample point is 8/12 66%.

Other combinations for TSEG1 / TSEG2 are possible; with TSEG2 3 the full range for SJW.

SJW should always be set to the highest value possible. SJW is not allowed to be greater than TSEG2.

The three-time sampling of the bus cannot be set because of the condition that <BRP[9:0]> is smaller than 4. Thus, SAM="0" should be set.

## 20. Remote control signal preprocessor(RMC)

### 20.1 Basic operation

Remote control signal preprocessor (hereafter referred to as RMC) receives a remote control signal of which carrier is removed.

#### 20.1.1 Reception of Remote Control Signal

- A sampling clock can be selected from either low frequency clock (32.768kHz) or Timer output.
- Noise canceling time can be adjusted.
- Leader detection
- Batch reception up to 72bit of data

### 20.2 Block Diagram

Figure 20-1 shows the block diagram of RMC.

Figure 20-1 Block diagram of RMC

## 20.3 Registers

### 20.3.1 Register List

Addresses and names of RMC control registers are shown below.

Base Address = 0x400E\_7000

Register		Address(Base+)
Enable Register	RMCCEN	0x0000
Receive Enable Register	RMCCREN	0x0004
Receive Data Buffer Register 1	RMCCBUF1	0x0008
Receive Data Buffer Register 2	RMCCBUF2	0x000C
Receive Data Buffer Register 3	RMCCBUF3	0x0010
Receive Control Register 1	RMCCRCR1	0x0014
Receive Control Register 2	RMCCRCR2	0x0018
Receive Control Register 3	RMCCRCR3	0x001C
Receive Control Register 4	RMCCRCR4	0x0020
Receive Status Register	RMCCSTAT	0x0024
Receive End bit Number Register 1	RMCCEND1	0x0028
Receive End bit Number Register 2	RMCCEND2	0x002C
Receive End bit Number Register 3	RMCCEND3	0x0030
Source Clock selection Register	RMCCSSEL	0x0034

## 20.3.2 RMCEN(Enable Register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	-	-	RMCEN
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-2	-	R	Read as 0.
1	-	R/W	Write as "1".
0	RMCEN	R/W	Controls RMC operation. 0: Disabled 1: Enabled To allow RMC to function, enable the RMCEN bit first. If the operation is disabled, all the clocks for RMC except for the enable register are stopped, and it can reduce power consumption. If RMC is enabled and then disabled, the settings in each register remain intact.

## 20.3.3 RMCREN(Receive Enable Register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	-	-	RMCREN
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-1	-	R	Read as 0.
0	RMCREN	R/W	Reception 0: Disabled 1: Enabled Controls reception of RMC. Setting this bit to "1" enables reception.

Note: Enable the <RMCREN> bit after setting the RMCRCR1, RMCRCR2, and RMCRCR3.

## 20.3.4 RMCRBUF1(Receive Data Buffer Register 1)

	31	30	29	28	27	26	25	24
bit symbol	RMCRBUF(Received data 31 to 24 bit)							
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	RMCRBUF(Received data 23 to 16 bit)							
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	RMCRBUF(Received data 15 to 8bit)							
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	RMCRBUF(Received data 7 to 0 bit)							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-0	RMCRBUF[31:0]	R	Received data (31 to 0 bit) Reads 4 bytes of received data. (31 to 0 bit)

## 20.3.5 RMCRBUF2(Receive Data Buffer Register 2)

	31	30	29	28	27	26	25	24
bit symbol	RMCRBUF(Received data 63 to 54 bit)							
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	RMCRBUF(Received data 55 to 48 bit)							
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	RMCRBUF(Received data 47 to 40 bit)							
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	RMCRBUF(Received data 39 to 32 bit)							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-0	RMCRBUF[63:32]	R	Received data (63 to 32 bit) Reads 4 bytes of received data. (63 to 32 bit)

## 20.3.6 RMCRBUF3(Receive Data Buffer Register 3)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	RMCRBUF(Received data 71 to 64 bit)							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as 0.
7-0	RMCRBUF[71:64]	R	Received data (71 to 64 bit). Reads 1 byte of received data. (71 to 64 bit).

Note: The received bit is stored in the data buffer register in MSB-first order, and the last received bit is stored in the LSB (bit 0). If the remote control signal is received in the LSB first algorithm, the received data is stored in reverse sequence.

## 20.3.7 RMCRCR1(Receive Control Register 1)

	31	30	29	28	27	26	25	24
bit symbol	RMCLCMAX							
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	RMCLCMIN							
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	RMCLLMAX							
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	RMCLLMIN							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-24	RMCLCMAX[7:0]	R/W	Specifies a maximum cycle of leader detection. Calculating formula of the maximum cycle: $\text{<RMCLCMAX>} \times 4/\text{fs}$ [s].
23-16	RMCLCMIN[7:0]	R/W	Specifies a minimum cycle of leader detection. Calculating formula of the minimum cycle: $\text{<RMCLCMIN>} \times 4/\text{fs}$ [s].
15-8	RMCLLMAX[7:0]	R/W	Specifies a maximum low width of leader detection. Calculating formula of the maximum low width: $\text{<RMCLLMAX>} \times 4/\text{fs}$ [s]
7-0	RMCLLMIN[7:0]	R/W	Specifies a minimum low width of leader detection. Calculating formula for the minimum low width: $\text{<RMCLLMIN>} \times 4/\text{fs}$ [s] When $\text{RMCRCR2} < \text{RMCLD} = 1$ , a value of the low-pulse width is less than the specified value, it is defined as data bit.

Note: When you configure the register, you must follow the rule shown below.

Leader	Rules
Low width + High width	$\text{<RMCLCMAX[7:0]>} > \text{<RMCLCMIN[7:0]>}$ $\text{<RMCLLMAX[7:0]>} > \text{<RMCLLMIN[7:0]>}$ $\text{<RMCLCMIN[7:0]>} > \text{<RMCLLMAX[7:0]>}$
Only high width	$\text{<RMCLCMAX[7:0]>} > \text{<RMCLCMIN[7:0]>}$ $\text{<RMCLLMAX[7:0]>} = 0x00$ $\text{<RMCLLMIN[7:0]>} = \text{don't care}$
No Leader	$\text{<RMCLCMAX[7:0]>} = 0x00$ $\text{<RMCLCMIN[7:0]>} = \text{don't care}$ $\text{<RMCLLMAX[7:0]>} = \text{don't care}$ $\text{<RMCLLMIN[7:0]>} = \text{don't care}$

## 20.3.8 RMCRCR2(Receive Control Register 2)

	31	30	29	28	27	26	25	24
bit symbol	RMCLIEN	RMCEDIEN	-	-	-	-	RMCLD	RMCPHM
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	RMCLL							
After reset	1	1	1	1	1	1	1	1
	7	6	5	4	3	2	1	0
bit symbol	RMCDMAX							
After reset	1	1	1	1	1	1	1	1

Bit	Bit Symbol	Type	Function
31	RMCLIEN	R/W	Leader detection interrupt 0: Not generated 1: Generated
30	RMCEDIEN	R/W	Remote control input falling edge interrupt 0: Not generated 1: Generated
29-26	-	R	Read as 0.
25	RMCLD	R/W	Receiving remote control signal with or without leader 0: Disabled 1: Enabled
24	RMCPHM	R/W	Receiving a remote control signal by a phase modulation 0: Not receiving a remote control signal by a phase modulation. (receive by a cycle modulation) 1: Receive remote control signal by a fixed-frequency pulse modulation. To receive a fixed-frequency remote control signal by a pulse modulation, set this bit to "1".
23-16	-	R	Read as 0.
15-8	RMCLL[7:0]	R/W	Excess low width that triggers reception completion and interrupt generation. 0000_0000 to 1111_1110: Reception completion and interrupt generation at $\langle \text{RMCLL} \rangle \times 1/\text{fs}$ [s]. 1111_1111: not to use as the trigger
7-0	RMCDMAX[7:0]	R/W	Maximum data bit cycle that triggers reception completion and interrupt generation. 0000_0000 to 1111_1110: Reception completion and interrupt generation at $\langle \text{RMCDMAX} \rangle \times 1/\text{fs}$ [s]. 1111_1111: not to use as the trigger

## 20.3.9 RMCRCR3(Receive Control Register 3)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	RMCDATH						
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	RMCDATL						
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-15	-	R	Read as 0.
14-8	RMCDATH[6:0]	R/W	Larger threshold to determine a signal pattern in a phase method Calculating formula of the threshold: $\langle \text{RMCDATH} \rangle \times 1/\text{fs}$ [s] Specifies a larger threshold (within a range of 1.5T and 2T) to determine a pattern of remote control signal in a phase method. If the measured cycle exceeds the threshold, the bit is determined as "10". If not, the bit is determined as "01".
7	-	R	Read as 0.
6-0	RMCDATL[6:0]	R/W	Threshold to determine 0 or 1 smaller threshold to determine a signal pattern in a phase method. Calculating formula of the threshold: $\langle \text{RMCDATL} \rangle \times 1/\text{fs}$ [s] Specifies two kinds of thresholds: a threshold to determine whether a data bit is 0 or 1; a smaller threshold (within a range of 1T and 1.5T) to determine a pattern of remote control signal in a phase method. As for the determination of data bit, if the measured cycle exceeds the threshold, the bit is determined as "1". If not, the bit is determined as "0". Calculating formula of the threshold: $\langle \text{RMCDATL} \rangle \times 1/\text{fs}$ [s]. As for the determination of a remote control signal pattern in a phase method, if the measured cycle exceeds the threshold, the bit is determined as "01". If not, the bit is determined as "00".

Note: If the  $\langle \text{RMCPHM} \rangle$  bit of the Receive Control Register 2 is "0",  $\langle \text{RMCDATH}[6:0] \rangle$  are not enabled.  
The bits are enabled when  $\langle \text{RMCPHM} \rangle$  is "1".

## 20.3.10 RMCRCR4(Receive Control Register 4)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	RMCP0	-	-	-	RMCNC			
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as 0.
7	RMCP0	R/W	Remote control input signal 0: Not reversed 1: Reversed
6-4	-	R	Read as 0.
3-0	RMCNC[3:0]	R/W	Specifies noise cancellation time. 0000: No cancellation 0001 to 1111: cancellation Calculating formula of noise cancellation time: <RMCNC> × 1/fs [s]

## 20.3.11 RMCSTAT(Receive Status Register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	RMCLIF	RMCLOIF	RMCDMAXIF	RMCEDIF	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	RMCLDR	RMCNUM						
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-16	-	R	Read as 0.
15	RMCLIF	R	Interrupt source flag 0: No leader detection interrupt generated. 1: Leader detection interrupt generated.
14	RMCLOIF	R	Interrupt source flag 0: No low width detection interrupt generated. 1: Low width detection interrupt generated.
13	RMCDMAXIF	R	Interrupt source flag 0: No maximum data bit cycle interrupt generated. 1: Maximum data bit cycle interrupt generated.
12	RMCEDIF	R	Interrupt source flag 0: No falling edge interrupt generated. 1: Falling edge interrupt generated.
11-8	-	R	Read as 0.
7	RMCLDR	R	Leader detection. 0: Disable leader detection. 1: Enable leader detection.
6-0	RMCNUM[6:0]	R	The number of received data bit 000_0000: no data bit (only with leader) 000_0001 to 100_1000: 1 to 72bit 100_1001 to 111_1111: 73bit and more Indicates the number of bits received as remote control signal data. The number cannot be monitored during reception. On completion of reception, the number is stored.

Note 1: This register is updated every time an interrupt is generated. Writing to this register is ignored.

Note 2: RMC keeps receiving 73 bit or more data unless reception is completed by detecting the maximum data bit cycle or the excess low width. In this case, the received data in the data buffer may not be ensured.

## 20.3.12 RMCEND1(Receive End bit Number Register 1)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	RMCEND1						
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-7	-	R	Read as 0.
6-0	RMCEND1[6:0]	R/W	Specifies that the number of receive data bit 000_0000 : No specifically the receive data bit 000_0001 to 100_1000 : Specifies that the number of receive data bit(1 to 72bit) 100_1001 to 111_1111 : Don't set the value

## 20.3.13 RMCEND2(Receive End bit Number Register 2)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	RMCEND2						
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-7	-	R	Read as 0.
6-0	RMCEND2[6:0]	R/W	Specifies that the number of receive data bit 000_0000 : No specifically the receive data bit 000_0001 to 100_1000 : Specifies that the number of receive data bit(1 to 72bit) 100_1001 to 111_1111 : Don't set the value

## 20.3.14 RMCEND3(Receive End bit Number Register 3)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0

After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-1	-	R	Read as 0.
0	RMCLK	R/W	Specifies that Sampling clock of RMC function 0 : Low frequency Clock (32.768kHz) 1 : Timer output(TB1OUT) For the Sampling of RMC function, It is able to set the Low Frequency Clock (32.768kHz) or Timer output (TB1OUT). The Setting range of Timer output by TB1OUT is from 30 to 34kHz.

Note: To Change the sampling clock by using the RMCFSSEL, disable the RMC operation first by using the RMCEN<RMCEN>. Then, enable it again, and set the RMCFSSEL before setting other RMC registers.

## 20.4 Operation Description

### 20.4.1 Reception of Remote Control Signal

#### 20.4.1.1 Sampling clock

A remote control signal is sampled by using low-speed 32.768kHz clock (fs).

#### 20.4.1.2 Basic operation

RMC set RMCSTAT<RMCRLDR> bit when a leader is detected.

At this time, if you set the RMCRCR2<RMCLIEN> bit, leader detection will generate a leader detection interrupt. When a leader detection interrupt occurs, RMCSTAT<RMCRLIF> bit is set.

After the leader detecting, each data bit is determined as "0" or "1" in sequence. The results are stored in RMCRCR2<RMCE-  
DIEN> bit, a remote control signal input falling edge interrupt can be generated in each falling edge of data bit. When a remote control signal input falling edge interrupt is generated, RMCSTAT<RMCEDIF> bit is set.

Data reception stops when the maximum data bit cycle is detected and low-width matches the setting value, and then, an interrupt occurs. If <RMCEND1>, <RMCEND2> and <RMCEND3> of the register RMCxEND1, RMCxEND2 and RMCEND3 have been configured, data reception stops and an interrupt occurs only in the case that the number of bits received before maximum data bit cycle is detected. The condition of RMC can be checked by reading the remote control receive status register.

To check the status of RMC if reception is completed, read the remote control receive status register.

On completion of reception, RMC is waiting for the next leader.

By setting RMC to receive a signal without a leader, RMC recognizes the received as data and starts reception without detecting a leader.

If the next data reception is completed before reading the preceding received data, the preceding data is overwritten by the next one.

Figure 20-2 Data reception completed by detecting the max data bit cycle

20.4.1.3 Preparation

Before starting receiving process, configure how to receive remote control signal using the Remote Control Signal Receive Control Registers (RMCRCR1, RMCRCR2 and RMCRCR3, RMCRCR4).

(1) Settings of Noise Cancelling Time

Configure noise cancelling time with the RMCRCR4 <RMCNC[3:0]> bit.

Noise canceling is applied to remote control signals sampled by the sampling clock.

RMC monitors a sampled remote control signal in each rising edge of a sampling clock. If "High" is monitored, RMC recognizes that the signal was changed to "Low" after monitoring cycles of "Low"s specified in <RMCNC>. If "Low" is monitored, RMC recognizes that the signal was changed to "High" after monitoring cycles of "High" specified in <RMCNC>.

The following figure shows how RMC operates according to the noise cancel setting of <RMCNC [3:0]> = "0011" (3 cycles). Subsequent to noise cancellation, the signal is changed from "High" to "Low" upon monitoring 3 cycles of "Low", and the signal is changed from "Low" to "High" upon monitoring 3 cycles of "High".

Figure 20-3 Noise Cancel (In the case of RMCRCR4="0011" (3 Cycles))

(2) Settings of Detecting Leader

Set the leader cycle and a low width of the leader to RMCRCR1 <RMCLLMIN[7:0]> <RMCLLMAX[7:0]> <RMCLCMIN[7:0]> <RMCLCMAX[7:0]> bits. When you configure those above, follow the rule shown below.

Leader	Rules
Low width + High Width	<RMCLCMAX[7:0]> > <RMCLCMIN[7:0]> <RMCLLMAX[7:0]> > <RMCLLMIN[7:0]> <RMCLCMIN[7:0]> > <RMCLLMAX[7:0]>
Only high width	<RMCLCMAX[7:0]> > <RMCLCMIN[7:0]> <RMCLLMAX[7:0]> = 0000_0000 <RMCLLMIN[7:0]> = don't care
No leader	<RMCLCMAX[7:0]> = 0000_0000 <RMCLCMIN[7:0]> = don't care <RMCLLMAX[7:0]> = don't care <RMCLLMIN[7:0]> = don't care

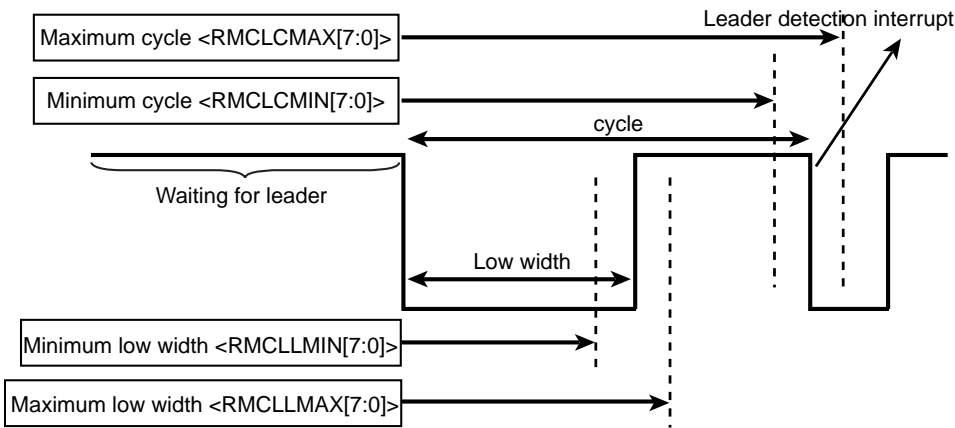

Figure 20-4 Leader wave form and the RMCRCR1 register settings

If you want to generate an interrupt when detecting a leader, configure the RMCRCR2 <RMCLIEN> bit.

A remote control signal without a leader cannot generate a leader detection interrupt.

(3) Setting of 0/1 determination data bit

Based on a falling edge cycle, the data bit of a cycle modulation is determined as 0 or 1.

There are two kinds of determinations:

As for data bit determination of a remote control signal in a phase method, see"20.4.1.8 Receiving a Remote Control Signal in a Phase Method".

1. Determination by threshold.

Configure a threshold value to RMCRCR3<RMCDATL[6:0]> bit which determines data bit as "0" or "1." If the determination value is equal to threshold value or more, it is determined as "1." If the determination value is less than threshold value, it is determined as "0."

2. Determination by falling edge interrupt inputs.

By setting "1" to the RMCRCR2<RMCDIEN> bit, a remote control signal input falling edge interrupt can be generated in each falling edge of the data bit. Using this interrupt together with a timer enables the determination to be done by software.

The followings shows the determination method of data bit.

Figure 20-5 Determination method of data bit (In case that threshold is 2.5T)

#### (4) Settings of Reception Completion

To complete data reception, settings of detecting the maximum data bit cycle and excess low width are required. If multiple factors are specified, reception is completed by the factor detected first. Make sure to configure the reception completion settings.

##### 1. Completion by the maximum data bit cycle

To complete reception by detecting a maximum data bit cycle, you need to configure the RMCRCR2 <RMCDMAX[7:0]> bits.

If the falling edge of the data bit cycle isn't monitored after time specified as threshold in the <RMCDMAX[7:0]> bits, a maximum data bit cycle is detected. The detection completes reception and generates an interrupt. After interrupt inputs generated, RMCSTAT<RMCDMAXIF> bit is set to "1".

To complete reception by setting the number of receive data is set a RMCEND 1 to 3 register of each <RMCEND1>, <RMCEND2>, <RMCEND3>. In this case when the number of set reception bit agreed with the number of bit which received at the time of the outbreak of MAX on the number of receive data is set a RMCEND 1 to 3 register of each <RMCEND1>, <RMCEND2>, <RMCEND3>, it occurs by an MAX interrupt in data bit period.

As specified to RMCEND3 to 1, it is able to set three kinds of the receive data bit.

When it can receive the Maximum Data bit, the number of bit is not match the setting value in <RMCEND1>, <RMCEND2>, <RMCEND3>, it wait for Leader Reception.

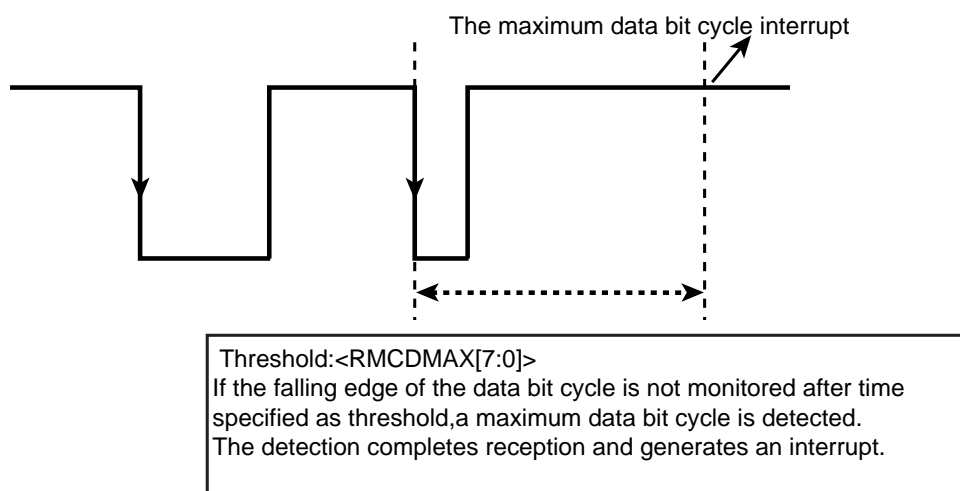

Figure 20-6 Completion by the maximum data bit cycle

2. Completion by detecting low width

To complete reception by detecting the low width, you need to configure the RMCRCR2 <RMCLL[7:0]> bits.

After the falling edge of the data bit is detected, if the signal stays low longer than specified, excess low width is detected. The detection completes reception and generates an interrupt.

After interrupt inputs generated, RMCSTAT<RMCLOIF> bit is set to "1."

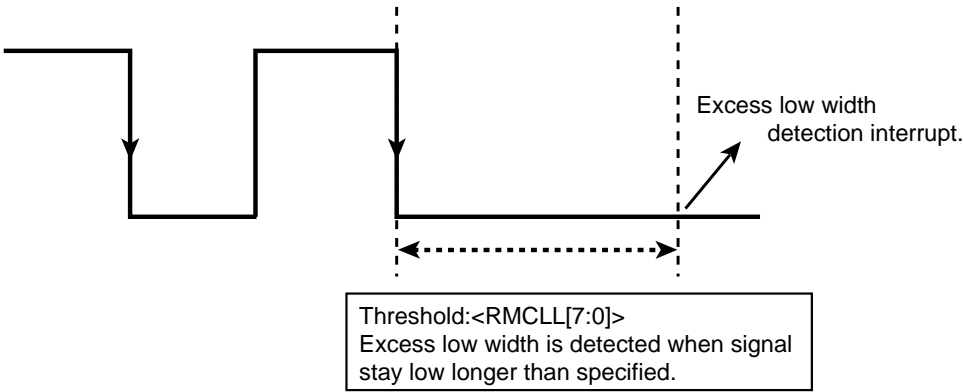

Figure 20-7 Completion by detecting low width

#### 20.4.1.4 Enabling Reception

By enabling the RMCREN <RMCREN> bit after configuring the RMCRCR1, RMCRCR2, RMCRCR3 and RMCRCR4 registers, RMC is ready for reception. Detecting a leader initiates reception.

Note: Changing the configurations of the RMCRCR1, RMCRCR2, RMCRCR3, RMCRCR4, RMCEND1, RMCEND2 or RMCEND3 registers during reception may harm their proper operation. Be careful if you change them during reception.

#### 20.4.1.5 Stopping Reception

RMC stops reception by clearing the RMCREN <RMCREN> bit to "0" (reception disabled).

Clearing this bit during reception stops reception immediately and the received data is discarded.

#### 20.4.1.6 Receiving Remote Control Signal without Leader in Waiting Leader

Setting RMCRCR2 <RMCLD> enables RMC to receive signals with or without a leader.

By setting RMCRCR2 <RMCLD>, RMC starts receiving data if it recognizes a signal of which low width is shorter than a maximum low width of leader detection specified in the RMCRCR1 <RMCLLMAX[7:0]> bits. RMC keeps receiving data until the final data bit is received.

If RMCRCR2 <RMCLD> is enabled, the same settings of error detection, reception completion and data bit determination of 0 or 1 are applied regardless of whether a signal has a leader or not.

Thus receivable remote control signals are limited.

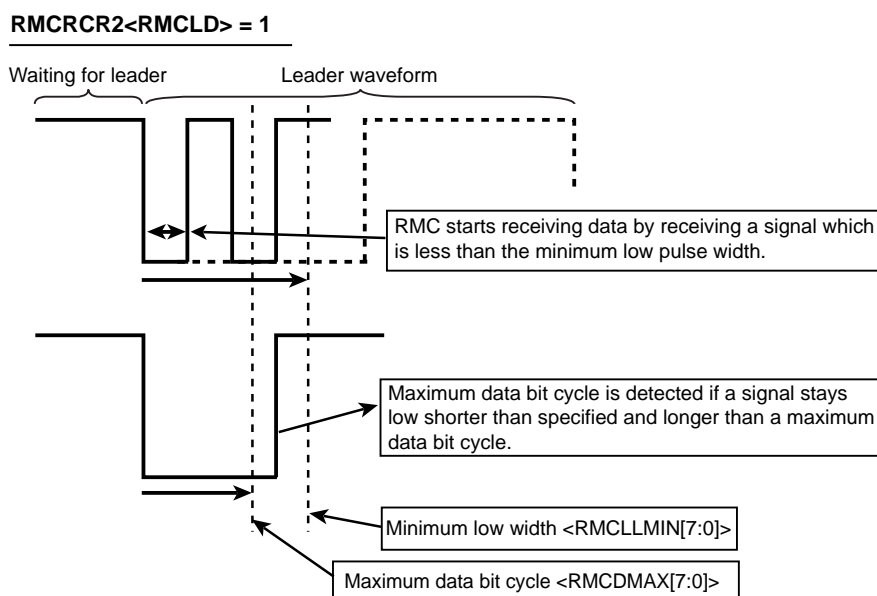

Figure 20-8 Receiving Remote Control RCR2<RMCLD>="1")

### 20.4.1.7 A Leader only with Low Width

The figure shown below illustrates a remote control signal that starts with a leader of which waveform only has low width.

This signal starts with a leader that only has low width and a data bit cycle starts from the rising edge. To enable the signal, it must be sent after being reversed by setting the RMCRCR4 <RMCPO> bit to "1".

This is because RMC is configured to detect a data bit cycle from the falling edge

To detect a leader, configure only low-pulse width of the leader with the <RMCLLMAX[7:0]> = "0000\_0000", <RMCLCMAX[7:0]> > <RMCLCMIN[7:0]>.

In this case, the value of <RMCLLMIN[7:0]> is set as "don't care".

To detect whether data "0" or data "1", configure the threshold of 0/1 detection with the RMCRCR3 <RMCDATL[6:0]>.

The maximum data bit cycle is configured with the <RMCDMAX[7:0]> of the RMCRCR2.

To complete data reception, configure the maximum data bit cycle with <RMCDMAX[7:0]> of the RMCRCR2, and configure the low-pulse width detection with <RMCLL[7:0]>.

After detecting the maximum data bit cycle and confirming the low-pulse with which is specified after receiving the last bit, receiving data is completed.

The RMC generates an interrupt and waits for the next leader.

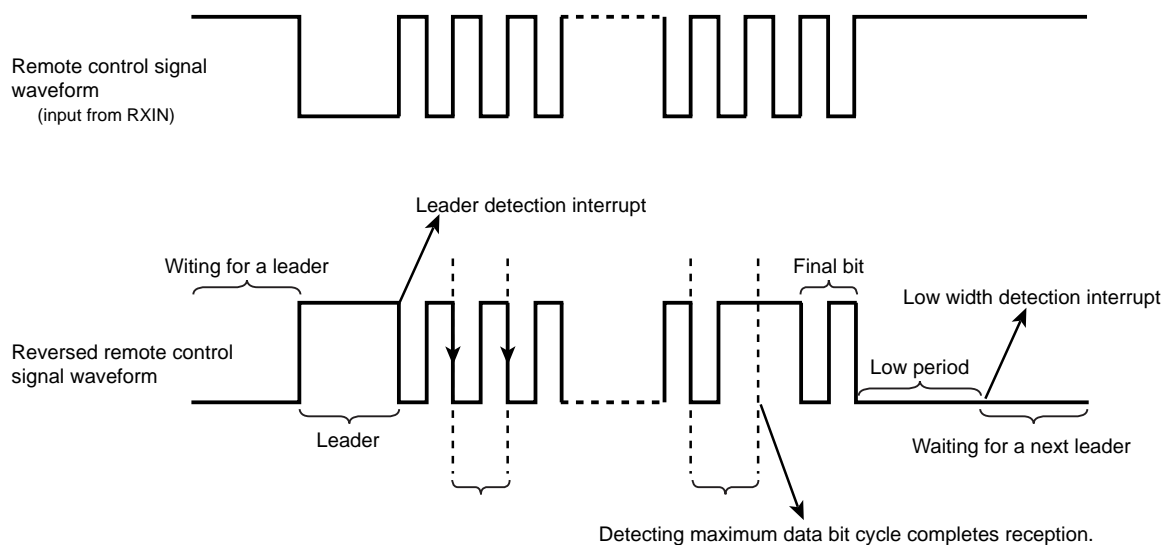

Figure 20-9 A Leader only with Low Width

20.4.1.8 Receiving a Remote Control Signal in a Phase Method

RMC is capable of receiving a remote control signal in a phase method of which signal cycle is fixed. A signal in the phase method has three waveform patterns (see the figure shown below).

By setting two thresholds a remote control signal pattern is determined. RMC converts the signal into data "0" or "1". On completion of reception, received data "0" and "1" are stored in the RMCRBUF1, RMCRBUF 2 and RMCRBUF3.

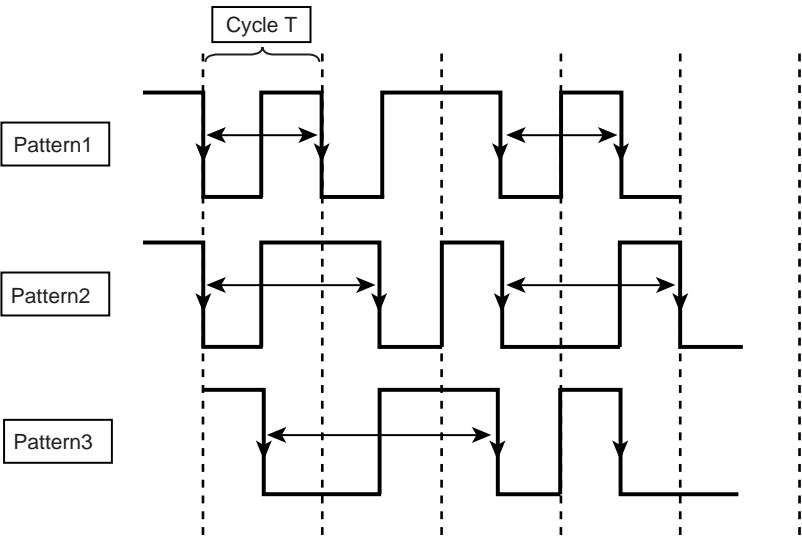

By setting RMCR2<RMCPHM> = "1", RMC enables to receive a remote control signal in the phase method. Each threshold can be configured with the RMCR3 <RMCDATL[6:0]> bits and <RMCDATH[6:0]> bits.

Two thresholds are used to distinguish three waveform patterns. On condition that a cycle between two falling edges is "T", three patterns show cycles of 1T, 1.5T and 2T. Details of the two thresholds are shown below.

	Determined by	Threshold	Register bits to set
Threshold 1	Pattern 1 & pattern 2	1T to 1.5T	RMCR3<RMCDATL[6:0]>
Threshold 2	Pattern 2 & pattern 3	1.5T to 2T	RMCR3<RMCDATH[6:0]>

To determine a remote control signal in the phase method, three patterns of data waveform and preceding data are required. In addition, the signal needs to start from data "11".

Waveform pattern in phase method

Remote control signal data in phase method

Figure 20-10 Waveform pattern in phase method and the example of data

Figure 20-11 The waveform pattern in phase method

## 21. Analog / Digital Converter (ADC)

### 21.1 Features

TMPM368FDXBG contain two units of 12-bit sequential-conversion analog/digital converters (ADC) with 8 analog input channels.

These 8 analog input channels (AINA0 to AINA3, AINB0 to AINB3) are also used as input/output ports.

There are two operation modes: one is the single unit mode operation, in which each unit operate separately, and the other is the dual unit mode, in which the interleave control circuit (ADCINTLV) generates trigger signals for AD conversion performed by two AD conversion units.

The dual unit mode offers two operation modes: interleave mode and trigger start mode.

Each unit receives trigger signals from ADCINTLV and operates according to the specified conditions.

In the interleave mode, ADCINTLV receives a trigger signal and outputs a trigger signal to the unit A. After the specified time, ADCINTLV outputs a trigger signal to the unit B.

In the trigger start mode, the ADCINTLV outputs a trigger signal to the unit A for the odd number of trigger input, and outputs a trigger signal to the unit B for the even number of trigger input.

This operation enables the result of AD conversion to be returned in half the time that each conversion takes (min. 0.5 $\mu$ s).

A 12-bit AD converter has the features shown below.

- Starting normal AD conversion and top-priority AD conversion
  - Software activation
  - Hardware activation with an external trigger input ( $\overline{\text{ADTRGA}}$ )
  - Activation with a 16-bit timer (dual unit mode only)
- Operation modes of Normal AD conversion
  - Fixed-channel single conversion mode
  - Channel scan single conversion mode (single unit mode only)
  - Fixed-channel repeat conversion mode
  - Channel scan repeat conversion mode (single unit mode only)
- Operation modes of top-priority AD conversion
  - Fixed-channel single conversion mode (single unit mode only)
- Normal AD conversion end interrupt and top-priority AD conversion end interrupt
- Normal AD conversion function and top-priority AD conversion contain the below status flags.
  - A flag that indicates AD conversion results are valid and a flag that indicates overwrite.
  - AD conversion completion flag and AD conversion busy flag.
- AD monitor function
  - If an arbitrary condition for comparison is satisfied, an interrupt occurs.
- AD conversion clock is controllable from  $f_c$  to  $f_c/16$ .
- Stand-by mode is supported.

21.2 Configuration

Figure 21-1 shown the block diagram of the AD converter.

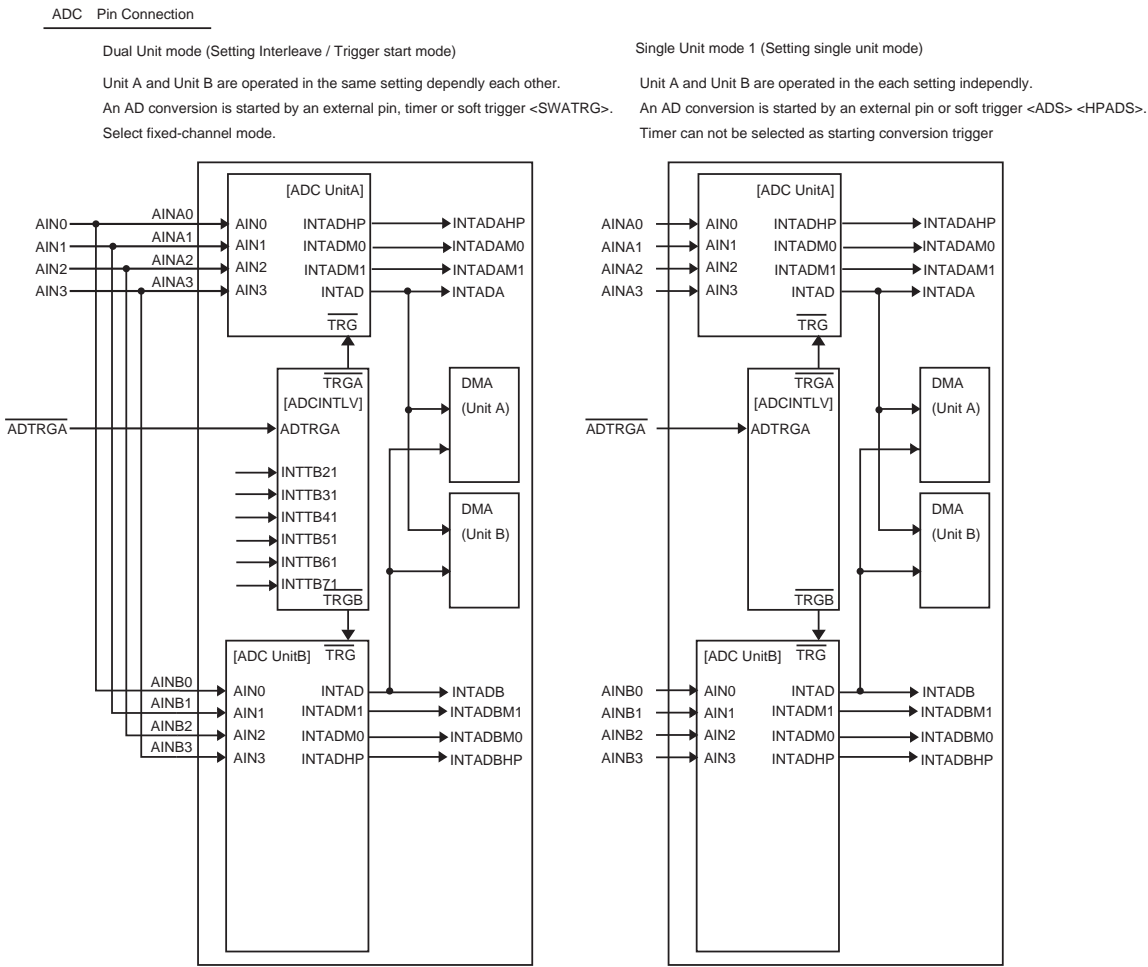

Figure 21-1 AD Converter Block Diagram

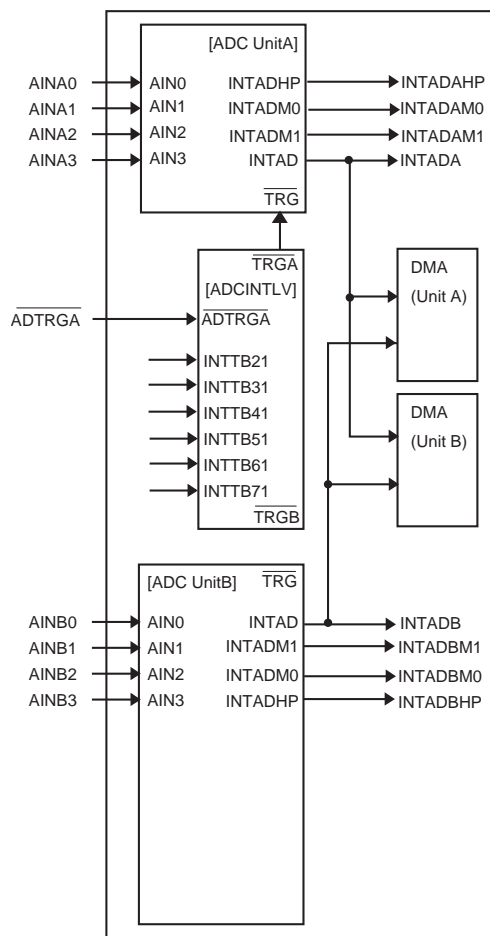

ADC Pin Connection

Single Unit mode 2 (Setting Interleave mode)

Unit A is operated by the trigger signal  $\overline{\text{TRGA}}$  of [ADCINTLV].

Unit B is operated by the soft trigger <ADS> <HPADS>.

Single Unit mode 3 (Setting interleave mode)

Unit A is operated by the soft trigger <ADS> <HPADS>.

Unit B is operated by the trigger signal  $\overline{\text{TRGB}}$  of [ADCINTLV].

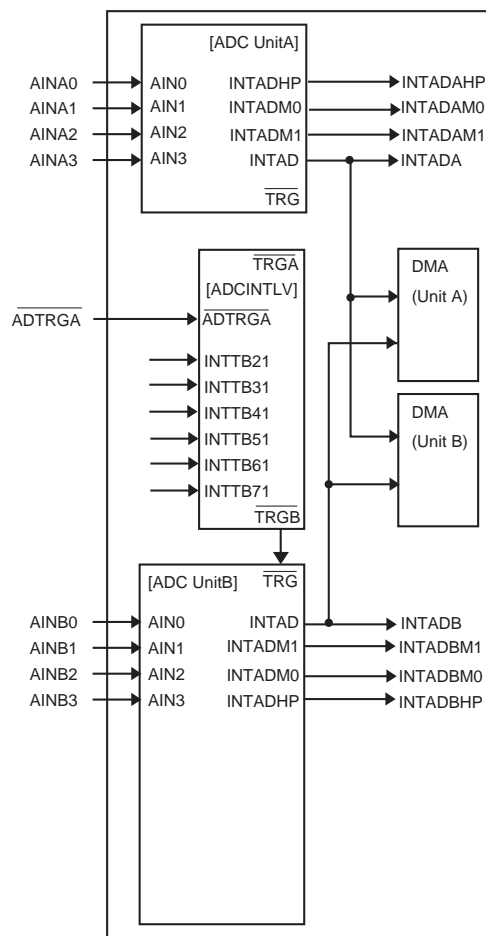

Figure 21-2 AD Converter Block Diagram

Figure 21-3 shows the block diagram of Unit A.

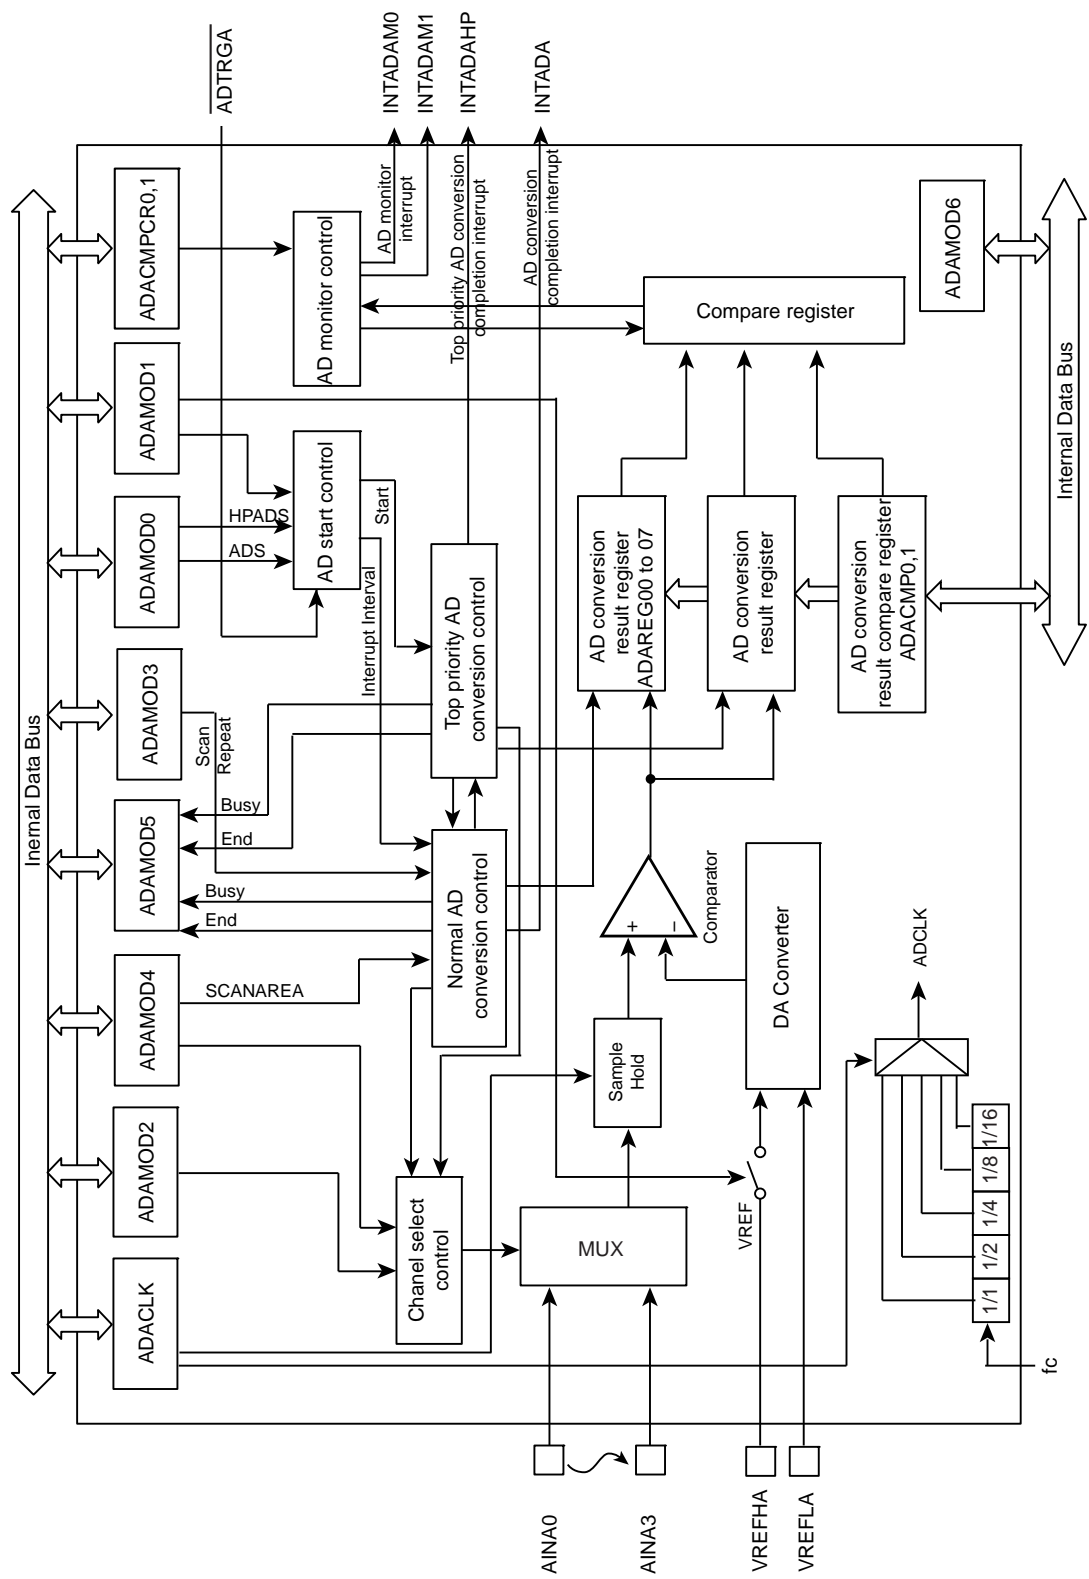

Figure 21-3 Block Diagram of Unit A

## 21.3 Registers

### 21.3.1 Register list

The AD converter is controlled by the Mode Setting Registers (ADAMOD0 through ADAMOD6/ADBMOD0 through ADBMOD6). The results of normal conversion are stored in the conversion result registers (ADAREG00 through ADAREG07/ADBREG00 through ADBREG8). The results of top-priority conversion are stored in the register ADAREGSP/ADBREGSP.

AD monitor function controls the setting value of the conversion result comparison registers (ADACMP0 through ADACMP1/ADBCMP0 through ADBCMP1) according to the setting values in the monitoring interrupt setting register (ADACMPCR0 through ADACMPCR1/ADBCMPCR0 through ADBCMPCR1).

## 21.3.2 ADCLK/ADBCLK (Clock Setting Register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	ADSH				-	ADCLK		
After reset	0	0	0	0	0	0	0	1

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as zero.
7-4	ADSH[3:0]	R/W	Select the ADC sample hold time. 0000: $10 \times \langle \text{ADCLK} \rangle$ 0001: $20 \times \langle \text{ADCLK} \rangle$ 0010: $30 \times \langle \text{ADCLK} \rangle$ 0011: $40 \times \langle \text{ADCLK} \rangle$ 0100: $80 \times \langle \text{ADCLK} \rangle$ 0101: $160 \times \langle \text{ADCLK} \rangle$ 0110: $320 \times \langle \text{ADCLK} \rangle$ 0111 to 1111: Reserved
3	-	R	Read as zero.
2-0	ADCLK[2:0]	R/W	Select the ADC prescaler output. 000: $f_c$ 001: $f_c/2$ 010: $f_c/4$ 011: $f_c/8$ 100: $f_c/16$ 101 to 111: Reserved

Note 1: Use in the range of  $4\text{MHz} \leq \text{ADCLK} \leq 40\text{MHz}$ . For example, if the settings are  $f_{\text{osc}} = 12\text{MHz}$  and  $\text{PLL} = \text{multiply-by-4}$ , the value is  $f_c = 48\text{MHz}$ . In this case, do not use the condition  $\text{ADACLK/ADBCLK} \langle \text{ADCLK}[2:0] \rangle = "000"$ .

Note 2: To select the  $\langle \text{ADCLK} \rangle$  ADC prescaler output, stop AD conversion and the condition must be as follows:  $\text{ADAMOD1/ADBMOD1} \langle \text{DAON} \rangle = "0"$ .

Figure 21-4 AD Conversion Clock (ADCLK)

The below table shows the conversion time. If you select the shortest conversion time, the conversion clock is 40 clocks.

ADCLK setting <ADCLK[2:0]>	Sample hold time setting <ADSH[3:0]>	Conversion time (Tconv)			
		fc=16MHz	fc=48MHz	fc=72MHz	fc=80MHz
000 (fc)	0000 (ADCLK × 10)	2.50 μs	–	–	–
	0001 (ADCLK × 20)	3.13 μs	–	–	–
	0010 (ADCLK × 30)	3.75 μs	–	–	–
	0011 (ADCLK × 40)	4.38 μs	–	–	–
	0100 (ADCLK × 80)	6.88 μs	–	–	–
001 (fc/2)	0000 (ADCLK × 10)	5.00 μs	1.67 μs	1.11 μs	1.00 μs
	0001 (ADCLK × 20)	6.25 μs	2.01 μs	1.39 μs	1.25 μs
	0010 (ADCLK × 30)	7.50 μs	2.50 μs	1.67 μs	1.50 μs
	0011 (ADCLK × 40)	8.75 μs	2.92 μs	1.95 μs	1.75 μs
	0100 (ADCLK × 80)	–	4.58 μs	3.06 μs	2.75 μs
	0101 (ADCLK × 160)	–	7.92 μs	5.28 μs	4.75 μs
	0110 (ADCLK × 320)	–	–	9.72 μs	8.75 μs
010 (fc/4)	0000 (ADCLK × 10)	10.00 μs	3.33 μs	2.22 μs	2.00 μs
	0001 (ADCLK × 20)	–	4.17 μs	2.78 μs	2.50 μs
	0010 (ADCLK × 30)	–	5.00 μs	3.34 μs	3.00 μs
	0011 (ADCLK × 40)	–	5.83 μs	3.89 μs	3.50 μs
	0100 (ADCLK × 80)	–	9.17 μs	6.12 μs	5.50 μs
	0101 (ADCLK × 160)	–	–	–	9.50 μs
011 (fc/8)	0000 (ADCLK × 10)	–	6.67 μs	4.45 μs	4.00 μs
	0001 (ADCLK × 20)	–	8.33 μs	5.56 μs	5.00 μs
	0010 (ADCLK × 30)	–	10.0 μs	6.67 μs	6.00 μs
	0011 (ADCLK × 40)	–	–	7.78 μs	7.00 μs
	0100 (ADCLK × 80)	–	–	–	–
100 (fc/16)	0000 (ADCLK × 10)	–	–	8.89 μs	8.00 μs
	0001 (ADCLK × 20)	–	–	–	10.00 μs
	0010 (ADCLK × 30)	–	–	–	–

Note 1: Do not change the setting of the AD conversion clock during AD conversion.

Note 2: Setting the element indicated by "–" in the above table is prohibited. Specify the <ADCLK> settings in the range of conversion time from 1μs to 10μs.

## 21.3.3 ADAMOD0/ADBMOD0 (Mode Setting Register 0)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	-	HPADS	ADS
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-2	-	R	Read as zero.
1	HPADS	W	When the conversion mode is in single unit mode, activate the top-priority AD conversion. 0: Don't care 1: Start conversion "0" is always read.
0	ADS	W	When the conversion mode is in single unit mode, activate normal (software) AD conversion. 0: Don't care 1: Start conversion "0" is always read.

Note 1: To start AD conversion, set ADAMOD1/ADBMOD1<DACON>="1" first, and then, perform software/hardware triggered start by setting ADAMOD0/ADBMOD0<ADS>,<HPADS>. After starting ADAMOD1/ADBMOD1<DACON> = ON("1"), wait for 3μs for stabilization.

Note 2: If the top-priority AD conversion <HPADS> and the normal AD conversion <ADS> start at the same time, the top-priority AD conversion receives preference to start. The normal AD conversion does not start.

## 21.3.4 ADAMOD1/ADBMOD1 (Mode Setting Register 1)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	DACON	I2AD	RCUT	-	HPADHWS	HPADHWE	ADHWS	ADHWE
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as zero.
7	DACON	R/W	Circuit ON/OFF control 0: OFF 1: ON
6	I2AD	R/W	ADC operation control in IDLE mode (WFI (Controls the Wait For Interrupt) instruction execution time). 0: Stop 1: Operate
5	RCUT	R/W	Controls the reference current between VREFH and VREFL. 0: Energizing only during conversion. 1: Always energized excepting the reset time.
4	-	R	Read as zero.
3	HPADHWS	R/W	Select hardware activation source of top-priority AD conversion. 0: Trigger output of ADCINTLV (interleave control circuit) 1: Reserved Write zero.
2	HPADHWE	R/W	Controls top-priority AD conversion triggered by hardware factors (ADCINTLV). 0: Disable 1: Enable
1	ADHWS	R/W	Hardware activation source to start normal AD conversion. 0: Trigger output of ADCINTLV (interleave control circuit). 1: Reserved Write zero.
0	ADHWE	R/W	Activate normal AD conversion triggered by hardware factor (ADCINTLV). 0: Disable 1: Enable

Note 1: To reduce consumption current used when shifting to IDLE mode with setting <I2AD>="0", or in STOP1/STOP2 mode, set "0" to <DACON> and <RCUT> after AD conversion, and then execute an instruction to move on to stand-by mode.

Note 2: In single unit mode, enable a hardware activation source, either <HPADHWE> or <ADHWE>, of a unit to use. Only an external trigger pin can be used for hardware activation source.

Note 3: In dual unit mode, enable the <ADHWE> of both units. Disable the <HPADHWE>. Activation source can be selected using ADILVMO2<TRGASEL>.

## 21.3.5 ADAMOD2/ADBMOD2 (Mode Setting Register 2)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	HPADCH				ADCH			
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as zero.
7-4	HPADCH[3:0]	R/W	Select an analog input channel for top-priority AD conversion.(refer to Table 21-1, Table 21-2)
3-0	ADCH[3:0]	R/W	Select an analog input channel for normal AD conversion (refer to Table 21-1, Table 21-2).

Table 21-1 Select input channels for normal AD conversion and top-priority AD conversion (ADAMOD2)

<HPADCH[3:0]>	Analog input channel for top-priority AD conversion	<ADCH[3:0]>	Analog input channel for normal AD conversion
0000	AINA0	0000	AINA0
0001	AINA1	0001	AINA1
0010	AINA2	0010	AINA2
0011	AINA3	0011	AINA3

Table 21-2 Select input channels for normal AD conversion and top-priority AD conversion (ADBMOD2)

<HPADCH[3:0]>	Analog input channel for top-priority AD conversion	<ADCH[3:0]>	Analog input channel for normal AD conversion
0000	AINB0	0000	AINB0
0001	AINB1	0001	AINB1
0010	AINB2	0010	AINB2
0011	AINB3	0011	AINB3
0100 to 1011	Reserved	0100 to 1011	Reserved

## 21.3.6 ADAMOD3/ADBMOD3 (Mode Setting Register 3)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	ITM			-	-	REPEAT	SCAN
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-7	-	R	Read as zero.
6-4	ITM[2:0]	R/W	Set interrupt generation timing in channel fixed repeated conversion mode.(refer to Table 21-3)
3-2	-	R	Read as zero.
1	REPEAT	R/W	Sets repeat mode. 0 : Single conversion 1 : Repeat conversion
0	SCAN	R/W	Sets scan mode. 0 : Fixed channel mode 1 : Channel scan mode

Table 21-3 Interrupt generation timing in fixed channel mode

<ITM[2:0]>	Fixed channel repeat conversion mode <SCAN> = "0", <REPEAT> = "1"
000	Each time one conversion is completed.
001	Each time when conversion is completed twice.
010	Each time when conversion is completed three times.
011	Each time when conversion is completed four times.
100	Each time when conversion is completed five times.
101	Each time when conversion is completed six times.
110	Each time when conversion is completed seven times.
111	Each time when conversion is completed eight times.

Note 1: <ITM[2:0]> is valid only in fixed channel repeat mode (<REPEAT>=1,<SCAN>=0).

Note 2: To stop the conversion during repeat conversion (when <REPEAT>=1, fixed channel and channel scan), zero clear the <REPEAT> (<REPEAT>=0). Do not change any bits excepting the <REPEAT> bit.

## 21.3.7 ADAMOD4/ADBMOD4 (Mode Setting Register 4)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	SCANAREA				SCANSTA			
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as zero.
7-4	SCANAREA [3:0]	R/W	Sets the range of channel scan (refer to Table 21-4 and Table 21-5.)
3-0	SCANSTA[3:0]	R/W	Sets the beginning channel of the channel scan (refer to Table 21-4 and Table 21-5).

The following setting sets the channel scan single mode: ADAMOD3/ADBMOD3<SCAN> = "1" and <REPEAT> = "0". Also, the following setting sets the channel scan repeat mode: ADAMOD3/ADBMOD3<SCAN> = "1" and <REPEAT> = "1". Then, select the channel for channel scan. For example, if you would like to set ADAMOD4<SCANSTA> = "0001"(AINA01), <SCANAREA>="0010"(3 channel scan), perform channel scan from AIN01 to AIN03 (for 3 channels).

Table 21-4 shows the <SCANSTA> setting in relation to the range of assignable value of <SCANAREA>.

Table 21-4 The range of assignable channel scan values (ADAMOD4)

<SCANSTA[3:0]>	Start channel	<SCANAREA[3:0]>	The range of assignable channel scan value
0000	(AINA0)	0000 to 0011	(1ch to 4ch)
0001	(AINA1)	0000 to 0010	(1ch to 3ch)
0010	(AINA2)	0000 to 0001	(1ch to 2ch)
0011	(AINA3)	0000	(1ch)

Note: Settings other than above is prohibited. Use assignable <SCANAREA>.

Table 21-5 The range of assignable channel scan values (ADBMOD4)

<SCANSTA[3:0]>	Start channel	<SCANAREA[3:0]>	The range of assignable channel scan
0000	(AINB0)	0000 to 0011	(1ch to 4ch)
0001	(AINB1)	0000 to 0010	(1ch to 3ch)
0010	(AINB2)	0000 to 0001	(1ch to 2ch)
0011	(AINB3)	0000	(1ch)

Note: Settings other than above is prohibited. Use assignable <SCANAREA>.

## 21.3.8 ADAMOD5/ADBMOD5 (Mode Setting Register 5)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	HPEOCF	HPADBF	EOCF	ADBF
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-4	-	R	Read as zero.
3	HPEOCF	R	Top-priority AD conversion completion flag (note 1) 0: Before or during conversion 1: Completion
2	HPADBF	R	Top-priority AD conversion BUSY flag 0: Conversion stop 1: During conversion
1	EOCF	R	Normal AD conversion end flag (note 1) 0: Before or during conversion 1: Completion
0	ADBF	R	Normal AD conversion BUSY flag 0: Conversion stop 1: During conversion

Note 1: <EOCF> and <HPEOCF> zero cleared by reading them.

Note 2: To reduce consumption current used when shifting to IDLE mode with setting <I2AD>="0", or in STOP1/STOP2 mode, set "0" to <DACON> and <RCUT> after AD conversion, and then execute an instruction to move on to standby mode.

### 21.3.9 ADAMOD6/ADBMOD6 (Mode Setting Register 6)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	-	ADRST	
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-2	-	W	Write as zero.
1-0	ADRST[1:0]	W	Overwriting 10 with 01 allows ADC to be software reset. All registers excepting <ADCLK> bit are initialized.

Note: To perform software, initialization takes 3μs.

## 21.3.10 ADACMPCR0/ADBCMPCR0 (Monitor Control Register 0)

	31	30	29	28	27	26	25	24

## 21.3.11 ADACMP1/ADBCMP1 (Monitor Control Register 1)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	CMPCNT1			
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	CMP1EN	-	CMPCOND1	ADBIG1	AINS1			
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-12	–	R	Read as zero.
11-8	CMPCNT1[3:0]	R/W	Sets judging large and small. <div><div>0000 : 1 count</div><div>0001 : 2 counts</div><div>0010 : 3 counts</div><div>0011 : 4 counts</div><div>0100 : 5 counts</div><div>0101 : 6 counts</div></div> <div><div>0110 : 7 counts</div><div>0111 : 8 counts</div><div>1000 : 9 counts</div><div>1001 : 10 counts</div><div>1010 : 11 counts</div><div>1011 : 12 counts</div></div> <div><div>1100 : 13 counts</div><div>1101 : 14 counts</div><div>1110 : 15 counts</div><div>1111 : 16 counts</div></div>
7	CMP1EN	R/W	AD monitor function 1 0: Disable (the number of counting for judgement is cleared) 1: Enable (if condition is satisfied, an AD monitor interrupt INTADAM1/INTADBM1 is generated)
6	–	R	Read as zero.
5	CMPCOND1	R/W	Sets the condition for judgement count. 0: Serial 1: Cumulative  Using serial method, an AD monitor interrupt occurs when the condition set to the <ADBIG1> continues and counts up to the number set to the <CMPCNT1>. After exceeding the setting value, an AD monitor interrupt occurs every time when the judgement condition is true. If the condition is different from the condition set to the <ADBIG1>, the counter is cleared.  Using cumulative method, an AD monitor interrupt occurs and the counter is cleared when the condition set to the <ADBIG1> is accumulated and reaches the number set to the <CMPCNT1>. Even if the condition is different from the value set to the <ADBIG1>, the value of the counter is held.
4	ADBIG1	R/W	Sets judging large and small. 0: Larger than the value of the comparison register (ADACMP1/ADBCMP1). 1: Smaller than the value of the comparison register (ADACMP1/ADBCMP1).  Sets the conversion results of the target analog input larger/smaller than the value of the comparison register.  Every time when the AD conversion set to AINS1[3:0] ends, judges large and small. If the result of the judgement matches to the setting of the <ADBIG1>, the counter is counted up.
3-0	AINS1[3:0]	R/W	Sets analog input as the comparison target. <div><div>ADACMPCR0</div><div>0000 : AINA0</div><div>0001 : AINA1</div><div>0010 : AINA2</div><div>0011 : AINA3</div><div>0100 to 1111: prohibited</div></div> <div><div>ADBCMPCR0</div><div>0000 : AINB0</div><div>0001 : AINB1</div><div>0010 : AINB2</div><div>0011 : AINB3</div><div>0100 : Reserved</div><div>0101 : Reserved</div></div> <div><div>0110 : Reserved</div><div>0111 : Reserved</div><div>1000 : Reserved</div><div>1001 : Reserved</div><div>1010 : Reserved</div><div>1011 : Reserved</div><div>1100 to 1111: prohibited</div></div>

Note: AD monitor function is used in the fixed repeat conversion mode and the scan repeat mode.

## 21.3.12 ADACMP0/ADBCMP0 (AD Conversion Result Compare Register 0)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0

bit symbol	CORCNT							
After reset	0	0	1	0	0	1	1	1

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as zero.
7-0	CORCNT[7:0]	R/W	Sets the trigger start adjusting counter. Sets an arbitrary value up to 0x01to0xFF. The initial value is 0x27.

Note 1: The actual delay time from the start of the unit A conversion to the start of the unit B conversion is calculated by multiplying  $1/f_c$  by (register setting value +1). Thus, the initial condition when  $f_c=80\text{MHz}$ ,  $0.5\mu\text{s}=40 \div 80\text{MHz}$  (initial count value: 0x28).

Note 2: Do not input a trigger to unit B before a trigger signal is output to unit B in operating interleave mode.

## 21.4 Description of Operations

This chapter describes the unit operation in single unit mode and dual unit mode.

### 21.4.1 Usage note about the activation of analog conversion

To start AD conversion, write "1" to the ADAMOD1/ADBMOD1<DACON>, and wait for 3  $\mu$ s until the internal circuit stabilizes. Then, write "1" to the ADAMOD0/ADBMOD0<ADS>. If you do not use this function, write "0" to the ADAMOD1/ADBMOD1<DACON>. The consumption current of the analog circuit is reduced.

### 21.4.2 AD conversion mode

Two types of AD conversion are supported: normal AD conversion and top-priority AD conversion.

#### 21.4.2.1 Normal AD conversion

Normal AD conversion supports the following four operation types. Operation modes are selected by setting ADAMOD3/ADBMOD3<REPEAT>, <SCAN>.

- Fixed channel single conversion mode
- Channel scan single conversion mode
- Fixed channel repeat conversion mode
- Channel scan repeat conversion mode

Only the fixed channel single conversion mode and fixed channel repeat conversion mode can be used in the dual unit mode.

##### (1) Fixed channel single conversion mode

If ADAMOD3/ADBMOD3<REPEAT>, <SCAN> is set to "00", AD conversion is performed in the fixed channel single conversion mode.

In this mode, AD conversion is performed once for one channel which is selected by ADAMOD2/ADBMOD2<ADCH>. After the AD conversion, ADAMOD5/ADBMOD5<EOCF> is set to "1", ADAMOD5/ADBMOD5<ADBF> is zero cleared, and an interrupt request of INTADA/INTADB is generated. <EOCF> is cleared to zero upon read.

The figure below shows an example of converting AINA0 in fixed channel single conversion mode.

##### (2) Channel scan single conversion mode

If ADAMOD3/ADBMOD3<REPEAT>, <SCAN> is set to "01", AD conversion is performed in the channel scan single conversion mode.

In this mode, AD conversion is performed once for the scan channel area selected by ADMOD4/ADBMOD4<SCANAREA> from the start channel selected by ADAMOD4/ADBMOD4<SCAN-

STA>. After AD scan conversion, ADAMOD5/ADBMOD5<EOCF> is set to "1", ADAMOD5/ADBMOD5<ADBF> is zero cleared, and an interrupt request of INTADA/INTADB is generated. <EOCF> is zero cleared upon read.

The figure below shows an example of converting from AINA0 to AINA2 in channel scan single conversion mode.

(3) Fixed channel repeat conversion mode

If ADAMOD3/ADBMOD3<REPEAT>, <SCAN> is set to "10", AD conversion is performed in fixed channel repeat conversion mode.

In this mode, AD conversion is repeated for the number of times set to ADAMOD3/ADBMOD3<ITM> (interrupt request generating timing for INTADA/INTADB can be selected) for the one channel selected by ADAMOD2/ADBMOD2<ADCH>. After the number of AD conversion set to <ITM> is repeated, ADAMOD5/ADBMOD5<EOCF> is set to "1", but ADAMOD5/ADBMOD5<ADBF> is not zero cleared and keeps "1". <EOCF> is zero cleared upon read.

The figure below is an conversion example of AINA0 in fixed channel repeat conversion mode.

(4) Channel scan repeat conversion mode

If ADAMOD3/ADBMOD3<REPEAT>, <SCAN> is set to "11", AD conversion is performed in the channel scan repeat conversion mode.

In this mode, AD conversion is performed repeatedly for the scan channel area in the channel selected by ADAMOD4/ADBMOD4<SCANSTA> from the start channel selected by ADAMOD4/ADBMOD4<SCANAREA>. Each time one AD scan conversion is completed, ADAMOD5/ADBMOD5<EOCF> is set to "1" and the INTADA/INTADB interrupt request is generated. ADAMOD5/ADBMOD5<ADBF> is not zero cleared and remains at "1". <EOCF> is cleared to "0" upon read.

The figure below shows an operation example of converting AINA0 to AINA2 in the channel scan repeat conversion mode.

21.4.2.2 Top-priority AD conversion

Top-priority AD conversion can be performed by interrupting ongoing normal AD conversion. If the top-priority AD conversion interrupts into normal AD conversion, the normal AD conversion starts from the stopped channel after the top-priority conversion.

The fixed channel single conversion is the only operation mode. The settings to ADAMOD3/ADBMOD3<REPEAT>, <SCAN> are invalid. When conditions to start operation are met, a conversion is performed just once for a channel selected by ADAMOD2/ADBMOD2<HPADCH>. When conversion is completed, the top-priority AD conversion completion interrupt (INTADAH/INTADBHP) is generated, ADAMOD5/ADBMOD5<HPEOCF> is set to "1" and <HPADBF> is zero cleared. <HPEOCF> returns to "0" upon read.

If a top-priority AD conversion is activated during the operation of another top-priority conversion, the previous conversion becomes invalid and the new operation becomes valid. The top-priority AD conversion cannot be used in the dual unit AD conversion mode.

### 21.4.3 AD monitor function

This function is used for configuring the fixed channel repeat mode and the scan repeat mode.

If ADACMPCR0/ADBCMPCR0 <CMP0EN> and ADACMPCR1/ADBCMPCR1<CMP1EN> are set to "1", AD monitor function is enabled. Two monitor function can be enabled concurrently.

Here is an example of ADACMPCR0/ADBCMPCR0 (same as ADACMPCR1/ADBCMPCR1).

Analog input for comparison is set to ADACMPCR0/ADBCMPCR0<AINS0[3:0]>. Large or small judgment is set to <ADBIG0>. Conditions of this comparison count is set to <CMPCOND0>. The number of comparison count is set to <CMPCNT0[3:0]>.

Once AD conversion starts, the AD converter checks comparison conditions (smaller/larger than values of the compare register) for each AD conversion. If the result of the comparison meets the settings of <ADBIG0>, the AD converter counts up the counter value.

There are two types of comparison condition: sequential method and cumulative method.

In the sequential method, an AD monitor interrupt (INTADAM0/INTADBM0) occurs if the condition set to <ADBIG0> continues and reaches the number of counts set to <CMPCNT0[3:0]>. An interrupt occurs without clearing the counter if the result of comparison meets the condition even after reaching the the number of counts set to <CMPCNT0[3:0]>. The value of the counter is zero cleared only when the condition does not meet the set condition of <ADBIG0>.

In the cumulative method, the counter is zero cleared when the total number of times that the condition set to <ADBIG0> meets reaches the number set to <CMPCNT0[3:0]>. An AD monitor interrupt (INTADAM0/INTADBM0) occurs at this time. The counter value is kept even if the result of the comparison is different from the set value of the counter. If values of the Conversion Result Register configured by the ADACMPCR0/ADBCMPCR0 register are the same as those of the target register, the AD converter does not count up. An AD conversion interrupt (INTADAM0/INTADBM0) does not occur either.

This comparison operation is performed each time a result is stored in a corresponding conversion result register. An interrupt (INTADAM0/INTADBM0) occurs when conditions meet (including counting). Since the conversion result register assigned to perform the AD monitor function is usually not read by software, the conversion result storage flag ADAREG/ADBREG<ADRF> and the overrun flag ADAREG/ADBREG<ADOVRF> remain being set. Do not use the conversion result register when you use the AD monitor function.

1. AINA0 input is set to the fixed channel repeat conversion mode and compare values of the AD Conversion Result Compare Register (0x0888).
  - ADAMOD3=0x0002: fixed channel repeat conversion
    - AD conversion completion interrupt (INTADA) is disabled.
  - ADACMPCR0=0x0280: compare target channel: AINA0, size determination: larger than a value of the compare register. Compare counting condition: sequential method. AD monitor function: enabled. Size determination count: 3 counts.
  - ADACMP0=0x0888: AD Conversion Result Compare Register (compared value 0x0888)

Figure 21-5 AD monitor function (fixed channel repeat and sequential method)

- 2. AINA0 is set to fixed channel repeat conversion and compare the value of the AD Conversion Result Compare Register (0x0888).
  - ADAMOD3=0x0002: fixed channel repeat conversion
    - AD conversion completion interrupt (INTADA) is disabled.
  - ADACMPCR0=0x02A0: compare target channel: AINA0, size determination: larger than a value of the compare register. compare counting condition: cumulative method. AD monitor function: enabled. size determination count: 3 counts
  - ADACMP0=0x0888: AD Conversion Result Compare Register (compared value 0x0888)

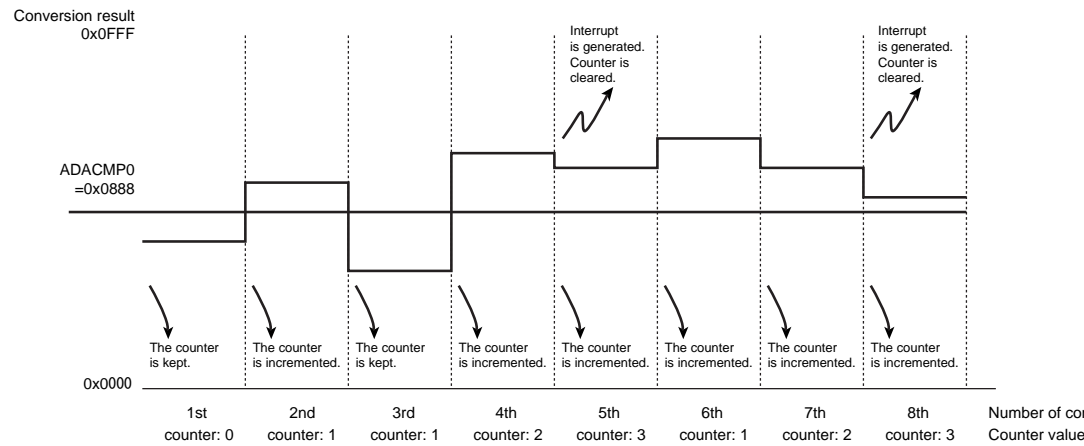

Figure 21-6 AD Monitor Function (fixed channel repeat and cumulative method)

#### 21.4.4 Selecting the input channel

After reset, ADAMOD3/ADBMOD3<REPEAT>, <SCAN> is initialized to "00" and ADAMOD2/ADBMOD2<ADCH[3:0]> is initialized to "0000".

The channels to be converted are selected according to the operation mode of the AD converter as shown below.

1. Normal AD conversion mode

- If the analog input channel is used in a fixed state (ADAMOD3/ADBMOD3<SCAN> = "0")

One channel is selected from analog input pins AIN0 through AIN3/AINB0 through AINB3 by setting ADAMOD2/ADBMOD2<ADCH> to an appropriate setting.

- If the analog input channel is used in a scan state (ADAMOD3/ADBMOD3<SCAN> = "1")

One scan mode is selected from the scan modes by setting ADAMOD4/ADBMOD4<SCAN-STA> and ADAMOD4 /ADBMOD4<SCANAREA> to an appropriate setting.

2. Top-priority AD conversion mode

One channel is selected from analog input pins from AIN0 through AIN3/AINB0 through AINB3 by setting ADAMOD2/ADBMOD2<HPADCH> to an appropriate setting. In this mode, if top-priority AD conversion has been activated during normal AD conversion, ongoing normal AD conversion is suspended, and restarts normal AD conversion after top-priority AD conversion is completed. The normal AD conversion restarts from the channel previously stopped after the top-priority AD conversion is completed.

## 21.4.5 Details of AD Conversion

### 21.4.5.1 Starting AD conversion

The normal AD conversion is enabled by setting "1" to ADAMOD0/ADBMOD0<ADS>. The top-priority AD conversion is enabled by setting "1" to ADAMOD0/ADBMOD0<HPADS>. Starting by setting values is called software start.

The normal AD conversion has four operation modes specified by ADAMOD3/ADBMOD3<REPEAT>, <SCAN>, and one of those mode is selected. The operation mode for the top-priority AD conversion is the fixed channel single conversion only.

Also, hardware activation can be selected. Set "0" to ADAMOD1/ADBMOD1<ADHWS> for the normal AD conversion and to ADAMOD1/ADBMOD1<HPADHWS> for the top-priority AD conversion. In single unit mode, use the external trigger pin ( $\overline{\text{ADTRGA}}$ ) for activation. In dual unit mode, set ADILVMO2<TRGASEL> to select from software trigger, external trigger pin ( $\overline{\text{ADTRGA}}$ ) and timer trigger activation.

To enable hardware activation, set "1" to ADAMOD1/ADBMOD1<ADHWE> for normal AD conversion and to ADAMOD1/ADBMOD1<HPADHWE> for top-priority AD conversion.

Even if hardware start is enabled, start with software can be done.

Note: When using external trigger is used as a hardware activating source for the top-priority AD conversion, external trigger cannot be selected for the normal AD conversion hardware start.

### 21.4.5.2 AD conversion

When normal AD conversion starts, the AD conversion Busy flag (ADAMOD5/ADBMOD5 <ADBF>) which indicates that AD conversion is under way is set to "1".

When top-priority AD conversion starts, the top-priority AD conversion Busy flag (ADAMOD5/ADBMOD5<HPADBF>) showing that AD conversion is underway is set to "1". At that time, the value of the Busy flag ADAMOD5/ADBMOD5<EOCF> and <ADBF> for normal AD conversion before the start of top-priority AD conversions are retained.

Note: Do not execute the normal AD conversion when the top-priority AD conversion is underway. A top-priority AD conversion completion flag is not set. Also, a previous normal AD conversion flag is not cleared.

21.4.5.3 Top-priority AD conversion during normal AD conversion

If top-priority AD conversion has been activated during normal AD conversion, ongoing normal AD conversion is suspended, and restarts normal AD conversion after top-priority AD conversion is completed.

If ADAMOD0/ADBMOD0<HPADS> is set to "1" during normal AD conversion, ongoing normal AD conversion is suspended, and the top-priority AD conversion starts; specifically, AD conversion (fixed-channel single conversion) is executed for a channel designated by MOD2/ADBMOD2<HPADCH>. After the result of this top-priority AD conversion is stored in the storage register ADAREGSP/ADBREGSP, normal AD conversion is resumed.

If H/W activation of top-priority AD conversion is authorized during normal AD conversion, ongoing AD conversion is discontinued when requirements for activation using a H/W activation resource are met, and top-priority AD conversion (fixed-channel single conversion) starts for a channel designated by <HPADCH>. After the result of this top-priority AD conversion is stored in the storage register ADAREGSP/ADBREGSP, normal AD conversion is resumed.

For example, if channel repeat conversion is activated for channels AINB0 through AINB2 and if <HPADS> is set to "1" during AINB1 conversion, AIN1 conversion is suspended, and conversion is performed for a channel designated by <HPADCH> (AINB3 in the case shown below). After the result of conversion is stored in ADBREGSP, channel repeat conversion is resumed, starting from AINB1.

21.4.5.4 Stopping Repeat Conversion Mode

To stop the AD conversion operation in the repeat conversion mode (fixed-channel repeat conversion mode or channel scan repeat conversion mode), write "0" to ADAMOD3/ADBMOD3<REPEAT>. When ongoing AD conversion is completed, the repeat conversion mode terminates, and ADAMOD5/ADBMOD5<ADBF> is set to "0".

#### 21.4.5.5 Reactivating normal AD conversion

Setting "1" to ADAMOD0/ADBMOD0<ADS> during normal AD conversion reactivates the normal AD conversion. The previous normal AD conversion is immediately discontinued when a new normal AD conversion is reactivated. At this time, the normal AD conversion busy flag ADAMOD5/ADBMOD5<ADBF>, the normal AD conversion completion flag ADAMOD5/ADBMOD5<EOCF> and the AD conversion result storage flag ADAREG00 to 03/ADBREG00 to 03<ADOVRF> <ADRF> are zero cleared.

If H/W activation of top-priority AD conversion is authorized during normal AD conversion, ongoing AD conversion is reactivated when requirements for activation using a H/W activation resource are met. At this time, the previous normal AD conversion is immediately discontinued. <ADBF>, <EOCF>, <ADOVRF> and <ADRF> are zero cleared.

#### 21.4.5.6 Conversion completion

##### (1) Completing normal AD conversion

When normal AD conversion is completed, the AD conversion completion interrupt (INTADA/INTADB) is generated. The result of AD conversion is stored in the storage register, and values of two registers change: the register ADMOD0<EOCFN> which indicates the completion of AD conversion and the register ADMOD0<ADBFN> which indicates conversion is ongoing. Interrupt requests, conversion register storage register and <EOCFN><ADBFN> change with a different timing according to a mode selected.

In mode other than fixed-channel repeat conversion mode, conversion results are stored in the AD conversion result registers (ADAREG00 to 03/ADBREG00 to 03) corresponding to a channel.

In fixed-channel repeat conversion mode, the conversion results are sequentially stored in storage registers ADAREG00/ADBREG00 through ADAREG07/ADBREG07, according to the interrupt condition set to ADAMOD3/ADBMOD3<ITM>.

Interrupt requests, flag changes and conversion result registers in each mode are as shown below.

- Fixed-channel single conversion mode

After AD conversion completed, <EOCF> is set to "1", <ADBF> is cleared to "0", and the interrupt request is generated.

Conversion results are stored a conversion result register correspond to a channel.

- Channel scan single conversion mode

After the channel scan conversion is completed, <EOCF> is set to "1", <ADBF> is set to "0", and an interrupt request is generated.

Conversion results are stored a conversion result register correspond to a channel.

- Fixed-channel repeat conversion mode

The <ADBF> is not cleared to "0". It remains at "1". The timing with which the interrupt request INTAD is generated can be selected by setting <ITM> to an appropriate setting. ADAREG04-ADAREG07 can be used only in the fixed channel repeat conversion mode.

- a. One-time conversion

With <ITM> set to "00", an interrupt request is generated each time one AD conversion set to <ADCH> is completed. In this case, the conversion results are always stored in the storage registers ADAREG00/ADBREG00 in sequential order. After the conversion result is stored, <EOCF> changes to "1".

b. Eight-time conversions

With <ITM> set to "111", an interrupt request is generated each time eight AD conversions set to <ADCH> are completed. In this case, the conversion results are always stored in the storage registers ADAREG00/ADBREG00 through ADAREG07/ADBREG07 in sequential order. After the conversion results are stored in ADAREG07/ADBREG07, <EOCF> is set to "1", and storage of subsequent conversion results from ADAREG00/ADBREG00.

- Fixed-channel repeat conversion mode

With <EOCF> set to "1", a INTADA/INTADB interrupt request is generated each time one scan conversion is completed. <ADBF> is not cleared to zero and remains at "1".

With ADAMOD4/ADBMOD4 <SCANAREA> set to "0011" (4-channel scan), four channel scans are performed from the Start Channel designated by ADAMOD4/ADBMOD4<SCANSTA>. Each time when a conversion of the final channel is completed, <EOCF> is set to "1", an interrupt request is generated, and four channel scanning starts from the Start Channel again. Since this mode is a repeat mode, <ADBF> is not zero cleared and maintains "1".

Conversion results are stored in a conversion result register corresponding to the channel.

(2) Completing top-priority AD conversion

After the top-priority AD conversion is completed, the top-priority AD conversion completion interrupt (INTADAHP/INTADBHP) is generated. ADAMOD5/ADBMOD5<HPEOCF> which indicates the completion of top-priority AD conversion is set to "1".

Conversion results are stored in the conversion result register ADAREGSP/ADBREGSP.

(3) Data polling

To confirm the completion of AD conversion without using interrupts, data polling can be used. When AD conversion is completed, ADAMOD5/ADBMOD5<EOCF> are set to "1". To confirm the completion of AD conversion and to obtain the results, poll this bit.

AD conversion result storage register must be read by word access. If <ADOVRF> = "0" and <ADRF> = "1" in ADAREG00 to ADAREG07 / ADBREG00 to ADBREG07, a correct conversion result has been successfully obtained.

A top-priority AD conversion can use data polling, too.

## 21.4.5.7 Interrupt Timing and Conversion Result Register

Table 21-6 shows the correlation between AD conversion modes, interrupt timing and flags. Table 21-7, Table 21-8 and Table 21-9 show the correlation between analog input channels and conversion result registers.

Table 21-6 Correlation between AD conversion mode, interrupt timing and flag operation

Conversion mode		Scan / repeat mode setting (ADAMOD3/ADBMOD3)			Interrupt generation timing	Conversion Status Flag (ADAMOD5/ADBMOD5)		
		<REPEAT>	<SCAN>	<ITM[2:0]>		<EOCF>/ <HPEOCF> set timing (note 1)	<ADBF> (after interrupt)	<HPADBF> (after interrupt)
Normal conversion	Fixed channel single conversion	0	0	–	After conversion	After conversion	0	–
	Fixed channel repeat conversion	1	0	000	Each 1 conversion	After 1 conversion is completed	1	–
				001	Each 2 conversions	After 2 conversions are completed	1	–
				010	Each 3 conversions	After 3 conversions are completed	1	–
				011	Each 4 conversions	After 4 conversions are completed	1	–
				100	Each 5 conversions	After 5 conversions are completed	1	–
				101	Each 6 conversions	After 6 conversions are completed	1	–

	0011	AINB3	0000	(1ch)	ADBREG03

## 21.4.6 Dual Unit Mode

### 21.4.6.1 Outline of Dual Unit Mode

Dual unit mode is controlled by ADCINTLV which generates two trigger signal for AD conversion start (unit A and unit B). AD conversions set to each unit are performed at the timing of trigger signals. Dual unit mode has two operation modes.

- Interleave mode
- Trigger start mode

Trigger source can be selected from software trigger, external trigger input and timer trigger input.

In interleave mode, a trigger signal generated based on a selected trigger input is output to the unit A. After that, a trigger signal for the unit B is generated after the elapse of a specified period of time.

In trigger start mode, a trigger signal is output to the unit A and the unit B in alternate shifts each time when a selected trigger become active.

### 21.4.6.2 Interleave Mode

To perform data polling in interleave mode, set ADILVMO2<ADILV><TRGAEN> to "1". Trigger source can be selected from software trigger, timer trigger and external trigger on the ADILVMO2<TRGASEL>.

If software trigger is selected as trigger source, generated pulses can be used as a trigger source (trigger output for the unit A) by setting "1" to ADILVMO1<SWATRG>. Simultaneously, the counter starts operation and a trigger for the unit B is output when the counter value becomes the set value of the ADILVMO3<CORCNT>.

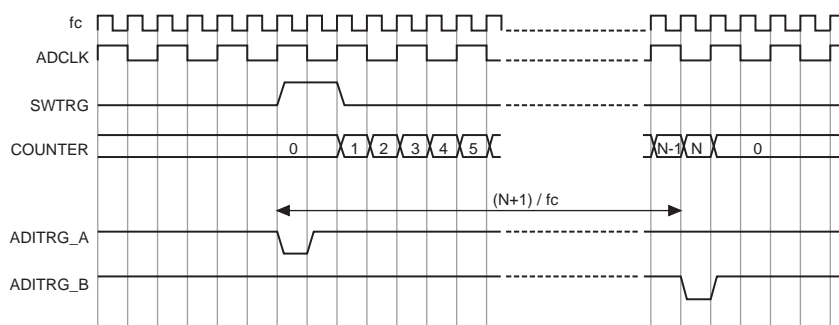

Figure 21-7 Interleave operation using a software trigger (ADCLK=fc/2)

If a timer trigger is selected as trigger source, a pulse generated by a timer trigger set to ADILVMO2<TRGASEL> becomes a trigger source, the first trigger output for the unit A. Simultaneously, the counter starts operation and a trigger for the unit B is output when the counter value becomes the set value of the ADILVMO3<CORCNT>.

If an external trigger is selected as a trigger source, the external trigger is a trigger source and a trigger output for the unit A. Simultaneously, the counter starts operation and a trigger for the unit B is output when the counter value becomes the set value of the ADILVMO3<CORCNT>.

Figure 21-8 Interleave operation using an external trigger ( $ADCLK=fc/2$ )

#### 21.4.6.3 Discontinuance and Resume of Interleave mode

After a trigger output for the unit B in interleave mode, conversion results of the unit B is stored and the operation stops if the below operation is performed before a trigger signal for the unit A is output. Also, after a trigger output for the unit A is output, the unit B does not start conversion and stops if the below operations are performed before a trigger signal for the unit B is output.

- $ADILVMO2<ADILV>$  is set to "0".
- $ADILVMO2<TRGAEN>$  is set to "0".

Interleave mode restarts if "1" is set to both registers above and a signal selected as a trigger source becomes active.

#### 21.4.6.4 Trigger Start Mode

To start operation in trigger start mode, set ADILVMO2<ADILV> to "0", <TRGAEN> to "1". Trigger source can be selected from software trigger, timer trigger and external trigger by setting ADILVMO2<TRGASEL>.

If the software trigger is selected as a trigger source, generated pulse is used as trigger source by setting ADILVMO1<SWATRIG> to "1". Trigger signals for the unit A and the unit B are output in alternate shift every time when this pulse is generated.

If the timer trigger is selected as a trigger source, the pulse generated by the timer trigger specified by the ADILVMO2<TRGASEL> becomes trigger source, and starts conversion at the falling edges. Trigger signals for the unit A and the unit B are output in alternate shift every time when a timer trigger is generated.

If the external trigger is selected as a trigger source, Trigger signals for the unit A and the unit B are output in alternate shift every time when an external trigger is input.

Figure 21-9 Trigger Start Operation by Timer Trigger ( $ADCLK = f_c/2$ )

#### 21.4.6.5 Notes on stopping and performing dual unit mode

Set "0" to ADILVMO2<TRGAEN> to stop the dual unit mode.

Also, do not write to the register during ongoing operation, without setting the above condition.

When interleave mode is active, do not set the next trigger source to output before ADCINTLV outputs a trigger signal for the unit B. Also, input of the next trigger source before the conversion of the unit A is prohibited. Ongoing operation stops as is the case in the single unit mode.

During an operation in trigger start mode, do not input a trigger source in odd number of time before the conversion for the unit A is completed. Do not input a trigger source in even number of time before the conversion for the unit B is completed, either. Ongoing operation stops as is the case in the single unit mode.

If you use the fixed channel repeat mode, settings of interrupt generation timing ADAMOD3/ADBMOD3<ITM> and the overrun flag ADAREG00-07/ADBREG00-07<ADOVRF> require attention to avoid an overrun error during the process of reading conversion results.

## Notes on designing for AD converter inputs

<An output impedance of the external signal source which is connected with AIN pin>

An output impedance of the external signal source which is connected with AIN pin is equal or less than  $R_{EXAIN}$  shown below formula.

- Calculating formula of allowable value of output impedance of the external signal source -

The maximum value of an output impedance connected with AIN pin :  $R_{EXAIN} < T_{scyc} \div (ADCLK \times C_{ADC} \times \ln(2^{14})) - R_{AIN}$

MCU information	Symbol	Min	Typ	Max	Unit
ADC clock frequency	ADCLK	4	-	40	MHz
Total AIN input capacity in MCU	$C_{ADC}$	-	-	12.2	pF
AIN resistance in MCU	$R_{AIN}$	-	-	1	kΩ
Cycle number in the sample hold period	$T_{scyc}$	10	-	320	Cycle

$R_{EXAIN}$  maximum value list ( ADCLK = 40MHz )

$T_{scyc}$	$R_{EXAIN}$	Unit
10	1.1	kΩ
20	3.2	kΩ
30	5.3	kΩ
40	7.5	kΩ
80	15.9	kΩ
160	32.8	kΩ
320	66.6	kΩ

< Addition of stabilizing capacity >

If high-speed AD conversion is required and the sample hold period cannot meet the conditions of calculating formula of allowable values of output impedance of external signal source, add stabilizing capacity to the AIN pin. The additional capacity depends on external circuit. Although the capacity depended on the external circuit is different from the each board set, add the capacity from about 0.1μF to 1μF, appropriate amount for your circuit board.

Set the capacity to be added next to the AIN pin.

< Adjustment of sample hold period>

Generally, by setting the sample hold period long, you can make the input voltage of the comparator in the ADC circuit as same as the input voltage of the AIN pin can reduce the error of an AD conversion.

Although, in case that the sample hold period is too long, the error of an AD conversion may be increased because the voltage held in sample hold circuit is changed.

Because the suitable sample hold period is depended on the each board set, please decided the suitable sample hold period on your board set.

## Notes of the use of the AD converter

The result value of AD conversion may vary depending on the fluctuation of the supply voltage, or may be affected by noise.

When using analog input pins and ports alternately, do not read and write ports during conversion because the conversion accuracy may be reduced. Also the conversion accuracy may be reduced if the output ports current fluctuate during AD conversion.

Please take counteractive measures with the program such as averaging the AD conversion results.

## 22. Digital Analog Converter (DAC)

### 22.1 Outline

The TMPM368FDXBG has two channels of 10-bit digital-analog converter.

- 2-channel synchronous output
- Trigger function
- Waveform generation function
- Power-down function

### 22.2 Block Diagram

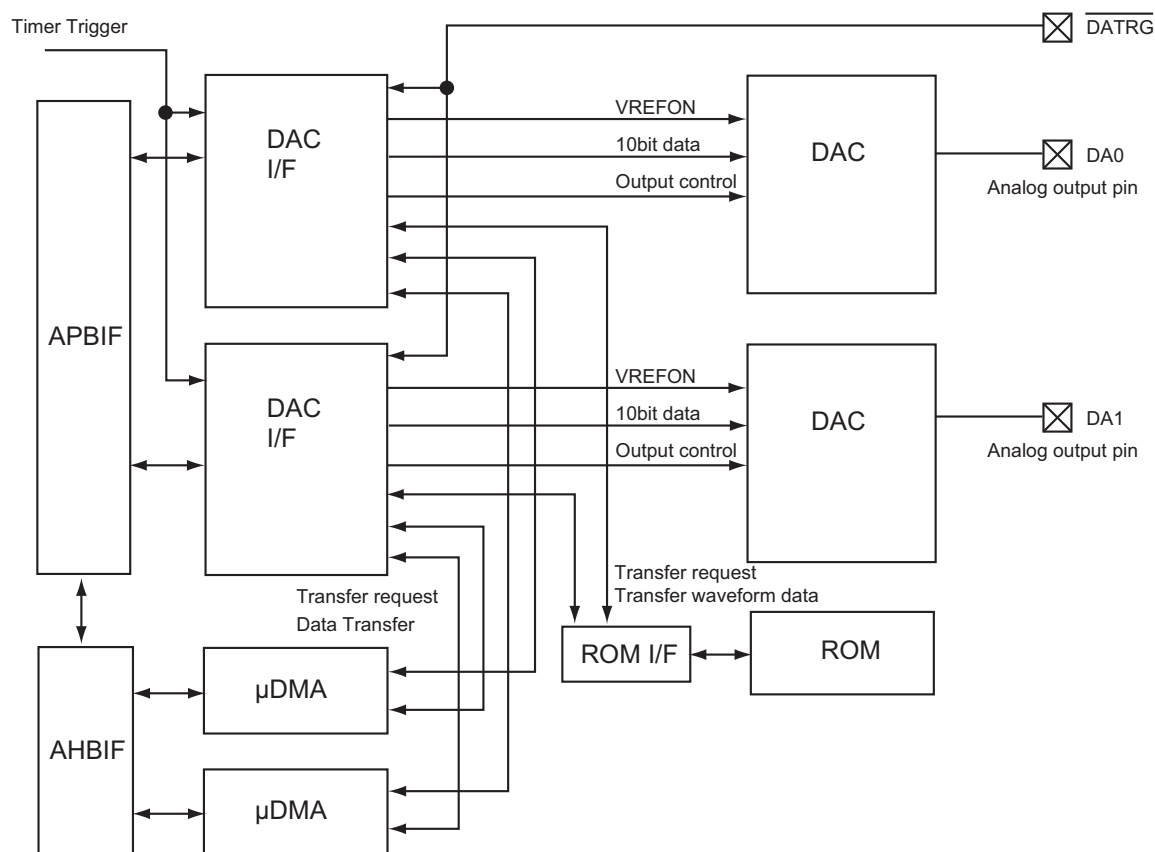

Figure 22-1 Block diagram of DAC

## 22.3 Registers

### 22.3.1 List of Registers

DA convertor is controlled by DACCNTx and DACVCTLx. It outputs an analog voltage depend on DACREGx.

When wave generation function is used, DACDCTLx is set the condition and operation mode.

DACTLx initialize DA convertor (<DACCLR>) and controls the software output control (SWTRG< >).

Channel x	Base Address
Channel0	0x4005_4000
Channel1	0x4005_5000

Register name (x=0 to 1)		Address (Base+)
DAC control register	DACCNTx	0x0000
DAC data register	DACREGx	0x0004
Waveform output control register	DACDCTLx	0x0008
Waveform trigger control register	DACTLx	0x000C
VOUTHOLD adjustment register	DACVCTLx	0x0010

## 22.3.2 DACCNTx (DAC control register)

## 22.4 Operational Description

### 22.4.1 Trigger Function

When the digital-analog converter is used, analog output values are required to update using the trigger function. To use the trigger function, set a trigger source to DACDCTLx<TRGSEL> then set "1" to <TRGEN>. When triggers are generated, analog output values are updated according to a value of DAREGx<DAC>. The trigger sources can be chosen among a 16-bit timer, an external trigger pin and software.

### 22.4.2 $\mu$ DMA controller interlocking function

When DACDCTLx<DMAEN>="1" is set, data transfer to DACREGx<DAC> is enabled using  $\mu$ DMA controller. Waveform output interlocking with trigger function is enabled as well. How to use  $\mu$ DMA controller is described in Chapter " $\mu$ DMA controller".

The following procedure is an example how to output an arbitrary waveform using external trigger and  $\mu$ DMA controller.

1. Sets  $\mu$ DMA controller
2. Sets DACCNTx<VREFON>="1" and <OP>="1"
3. Sets DACTCTLx<DACCLR>="1"
4. Sets VOUTHOLD time to DACVCTLx<VHOLDCTB>, <VHOLDCTF>
5. Sets DACDCTLx<OFFSET>="000", <AMPSEL>="00", <TRGSEL>="001", <TRGEN>="1", <DMAEN>="1" and <WAVE>="00"

### 22.4.3 Waveform Generation Function

The waveform generation function can be output sine waves, triangle waves and noise waveforms by setting output waveform to DACDCTLx<WAVE>. When sine waves or triangle waves are set, amplitude of output value and offset value can be set to DACDCTLx<AMPSEL> and <OFFSET> respectively.

Once the trigger which is set to DACDCTLx<TRGSEL> occurs, data in ROM table is read via ROM interface to output waveforms. Data setting is executed per one trigger. To output one cycle waveform, N time data setting is required.

Note: A value of N varies according to output waveforms.

Table 22-1 The value of <OFFSET> and <AMPSEL> when sine waves and triangle waves are output

<AMPSEL>	<OFFSET>	Output level (min.)	Output level (max)
00	000	$AVDD3\_DA \times 0/8$ (note)	$AVDD3\_DA \times 8/8$ (note)
01 (When the amplitude is 50%)	000	$AVDD3\_DA \times 0/8$ (note)	$AVDD3\_DA \times 4/8$
	001	$AVDD3\_DA \times 1/8$	$AVDD3\_DA \times 5/8$
	010	$AVDD3\_DA \times 2/8$	$AVDD3\_DA \times 6/8$
	011	$AVDD3\_DA \times 3/8$	$AVDD3\_DA \times 7/8$
	100	$AVDD3\_DA \times 4/8$	$AVDD3\_DA \times 8/8$ (note)
10 (When the amplitude is 25%)	000	$AVDD3\_DA \times 0/8$ (note)	$AVDD3\_DA \times 2/8$
	001	$AVDD3\_DA \times 1/8$	$AVDD3\_DA \times 3/8$
	010	$AVDD3\_DA \times 2/8$	$AVDD3\_DA \times 4/8$
	011	$AVDD3\_DA \times 3/8$	$AVDD3\_DA \times 5/8$
	100	$AVDD3\_DA \times 4/8$	$AVDD3\_DA \times 6/8$
	101	$AVDD3\_DA \times 5/8$	$AVDD3\_DA \times 7/8$
	110	$AVDD3\_DA \times 6/8$	$AVDD3\_DA \times 8/8$ (note)

Note: About the output level near the full scale or zero point, refer to the 10-bit D/A Converter Electrical characteristics in Electrical characteristics.

### 22.4.3.1 Sine Wave Output

When sine waves are output, set  $\text{DACDCTLx} \langle \text{WAVE} \rangle = "11"$ . A waveform cycle is determined by the trigger generation interval. To output one cycle waveform, 2048-time data read is required. The cycle is calculated as follows; the trigger generation interval  $\times 2048$ .

The following shows an example that the 50% amplitude triggered by 16-bit timer and sine waves with 1/8 offset are configured.

1. Sets  $\text{DACCNTx} \langle \text{VREFON} \rangle = "1"$ ,  $\langle \text{OP} \rangle = "1"$
2. Sets  $\text{DACTCTLx} \langle \text{DACCLR} \rangle = "1"$
3. Sets VOUTHOLD time to  $\text{DACVCTLx} \langle \text{VHOLDCTB} \rangle$ ,  $\langle \text{VHOLDCTF} \rangle$
4. Sets  $\text{DACDCTLx} \langle \text{OFFSET} \rangle = "001"$ ,  $\langle \text{AMPSEL} \rangle = "01"$ ,  $\langle \text{TRGSEL} \rangle = "010"$ ,  $\langle \text{TRGEN} \rangle = "1"$ ,  $\langle \text{DMAEN} \rangle = "0"$  and  $\langle \text{WAVE} \rangle = "11"$
5. Sets the 16-bit timer interrupt

AMPSEL=1/1VDD, OFFSET=0VDD

AMPSEL=1/2VDD, OFFSET=0VDD

AMPSEL=1/2VDD, OFFSET=1/8VDD

AMPSEL=1/2VDD, OFFSET=2/8VDD

Figure 22-2 Sine wave output

22.4.3.2 Triangle Wave Output

When triangle waveforms are output, set DACDCTLx<WAVE>="01". A waveform cycle is determined by the set amplitude and the trigger generation intervals. The cycle is calculated as follows:

The following shows an example that the 50% amplitude triggered by 16-bit timer and the triangle waves with 1/8 offset are configured.

- 1. Sets DACCNTx<VREFON>="1", <OP>="1"
- 2. Sets DACTCTLx<DACCLR>="1"
- 3. Sets VOUTHOLD time to DACVCTLx<VHOLDCTB>, <VHOLDCTF>
- 4. Sets DACDCTLx<OFFSET>="001", <AMPSEL>="01", <TRGSEL>="010", <TRGEN>="1", <DMAEN>="0" and <WAVE>="01"
- 5. Sets the 16-bit timer interrupt

Table 22-2 Relationship between amplitude of triangle wave and waveform cycles

Amplitude of triangle wave	Number of data reads per one cycle	Waveform cycle
00	2046	Interrupt interval × 2046
01 (When the amplitude is 50%)	1022	Interrupt interval × 1022
10 (When the amplitude is 25%)	510	Interrupt interval × 510

AMPSEL=1/1VDD, OFFSET=0VDD

AMPSEL=1/2VDD, OFFSET=0VDD

AMPSEL=1/2VDD, OFFSET=1/8VDD

AMPSEL=1/2VDD, OFFSET=2/8VDD

Figure 22-3 Triangle wave output

22.4.3.3 Noise Waveform Output

When "10" is set to DACDCTLx<WAVE>, white noise is output. A waveform cycle is determined by the trigger interval. To output one cycle waveform, 1023-time data read is required. The cycle is calculated as follows; the trigger generation interval ×1023.

The following shows an example that noise waveforms is output triggered by software trigger.

- 1. Sets DACCNTx<VREFON>="1", <OP>="1"
- 2. Set DACTCTLx<DACCLR>="1"
- 3. Sets VOUTHOLD time to DACVCTLx<VHOLDCTB>, <VHOLDCTF>
- 4. Sets DACDCTLx<OFFSET>="00", <AMPSEL>="00", <TRGSEL>="000", <TRGEN>="1", <DMAEN>="0" and <WAVE>="10"
- 5. Sets DACTCTLx<SWTRG>="1" periodically

22.4.4 Low Consumption Mode

When DACCNTx<VREFON>="0" is set, VREF is cut. This causes that VREF are becomes same voltage as AVREFL, so that the consumption current will be reduced. When DACCTLx<OP>="0" is set, the DAC operation is stopped and analog output pin becomes Hi-Z.

When transferring to the low power consumption mode, set DACCNT<OP>="0" and <VREFON>="0".

Table 22-3 Relationship between DACCNTx register setting value and analog output value

DACCNTx register		Analog output value
<OP>	<VREFON>	
0	0	Hi-Z
0	1	Hi-Z
1	0	0V (to 0.2V) (Note)depending on current value.
1	1	DACREGx<DAC> register value

### 22.4.5 VOUTHOLD Time Adjustment Function

DACVCTLx<VHOLDCTB>, <VHOLDCTF> is a register to set a waiting time for waveform outputs until stabilizing. Note that DACVCTLx<VHOLDCTB>, <VHOLDCTF> is not modified while VOUTHOLD signal is ON.

### 22.4.6 Settling Time

The settling time  $T_{stng}$  is a time from rising of VOUTHOLD signal to stabilization of waveform. The settling time  $T_{stng}$  is depended on DACVCTLx<VHOLDCTB>, <VHOLDCTF>.

When  $f_{sys}$  is 80MHz, VHOLDCTB=200ns and VHOLDCTF=25ns is set, the settling time  $t_{stng}$  is 3 $\mu$ s in maximum. If the amount of variable is within 16LSB, the settling time is 1 $\mu$ sec in maximum.

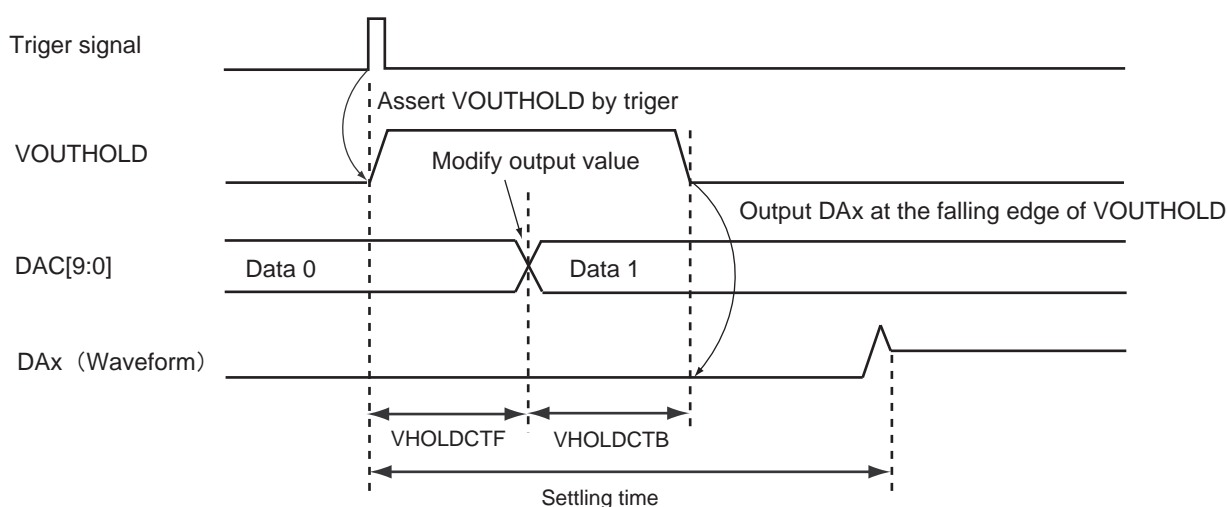

Figure 22-4 VOUTHOLD and settling time

Table 22-4 The value of VHOLDCTB/VHOLDCTF (min.)

fsys [MHz]	VHOLD time (min.)			Tstng(max) - Tvhd [μs]	
	<VHOLDCTB>	<VHOLDCTF>	Tvhd [s]	16LSB	max
70<fsys≤80	1000	0001	$2/f_{sys} \times 9$	0.775	2.775
60<fsys≤70	0111	0001	$2/f_{sys} \times 8$		
50<fsys≤60	0110	0001	$2/f_{sys} \times 7$		
40<fsys≤50	0101	0001	$2/f_{sys} \times 6$		
30<fsys≤40	0100	0001	$2/f_{sys} \times 5$		
20<fsys≤30	0011	0001	$2/f_{sys} \times 4$		
10<fsys≤20	0010	0001	$2/f_{sys} \times 3$		
1<fsys≤10	0001	0001	$2/f_{sys} \times 2$		

## 23. 16-bit Multi-Purpose Timer (MPT)

### 23.1 Outline

TMPM368FDXBG has four channels of multi-purpose timer (MPT).

The MPT provides three operational modes as follows.

<Timer mode>

- 16-bit interval timer mode
- 16-bit event counter mode
- 16-bit programmable rectangular waveform output (PPG, one output) mode
- Pulse width measurement (capture)

<IGBT mode>

- 16-bit programmable rectangular waveform output (PPG, two outputs) mode
- External trigger start
- Cycle match detection
- Emergency stop function

<PMD mode>

- 3-phase motor control mode

Hereafter, "x" indicates a channel number.

Note: **MPT1**, **MPT2** and **MPT3** do not have **PMD mode**.

### 23.2 Specification Differences in Channel line-up

Each channel (MPT0-MPT3) operates independently and identically except the differences shown in the Table 23-1.

Table 23-1 MPT specification differences in channel line-up.

Specification Channel	External pin					
	External clock/ capture trigger input pin	Timer flip-flop output pin	IGBT input pin	IGBT output pin	PMD input pin	PMD output pin
Channel 0	MTTB0IN	MTTB0OUT	$\overline{\text{GEMG0}}$ MT0IN	MTOUT00 MTOUT10	$\overline{\text{EMG}}$	UO,VO, WO,XO, YO,ZO
Channel 1	MTTB1IN	MTTB1OUT	$\overline{\text{GEMG1}}$ MT1IN	MTOUT01 MTOUT11	-	-
Channel 2	MTTB2IN	MTTB2OUT	$\overline{\text{GEMG2}}$ MT2IN	MTOUT02 MTOUT12	-	-
Channel 3	MTTB3IN	MTTB3OUT	$\overline{\text{GEMG3}}$ MT3IN	MTOUT03 MTOUT13	-	-

23.3 Block Diagram

The MPT consists of three modules including a timer, IGBT and PMD. Each module is switched by registers.

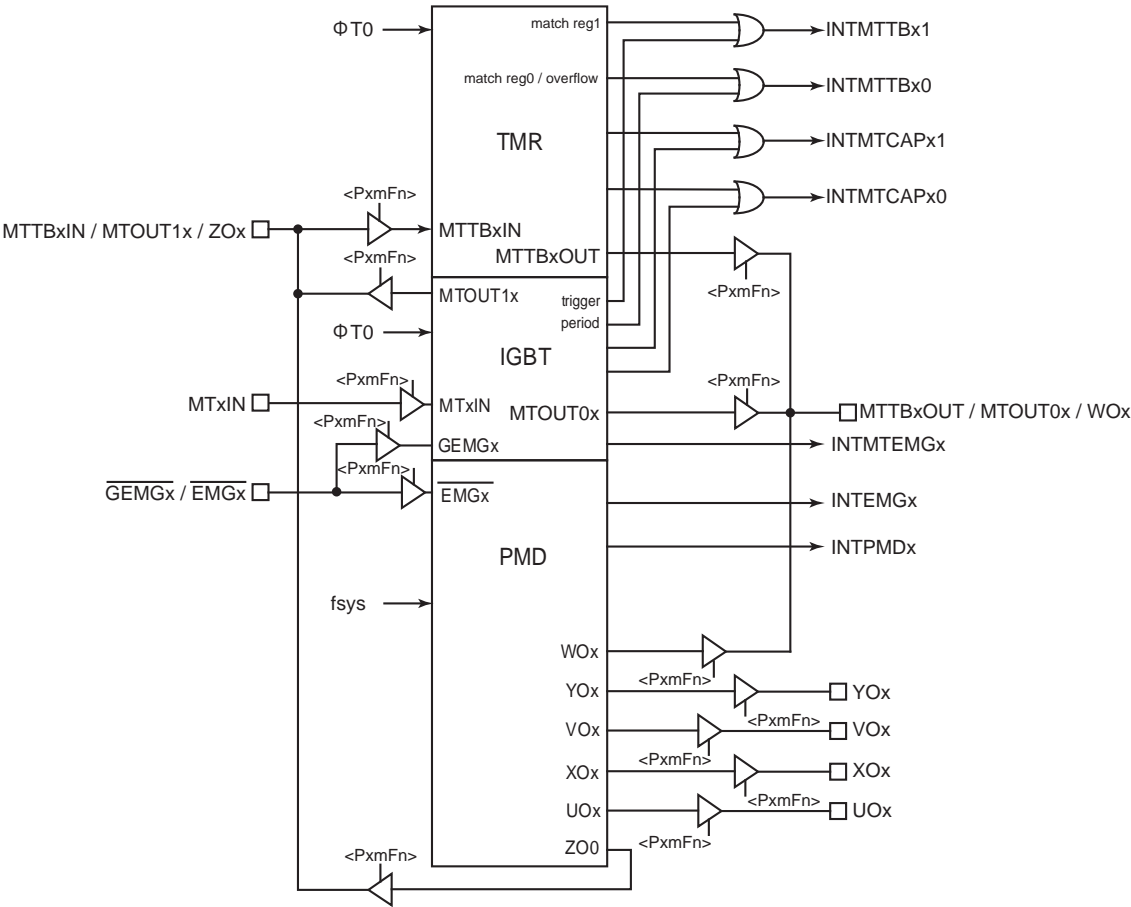

Figure 23-1 Block Diagram of MPTx

Note:MPT1, MPT2 and MPT3 do not have PMD mode.

## 23.4 Operation Description of Timer Mode

### 23.4.1 Block Diagram

Figure 23-2 Block Diagram of Timer Mode

## 23.4.2 Registers categorized by timer mode channel

This section describes registers and addresses of each channel.

Channel x	Base Address
Channel 0	0x400C_7000
Channel 1	0x400C_7100
Channel 2	0x400C_7200
Channel 3	0x400C_7300

Register name (x=0 to 3)		Address (Base+)
MPT enable register	MTxEN	0x0000
MPT RUN register	MTxRUN	0x0004
MPT control register	MTxTBCR	0x0008
MPT mode register	MTxTBMOD	0x000C
MPT flip-flop control register	MTxTBFFCR	0x0010
MPT status register	MTxTBST	0x0014
MPT interrupt mask register	MTxTBIM	0x0018
MPT up-counter register	MTxTBUC	0x001C
MPT register	MTxRG0	0x0020
	MTxRG1	0x0024
MPT capture register	MTxCP0	0x0028
	MTxCP1	0x002C

## 23.4.3 MTxEN (MPT enable register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	MTEN	MTHALT	-	-	-	-	-	MTMODE
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7	MTEN	R/W	Specifies MPT operation. 0: Disable 1: Enable When MTEN is disabled, feeding clock to other registers of MPT module is stopped, so that power consumption can be reduced. (Read or write to other registers cannot be done.)
6	MTHALT	R/W	Specifies MPT operation when core halts (debug break). [TMR function] 0: Clock stopping operation is disabled while core halts. 1: Clock stopping operation is enabled while core halts. [IGBT function] 0: Not control clock stopping operation and MTOUT0x/MTOUT1x output. 1: Clock stopping operation is enabled while core halt. It controls MTOUT0x/MTOUT1x output according to the MTxIGEMGCR<IGEMGOC> setting.
5-1	-	R	Read as "0".
0	MTMODE	R/W	Specifies operation modes 0: Timer mode 1: IGBT mode

Note: When MPT is used, MPT operation is enabled (<MTEN>="1") before each register of MPT module is set. Even if MPT operation is disabled after MPT is stopped, each register setting is maintained.

### 23.4.4 MTxRUN (MPT RUN register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	MTPRUN	-	MTRUN
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-3	-	R	Read as "0".
2	MTPRUN	R/W	Controls MPT prescaler operation 0: Stops prescaler operation. Prescaler is cleared to "0". 1: Starts prescaler operation.
1	-	R	Read as "0".
0	MTRUN	R/W	Controls MPT counting operation 0: Stops counting operation. Counter is cleared to "0". 1: Starts counting operation.

## 23.4.5 MTxTBCR (MPT control register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	MTTBWBF	-	-	-	MTI2TB	-	MTTB TRGSEL	MTTBCSSEL
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7	MTTBWBF	R/W	Specifies double buffer to enable/disable 0:Disabled 1:Enabled
6-5	-	R/W	Write "0".
4	-	R	Read as "0".
3	MTI2TB	R/W	Controls clock operation to star/stop in IDLE mode 0:Stop 1:Start
2	-	R	Read as "0".
1	MTTBTRGSEL	R/W	Selects rising or falling edge of external trigger. 0:Rising edge 1:Falling edge
0	MTTBCSSEL	R/W	Selects how to start counting 0:Soft start 1:External trigger

Note 1: Do not modify MTxTBCR during timer in operation (MTxRUN<MTRUN>="1").

Note 2: In the IGBT mode, double-buffering is automatically enabled regardless of <MTTBWBF> setting.

### 23.4.6 MTxTBMOD (MPT mode register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	MTTBRSWR	MTTBBCP	MTTBBCPM		MTTBCLE	MTTBCLK	
After reset	0	0	1	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-7	-	R	Read as "0".
6	MTTBRSWR	R/W	Controls the write timing to timer register 0 and 1 when double-buffer is used. 0: If either timer register 0 or timer register 1 is prepared to be written, one register can be written at a time. 1: If both timer register 0 and timer register 1 are not prepared, timer register cannot be written.
5	MTTBBCP	W	Controls software capture 0: Capture count values to the capture register 0 (MTxCP0) 1: Don't care
4-3	MTTBBCPM[1:0]	R/W	Sets capture timing 00: Capture is disabled. 01: At the rising edge of MTxBxIN input, counter values are captured to the capture register 0 (MTxCP0). 10: At the rising edge of MTxBxIN input, counter values are captured to the capture register 0 (MTxCP0). At the falling edge of MTxBxIN input, counter values are captured to the capture register 1 (MTxCP1). 11: Capture is disabled.
2	MTTBCLE	R/W	Clear MPT up-counter 0: Clear is disabled. 1: Clear MPT up-counter by matching with timer register 1 (MTxRG1)
1-0	MTTBCLK[1:0]	R/W	Selects timer count clock of MPT 00: MTxBxIN input 01: $\phi T1$ 10: $\phi T4$ 11: $\phi T16$

Note 1: MTxTBMOD<MTTBBCP> reads as "1".

Note 2: Do not modify MTxTBMOD during timer in operation (MTxRUN<MTRUN>="1").

## 23.4.7 MTxTBFFCR (MPT flip-flop control register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	MTTBC1T1	MTTBC0T1	MTTBE1T1	MTTBE0T1	MTTBFF0C	
After reset	1	1	0	0	0	0	1	1

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7-6	-	R	Read as "11".
5	MTTBC1T1	R/W	Controls timer flip-flop reverse when up-counter values are captured to the capture register 1 (MTxCP1). 0: MTxFF0 does not reverse. 1: MTxFF0 reverses.
4	MTTBC0T1	R/W	Controls timer flip-flop reverse when up-counter values are captured to the capture register 1 (MTxCP0). 0: MTxFF0 does not reverse. 1: MTxFF0 reverses.
3	MTTBE1T1	R/W	Controls timer flip-flop reverse when up-counter values and the timer register 1 (MTxRG1) are matched. 0: MTxFF0 does not reverse. 1: MTxFF0 reverses.
2	MTTBE0T1	R/W	Controls timer flip-flop reverse when up-counter values and the timer register 1 (MTxRG0) are matched. 0: MTxFF0 does not reverse. 1: MTxFF0 reverses.
1-0	MTTBFF0C	R/W	Controls timer flip-flop 00: Reverses a value of MTxFF0. 01: Sets "1" to MTxFF0. 10: Sets "0" MTxFF0 to clear. 11: Don't care. Read as "11".

Note: Do not modify **MTxTBFFCR** during timer in operation (**MTxRUN**<**MTRUN**>="1").

### 23.4.8 MTxTBST (MPT status register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	MTTBINT TBOF	MTTBINTTB1	MTTBINTTB0
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-3	-	R	Read as "0".
2	MTTBINTTBOF	R	Indicates the status of up-counter overflow interrupt generation. 0: No interrupt generation 1: Interrupt generation
1	MTTBINTTB1	R	Indicates the interrupt generation by matching with timer register 1 (MTxRG1) 0: No interrupt generation 1: Interrupt generation
0	MTTBINTTB0	R	Indicates the interrupt generation by matching with timer register 0 (MTxRG0) 0: No interrupt generation 1: Interrupt generation

**Note:** Once any interrupt generates, corresponding flag in MTxTBST register is set to notify CPU of an interrupt generation. If MTxTBST register is read, the flag is cleared to "0".

## 23.4.9 MTxTBIM (MPT interrupt mask register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	MTTBIMOF	MTTBIM1	MTTBIM0
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-3	-	R	Read as "0".
2	MTTBIMOF	R/W	Controls up-counter overflow interrupt to mask 0: Not mask interrupt 1: Masks interrupt
1	MTTBIM1	R/W	Controls to mask the interrupt when the match between timer register 1 (MTxRG1) and up-counter. 0: Not mask interrupt 1: Masks interrupt
0	MTTBIM0	R/W	Controls to mask the interrupt when the match between timer register 0 (MTxRG0) and up-counter. 0: Not mask interrupt 1: Masks interrupt

Note: MTxTBST reflects interrupt requests even though **MTxTBIM masks interrupts**.

### 23.4.10 MTxTBUC (MPT read capture register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	MTUC							
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	MTUC							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-16	-	R	Read as "0".
15-0	MTUC[15:0]	R	Reading MTxTBUC captures the current up-counter value.

### 23.4.11 MTxRG0/MTxRG1 (MPT timer register)

MTxRG0

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	MTRG0							
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	MTRG0							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-16	-	R	Read as "0".
15-0	MTRG0[15:0]	R/W	Timer count value [Timer mode] When up-counter values match with MTRG0[15:0], match detection interrupt (INTMTTBx0) occurs. Also, MTTBxOUT can be reversed when matching, [IGBT mode] When up-counter values match with MTRG0[15:0], MTOUT0x becomes active level.

Note 1: Use half word access or word access.

Note 2: Set to the condition of  $0x0000 < \text{MTxRG0} < \text{MTxRG1} \leq \text{MTxIRG40} \leq 0xFFFF$ .

MTxRG1

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	MTRG1							
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	MTRG1							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-16	-	R	Read as "0".
15-0	MTRG1[15:0]	R/W	<p>Timer count value</p> <p>[Timer mode]</p> <p>When up-counter values match with MTRG1[15:0], match detection interrupt (INTMTTBx1) occurs. Also, MTTBxOUT can be reversed when matching.</p> <p>[IGBT mode]</p> <p>When up-counter values match with MTRG1[15:0], MTOUT0x becomes inactive level.</p>

Note 1: Use half word access or word access.

Note 2: Set to the condition of  $0x0000 < MTxRG0 < MTxRG1 \leq MTxIRG40 \leq 0xFFFF$ .

## 23.4.12 MTxCP0 /MTxCP1 (MPT capture register)

MTnCP0

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	MTCP0							
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	MTCP0							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-16	-	R	Read as "0".
15-0	MTCP0[15:0]	R	Read captured up-counter values.

MTnCP1

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	MTCP1							
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	MTCP1							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-16	-	R	Read as "0".
15-0	MTCP1[15:0]	R	Read captured up-counter values.

Note: During the timer stopping, a value of timer counter (MTUCx) cannot be read. When the timer stops, a value previously captured is held and the value can be read.

## 23.5 Operational Description categorized by circuit

## 23.5.1 Prescaler

This 4-bit prescaler generates the source clock for up-counter MTUCx.

Input clock  $\phi T0$  to the prescaler is chosen among  $f_{\text{periph}}/1$ ,  $f_{\text{periph}}/2$ ,  $f_{\text{periph}}/4$ ,  $f_{\text{periph}}/8$ ,  $f_{\text{periph}}/16$  and  $f_{\text{periph}}/32$  by specifying with CGSYSCR<PRCK[2:0]>. This peripheral clock ( $f_{\text{periph}}$ ) is either  $f_{\text{gear}}$  specified with CG SYSCR<FPSEL> or  $f_c$  that is pre-divided clock gear.

Prescaler is set to enable/disable with MTxRUN<MTPRUN>. When MTxRUN<MTPRUN> is set to "1", counting starts. When MTxRUN<MTPRUN> is set to "0", the counter is stopped and cleared. Table 23-2 shows prescaler output clock resolutions.

Table 23-2 Prescaler output clock resolutions (fc = 80MHz)

Peripheral clock selection <FPSEL>	Clock gear value <GEAR[2:0]>	Prescaler clock selection <PRCK[2:0]>	Prescaler output clock function		
			$\phi T1$	$\phi T4$	$\phi T16$
0 (fgear)	000 (fc)	000 (fperiph/1)	$fc/2^1$ (0.025 $\mu s$ )	$fc/2^3$ (0.1 $\mu s$ )	$fc/2^5$ (0.4 $\mu s$ )

	111 (fc/16)	000 (fperiph/1)	—	—	$fc/2^5$ (0.4 $\mu s$ )
		001 (fperiph/2)	—	—	$fc/2^6$ (0.8 $\mu s$ )
		010 (fperiph/4)	—	$fc/2^5$ (0.4 $\mu s$ )	$fc/2^7$ (1.6 $\mu s$ )
		011 (fperiph/8)	—	$fc/2^6$ (0.8 $\mu s$ )	$fc/2^8$ (3.2 $\mu s$ )
		100 (fperiph/16)	$fc/2^5$ (0.4 $\mu s$ )	$fc/2^7$ (1.6 $\mu s$ )	$fc/2^9$ (6.4 $\mu s$ )
		101 (fperiph/32)	$fc/2^6$ (0.8 $\mu s$ )	$fc/2^8$ (3.2 $\mu s$ )	$fc/2^{10}$ (12.8 $\mu s$ )

Note 1: Prescaler output clock  $\phi Tn$  must satisfy the condition of  $\phi Tn < f_{sys}$ . ( $\phi Tn$  must be slower than  $f_{sys}$ .)

Note 2: Do not change the clock gear during timer in operation.

Note 3: In the above table, "—" indicates prohibition.

### 23.5.2 Up-Counter (MTUC0)

This counter is a 16-bit binary counter.

- Source clock

The source clock can be set with  $MTxTBMOD<MTTBCLK[1:0]>$ .

Prescaler output clock can choose among  $\phi T1$ ,  $\phi T4$ ,  $\phi T16$  or external clock of  $MTTBxIN$  pin.

- Start/Stop counter operation

Counter operation is set with  $MTxRUN<MTRUN>$ . When  $<MTRUN>="1"$  is set, counter operation starts. When  $<MTRUN>="1"$  is set, the counter is stopped and cleared at the same time.

When a value of up-counter  $MTUCx$  detects the match with a setting value of timer register  $MTxRG0/MTxRG1$ ,  $INTMTTB0x$  or  $INTMTTB1x$  occurs.

- Counter clear timing

1. Comparing a match

If  $MTxTBMOD<MTTBACLE>="1"$  is set, the counter is cleared when comparing matches with  $MTxRG1$ .

If  $MTxTBMOD<MTTBACLE>="0"$  is set, the counter becomes a free-running counter.

2. Counter stopping

If  $MTxRUN<MTRUN>="0"$  is set, the counter is stopped and cleared.

- Overflow of the counter

If  $MTUCx$  is overflowed, an overflow interrupt  $INTMTTB0x$  occurs.

### 23.5.3 Timer Register (MTxRG0, MTxRG1)

Timer register sets a values to compare with up-counter MTUCx. Comparator compares a value of timer register with a value of up-counter. If these two are matched, the match detection signal is output.

- Structure

In the timer register, MTxRG0/1 is double-buffering structure paired with register buffer.

Double-buffer is set to enable/disable with MTxTBCR<MTTBWBF>. If <MTTBWBF>="0" is set, double-buffer is disabled. If <MTTBWBF>="1" is set, double-buffer is enabled.

While double-buffer is enabled, data transfer is taken place from register buffer 0 to timer register MTxRG0/1 when MTUCx matches with MTxRG1.

- Initial state

After reset, MTxRG0 and MTxRG1 are undefined and double-buffer is disabled.

- How to set

1. If double-buffer is not used.

Use half-word access or word access

2. If double-buffer is used.

MTxRG0 and 1, and register buffer 0 and 1 are assigned to the same address respectively.

When <MTTBWBF> is "0", MTxRG0 and 1 and each register buffer are written the same value. When <MTTBWBF> is "1", only corresponding register buffer is written data. Thus when writing the initial value to timer register, set as follows; firstly register buffer is disabled, secondly timer register is written data, thirdly <MTTBWBF> is set to "1". Finally next data is written to register buffer.

### 23.5.4 Capture Control

This circuit controls the timing when a value of up-counter MTUCx is latched by capture register MTxCP0/MTxCP1. This latch timing is set with MTxTBMOD<MTTBCEM[1:0]>.

Also the timing is controlled by software. Every time MTxTBMOD<MTTBCEM> is set to "0", a value of MTUCx is captured to the capture register MTxCP0 at the time. Note that prescaler must be set to RUN status (MTxRUN<MTPRUN> "1").

### 23.5.5 Capture Register (MTxCAP0, MTxCAP1)

This register captures a value of up-counter MTUCx.

### 23.5.6 Up-counter Capture Register (MTxTBUC)

Besides the capture function using capture control circuit, current counter value of up-counter (MTUC0) is also captured by reading MTxTBUC register.

### 23.5.7 Comparators (CP0, CP1)

This comparator detects the match comparing a value of up-counter (MTUCx) with a setting value of timer register MTxRG0/MTxRG1. If these values are matched, INTMTTBx0 or INTMTTBx1 occurs.

### 23.5.8 Timer Flip-flop (MTxFF0)

Timer flip-flop circuit (MTxFF0) reverses by a match signal from comparators or a latch signal to the capture register. This reverse is enabled/disabled with MTxTBFFCR<MTTBC1T1, MTTBC0T1, MTTBE1T1, MTTBE0T1>.

After reset, a value of MTxFF0 is undefined. If MTxTBFFCR<MTTBFF0C[1:0]> is set to "00", the reverse is enabled. If MTxTBFFCR<MTTBFF0C[1:0]> is set to "01", MTxFF0 is set to "1". MTxTBFFCR<MTTBFF0C[1:0]> is set to "10", MTxFF0 is set to "0" to clear.

A value of MTxFF0 can be output to timer output pin MTTBxOUT. If timer output is used, port related registers (PxCR and PxFR) must be set beforehand.

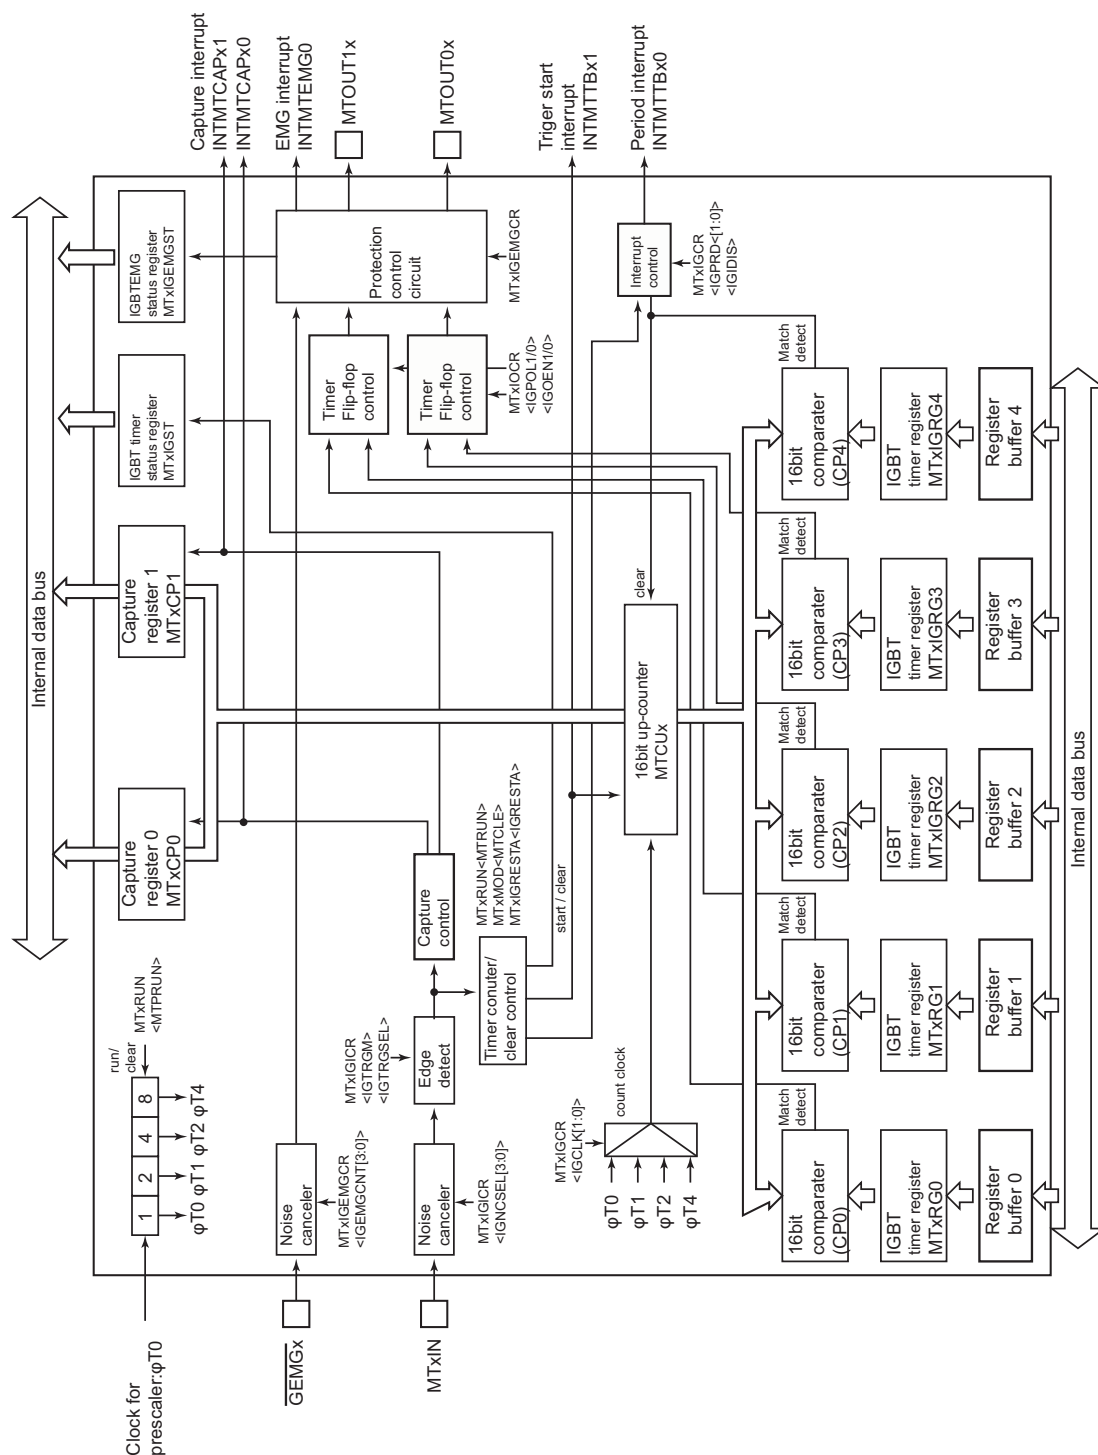

### 23.5.9 Capture Interrupts (INTMTCAPx0, INTMTCAPx1)

Capture interrupts (INTMTCAPx0 and INTMTCAPx1) occur respectively at the timing when data is latched to each capture register (MTxCP0 and MTxCP1). Interrupt setting is set by CPU.

## 23.6 Operational Description in IGBT mode

### 23.6.1 Block Diagram

### Figure 23-3 Block Diagram in IGBT mode

## 23.6.2 Registers in IGBT mode categorized by channel

This section describes registers and addresses of each channel.

Channel x	Base Address
Channel 0	0x400C_7000
Channel 1	0x400C_7100
Channel 2	0x400C_7200
Channel 3	0x400C_7300

Register name (x=0 to 3)		Address (Base+)
MPT enable register	MTxEN	0x0000
MPT RUN register	MTxRUN	0x0004
MPT register	MTxRG0	0x0020
	MTxRG1	0x0024
MPT capture register	MTxCP0	0x0028
	MTxCP1	0x002C
IGBT control register	MTxIGCR	0x0030
IGBT timer restart register	MTxIGRESTA	0x0034
IGBT timer status register	MTxIGST	0x0038
IGBT input control register	MTxIGICR	0x003C
IGBT output control register	MTxIGOCR	0x0040
IGBT timer register 2, 3, 4	MTxIGRG2	0x0044
	MTxIGRG3	0x0048
	MTxIGRG4	0x004C
IGBT EMG control register	MTxIGEMGCR	0x0050
IGBT EMG status register	MTxIGEMGST	0x0054

## 23.6.3 MTxEN (MPT enable register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	MTEN	MTHALT	-	-	-	-	-	MTMODE
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7	MTEN	R/W	Specifies MPT operation. 0: Disabled 1: Enabled When MTEN is disabled, feeding clock to other registers of MPT module is stopped, so that power consumption can be reduced. (Read or write to other registers cannot be done.)
6	MTHALT	R/W	Specifies MPT operation when core halts (debug break). [TMR function] 0: Clock stopping operation is disabled while core halts. 1: Clock stopping operation is enabled while core halts. [IGBT function] 0: Not control clock stopping operation and MTOUT0x/MTOUT1x output. 1: Clock stopping operation is enabled while core halt. It controls MTOUT0x/MTOUT1x output according to the MTxIGEMGCR<IGEMGOC> setting.
5-1	-	R	Read as "0".
0	MTMODE	R/W	Specifies operation mode. 0: Timer mode 1: IGBT mode

Note: When MPT is used, MPT operation is enabled (<MTEN>="1") before each register of MPT module is set. If MPT operation is disabled after MPT is stopped, each register setting is maintained.

## 23.6.4 MTxRUN (MPT RUN register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	MTPRUN	-	MTRUN
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-3	-	R	Read as "0".
2	MTPRUN	R/W	Controls MPT prescaler operation 0: Stops prescaler operation. Prescaler is cleared to "0". 1: Starts prescaler operation.
1	-	R	Read as "0".
0	MTRUN	R/W	Controls MPT counting operation 0: Stops counting operation. Counter is cleared to "0". 1: Starts counting operation.

## 23.6.5 MTxRG0/MTxRG1 (MPT timer register)

MTxRG0

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16

MTnCP1

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	MTCP1							
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	MTCP1							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-16	-	R	Read as "0".
15-0	MTCP1[15:0]	R	Read captured up-counter values.

Note: During the timer stopping, a value of timer counter (MTUCx) cannot be read. When the timer stops, a value previously captured is held and the value can be read.

### 23.6.7 MTxIGCR (IGBT control register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	IGDIS	IGPRD	
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	IGSNGL	IGSTP		IGSTA		IGCLK	
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-11	-	R	Read as "0".
10	IGDIS	R/W	Controls an interrupt when commands start 0: Enabled 1: Disabled
9-8	IGPRD[1:0]	R/W	Chooses an interrupt cycle 00: Every one cycle 01: Every two cycles 10: Every four cycles 11: Reserved
7	-	R	Read as "0".
6	IGSNGL	R/W	Chooses IGBT operation 0: Continuous operation 1: Single operation
5-4	IGSTP[1:0]	R/W	Chooses stopping status 00: Initial output status and counter immediately stops to clear 01: Sustains output status and counter immediately stops to clear 10: After cycle time has elapsed then counter stops to clear 11: Reserved
3-2	IGSTA[1:0]	R/W	Chooses start mode 00: Command start and trigger capture 01: Command start and trigger start 10: Trigger start 11: Reserved
1-0	IGCLK[1:0]	R/W	Chooses a source clock of IGBT 00: $\phi T0$ 01: $\phi T1$ 10: $\phi T2$ 11: $\phi T4$

Note 1: Do not modify MTxIGCR during timer in operation (MTxRUN<MTRUN>="1").

Note 2: When the counter stops after specified cycle time has elapsed, or counter is stopped with (MTxIGCR<IGSTP>="10") and cleared with MTxRUN<MTRUN>, check if the timer is stopped by cycle interrupt generation. Then change the setting and restart.

## 23.6.8 MTxIGRESTA (IGBT timer restart register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	-	-	IGRESTA
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-1	-	R	Read as "0".
0	IGRESTA	W	Controls counting restart 0: Don't care 1: Restart Read as "0".

Note: If MTxIGRESTA<IGRESTA> is set to "1" during timer in operation, timer counter can be cleared and restart. Please check the status of output waveform before setting is changed.

## 23.6.9 MTxIGST (IGBT timer status register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	-	-	IGST
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-1	-	R	Read as "0".
0	IGST	R	Counter operation status 0: Stop 1: Operating

### 23.6.10 MTxIGICR (IGBT input control register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	IGTRGM	IGTRGSEL	-	-	IGNCSEL			
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7	IGTRGM	R/W	Controls trigger edge accept mode 0: Always accept 1: Acceptance is disabled during active level
6	IGTRGSEL	R/W	Chooses start trigger edges and its active levels. 0: Rising edge start and active level is "High". 1: Falling edge start and active level is "Low".
5-4	-	R	Read as "0".
3-0	IGNCSEL[3:0]	R/W	Trigger input noise elimination time selection Noise elimination time is calculated with the following formula: $IGNCSEL[3:0] \times 16 / f_{sys}$ 0000: Noise filter is not used. 0001: Noise elimination time 16 / fsys [s] 0010: Noise elimination time 32 / fsys [s] 0011: Noise elimination time 48 / fsys [s] 0100: Noise elimination time 64 / fsys [s] 0101: Noise elimination time 80 / fsys [s] 0110: Noise elimination time 96 / fsys [s] 0111: Noise elimination time 112 / fsys [s] 1000: Noise elimination time 128 / fsys [s] 1001: Noise elimination time 144 / fsys [s] 1010: Noise elimination time 160 / fsys [s] 1011: Noise elimination time 176 / fsys [s] 1100: Noise elimination time 192 / fsys [s] 1101: Noise elimination time 208 / fsys [s] 1110: Noise elimination time 224 / fsys [s] 1111: Noise elimination time 240 / fsys [s]

Note 1: Do not modify MTxIGCR during timer in operation (MTxRUN<MTRUN>="1").

Note 2: When MTxGCR<IGNCSEL[3:0]> is used, EMG protection circuit must be disabled (MTxIGEMGCR<IGEMGEN>="0").

Note 3: When MTxIGCR<IGNCSEL[3:0]> is changed, specified noise elimination time or more is required to start the timer with (MTxRUN<MTRUN>="1").

## 23.6.11 MTxIGOCR (IGBT output control register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	IGPOL1	IGPOL0	-	-	IGOEN1	IGOEN0
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-6	-	R	Read as "0".
5	IGPOL1	R/W	Indicates the initial state of MTOUT1x 0: Low 1: High
4	IGPOL0	R/W	Indicates the initial state of MTOUT0x 0: Low 1: High
3-2	-	R	Read as "0".
1	IGOEN1	R/W	Controls MTOUT1x output 0: Disable 1: Enable
0	IGOEN0	R/W	Control MTOUT0x output 0: Disabled 1: Enabled

Note: MTOUT0x/MTOUT1x output is changing according to a content of IGBT output control register (MTxIGOCR) regardless of timer in operation/stopping. Check the operation status before MTxGOCR is set.

### 23.6.12 MTxIGRG2 (IGBT timer register 2)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	IGRG2							
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	IGRG2							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-16	-	R	Read as "0".
15-0	IGRG2[15:0]	R/W	Timer count value When up-counter matches with IGRG2[15:0], MTOUT1x becomes active level.

Note 1: Use half-word access or word access.

Note 2: Set the value to the condition of  $0 < \text{MTxIGRG2} < \text{MTxIGRG3} \leq \text{MTxIGRG4} \leq 0\text{xFFFF}$ .

### 23.6.13 MTxIGRG3 (IGBT timer register 3)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	IGRG3							
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	IGRG3							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-16	-	R	Read as "0".
15-0	IGRG3[15:0]	R/W	Timer count value When up-counter matches with <IGRG3[15:0]>, MTOUT1x becomes inactive level.

Note 1: Use half-word access or word access.

Note 2: Set the value to the condition of  $0 < \text{MTxIGRG2} < \text{MTxIGRG3} \leq \text{MTxIGRG4} \leq 0\text{xFFFF}$ .

## 23.6.14 MTxIGRG4 (IGBT timer register 4)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	IGRG4							
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	IGRG4							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-16	-	R	Read as "0".
15-0	IGRG4[15:0]	R/W	Timer count value Specifies IGBT mode cycle

Note 1: Use half-word access or word access.

Note 2: Set the value to the condition of  $0 < \text{MTxRG0} < \text{MTxRG1} \leq \text{MTxIGRG4} \leq 0\text{xFFFF}$ .

Note 3: Set the value to the condition of  $0 < \text{MTxIGRG2} < \text{MTxIGRG3} \leq \text{MTxIGRG4} \leq 0\text{xFFFF}$ .

### 23.6.15 MTxIGEMGCR (IGBT EMG control register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	IGEMGCNT				-	IGEMGRS	IGEMGOC	IGEMGEN
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7-4	IGEMGCNT[3:0]	R/W	<p>GEMG input noise elimination time selection</p> <p>Noise elimination time is calculated with the following formula:  <math>IGEMGCNT[3:0] \times 16 / f_{sys}</math></p> <p>0000: Noise filter is not used.</p> <p>0001: Input noise elimination time 16 / fsys [s]  0010: Input noise elimination time 32 / fsys [s]  0011: Input noise elimination time 48 / fsys [s]  0100: Input noise elimination time 64 / fsys [s]  0101: Input noise elimination time 80 / fsys [s]  0110: Input noise elimination time 96 / fsys [s]  0111: Input noise elimination time 112 / fsys [s]  1000: Input noise elimination time 128 / fsys [s]  1001: Input noise elimination time 144 / fsys [s]  1010: Input noise elimination time 160 / fsys [s]  1011: Input noise elimination time 176 / fsys [s]  1100: Input noise elimination time 192 / fsys [s]  1101: Input noise elimination time 208 / fsys [s]  1110: Input noise elimination time 224 / fsys [s]  1111: Input noise elimination time 240 / fsys [s]</p>
3	-	R	Read as "0".
2	IGEMGRS	W	<p>Return from EMG protection status</p> <p>0: Don't care  1: Returned (automatically cleared to "0".)  (Read as "0".)</p>
1	IGEMGOC	R/W	<p>Set the polarity of MTOU0x/MTOU1x at EMG protection</p> <p>0: Inactive level  1: High-impedance</p>
0	IGEMGEN	R/W	<p>Controls EMG protection circuit operation</p> <p>0: Disable  1: Enable</p>

Note: Do not modify MTxIGEMGCR during timer in operation (MTxRUN<MTRUN>="1").

## 23.6.16 MTxIGEMGST (IGBT EMG status register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	-	IGEMGIN	IGEMGST
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-2	-	R	Read as "0".
1	IGEMGIN	R	EMG input status after noise elimination 0: Low 1: High
0	IGEMGST	R	EMG protection status 0: Normal operation 1: During in protection Read value indicates EMG protection status

## 23.7 Operation Description categorized by circuit

### 23.7.1 Prescaler

This 4-bit prescaler generates the source clock for up-counter MTUCx.

Input clock  $\phi T0$  to the prescaler is chosen among  $f_{periph}/1$ ,  $f_{periph}/2$ ,  $f_{periph}/4$ ,  $f_{periph}/8$ ,  $f_{periph}/16$  and  $f_{periph}/32$  by specifying with CGSYSCR<PRCK[2:0]>. This peripheral clock ( $f_{periph}$ ) is either  $f_{gear}$  specified with CGSYSCR<FPSEL> or  $f_c$  that is a pre-dividing clock gear.

Prescaler is set to enable/disable with MTxRUN<MTPRUN>. When MTxRUN<MTPRUN> is set to "1", counting starts. When MTxRUN<MTPRUN> is set to "0", the counter is stopped and cleared. Table 23-3 shows prescaler output clock resolutions.

Table 23-3 Prescaler output clock resolutions (fc = 80MHz)

Peripheral clock se- lection <FPSEL>	Clock gear value <GEAR[2:0]>	Prescaler clock se- lection <PRCK[2:0]>	Prescaler output clock function			
			$\phi T0$	$\phi T1$	$\phi T2$	$\phi T4$
0 (fgear)	000 (fc)	000 (fperiph/1)	fc (0.0125 $\mu$ s)	fc/2 <sup>1</sup> (0.025 $\mu$ s)	fc/2 <sup>2</sup> (0.05 $\mu$ s)	fc/2 <sup>3</sup> (0.1 $\mu$ s)

Note 1: Prescaler output clock  $f \phi Tn$  must satisfy the condition of  $\phi Tn < f_{sys}$ . ( $\phi Tn$  must be slower than  $f_{sys}$ .)

Note 2: In the above table, "—" indicates prohibition.

Note 3: Do not change the clock gear during timer in operation.

### 23.7.2 Up-Counter (MTUCx)

This counter is a 16-bit binary counter.

- Source clock

The source clock can be set with  $MTxIGCR<IGCLK[1:0]>$ .

Prescaler output clock can be chosen among  $\phi T0$ ,  $\phi T1$ ,  $\phi T2$ ,  $\phi T4$

- Start/Stop counter operation

Counter operation is set with  $MTxRUN<MTRUN>$ . When  $<MTRUN>="1"$  is set, counter operation starts. When  $<MTRUN>="1"$  is set, the counter is stopped and cleared at the same time.

And when  $MTxIGRESTA<IGRESTA>="1"$  is set, counter is cleared and started count-up from zero.

- Counter clear timing

1. Comparing a match

The counter is cleared when a value of up-counter (MTUCx) is match with  $MTxIGRG4$ .

2. Counter stopping

If  $Mx0RUN<MTRUN>="0"$  is set, the counter is stopped and cleared.

3. Counter restarts

If  $MTxIGRESTA<IGRESTA>="1"$  is set, the counter is cleared and counted-up from 0.

4. In trigger start mode

In trigger start mode, the counter is stopped and cleared when  $MTxIN$  pin becomes the stop-ping to clear level.

- Count-up & clear operation

Count-up & clear operation and setting cycle are described in the two cases respectively; one is the case that  $\phi T0$  is chosen as a source clock, the other case is that  $\phi T1$ ,  $\phi T2$  or  $\phi T4$  is chosen as a source clock.

1.  $\phi T0$  is selected as a source clock

When  $\phi T0$  is selected as a source clock, two source clocks are required for match counting and clear counting, so that setting cycle is  $M+1$ .

2.  $\phi T1$ ,  $\phi T2$  or  $\phi T4$  is selected as a source clock

When  $\phi T1$ ,  $\phi T2$  or  $\phi T4$  is selected as a source clock, one source clock is required for match counting and clear counting, so that setting cycle is  $M$ .

Figure 23-4 Count-up/clear operation when  $\phi T0$  is selected as a source clock

Figure 23-5 Count-up/clear operation when  $\phi T1$ ,  $\phi T2$  or  $\phi T4$  is selected as a source clock

### 23.7.3 Cycle Setting Register (MTxIGRG4)

This register sets the cycle of PPG output consisting of double-buffering structure. Data update timing is one cycle after when MTxIGRG4 matches with up-counter MTUCx clearing the counter. At this time, data transfer is taken place from register buffer 4 to timer register MTxIGRG4.

### 23.7.4 Timer register (MTxRG0, MTxRG1, MTxIGRG2, MTxIGRG3, MTxIGRG4)

This register sets a value to compare with up-counter MTUCx. When these are matched, the match detect signal is output. Timer register, MTxRG0/1, MTxIGRG2/3 are double-buffering structure paired with each register buffer. When MTxIGRG4 matches with up-counter MTUCx, the counter is cleared and data is updated at the same time. Also at this time, data transfer is taken place from register buffer 2/3 to timer register MTxIGRG2/3.

In IGBT mode, MTxRG0/1 is always double-buffering structure.

- Write/read operation of timer registers (MTxRG0, MTxRG1, MTxIGRG2 and MTxIGRG3) and cycle register (MTxIGRG4)

#### 1. Write

When timer is stopping, above registers can be written directly. In timer in operation, data is latched in each register. When MTxIGRG4 matches with up-counter MTUCx, the counter is cleared and data is updated at the same time.

#### 2. Read

Read the current value of target register comparing with 16-bit comparator. A value of register buffer cannot be read.

Note: **Use half-word access or word access.**

### 23.7.5 Capture Control

If command start or capture mode is set, this circuit captures up-counter values (MTUCx) at the rising and falling edges of MTxIN to MTxCP0 and MTxCP1 respectively.

### 23.7.6 Capture Register (MTxCAP0, MTxCAP1)

This register captures a value of up-counter MTUCx.

### 23.7.7 Comparators (CP0, CP1, CP2, CP3, CP4)

This comparator detects the match comparing a value of up-counter (MTUCx) with a setting value of timer register MTxRG0, MTxRG1, MTxIGRG2, MTxIGRG3 and MTxIGRG4.

### 23.7.8 MTOUT0x, MTOUT1x Output Control

When up-counter matches with timer register, MTOUT0x or MTOUT1x is output.

Initial setting of output pin is set with MTxIGOCR<IGPOL0,1>. After reset, initial state is low. When MTxIGOCR<IGPOL0,1>=0 is set, initial state is low. When MTxIGOCR<IGPOL0,1>=1 is set, initial state is high. Output control is set with MTxIGOCR<IGOEN0,1>. After reset, MTxIGOCR<IGOEN0,1> is disabled. If MTxIGOCR<IGOEN0,1> is enabled, set to 1.

### 23.7.9 Capture Interrupts (INTMTCAPx0, INTMTCAPx1)

Capture interrupts (INTMTCAPx0 and INTMTCAPx1) occur respectively when each capture register (MTxCP0 and MTxCP1) latches data. Interrupt setting is set by CPU.

### 23.7.10 Trigger Start Interrupt (INTMTTBx1)

When command start & trigger start mode or trigger start mode is chosen, trigger interrupt occurs when the edge specified with MTxIGCR<IGTRGSEL> is input and the counter starts. In the trigger capture mode, INTMTTBx1 interrupt does not generate at the trigger edge. When emergency output is stopping, a start trigger interrupt occurs.

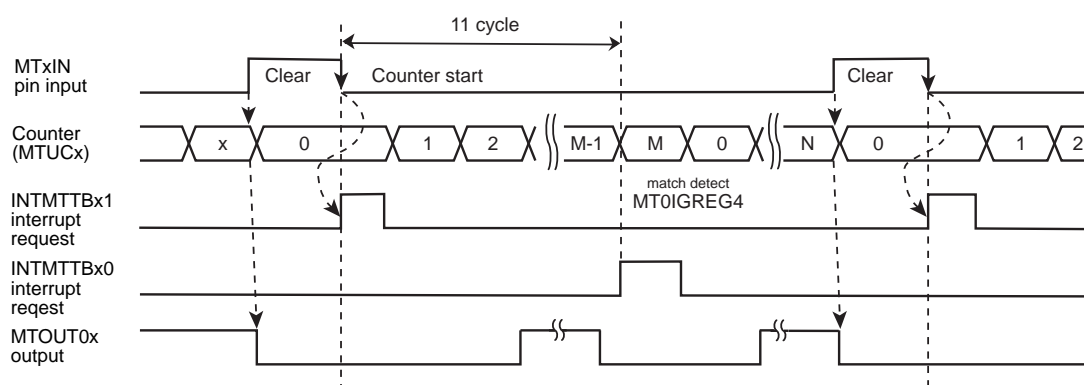

Figure 23-6 Trigger start interrupt operation

### 23.7.11 Cycle Interrupt (INTMTTBx0)

When command start & trigger capture mode or command start & trigger start mode is chosen, a cycle interrupt occurs when count starts in command start or counter reaches to a value of counter cycle setting (MTxIGREG4) (cycle finishes by matching with a value of cycle setting). Also, a cycle interrupt occurs by matching with a value of counter cycle when emergency output is stopping. Interrupt cycle can be set to among every one cycle, every two cycles or every four cycles with MTxIGCR<IGPRD[1:0]>.

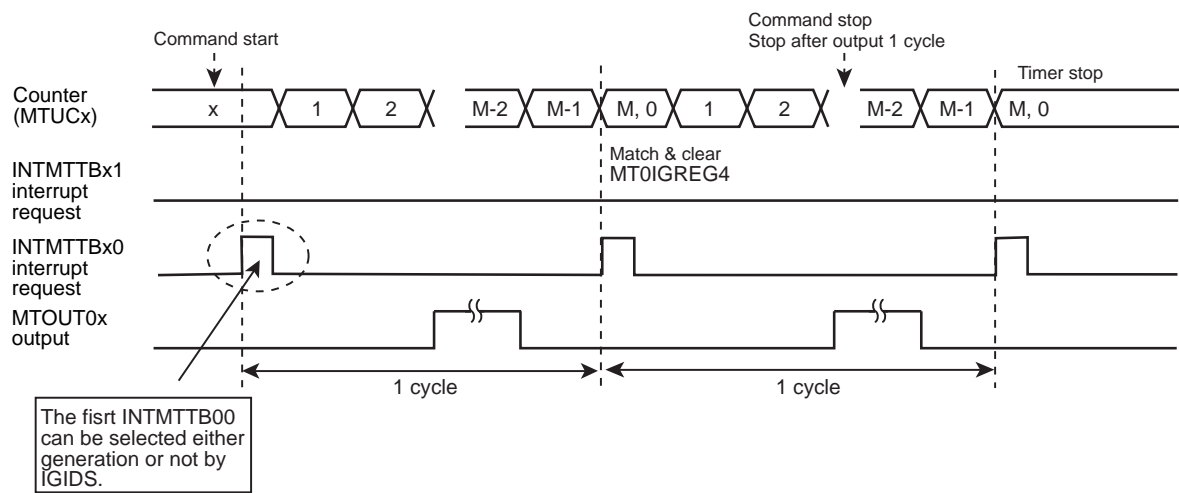

Figure 23-7 Cycle interrupt operation

In command start, a cycle interrupt at the starting count is set to enable/disable with interrupt control register MTxIGCR<IGIDIS>. At starting command (MTxRUN<MTRUN> is set to "1"), if MTxIN pin is stop-ping level, counting does not start (INTMTTBx0 does not occur). Counting starts by trigger start edge and NTMTTBx1 occurs.

23.7.12 Basic Operation

Each MTOUT0x pin and MTOUT1x pin output PPG.

This circuit controls waveform by comparing data set in the timer register (MTxRG0/1, MTxIGRG2/3/4) with a value of 16-bit up-counter.

Figure 23-8 IGBT mode basic timing

### 23.7.13 Start modes

In IGBT mode, three start modes are available.

#### 23.7.13.1 Command Start & Trigger Capture Mode

When MTxRUN<MTRUN> is set to "1", counting-up starts. If the counter reaches to the setting cycle, the counter is cleared. At this time, continuous mode is set with MTxIGCR<IGSNGL>, count-up starts again. If single mode is set, counting stops.

If MTxIGRESTA<IGRESTA> is set to "1" before reaching to the setting cycle, counter is cleared at this point and count-up continues.

Counter value at the rising edge/falling edge of MTxIN input can be stored to capture registers.

Figure 23-9 Continuous mode in command start

In the command start & trigger capture mode, when the counter starts, a counter value is captured at the each rising/falling edge of MTxIN input to each capture register (MTxCAP0 and MTxCAP1).When capture operation is done, INTMTCAPx0 and INTMTCAPx1 occur at each edge.

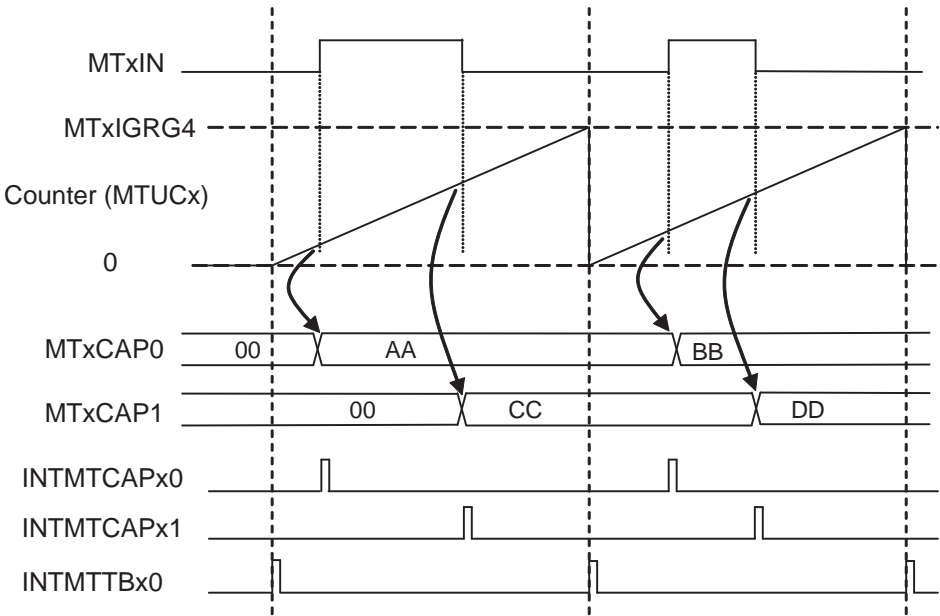

Figure 23-10 Capture operation

23.7.13.2 Command Start & Trigger Start Mode

When MTxRUN<MTRUN> is set to "1", count-up starts. If there is no trigger inputs to MTxIN input, same operation previously described in command start & capture mode starts. If an edge input specified with MTxIGICR<IGTRGSEL> to MTxIN pin exists, timer counting starts. While specified clear stop-ping level is input, the counter is not cleared. At the starting command (when MTxRUN<MTRUN> is set to "1"), if MTxIN pin is in the stopping level, the counter does not start (INTMTTBx1 does not generate). Counting starts by trigger start edge and NTMTTBx1 occurs. (Trigger input is prior to command start.)

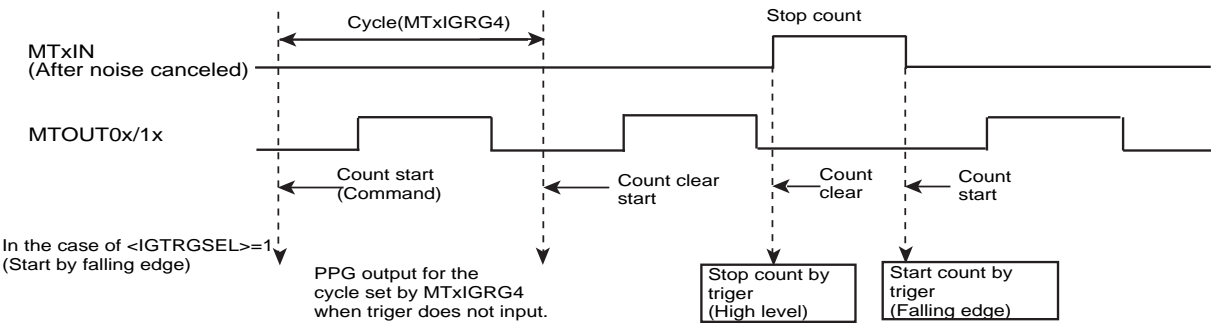

Figure 23-11 Command start & trigger start

23.7.13.3 Trigger Start Mode

If an edge input specified with MTxIGICR<IGTRGSEL> exists, timer counting starts. While specified clear stopping level is input, the counter is not cleared.

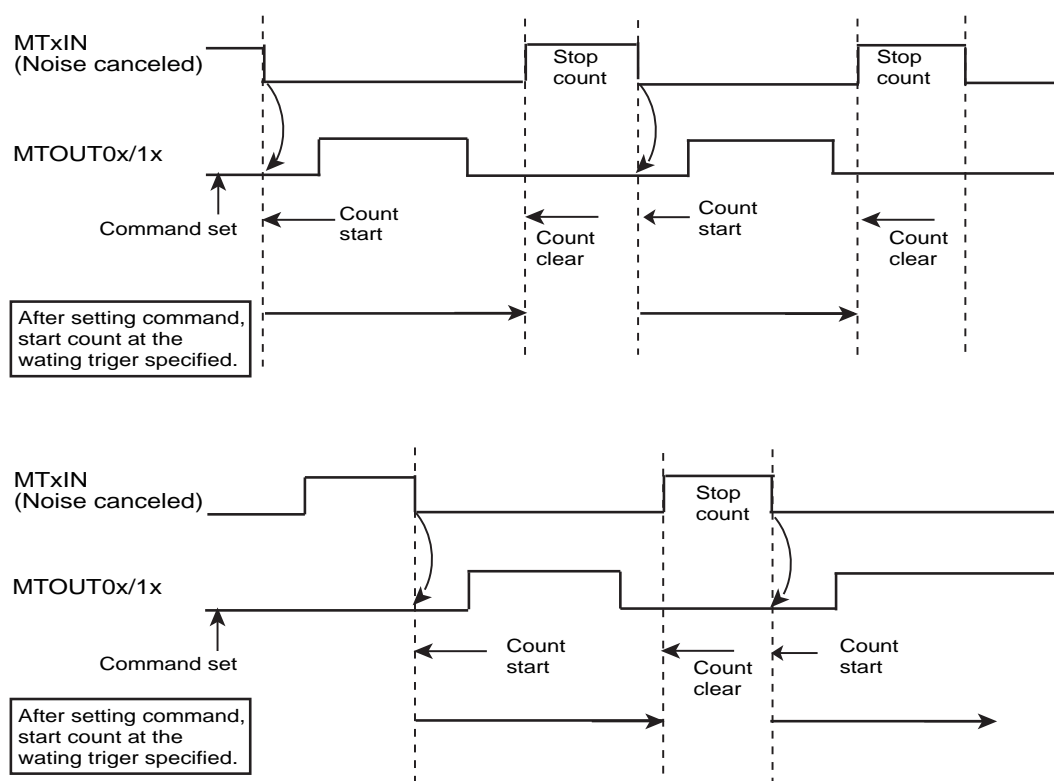

Figure 23-12 Trigger Start

### 23.7.14 Single/Continuous Output Mode

Single/continuous output mode can be set with IGBT output.

#### 23.7.14.1 Continuous Output Mode

At the starting timer (MTxRUN<MTRUN>="1"), if MTxIGCR<IGSNGL>="0" is set, continuous output mode is chosen. In the continuous output mode, specified continuous waveform can be output.

#### 23.7.14.2 Single Output Mode

At the starting timer (MTxRUN<MTRUN>="1"), if MTxIGCR<IGSNGL>="1" is set, single output mode is chosen. In the single output mode, the counter stops after output every single cycle.

At the trigger starting, the counter stops until triggers are input. Counting starts by the specified trigger input, and after one cycle has elapsed, counting stops. If trigger starts again, set MTxRUN<MTRUN>="1".

### 23.7.15 Stopping Type

By setting "0" to MTxRUN<MTRUN>, outputs and timers stop according to MTxIGCR<IGSTP[1:0]> setting.

#### 23.7.15.1 Counter Stops with Initial State Output

When MTxIGCR<IGSTP[1:0]> is set to "00", the counter immediately stops and MTOU0x/1x output becomes an initial value set with MTxIGOCR<IGPOL[1:0]>.

Figure 23-13 Counter stops with initial state output

23.7.15.2 Counter Stops with maintaining the output status

When <IGSTP[1:0]> is set to “01”, the counter immediately stops and MTOUT0x/1x output is maintained.

If the counter starts again, set MTxRUN<MTRUN>="1". At this time, outputs become an initial value (setting value of <IGPOL0> or <IGPOL1>) and then restarts.

Figure 23-14 Counter stops with maintaining the output status

23.7.15.3 Counter Stops with Initial State after Cycle finished

When <IGSTP[1:0]> is set to "10", the counter operates until the cycle has finished. After cycle has finished, the counter stops. However, if trigger input becomes stop level until the cycle finishes, the counter stops at this point.

If the timer is set again, check if the counter stops after cycle has finished.

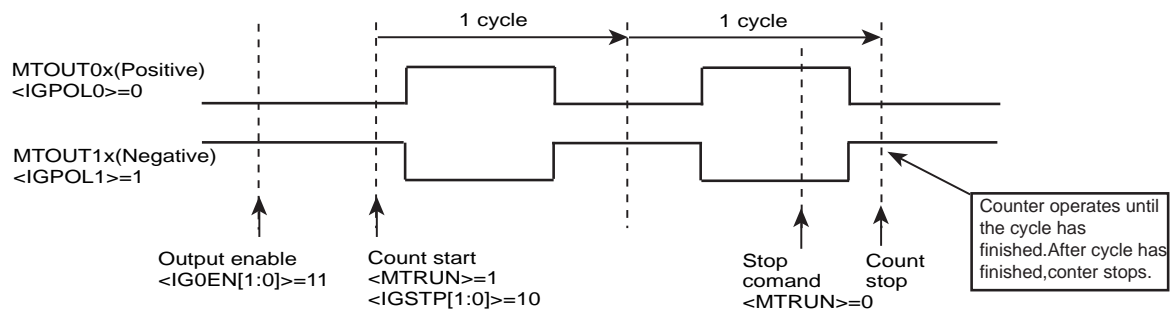

Figure 23-15 Counter stops with initial state after cycle has finished

## 23.7.16 Trigger Input

### 23.7.16.1 Logic of Trigger Input

The valid condition of MTxIN input is set with MTxIGICR<IGTRGSEL>.

- <IGTRGSEL>=0 : Rising edge detection to start counting  
During "High" level, count-up is performed. During "Low" level, counter stops.
- <IGTRGSEL>=1 : Falling edge detection to start counting  
During "Low" level, count-up is performed. During "High" level, counter stops.

Figure 23-16 Logic of trigger input

While cycles are stopping, a stop trigger signal is accepted but a start signal is not. (Once a stop trigger signal is accepted while cycles are stopping, outputs become an initial value then the counter stops.)

Figure 23-17 Trigger acceptance while cycles are stopping

### 23.7.16.2 Trigger Constant Acceptance/prohibit accessing during active level

MTxIGICR<IGTRGM> can choose either condition; one is a trigger from MTxIN is always accepted during PPG output, or another is a trigger is prohibited accessing during PPG output in active. This setting is only valid for enabled pin with MTxIGOCR <IGOEN[1:0]>.

When <IGTRGM>="0" is set, a trigger input from MTxIN is always accepted regardless of MTOUT0x/1x in active/non-active. During this period, timer is started/stopped to clear and MTOUT0x/1x output becomes non-active.

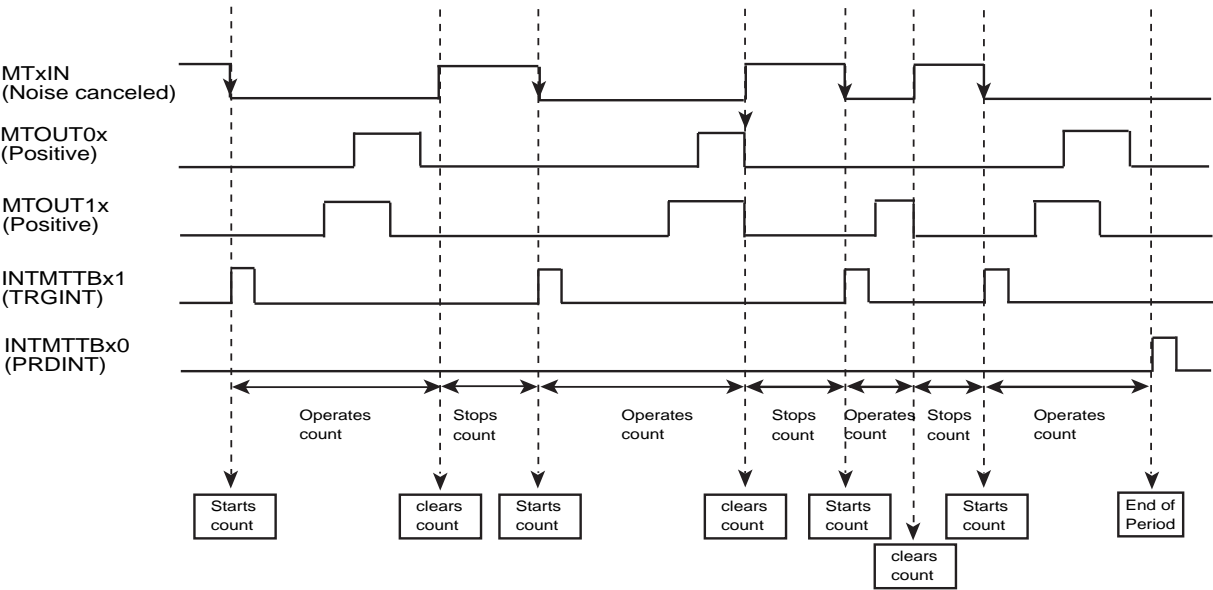

Figure 23-18 Trigger constant acceptance

When  $\text{IGTRGM} = "1"$  is set, input edge at MTOU0x/1x output in non-active is accepted and cleared to stop.

If input edge at MTOU0x/1x output in active, the counter does not immediately stops. It continues to count until MTOU0x/1x output becomes non-active. When MTOU0x/1x output is non-active, if trigger signal is not in active level, the counter is cleared to stop and waits next start trigger signal.

If the counter operates when both MTOU0x and MTOU1x are enabled, both outputs must be in non-active. Otherwise triggers are not accepted.

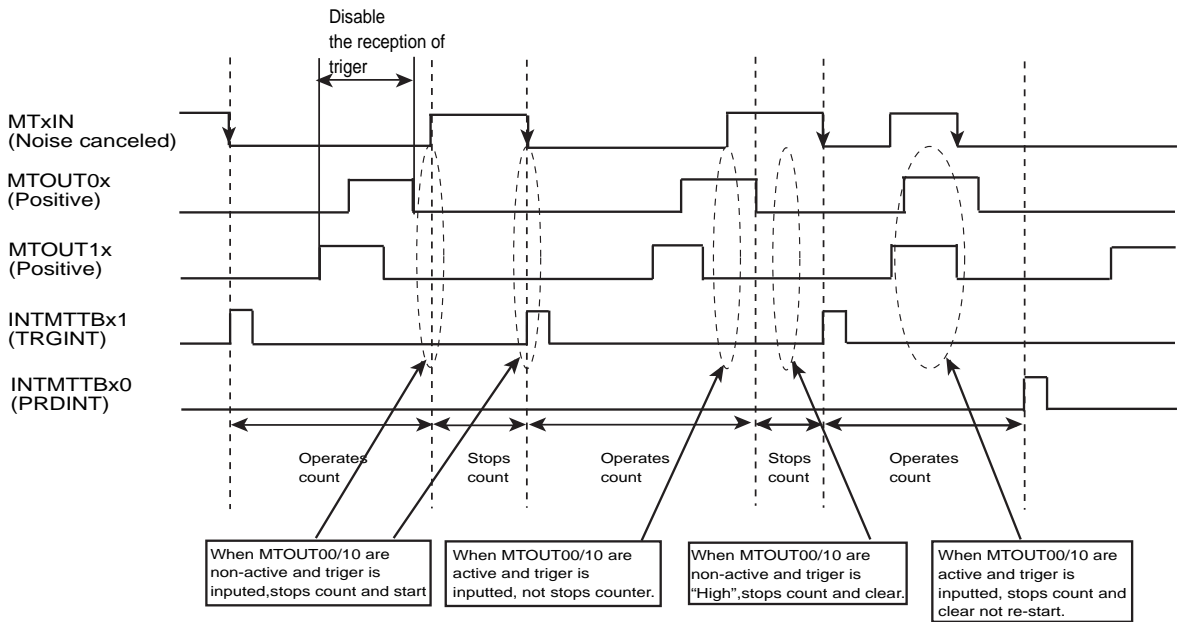

Figure 23-19 Prohibit accessing during active level

## 23.7.17 Emergency Stop Function

### 23.7.17.1 Operation Description

When MTxIGEMGCR<IGEMGEN>="1" is set, the emergency stop function is enabled (GEMGx pin is enabled to input).

If GEMGx pin detects a low level input, MTOUT0x/ MTOUT1x waveform becomes initial state (set with IGPOL0/IGPOL1) according to MTxIGEMGCR<IGEMGOC> setting or becomes high-impedance and generates a GEMGx interrupt.

This function prohibits only MTOUT0x/ MTOUT1x output. The counter does not stop so that timer must be stopped in the GEMG interrupt service routine.

### 23.7.17.2 Emergency stop monitor

On the emergency stop condition, MTxIGEMGST<IGEMGST> is set to "1". When IGEMGST is read, "1" indicates of emergency stopping.

### 23.7.17.3 GEMG interrupts

When an emergency stop input is received, a GEMG interrupt (INTMTEMGx) occurs. If this process uses interrupt service routine, the INTMTEMGx interrupt must be enabled in advance.

If GEMGx pin is "Low" and exits emergency stop status, GEMG interrupt occurs again, and MCU is in emergency stop condition again.

### 23.7.17.4 Exiting Emergency Stop Condition

When MCU exits emergency stop condition, check if GEMGx input is high and MTxRUN<MTRUN> is set to "0". Then confirm the timer stops (MTxIGST<IGST>=0), later MTxIGEMGCR<IG-EMGRS>="1" is set for exiting emergency stop condition.

When MTxIGCR<IGSTP[1:0]>="01" or "10" is set in the stopping type selection register, set the initial setting with MTxIGOCR<IGPOL[1:0]> before writing MTxIGEMGCR<IGEMGRS>="1".

## 23.7.18 Noise Canceller

The digital noise canceller eliminate noise inputting to external input pins (MTxIN and GEMGx).

It can be chosen the noise elimination time with MTxIGICR<IGNCSEL[3:0]> or MTxIGEMGCR <IG-EMGCNT[3:0]> setting.

## 23.8 Operation Description of Motor Control Circuit (PMD : Programmable Motor Driver)

TMPM368FDXBG has one channel of motor control circuits (PMD).

This PMD is added the applying current control and the DC over-voltage detection input to fabricate one-shunt sensor less motor control.

Figure 23-20 Block diagram of related with motor control

### 23.8.1 Input/output signal to PMD circuit

The following table describes input and output signals categorized by channel in motor control circuit.

Table 23-4 Input/output signals

CH	Pin name	PMD signal name	Function
PMD0	PG7/UO	UO	U-phase output
	PG6/XO	XO	X-phase output
	PG5/VO	VO	V-phase output
	PG4/YO	YO	Y-phase output
	PG3/WO	WO	W-phase output
	PG2/ZO	ZO	Z-phase output
	PG1/EMG0	EMG	Abnormal detection input signal

### 23.8.2 Structure

The PMD (programmable motor driver) contains a waveform generation circuit which is comprised of a pulse width modulation circuit, an applying current control circuit, a protection circuit and a dead time control circuit.

- Pulse width modulation circuit generates identical 3-phase independent PWM waveforms.
- Applying current circuit determines each upper/lower output pattern of U-, V-, W-phase.
- Protection control circuit takes place emergency stop by detecting abnormal detect input.
- Dead time control prevent a short circuit at switching upper/lower phase.

Figure 23-21 Schematic diagram of PMD circuit

## 23.8.3 Registers

### 23.8.3.1 Registers categorized by channel

This section describes registers and addresses of each channel.

Base address = 0x400F\_6000

Register name		Address (Base+)
PMD enable register	MTPDMDEN	0x0000
Port output mode register	MTPDPORTMD	0x0004
PMD control register	MTPDMDCR	0x0008
PWM count status register	MTPDCNTSTA	0x000C
PWM count register	MTPDMDCNT	0x0010
PWM cycle register	MTPDMDPRD	0x0014
PWM compare U register	MTPDCMPU	0x0018
PWM compare V register	MTPDCMPV	0x001C
PWM compare W register	MTPDCMPW	0x0020
Reserved	–	0x0024
PMD output control register	MTPDMDOUT	0x0028
PMD output setting register	MTPDMDPOT	0x002C
EMG release register	MTPDEMGREL	0x0030
EMG control register	MTPDEMGCR	0x0034
EMG status register	MTPDEMGSTA	0x0038
Reserved	–	0x003C
Reserved	–	0x0040

## 23.8.3.2 MTPDMDEN (PMD enable register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	-	-	PWMEN
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-1	-	R	Read as "0".
0	PWMEN	R/W	Controls waveform generation to enable/disable 0: Disabled 1: Enabled While ports are set to PWM output, if <PWMEN>="0"(disable)is set, output ports become high-impedance. Initial settings other than <PWMEN> such as output port polarity must be done before <PWMEN>="1" (Enable) is set.

## 23.8.3.3 MTPDPORTMD (Port output mode register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	-	-	PORTMD
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-2	-	R	Read as "0".
1	-	R/W	Write "0".
0	PORTMD	R/W	Sets port control 0: High-impedance 1: PMD output Six output ports with all phase output control signals to external port by setting <PORTMD>. If tool break occurs when high-impedance is chosen, external output port becomes high-impedance. Otherwise PMD output is set. Note 1) When MTPDMDEN<PWMEN>=0 is set, high-impedance output is set regardless of output port setting. Note 2) External port output control can be done according to PMDxEMGMD setting, even when EMG input.

## 23.8.3.4 MTPDMDCR (PMD control register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	PWMCK	SYNTMD	DTYMD	PINT	INTPRD		PWMMD
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-7	-	R	Read as "0".
6	PWMCK	R/W	Specifies PWM cycle extension mode 0: Normal cycle 1: 4-fold cycle In the normal setting, PWM counter operates at a resolution of 12.5ns@fsys=80MHz. *Sawtooth wave 12.5ns, Triangle wave 25ns In the 4-fold cycle setting, PWM counter operates at a resolution of 50ns@2-bit counter (fsys=80MHz) *Sawtooth wave 50ns, Triangle wave 100ns
5	SYNTMD	R/W	Sets port output of U-, V- and W-phases. Refer to Table 23-6.
4	DTYMD	R/W	Chooses DUTY mode 0: U-phase in common 1: 3-phase independent Chooses duty setting among either each 3-phase (PMDxCMPU, V and W) is independent or PMDxCMPU register in each 3-phase is used in common.
3	PINT	R/W	Chooses PWM interrupt timing when PWM mode 1 (triangle wave) is set. 0: When PWM count MDCNT="1" is set, (minimum) interrupt request occurs. 1: When PWM count MDCNT=MTPDMDPRD<MDPRD> is set, (maximum) interrupt request occurs. User can be choose the interrupt generation timing in the PWM mode 1 (triangle wave) either when PWM counter MDCNT becomes "1" (minimum) or when PWM counter becomes MTPDMDPRD<MDPRD> (maximum). If PWM interrupt cycle is set as 0.5 cycle with <INTPRD>, PWM interrupt occurs both when PWM counter MDCNT becomes "1" (minimum) and <MDPRD>(maximum) regardless of this register. Also in PWM mode 0 (sawtooth wave), PWM interrupt occurs when PWM counter MDCNT becomes <MDPRD> (maximum) regardless of this register.
2-1	INTPRD	R/W	Chooses PWM interrupt cycle 00: Every PWM 0.5 cycles (can be set in PWM mode1 (triangle wave)) 01: Every PWM 1 cycle 10: Every PWM 2 cycles 11: Every PWM 4 cycles Frequency of PWM interrupt generation can be chosen among every 0.5 cycles, 1 cycles, 2 cycles or 4cycles.
0	PWMMD	R/W	Specifies PWM carrier wave 0: PWM mode 0 (edge PWM, sawtooth) 1: PWM mode 1 (center PWM, triangle wave)

## 23.8.3.5 MTPDCNTSTA (PWM count status register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	-	-	UPDWN
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-1	-	R	Read as "0".
0	UPDWN	R	PWM counter flag 0: Up-counting 1: Down-counting Indicate PWM counter is up-counting or down-counting. When PWM mode 0 (sawtooth) is chosen, always read "0".

## 23.8.3.6 MTPDMDCNT (PWM count register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	MDCNT							
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	MDCNT							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-16	-	R	Read as "0".
15-0	MDCNT	R	16-bit read-only register for counting PWM cycles. When MTPDMDCR<PWMCK>="0" is set, PWM counter resolution is 12.5ns@fsys=80MHz in PWM mode 0 (sawtooth) or 25ns@fsys=80MHz in PWM mode 1 (triangle wave). When <PWMCK>="1" is set, PWM counter resolution is 50ns@fsys=80MHz in PWM mode 0 (sawtooth) or 100ns@fsys=80MHz in PWM mode 1 (triangle).

## 23.8.3.7 MTPDMDPRD (PWM cycle register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	MDPRD							
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	MDPRD							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-16	-	R	Read as "0".
15-0	MDPRD	R/W	<p>Sets PWM cycles.</p> <p>PWM counter resolution is 12.5ns@fsys=80MHz in PWM mode 0 (sawtooth) or 25ns@fsys=80MHz in PWM mode 1 (triangle wave).</p> <p>When MTPDMDCR&lt;PWMCK&gt;="1" is set, PWM counter resolution is 50ns@fsys=80MHz in PWM mode 0 (sawtooth) or 100ns@fsys=80MHz in PWM mode 1 (triangle wave).</p> <p>&lt;MDPRD&gt; is a PWM cycle setting register with double-buffering structure. Thus even if PWM counter is operating, it can be changed. Transfer timing from register to latch circuit is when PWM counter MDCNT matches with MTPDMDPRD &lt;MDPRD&gt;. If interrupt timing is set to 0.5 cycles (MTPDMCR&lt;INTPRD&gt;="00"), the transfer is taken place when PWM counter MDCNT is set to "1" or matches with &lt;MDPRD&gt;.</p> <p>Sets a value of 0x10 or more to &lt;MDPRD&gt;. Even if a value less than 0x10 is set, the register assumes 0x10 is set. (User specified value is set in the register.)</p> <p>Read a value of register (data set from bus) when read.</p>

Note: Use half-word access or word access.

## 23.8.3.8 MTPDCMPU (PWM compare register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	CMPU							
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	CMPU							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-16	-	R	Read as "0".
15-0	CMPU	R/W	<p>Controls PWM pulse width</p> <p>Resolutions are 12.5ns@fsys=80MHz in PWM mode 0 (sawtooth) and 25ns@fsys=80MHz in PWM mode 1 (triangle wave). When MTPDMDCR&lt;PWMCK&gt; is set to "1", a resolution is set to 50ns@fsys=80MHz in PWM mode 0 (sawtooth) or 100ns@fsys=80MHz in PWM mode 1 (triangle).</p> <p>&lt;CMPU&gt; is the compare register that determines the pulse width outputting to U-phase. This register compares a pulse large or small with PWM counter MDCNT to determine the pulse width.</p> <p>&lt;CMPU&gt; is double-buffering structure, so that even if PWM counter is operating, it can be changed. Transfer timing from buffers to registers is when PWM counter MDCNT matches with MTPDMDPRD &lt;MDPRD&gt;. If interrupt timing is set to 0.5 cycles (MTPDMCR &lt;INTPRD&gt;="00"), the transfer is taken place when PWM counter MDCNT is set to "1" or matches with &lt;MDPRD&gt;.</p> <p>Read a value of buffer (data set from bus) when read.</p>

Note: Use half-word access or word access.

## 23.8.3.9 MTPDCMPV (PWM compare register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	CMPV							
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	CMPV							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-16	-	R	Read as "0".
15-0	CMPV	R/W	<p>Sets PWM pulse width</p> <p>Resolutions are 12.5ns@fsys=80MHz in PWM mode 0 (sawtooth) and 25ns@fsys=80MHz in PWM mode 1 (triangle wave). When MTPDMDCR&lt;PWMCK&gt; is set to "1", a resolution is set to 50ns@fsys=80MHz in PWM mode 0 (sawtooth) or 100ns@fsys=80MHz in PWM mode 1 (triangle).</p> <p>&lt;CMPV&gt; is the compare register that determines the pulse width outputting to U-phase. This register compares a pulse large or small with PWM counter MDCNT to determine the pulse width.</p> <p>&lt;CMPV&gt; is double-buffering structure, so that even if PWM counter is operating, it can be changed. Transfer timing from buffers to registers is when PWM counter MDCNT matches with MTPDMDPRD &lt;MDPRD&gt;. If interrupt timing is set to 0.5 cycles (MTPDMCR &lt;INTPRD&gt;="00"), the transfer is taken place when PWM counter MDCNT is set to "1" or matches with &lt;MDPRD&gt;.</p> <p>Read a value of buffer (data set from bus) when read.</p>

Note: Use half-word access or word access.

## 23.8.3.10 MTPDCMPW (PWM compare register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	CMPW							
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	CMPW							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-16	-	R	Read as "0".
15-0	CMPW	R/W	<p>Sets PWM pulse width</p> <p>Resolutions are 12.5ns@fsys=80MHz in PWM mode 0 (sawtooth) and 25ns@fsys=80MHz in PWM mode 1 (triangle wave). When MTPDMDCR&lt;PWMCK&gt; is set to "1", a resolution is set to 50ns@fsys=80MHz in PWM mode 0 (sawtooth) or 100ns@fsys=80MHz in PWM mode 1 (triangle).</p> <p>&lt;CMPW&gt; is the compare register that determines the pulse width outputting to W-phase. This register compares a pulse large or small with PWM counter MDCNT to determine the pulse width.</p> <p>&lt;CMPW&gt; is double-buffering structure, so that even if PWM counter is operating, it can be changed. Transfer timing from buffers to registers is when PWM counter MDCNT matches with MTPDMDPRD &lt;MDPRD&gt;. If interrupt timing is set to 0.5 cycles (MTPDMCR &lt;INTPRD&gt;="00"), the transfer is taken place when PWM counter MDCNT is set to "1" or matches with &lt;MDPRD&gt;.</p> <p>Read a value of buffer (data set from bus) when read.</p>

Note: Use half-word access or word access.

## 23.8.3.11 MTPDMDOUT (PMD output control register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	WPWM	VPWM	UPWM
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	WOC		VOC		UOC	
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-11	-	R	Read as "0".
10	WPWM	R/W	Controls U-, V- and W-phase outputs 0: H/L output 1: PWM output For details, refer to Table 23-6.
9	VPWN	R/W	
8	UPWN	R/W	
7-6	-	R	Read as "0".
5-4	WOC[1:0]	R/W	Controls U-, V- and W-phase outputs For details, refer to Table 23-6.
3-2	VOC[1:0]	R/W	
1-0	UOC[1:0]	R/W	

Note: Use half-word access or word access.

## 23.8.3.12 MTPDMDPOT (PMD output setting register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	POLH	POLL	PSYNCS	
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-4	-	R	Read as "0".
3	POLH	R/W	Chooses polarity of upper phase output port 0: Low active 1: High active *Chooses the setting when MTPDMDEN<PWMEN>=0 is set.
2	POLL	R/W	Choose polarity of lower phase output port 0: Low active 1: High active *Chooses the setting when MTPDMDEN<PWMEN>=0 is set.
1-0	PSYNCS	R/W	Chooses the timing when port outputs of U-, V- and W-phase output setting is reflected. 00: Reflects when write 01: Reflects when PWM counter MDCNT="1"(minimum) 10: Reflects when PWM counter MDCNT=MTPDMDPRD<MDPRD>(maximum) 11: Reflects when PWM counter MDCNT="1"(minimum) and MTPDMDPRD<MDPRD>(maximum) *Chooses the setting when MTPDMDEN<PWMEN>=0 is set.

## 23.8.3.13 MTPDEMGREL (EMG release register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	EMGREL							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31-8	-	R	Read as "0".
7-0	EMGREL[7:0]	W	Writes EMG prohibition code To prohibit EMG function, set the procedure as follows; set "0x5A"→"0xA5" to <EMGREL[7:0]>, then set "0" to MTPDEMGCR<EMGEN>.

Note: To prohibit EMG function, three instructions must be executed consecutively. Three instructions are as follows; set "0x5A", change to "0xA5" and set "0" to MTPDEMGCR<EMGEN>.

## 23.8.3.14 MTPDEMGCR (EMG control register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16

7-0	DTR[7:0]	R/W	Sets dead time Dead time is calculated with the following formula: $100\text{nsec} \times \text{DTR}[7:0] > (\text{fsys}=80\text{MHz})$

Note: Do not modify MTPDDTR<DTR[7:0]> when MTPMDEN<PWMEN>="1" is set.

## 23.9 Operation Description categorized by Circuit

### 23.9.1 Pulse Width Modulation Circuit

Figure 23-22 Schematic diagram of pulse width modulation circuit

Pulse width modulation circuit contains PWM counter MDCNT which is a 16-bit up-/down-counter. In PWM mode 0 (sawtooth), the counter resolution is  $12.5\text{ns}@f_{\text{sys}}=80\text{MHz}$ . In PWM mode 1 (triangle wave), the counter resolution is  $25\text{ns}@f_{\text{sys}}=80\text{MHz}$  to generate PWM carrier. When  $\text{MTPDMDCR} < \text{PWMCK} > = "1"$  is set, the counter resolution is  $50\text{ns}@f_{\text{sys}}=80\text{MHz}$  in PWM mode 0 (sawtooth). In the PWM mode 1 (triangle wave), the counter resolution is  $100\text{ns}@f_{\text{sys}}=80\text{MHz}$  to generate PWM carrier.

PWM carrier waveform mode can be chosen either an edge PWM (sawtooth) in PWM mode 0 or a center PWM (triangle wave) in mode 1.

## 1. PWM cycle setting

MTPDMDPRD<MDPRD> register determines PWM cycles.

MTPDxMDPRD register contains a latch circuit with double-buffering structure. Register values are synchronously transferred as the comparator input (latch) when PWM counter MDCNT matches with <MDPRD>. If MTPDMDCR<INTPRD> is set to "00", updating on every PWM half cycle can be chosen.

$$\text{Saw wave PWM : Value of MDPRD register} = \frac{\text{Oscillation frequency [Hz]}}{\text{PWM frequency [Hz]}}$$

$$\text{Triangle wave modulation PWM : Value of MDPRD register} = \frac{\text{Oscillation frequency [Hz]}}{\text{PWM frequency [Hz]} \times 2}$$

## 2. Compare function

This compare function generates desirable duty PWM waveforms by small/large comparing a value of 3-phase PWM compare register (PMDxCMPU/V/W) with a carrier generated by PWM counter MDCNT.

PWM compare registers in each phase have double-buffering structure. Buffer values are synchronously transferred to PWM compare register when internal counter value matches with <MDPRD>. If MTPDMDCR<INTPRD> is set to "00", loading on every PWM half cycle can be chosen.

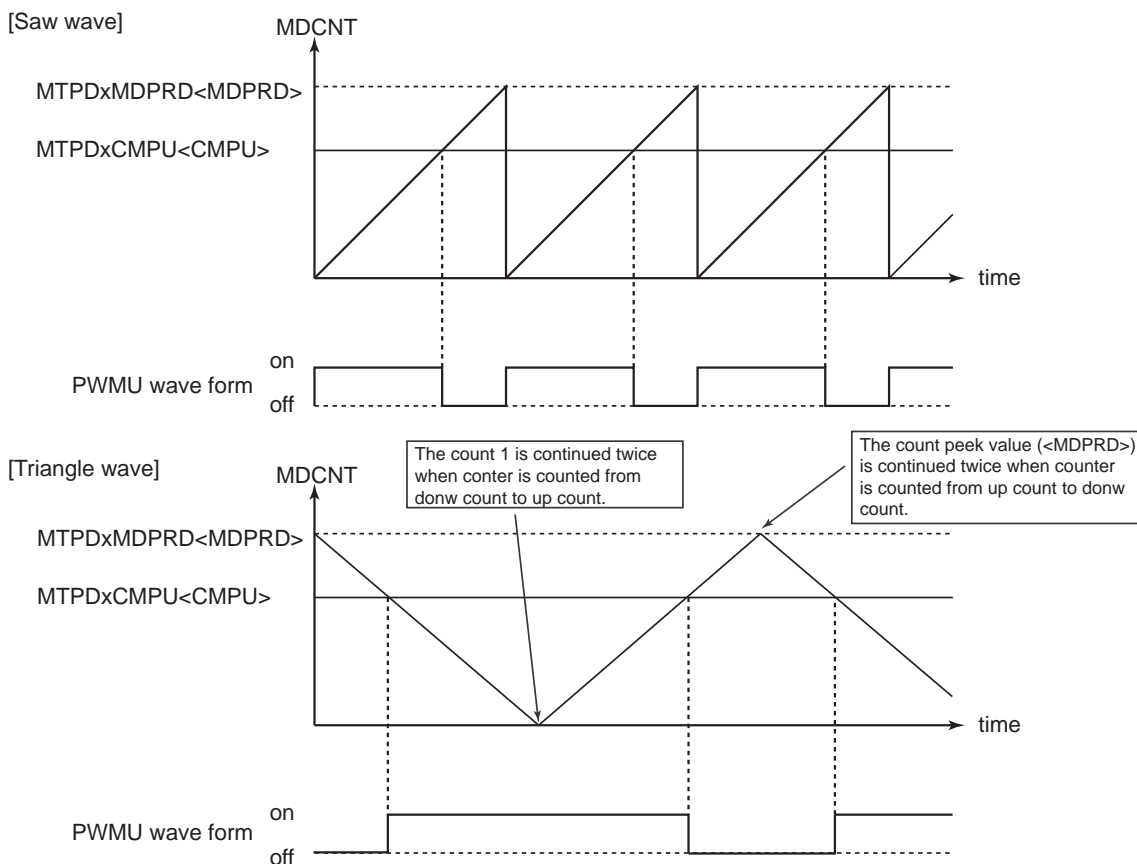

Figure 23-23 PWM waveform

## 3. Waveform mode

Two kinds of 3-phase PWM generation can be chosen.

1. 3-phase independent duty mode: Set independent values to each 3-phase compare register to generate 3-phase independent PWM waveforms. This is used for generating arbitrary drive waveform such as a sine wave.
2. 3-phase common duty mode: Set only U-phase PWM compare register. By setting a value in U-phase, identical PWM waveform in 3-phase common. This is used for square waveform drive used in DC motor.

## 4. Interrupt service routine

In pulse width modulation circuit, PWM interrupts synchronously occurs with PWM waveforms. A frequency of PWM interrupt is chosen among once every half PWM cycle, once every one PWM cycle, once every two PWM cycles or once every four PWM cycles.

## 23.9.2 Applying Current Control Circuit

Figure 23-24 Schematic diagram of applying current control circuit

This circuit controls output port according to the content set in the PMD output register (MTPDMDOUT). The settings can be divided two contents such as the selection of synchronous signal at port output, and the port output setting. The port output setting is double-buffering structure, so that the update timing can be chosen between synchronous update or asynchronous update with PWM.

The output setting of six ports can be set independently between active or inactive using MTPDMDPOT<POLH><POLL>. In addition, PWM output or H/L output can be chosen in each three phase (U-, V- and W-phase) using MTPDMDOUT<WPWM><VPWM><UPWM>. If PWM output is chosen,

PWM waveform generates. If H/L output is chosen, fixed-high output or fixed-low output generates. For the relation between the port output settings using MTPDMDOUT and the pin output using the polarity of PMD control register(MTPDMDCR), refer to "Table 23-6 Port outputs setting by UOC, VOC, WOC, UPWN, VPWN and WPWM bits".

Also, one shunt current can be detected as follows:

Table 23-5 Settings for one shunt current detection

	Normal	U-phase PWM shift	V-phase PWM shift	W-phase PWM shift
CMPU	duty_U	MTPDMDPRD <MDPRD>-duty_U	duty_U	duty_U

23.9.3 Protection Control Circuit

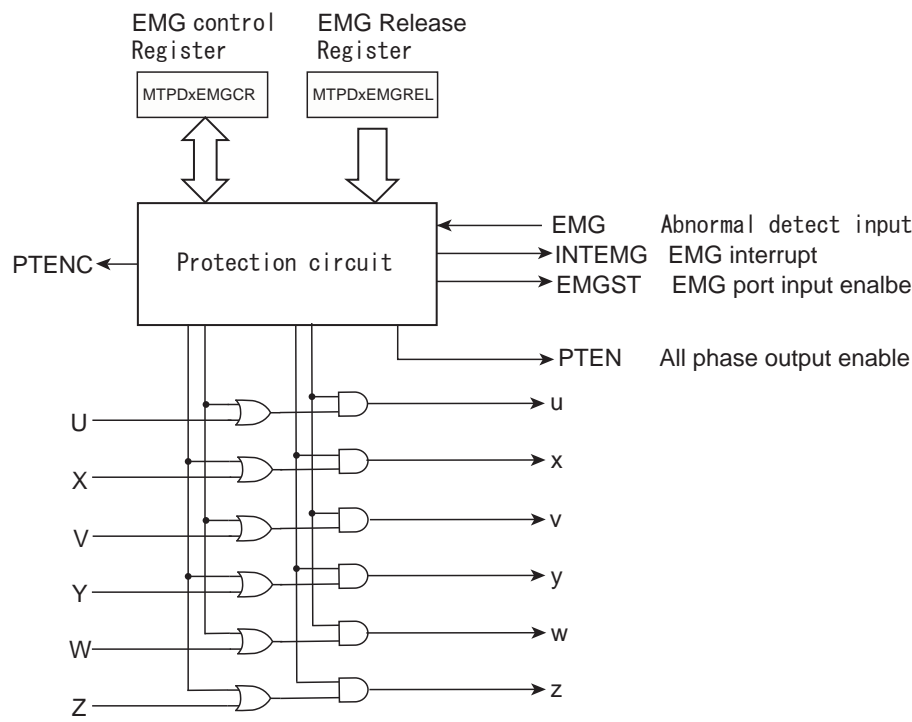

Figure 23-25 Schematic diagram of protection control circuit

The protection control circuit consists of the protection control part and the port output prohibition circuit part. It operates when abnormal detection input is low level. The EMG protection circuit is used for emergency stop. If abnormal detection input is found (high level → low level), six PWM outputs are immediately prohibited (depending on MTPDxEMGCR<EMGMD> setting) and an EMG interrupt (ITEMG) occurs.

In addition, this circuit outputs control signals that bemuse external output ports to be high-impedance by setting <EMGMD>.

This circuit prohibits six PWM outputs when PMD is stopped caused by tool break as well. This prohibition depends on <EMGMD> setting. At tool break, it can choose the high-impedance control of external output port by setting MTPDPORTMD<PORTMD>.

When MTPDEMGSTA<EMGST> reads as "1", this indicates MCU is in the EMG protection status.

To return from the EMG protection status, set as follows; all ports are set to in-active (MTPDMDOUT<WPWM> <VPWM><UPWM><WOC[1:0]><VOC[1:0]><UOC[1:0]>="0"); then MTPDEMGCR<EMGRS> is set to "1".

To prohibit the EMG function, set as follows; set 0x5A and 0xA5 to the EMG prohibition code register (MTPDEMGREL<EMGREL[7:0]>)in order; set "0" to MTPDEMGCR<EMGEN> (These three instruction must be executed consecutively.) However, the returning service routine is ignored while abnormal detection inputs are low. The returning service routine must be taken place when abnormal detection input level becomes high after confirming MTPDEMGSTA<EMGI> is high.

By setting specified key codes (0x5A and 0xA5) to <EMGREL[7:0]>, the EMG protection circuit is enabled to prevent unintentional operation.

## 23.9.4 Dead Time Circuit

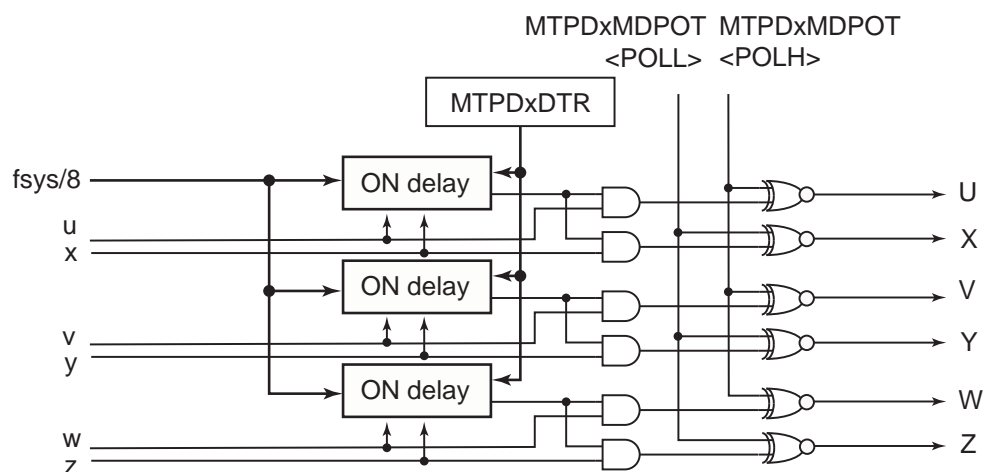

Figure 23-26 Schematic diagram of dead time circuit

The dead time circuit consists of the dead time circuit part and the output polarity switching part.

In each U-, V- and W-phase, this circuit prevent short circuit with delaying on-time using the dead time counter in case that upper phase and lower phase are reversed. A delay time is set to the dead time register (MTPDDTR<DTR>) and can be set to 100ns @ fsys=80MHz resolution with 8 bits.

The output polarity switching circuit can be set upper or lower signals to be high-active or low-active respectively using TPDxMDPOT<POLH><POLL>.

## 24. Encoder Input Circuit (ENC)

### 24.1 Outline

The encoder input circuit supports four operation modes including encoder mode, sensor mode (two types) and timer mode. And the functions are as follows:

- Supports incremental encoders and Hall sensor ICs. (signals of Hall sensor IC can be input directly)
- 24-bit general-purpose timer mode
- Multiply-by-4 (multiply-by-6) circuit
- Rotational direction detection circuit
- 24-bit counter
- Comparator enable/disable
- Interrupt request output: 1
- Digital noise filters for input signals

### 24.2 Differences between channels

The TMPM368FDXBG has a one-channel incremental encoder interface (ENC0), which can obtain the absolute position of the motor, based on input signals from the incremental encoder.

These channels operate identical except the differences in below.

Table 24-1 Differences between channels

Channel	Input pin			Encoder input interrupt
	A-phase	B-phase	Z-phase	
Channel0	PF7 / ENCA	PF6 / ENCB	PF5 / ENCZ	INTENC

### 24.3 Block Diagram

Figure 24-1 Block diagram of encoder input circuit

## 24.4 Registers

### 24.4.1 List of Registers

The following is control registers and addresses of encoder input circuit.

Base Address = 0x400F\_7000

Register name		Address (Base+)
Encoder Input Control Register	ENTNCR	0x0000
Encoder Counter Reload Register	ENRELOAD	0x0004
Encoder Compare Register	ENINT	0x0008
Encoder Counter	ENCNT	0x000C

## 24.4.2 ENTNCR (Encoder Input Control Register)

If a falling edge of ENCZ is detected during rotating counter- clockwise, the encoder counter is cleared to "0".  If the edges of ENCLK (multiply by 4 clock derived from the decoded A and B signals) and the edge of ENCZ coincide, the encoder counter is cleared to 0 without incrementing or decrementing (i.e., the clear takes precedence).</p>						
<p>&lt;Timer mode&gt; Sets ENCZ input to use as an external trigger.</p>	<p>When &lt;ZEN&gt; = 1, the value of the encoder counter is captured into the ENINT register and cleared to 0 on the edge of ENCZ selected by &lt;ZESEL&gt;.</p>						
6	ENRUN	R/W	<p>Encoder operation enable 0:Disable 1:Enable</p> <p>Setting &lt;ENRUN&gt; to 1 and clearing &lt;ZDET&gt; to 0 enables the encoder operation.</p> <p>Clearing &lt;ENRUN&gt; to 0 disables the encoder operation.</p> <p>There are counters and flags that are cleared and not cleared when &lt;ENRUN&gt; bit is cleared to 0.</p>				

Bit	Bit Symbol	Type	Function
5-4	NR[1:0]	R/W	<p>Noise filter</p> <p>00:No filtering</p> <p>01:Filters out pulses narrower than 31/fsys as noise (387.5ns@80MHz)</p> <p>10:Filters out pulses narrower than 63/fsys as noise (787.5ns@80MHz)</p> <p>11:Filters out pulses narrower than 127/fsys as noise (1587ns@80MHz)</p> <p>The digital noise filters remove pulses narrower than the width selected by &lt;NR[1:0]&gt;.</p>
3	INTEN	R/W	<p>Encoder interrupt enable</p> <p>0:Disable</p> <p>1:Enable</p> <p>&lt;INTEN&gt; enables or disables the ENC interrupt.</p> <p>Setting &lt;INTEN&gt; to "1" enables interrupt generation. Setting &lt;INTEN&gt; to "0" disables interrupt generation.</p>
2-0	ENDEV[2:0]	R/W	<p>Encoder pulse division factor</p> <p>000:divided by 1 100:divided by 16</p> <p>001:divided by 2 101:divided by 32</p> <p>010:divided by 4 110:divided by 64</p> <p>011:divided by 8 111:divided by 128</p> <p>Sets encoder pulse division factor</p> <p>The frequency of the encoder pulse is divided by the factor specified by &lt;ENDEV[2:0]&gt;. The divided signal determines the interval of the event interrupt.</p>

Note 1: In the encoder mode or timer mode, <P3EN> must be set to "0".

Note 2: If changing the mode, first read the flag to clear.

The operation mode has eight modes specified with <MODE[1:0]>, <P3EN> and <ZEN>.

The operation mode settings are as follows:

<MODE[1:0]>	<ZEN>	<P3EN>	Input pin	Mode
00	0	0	A, B	Encoder mode
	1		A,B,Z	Encoder mode (use of Z)
01	0	0	U,V	Sensor mode (event count, 2-phase input)
		1	U,V,W	Sensor mode (event count, 3-phase input)
10	0	0	U,V	Sensor mode (timer count, 2-phase input)
		1	U,V,W	Sensor mode (timer count, 3-phase input)
11	0	0	-	Timer mode
	1		Z	Timer mode (use of Z)

The following is the status of <ENRUN> and corresponding signals.

Counter/flag	<ENRUN> = 0 (After reset)	<ENRUN> = 1 (Operating)	<ENRUN> = 0 (Stopping)	<ENRUN> = 0 Object flag/counter clear procedure
Encoder counter	0x000000	Count operation	Maintains a value when stopping	Software clear (<ENCLR> = 1 WR)
Noise filter counter	000_0000	Count-up operation	Count-up operation (Always filtering)	Only reset
Encoder pulse division counter	0x00	Count-down operation	Stopped and cleared	Clear when <ENRUN> = 0
Compare flag <CMP>	0	"1" is set when comparing Clear when read.	Cleared	Clear when <ENRUN> = 0
Reverse error flag <REVERR>	0	"1" is set when error occurs. Clear when read.	Cleared	Clear when <ENRUN> = 0
Z detection flag <ZDET>	0	"1" is set when Z is detected.	Cleared	Clear when <ENRUN> = 0
Rotation direction bit <UD>	0	"0"/"1" is set depending on the direction	Cleared	Clear when <ENRUN> = 0

## 24.4.3 ENRELOAD (Encoder Counter Reload Register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16

bit symbol	INT							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function		
31-24	–	R	Read as "0".		
23-0	INT[23:0]	R/W	Counter compare value setting		
			Encoder mode:	Interrupt condition of the encoder pulse position.	0x0000 to 0xFFFF
				While <CMPEN> = 1 is set, if an encoder counter value matches a value of <INT[15:0]>, <CMP> is set to "1". If <INTEN> = 1 is set, an interrupt request (INTENCx) occurs. However if <ZEN> = 1 is set, an interrupt request does not occur until <ZDET> = 1.	
			Sensor mode: (event count)	Interrupt condition of the encoder pulse position.	0x0000 to 0xFFFF
				While <CMPEN> = 1 is set, if an encoder counter value matches a value of <INT[15:0]>, <CMP> is set to "1". If <INTEN> = 1 is set, an interrupt request (INTENCx) occurs. This bit has no effect on a value of <ZEN>.	
			Sensor mode: (Timer count)	Interrupt condition of abnormal pulse detection time	0x000000 to 0xFFFFF
When <CMPEN> = 1 is set, an internal counter value matches a value of <INT[23:0]>, abnormal pulse detection time error is determined and <CMP> is set to "1". If <INTEN> = 1 is set, an interrupt request (INTENCx) occurs. This bit has no effect on a value of <ZEN>.					
Timer mode	Interrupt condition of timer compare	0x000000 to 0xFFFFF			
	When <CMPEN> = 1 is set, an internal counter value matches a value of <INT[23:0]>, abnormal pulse detection time error is determined and <CMP> is set to "1". If <INTEN> = 1 is set, an interrupt request (INTENCx) occurs. This bit has no effect on a value of <ZEN>.				

<INT[23:16]> is used only in Sensor mode (timer count) and Timer mode.

<CNT[23:16]> is used only in the sensor mode (Timer counting) or timer mode. In the encoder mode or sensor mode (event counting), always reads as "0".

## 24.5 Operational Description

### 24.5.1 Encoder mode

The high-speed position sensor determines the phase input from the AB encoder and the ABZ encoder.

- Event detection (rotation pulse) → interrupt generation
- Event count → match detection interrupt generation (measures the amount of transferring)
- Detects rotation direction
- Up/down-count (changeable in operation)
- Settable counter cycle

### 24.5.2 Sensor mode

The low-speed position sensor determines (zero-cross determination) the phase input from UV Hall sensor and UVW Hall sensor.

There are two kinds of sensor modes such as event count mode and timer count mode (counts with fsys).

#### 24.5.2.1 Event Count Mode

- Event detection (rotation pulse) → interrupt generation
- Event count → match interrupt occurs (measuring the amount of transfer)
- Rotation direction detection

#### 24.5.2.2 Timer count mode

- Event detection (rotation pulse) → interrupt generation
- Timer count
- Rotation direction detection
- Capture function → event capture (measures event intervals) → interrupt generation  
software capture
- Abnormal detection time error (timer compare) → match detection interrupt generation
- Reverse detection error → error flag caused by changing rotation direction

### 24.5.3 Timer mode

This mode can be used as a general-purpose 24-bit timer.

- 24-bit up counter
- Counter clear control (software clear, timer clear, external trigger and free-run count)
- Compare function → match detection interrupt generation
- Capture function → external trigger capture → interrupt generation  
software capture

## 24.6 Function

### 24.6.1 Mode operation outline

#### 24.6.1.1 Encoder mode

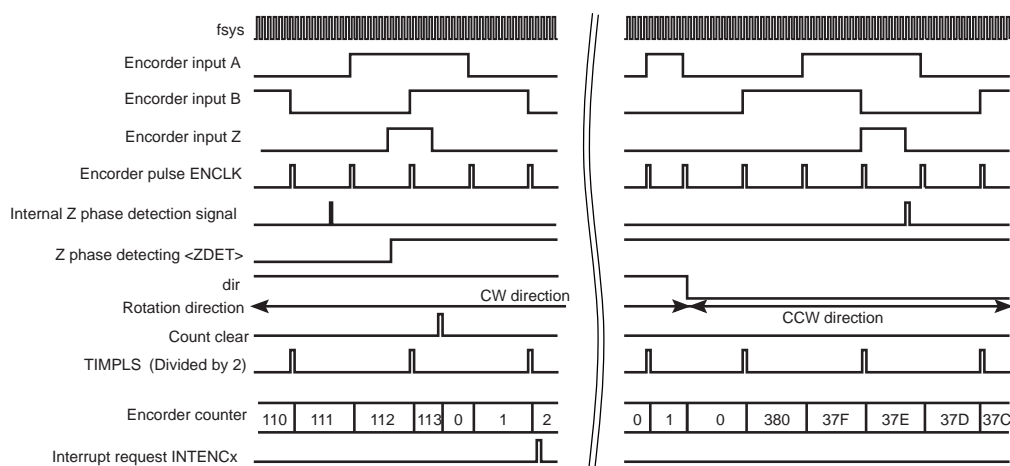

##### 1. If ENTNCR<ZEN> = 1

(ENRELOAD<RELOAD[15:0]> = 0x0380, ENINT<INT[15:0]> = 0x0002)

##### 2. If ENTNCR<ZEN> = 0

(ENRELOAD<RELOAD[15:0]> = 0x0380, ENINT<INT[15:0]> = 0x0002)

- The incremental encoder inputs of the MCU should be connected to the A, B and Z channels. The encoder counter counts pulses of ENCLK, which is multiplied by 4 clock derived from the decoded A and B quadrature signals.
- During CW rotation (i.e., A has the 90-degree phase lead to B), the encoder counter counts up; when it has reached to the value of ENRELOAD<RELOAD[15:0]>, it wraps around to 0 on the next ENCLK.

- During CCW rotation (i.e., A has the 90-degree phase lag to B), the encoder counter counts down; when it has reached to 0x0000, it is reloaded with the value of ENRELOAD<RELOAD [15:0]> on the next ENCLK.
- Additionally, when ENTNCR<ZEN> = 1, the encoder counter is cleared to 0 on the rising edge of Z during CW rotation and on the falling edge of Z during CCW rotation (at the internal Z\_Detected timing). If the ENCLK edge matches Z edge, the encoder counter is cleared to 0 without incrementing or decrementing.
- When ENTNCR<ENCLR> is set to 1, the encoder counter is cleared to 0.
- ENTNCR<UD> is set to 1 during CW rotation and cleared to 0 during CCW rotation.
- TIMPLS, which is derived by dividing ENCLK by a programmed factor, can be driven out externally.
- If ENTNCR<CMPEN> is set to 1, an interrupt is generated when the value of the encoder counter has reached to the value of ENINT<INT[15:0]>. When ENTNCR<ZEN> = 1, however, an interrupt does not occur while ENTNCR<ZDET> = 0.
- When <ZDET> and <UD> are set to "0", ENTNCR<ENRUN> is cleared to "0".

### 24.6.1.2 Sensor mode (event count)

1. If ENTNCR<P3EN> = 1 (ENINT<INT[15:0]> = 0x0002)

2. If ENTNCR<P3EN> = 0 (ENINT<INT[15:0]> = 0x0002)

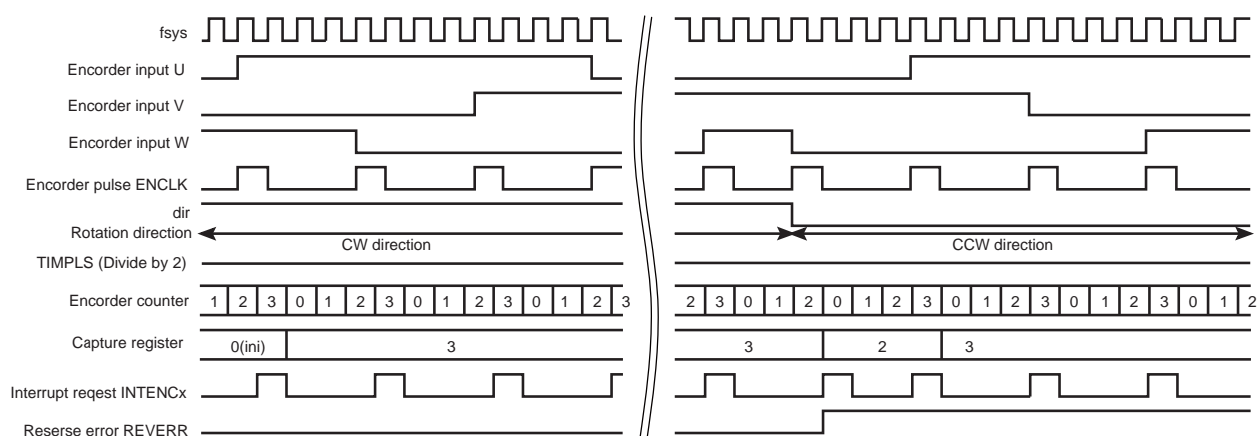

- The Hall sensor inputs of the MCU should be connected to the U, V and W channels. The encoder counter counts the pulses of ENCLK, which is either multiplied by 4 clock (when ENTNCR<P3EN> = 0) derived from the decoded U and V signals or multiplied by 6 clock (when ENTNCR<P3EN> = 1) derived from the decoded U, V and W signals.

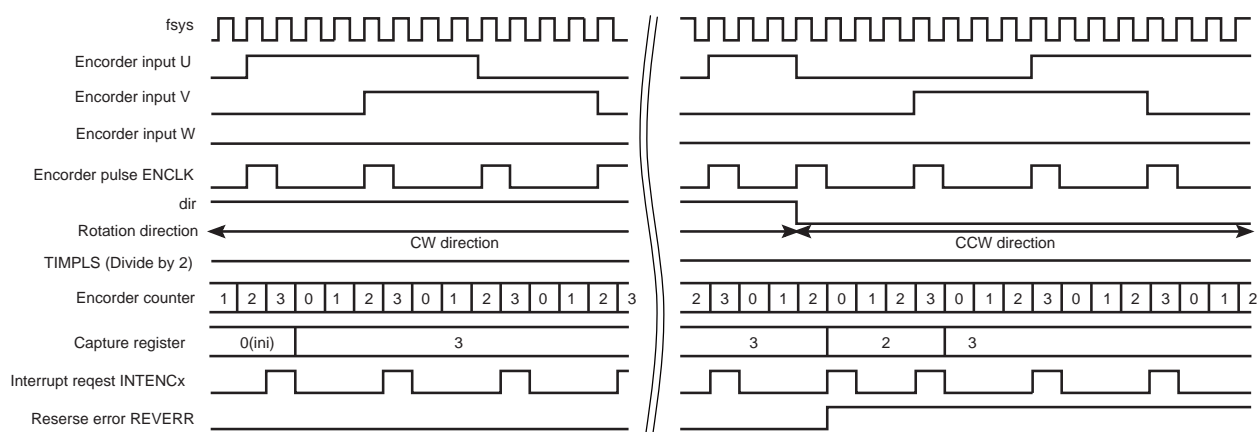

- During CW rotation (i.e., U channel has the 90-degree phase lead to V channel; V channel has the 90-degree phase lead to W channel), the encoder counter counts up; when it has reached to 0xFFFF, it wraps around to 0 on the next ENCLK.
- During CCW rotation (i.e., U channel has the 90-degree phase lag to V channel; V channel has the 90-degree phase lag to W), the encoder counter counts down; when it has reached to 0x0000, it wraps around to 0xFFFF on the next ENCLK.
- When ENTNCR<ENCLR> is set to 1, the internal counter is cleared to 0.
- ENTNCR<UD> is set to 1 during CW rotation and cleared to 0 during CCW rotation.
- TIMPLS, which is derived by dividing ENCLK by a programmed factor, can be driven out externally.
- If ENTNCR<CMPEN> is set to 1, an interrupt is generated when the value of the internal counter has reached to the value of ENINT<INT[15:0]>.
- When ENTNCR<UD> and ENTNCR<ENRUN> are set to "0", <UD> is cleared to "0".

### 24.6.1.3 Sensor mode (Timer count)

1. If ENTNCR<P3EN> = 1 (ENINT<INT[23:0]> = 0x000002)

2. If ENTNCR<P3EN> = 0 (ENINT<INT[23:0]> = 0x000002)

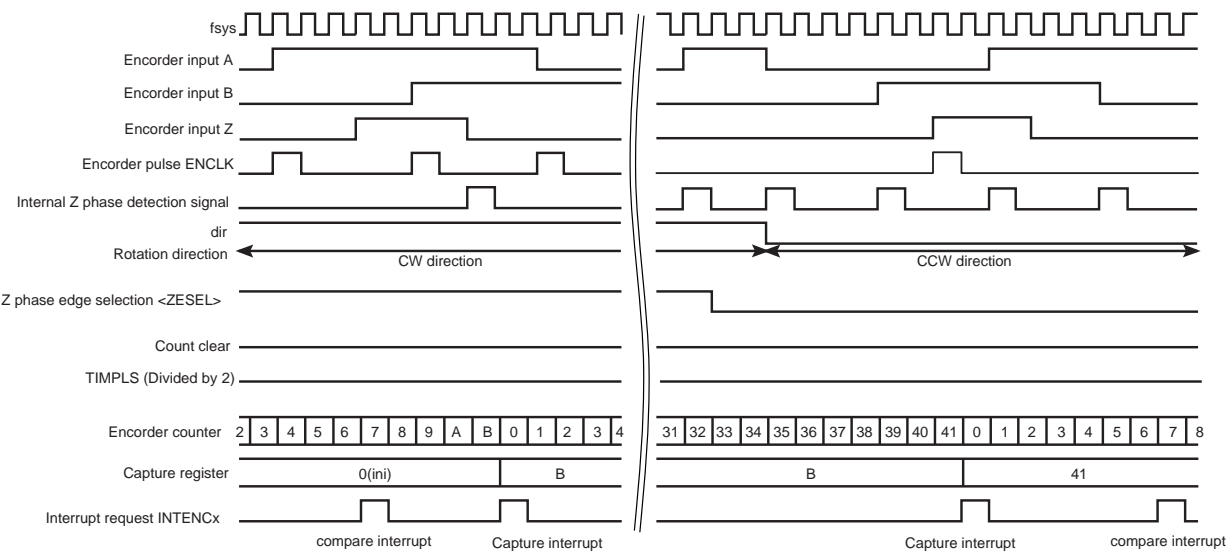

- In Sensor Timer Count mode, the Hall sensor inputs of the MCU should be connected to the U, V and W channels. The encoder counter measures the interval between two contiguous pul-

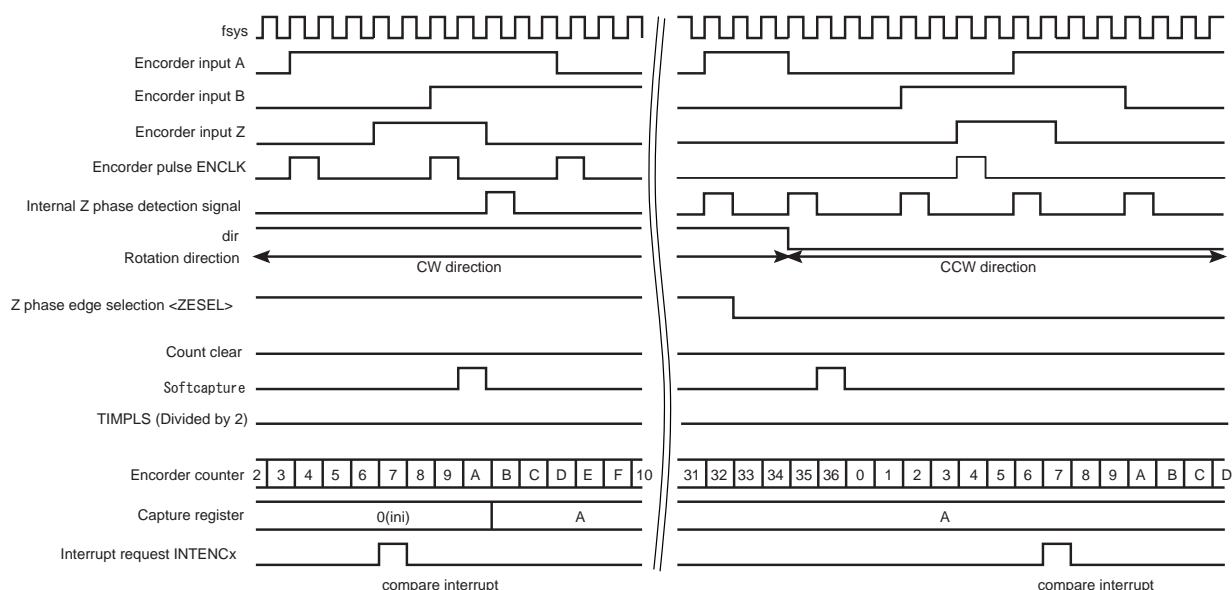

- ses of ENCLK, which is either multiplied by 4 clock (when ENTNCR<P3EN> = 0) derived from the decoded U and V signals or multiplied by 6 clock (when ENTNCR<P3EN> = 1) derived from the decoded U, V and W signals.
- The encoder counter always counts up; it is cleared to 0 on ENCLK. When the encoder counter has reached to 0xFFFFF, it wraps around to 0.
  - When ENTNCR<ENCLR> is set to 1, the encoder counter is cleared to 0.
  - ENCLK captures the value of the encoder counter into the ENCNT register. The captured counter value can be read out of ENCNT.
  - Setting the software capture bit, ENTNCR<SFTCAP>, to 1 causes the value of the encoder counter to be captured into the ENCNT register. This capture operation can be performed at any time. The captured counter value can be read out of ENCNT.
  - ENTNCR<UD> is set to 1 during CW rotation and cleared to 0 during CCW rotation.
  - If ENTNCR<CMPEN> is set to 1, an interrupt is generated when the value of the encoder counter has reached to the value of ENINT<INT[23:0]>.
  - When ENTNCR<ENRUN> is set to "0", ENTNCR<UD> is cleared to "0".
  - ENTNCR<REVERR> is set to 1 when the rotation direction has changed. This bit is cleared to 0 on a read.
  - The value of the ENCNT register (the captured value) is retained, regardless of the value of ENTNCR<ENRUN>. The ENCNT register is only cleared by a reset.

24.6.1.4 Timer mode

1. If ENTNCR<ZEN> = 1 (ENINT<INT[23:0]> = 0x000006)

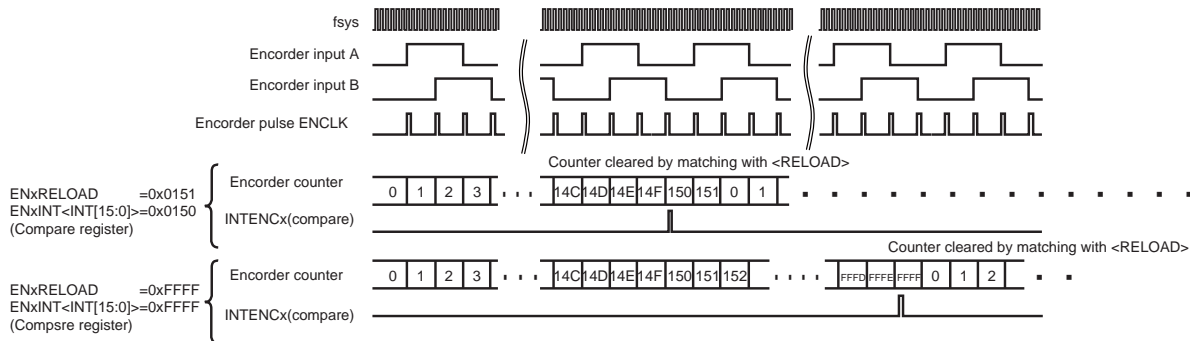

2. If ENTNCR<ZEN> = 0 (ENINT<INT[23:0]> = 0x000006)

- When  $\text{ENTNCR}\langle\text{ZEN}\rangle = 1$ , the Z input pin is used as an external trigger. When  $\text{ENTNCR}\langle\text{ZEN}\rangle = 0$ , no external input is used to trigger the timer.
- The encoder counter always counts up. If  $\text{ENTNCR}\langle\text{ZEN}\rangle = 1$ , the counter is cleared to 0 on the rising edge of Z when  $\text{ENTNCR}\langle\text{ZESEL}\rangle$  is set to "0" and a falling edge when  $\text{ENTNCR}\langle\text{ZESEL}\rangle$  is set to "1". When the encoder counter has reached to 0xFFFFF, it wraps around to 0.
- When  $\text{ENTNCR}\langle\text{ENCLR}\rangle$  is set to 1, the encoder counter is cleared to 0.
- Z-Detected causes the value of the encoder counter to be captured into the ENCNT register. The captured counter value can be read out of ENCNT.
- Setting the software capture bit,  $\text{ENTNCR}\langle\text{SFTCAP}\rangle$ , to 1 causes the value of the encoder counter to be captured into the ENCNT register. This capture operation can be performed at any time. The captured counter value can be read out of ENCNT.
- $\text{ENTNCR}\langle\text{UD}\rangle$  is set to 1 during CW rotation and cleared to 0 during CCW rotation.
- If  $\text{ENTNCR}\langle\text{CMPEN}\rangle$  is set to 1, an interrupt is generated when the value of the encoder counter has reached to the value of  $\text{ENINT}\langle\text{INT}[23:0]\rangle$ .
- When  $\text{ENTNCR}\langle\text{ENRUN}\rangle$  is set to "0",  $\text{ENTNCR}\langle\text{UD}\rangle$  is cleared to "0".
- The value of the ENCNT register (the captured value) is retained, regardless of the value of  $\text{ENTNCR}\langle\text{ENRUN}\rangle$ . The ENCNT register is only cleared by a reset.

24.6.2 Counter and interrupt generate operation when ENTNCR<CMPEN> = 1

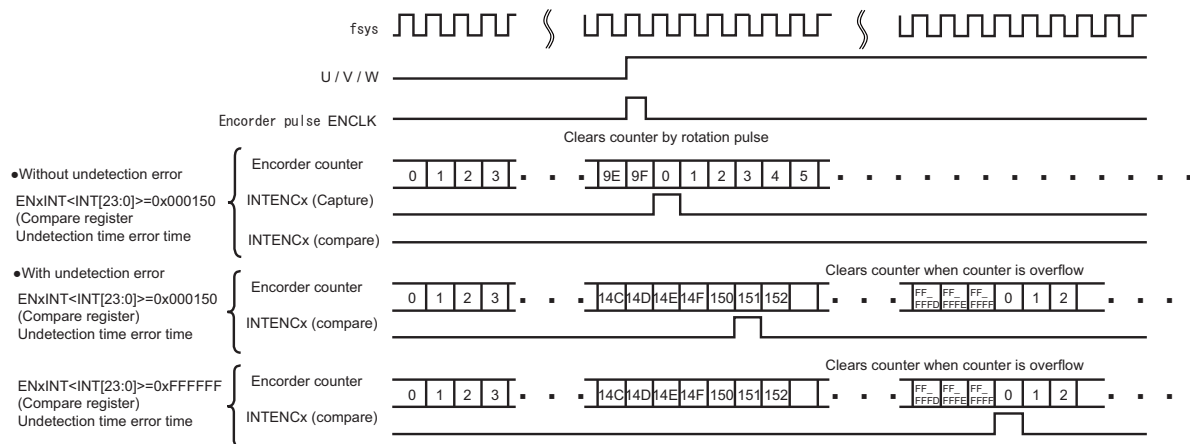

24.6.2.1 Encoder mode

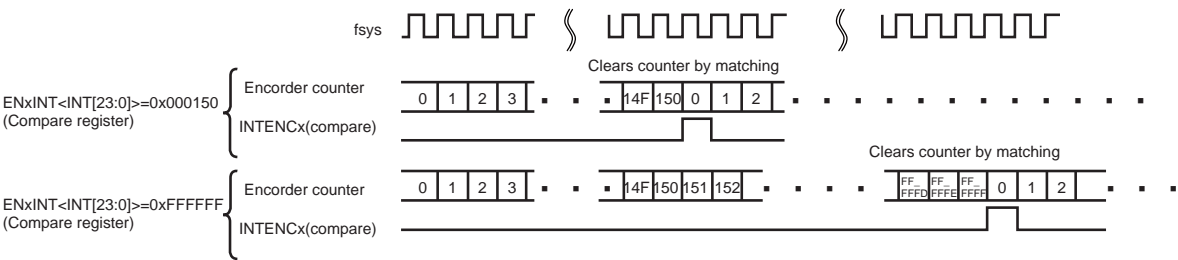

24.6.2.2 Sensor mode (event count)

24.6.2.3 Sensor mode (Timer count)

24.6.2.4 Timer mode

24.6.3 Counter and interrupt generate operation when ENTNCR<CMPEN> = 0

24.6.3.1 Encoder mode

ENTNCR<ENDEV[2:0]>="000"

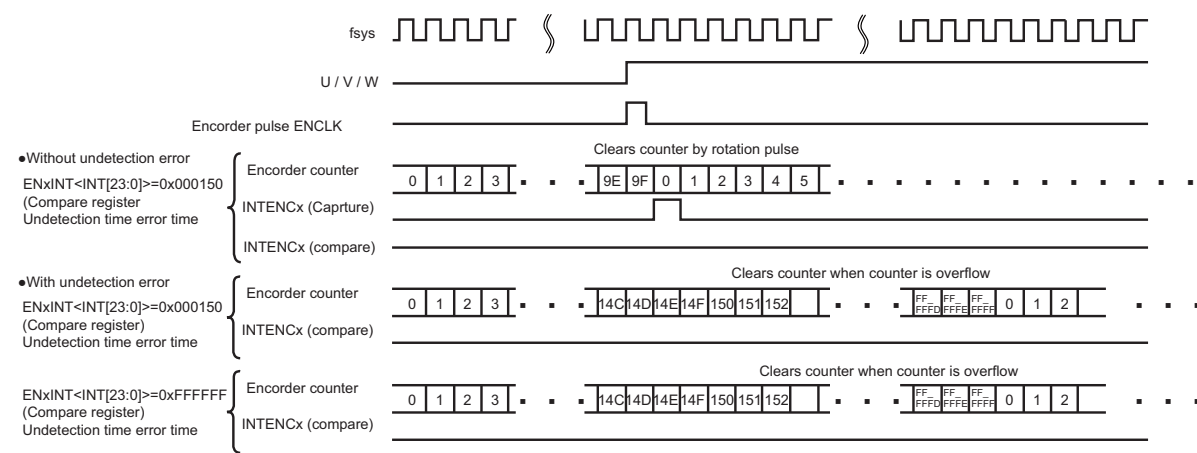

24.6.3.2 Sensor mode (event count)

ENTNCR<ENDEV[2:0]>="000"

24.6.3.3 Sensor mode (Timer count)

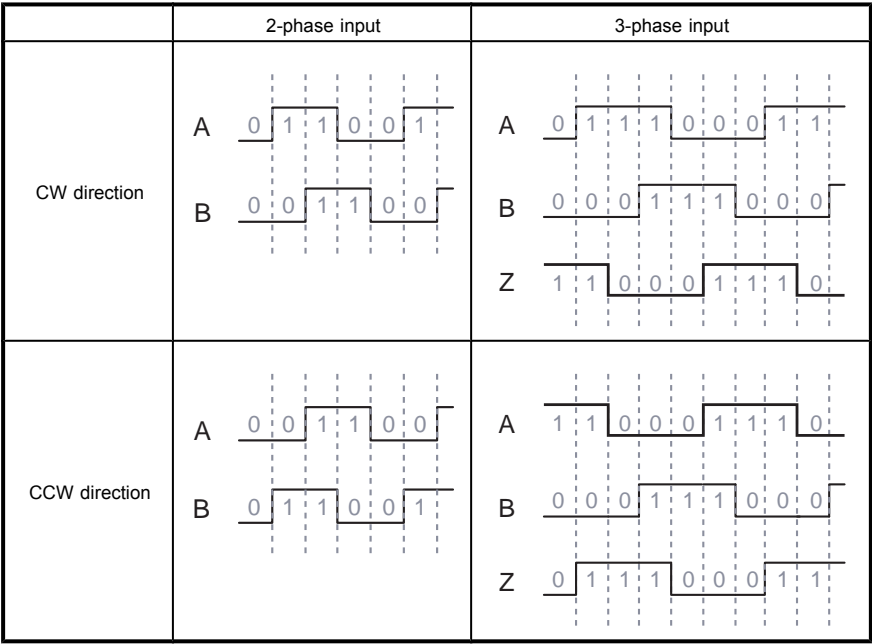

24.6.3.4 Timer mode

24.6.4 Encoder rotation direction

This circuit determines a phase either A-, B- or Z-phase.

It is used as 2-phase input (A,B) and 3-phase input (A,B,Z) in common. When 3-phase input is used, set ENTNCR<P3EN> = 1.

## 24.6.5 Counter Circuit

The counter circuit has a 24-bit up/down counter.

### 24.6.5.1 Operation Description

Depending on the operation modes, counting, clearing and reloading operation are controlled as described in Table 24-2.

Table 24-2 Counter control

Mode <MODE[1:0]>	<ZEN>	<P3EN>	Input pin	Count	Operation	Counter clear condition	Counter reload condition	Operational range of counter (Reload value)
Encoder mode 00	0	0	A,B	Encoder pulse (ENCLK)	UP	[1]<ENCLR> = 1 WR [2] Matches with <RE- LOAD>	-	0x0000 to <RE- LOAD>
					DOWN	[1]<ENCLR> = 1 WR	[1] Matches with 0x0000	
	1		A,B,Z		UP	[1]<ENCLR> = 1 WR [2] Matches with <RE- LOAD> [3] Z-trigger	-	
					DOWN	[1]<ENCLR> = 1 WR	[1] Matches with 0x0000	
Sensor mode (event count) 01	0	0	U,V		UP	[1]<ENCLR> = 1 WR [2] Matches with 0xFFFF	-	0x0000 to 0xFFFF
			DOWN		[1]<ENCLR> = 1 WR	[1] Matches with 0x0000		
		1	U,V,W		UP	[1]<ENCLR> = 1 WR [2] Matches with 0xFFFF	-	
					DOWN	[1]<ENCLR> = 1 WR	[1] Matches with 0x0000	
Sensor mode (Timer count) 10	0	0	U,V	fsys	UP	[1]<ENCLR> = 1 WR [2] Matches with 0xFFFFF	-	0x000000 to 0xFFFFF
		1	U,V,W		UP	[3] Encoder pulse (ENCLK)	-	
Timer mode 11	0	×	-	fsys	UP	[1]<ENCLR> = 1 WR [2] Matches with 0xFFFFF [3] Matches with <INT [23:0]>	-	0x000000 to 0xFFFFF
	1		Z		UP	[1]<ENCLR> = 1 WR [2] Matches with 0xFFFFF [3] Matches with <INT [23:0]> [4] Z-trigger	-	

Note: The counter value is not cleared by writing "0" to ENTNCR<ENRUN>. If <ENRUN> = 1 is set again, the counter restarts from the counter value which has stopped. If clear the counter value, write "1" to <ENCLR> to execute software clear.

## 24.6.6 Interrupt

The interrupt consists of four interrupts including Event (divide pulse and capture), Abnormal detecting time, Timer compare and Capture interrupts.

### 24.6.6.1 Operational Description

When  $\text{ENTNCR} \langle \text{INTEN} \rangle = 1$  is set, interrupts occurs by counter value and encoder pulses.

Interrupt factor setting consists of six kinds setting with operation modes and the setting of  $\text{ENTNCR} \langle \text{CMPEN} \rangle$  and  $\langle \text{ZEN} \rangle$ . Table 24-3 shows interrupt factors.

Table 24-3 Interrupt factors

	Interrupt factor	Description	Mode	Interrupt output	Status flag
1	Event count interrupt	When $\langle \text{CMPEN} \rangle = 1$ , the encoder counter counts events (encoder pulses). When it has reached to the value programmed in $\langle \text{INT}[15:0] \rangle$ , an interrupt occurs.	Encoder mode and Sensor mode (event count)	$\langle \text{INTEN} \rangle = 1$ and $\langle \text{CMPEN} \rangle = 1$	$\langle \text{CMP} \rangle$
2	Event interrupt (divide pulse)	An interrupt occurs on each divided clock pulse (1 to 128 divide), which is derived by dividing the encoder pulse by a factor programmed in $\langle \text{ENDEV} \rangle$ .		$\langle \text{INTEN} \rangle = 1$	Not available
3	Event interrupt (capture interrupt)	An interrupt occurs to indicate that an event (encoder pulse) has occurred, causing the counter value to be captured on the rotation pulse timing.	Sensor mode (Timer count)	$\langle \text{INTEN} \rangle = 1$	Not available
4	Abnormal detection time error interrupt	When $\langle \text{CMPEN} \rangle = 1$ , the ENC uses a counter that counts up with $f_{\text{sys}}$ and is cleared by an event (encoder pulse). If no event occurs for a period of time programmed in $\langle \text{INT}[23:0] \rangle$ , an interrupt occurs.		$\langle \text{INTEN} \rangle = 1$ and $\langle \text{CMPEN} \rangle = 1$	$\langle \text{CMP} \rangle$
5	Timer compare interrupt	When $\langle \text{CMPEN} \rangle = 1$ , an interrupt occurs when the timer has reached to the value programmed in $\langle \text{INT}[23:0] \rangle$ .	Timer mode	$\langle \text{INTEN} \rangle = 1$ and $\langle \text{CMPEN} \rangle = 1$	$\langle \text{CMP} \rangle$
6	Capture interrupt	An interrupt occurs when the counter value has been captured on an external trigger (Z input).		$\langle \text{INTEN} \rangle = 1$	Not available

In Sensor Timer Count mode and Timer mode, the value of the encoder counter can be captured into the ENCNT register.

The captured counter value can be read out of the ENCNT register.

In Sensor Timer Count mode, the value of the encoder counter is captured into the ENCNT register upon occurrence of an event (encoder pulse). The counter value can also be captured by writing a 1 to  $\text{ENTNCR} \langle \text{SFTCAP} \rangle$  by software.

In Timer mode, the counter value can be captured by writing a 1 to  $\text{ENTNCR} \langle \text{SFTCAP} \rangle$  by software. If  $\text{ENTNCR} \langle \text{ZEN} \rangle$  is set to 1, the counter value can also be captured by an edge of the Z signal input selected according to  $\text{ENTNCR} \langle \text{ZESEL} \rangle$  by external trigger.

## 25. Real Time Clock (RTC)

### 25.1 Function

1. Clock (hour, minute and second)
2. Calendar (month, week, date and leap year)
3. Selectable 12 (am/ pm) and 24 hour display
4. Time adjustment + or - 30 seconds (by software)
5. Interrupt

### 25.2 Block Diagram

Figure 25-1 Block Diagram

Note 1: **Western calendar year column:** This product uses only the final two digits of the year. The year following 99 is 00 years. Please take into account the first two digits when handling years in the western calendar.

Note 2: **Leap year:** A leap year is divisible by 4 excluding a year divisible by 100; the year divisible by 100 is not considered to be a leap year. Any year divisible by 400 is a leap year. This product is considered the year divisible by 4 to be a leap year and does not take into account the above exceptions. It needs adjustments for the exceptions.

## 25.3 Detailed Description Register

### 25.3.1 Register List

The registers and the addresses related to RTC are shown as below.

RTC has two functions, PAGE0 (clock) and PAGE1 (alarm), which share some parts of registers.

The PAGE can be selected by setting RTCPAGER<PAGE>.

Base Address = 0x400C\_C000

Register name		Address (Base+)
Second column register (only PAGE0)	RTCSECR	0x0000
Minute column register	RTCMINR	0x0001
Hour column register	RTCHOURR	0x0002
- (note 1)	-	0x0003
Day of the week column register	RTCDAYR	0x0004
Day column register	RTCDATER	0x0005
Month column register (PAGE0)	RTCMONTHR	0x0006
Selection register of 24-hour,12-hour (PAGE1)		
Year column register (PAGE0)	RTCYEARR	0x0007
Leap year register (PAGE1)		
PAGE register	RTCPAGER	0x0008
- (note 1)	-	0x0009
- (note 1)	-	0x000A
- (note 1)	-	0x000B
Reset register	RTCRESTR	0x000C
Reserved	-	0x000D
- (note 1)	-	0x000E
- (note 1)	-	0x000F

Note 1: "0" is read by reading the address. Writing is disregarded.

Note 2: Access to the "Reserved" areas is prohibited.

### 25.3.2 Control Register

Reset operation initializes the following registers.

- RTCPAGER<PAGE>, <ADJUST>, <INTENA>
- RTCRESTR<RSTALM>, <RSTTMR>, <DIS16HZ>, <DIS1HZ>, <DIS2HZ>, <DIS4HZ>, <DIS8HZ>

Other clock-related registers are not initialized by reset operation.

Before starting the RTC, set the time, month, day, day of the week, year and leap year in the relevant registers.

Caution is required in setting clock data, adjusting seconds or resetting the clock.

Refer to "25.4.3 Entering the Low Power Consumption Mode" for more information.

Table 25-1 PAGE0 (clock function) register

Symbol	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	Function
RTCSECR	–	40sec.	20sec.	10sec.	8sec.	4sec.	2sec.	1sec.	Second column
RTCMINR	–	40min.	20min.	10min.	8min.	4min.	2min.	1min.	Minute column
RTCHOURR	–	–	20hours PM/AM	10hour	8hour	4hour	2hour	1hours	Hour column
RTCDAYR	–	–	–	–	–	Day of the week			Day of the week column
RTCDATER	–	–	Day20	Day10	Day8	Day4	Day2	Day1	Day column
RTCMONTHR	–	–	–	Oct.	Aug.	Apr.	Feb.	Jan.	Month column
RTCYEARR	year 80	year 40	year20	year 10	year 8	year 4	year 2	year 1	Year column (lower two columns)
RTCPAGER	Interrupt enable	–	–	Adjustment function	Clock ena- ble	Alarm en- able	–	PAGE setting	PAGE register
RTCRESTR	1 Hz enable	16 Hz enable	Clock reset	Alarm reset	–	2Hz enable	4Hz enable	8Hz enable	Reset register

Note: Reading RTCSECR, RTCMINR, RTCHOURR, RTCDAYR, RTCMONTHR, RTCYEARR of PAGE0 captures the current state.

Table 25-2 PAGE1 (alarm function) registers

Symbol	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	Function
RTCSECR	–	–	–	–	–	–	–	–	–
RTCMINR	–	40min.	20min.	10min.	8min.	4min.	2min.	1min.	Minute column
RTCHOURR	–	–	20hours PM/AM	10hour	8hour	4hour	2hour	1hour	Hour column
RTCDAYR	–	–	–	–	–	Day of the week			Day of the week column
RTCDATER	–	–	Day20	Day10	Day8	Day4	Day2	Day1	Day column
RTCMONTHR	–	–	–	–	–	–	–	24/12	24-hour clock mode
RTCYEARR	–	–	–	–	–	–	Leap-year setting		Leap-year mode
RTCPAGER	Interrupt enable	–	–	Adjustment function	Clock ena- ble	Alarm en- able	–	PAGE setting	PAGE register
RTCRESTR	1 Hz Enable	16 Hz Enable	Clock reset	Alarm reset	–	2Hz enable	4Hz enable	8Hz enable	Reset register

Note 1: Reading RTCMINR, RTCHOURR, RTCDAYR, RTCMONTHR, RTCYEARR of PAGE1 captures the current state.

Note 2: RTCSECR, RTCMINR, RTCHOURR, RTCDAYR, RTCDATER, RTCMONTHR, RTCYEARR of PAGE0 and RTCYEARR of PAGE1 (for leap year) must be read twice and compare the data captured.

## 25.3.3 Detailed Description of Control Register

### 25.3.3.1 RTCSECR (Second column register (for PAGE0 only))

	7	6	5	4	3	2	1	0
bit symbol	-	SE						
After reset	0	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined

Bit	Bit Symbol	Type	Functon
7	-	R	Read as 0.
6-0	SE	R/W	Setting digit register of second 000_0000 : 00sec.      001_0000 : 10sec.      010_0000 : 20sec. 000_0001 : 01sec.      001_0001 : 11sec.           " 000_0010 : 02sec.      001_0010 : 12sec.      011_0000 : 30sec. 000_0011 : 03sec.      001_0011 : 13sec.           " 000_0100 : 04sec.      001_0100 : 14sec.      100_0000 : 40sec. 000_0101 : 05sec.      001_0101 : 15sec.           " 000_0110 : 06sec.      001_0110 : 16sec.      101_0000 : 50sec. 000_0111 : 07sec.      001_0111 : 17sec.           " 000_1000 : 08sec.      001_1000 : 18sec.           " 000_1001 : 09sec.      001_1001 : 19sec.      101_1001 : 59sec.

Note: The setting other than listed above is prohibited.

### 25.3.3.2 RTCMINR (Minute column register (PAGE0/1))

	7	6	5	4	3	2	1	0
Bit symbol	-	MI						
After reset	0	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined

After reset	0	0	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined

Bit	Bit Symbol	Type	Function
7-6	-	R	Read as 0.
5-0	DA	R/W	Setting digit register of day. 00_0001 : 1st day 00_0010 : 2nd day 00_0011 : 3rd day 00_0100 : 4th day 00_0101 : 5th day 00_0110 : 6th day 00_0111 : 7th day 00_1000 : 8th day 00_1001 : 9th day 01_0000 : 10th day 01_0001 : 11th day 01_0010 : 12th day 01_0011 : 13th day 01_0100 : 14th day 01_0101 : 15th day 01_0110 : 16th day 01_0111 : 17th day 01_1000 : 18th day 01_1001 : 19th day 10_0000 : 20th day 10_0001 : 21st day 10_0010 : 22nd day 10_0011 : 23rd day 10_0100 : 24th day 10_0101 : 25th day 10_0110 : 26th day 10_0111 : 27th day 10_1000 : 28th day 10_1001 : 29th day 11_0000 : 30th day 11_0001 : 31st day 11_1111 : don't care (Only PAGE1)

Note 1: The setting other than listed above is prohibited.

Note 2: Do not set for non-existent days (e.g.: 30th Feb.).

## 25.3.3.6 RTCMONTHR (Month column register (for PAGE0 only))

	7	6	5	4	3	2	1	0
Bit symbol	-	-	-	MO				
After reset	0	0	0	Undefined	Undefined	Undefined	Undefined	Undefined

Bit	Bit Symbol	Type	Function
7-5	-	R	Read as 0.
4-0	MO	R/W	Setting digit register of Month. 0_0001 : January      0_0111 : July 0_0010 : February    0_1000 : August 0_0011 : March        0_1001 : September 0_0100 : April        1_0000 : October 0_0101 : May          1_0001 : November 0_0110 : June         1_0010 : December

Note: The setting other than listed above is prohibited.

## 25.3.3.7 RTCMONTHR (Selection of 24-hour clock or 12-hour clock (for PAGE1 only))

	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	-	-	MO0
After reset	0	0	0	0	0	0	0	Undefined

Bit	Bit Symbol	Type	Function
7-1	-	R	Read as 0.
0	MO0	R/W	0: 12-hour 1: 24-hour

Note: Do not change the RTCMONTHR<MO0> while the RTC is in operation.

#### 25.3.3.8 RTCYEARR (Year column register (for PAGE0 only))

[illegible]

Bit	Bit Symbol	Type	Function
7-0	YE	R/W	Setting digit register of Year.
			0000_0000 : 00 years      0001_0000 : 10 years      0110_0000 : 60 years
			0000_0001 : 01 year      "      "
			0000_0010 : 02 years      0010_0000 : 20 years      0111_0000 : 70 years
			0000_0011 : 03 years      "      "
			0000_0100 : 04 years      0011_0000 : 30 years      1000_0000 : 80 years
			0000_0101 : 05 years      "      "
			0000_0110 : 06 years      0100_0000 : 40 years      1001_0000 : 90 years
			0000_0111 : 07 years      "      "
			0000_1000 : 08 years      01001_0000 : 50 years      "
			0000_1001 : 09 years      "      1001_1001 : 99 years

**Note: The setting other than listed above is prohibited.**

#### 25.3.3.9 RTCYEARR (Leap year register (for PAGE1 only))

[illegible]

Bit	Bit Symbol	Type	Function
7-2	–	R	Read as 0.
1-0	LEAP	R/W	00 : leap year 01 : one year after leap year 10 : two years after leap year 11 : three years after leap year

## 25.3.3.10 RTCPAGER(PAGE register(PAGE0/1))

	7	6	5	4	3	2	1	0
Bit symbol	INTENA	-	-	ADJUST	ENATMR	ENAALM	-	PAGE
After reset	0	0	0	0	Undefined	Undefined	0	0

Bit	Bit Symbol	Type	Function
7	INTENA	R/W	INTRTC 0:Disable 1:Enable
6-5	-	R	Read as 0.
4	ADJUST	R/W	[Write] 0: Don't care 1: Sets ADJUST request Adjusts seconds. The request is sampled when the sec. counter counts up. If the time elapsed is between 0 and 29 seconds, the sec. counter is cleared to "0". If the time elapsed is between 30 and 59 seconds, the min. counter is carried and sec. counter is cleared to "0". [Read] 0: ADJUST no request 1: ADJUST requested If "1" is read, it indicates that ADJUST is being executed. If "0" is read, it indicates that the execution is finished.
3	ENATMR	R/W	Clock 0: Disable 1: Enable
2	ENAALM	R/W	ALARM 0: Disable 1: Enable
1	-	R	Read as 0.
0	PAGE	R/W	PAGE selection 0:Selects Page0 1:Selects Page1

Note 1: A read-modify-write operation cannot be performed.

Note 2: To set interrupt enable bits to <ENATMR>, <ENAALM> and <INTENA>, you must follow the order specified here. Make sure not to set them at the same time (make sure that there is time lag between interrupt enable and clock/alarm enable).To change the setting of <ENATMR> and <ENAALM>, <INTENA> must be disabled first.

Example: Clock setting/Alarm setting

		7	6	5	4	3	2	1	0	
RTCPAGER	←	0	0	0	0	1	1	0	0	Enables Clock and alarm
RTCPAGER	←	1	0	0	0	1	1	0	0	Enables interrupt

### 25.3.3.11 RTCRESTR (Reset register (for PAGE0/1))

	7	6	5	4	3	2	1	0
Bit symbol	DIS1HZ	DIS16HZ	RSTTMR	RSTALM	-	DIS2HZ	DIS4HZ	DIS8HZ
After reset	1	1	0	0	0	1	1	1

Bit	Bit Symbol	Type	Function
7	DIS1HZ	R/W	1 Hz 0: Enable 1: Disable
6	DIS16HZ	R/W	16 Hz 0: Enable 1: Disable
5	RSTTMR	R/W	[Write] 0: Don't care 1: Sec.counter reset Resets the second counter. The Request is sampled using low-speed clock. [Read] 0: No reset request 1: RESET requested If "1" is read, it indicates that RESET is being executed. If "0" is read, it indicates that the execution is finished.
4	RSTALM	R/W	0: Don't care 1: Alarm reset Initialize alarm registers (Minute column, hour column, day column and day of the week column) as follows. Minus: 00, Hour:00, Day:01, Day of the week: Sunday
3	-	R	Read as 0.
2	DIS2HZ	R/W	2 Hz 0: Enable 1: Disable
1	DIS4HZ	R/W	4 Hz 0: Enable 1: Disable
0	DIS8HZ	R/W	8 Hz 0: Enable 1: Disable

Note 1: A read-modify-write operation cannot be performed for this register.

The setting of RTCPAGER<ENAALM> and <DIS1HZ>, <DIS16HZ>, <DS8HZ>, <DS4MZ>, <DS2MZ> used for alarm, 1Hz interrupt and 2Hz interrupt, 4Hz interrupt, 8Hz interrupt, 16Hz interrupt are shown as below.

Table 25-3 Select interrupt source signal

<DIS1HZ>	<DIS2HZ>	<DIS4HZ>	<DIS8HZ>	<DIS16HZ>	RTCPAGER <ENAALM>	Interrupt source signal
1	1	1	1	1	1	ALARM
0	1	1	1	1	0	1 Hz
1	0	1	1	1	0	2 Hz
1	1	0	1	1	0	4Hz
1	1	1	0	1	0	8Hz
1	1	1	1	0	0	16 Hz
Others						Interrupt not generated

## 25.4 Operational Description

The RTC incorporates a second counter that generates a 1Hz signal from a 32.768 kHz signal.

The second counter operation must be taken into account when using the RTC.

### 25.4.1 Reading clock data

1. Using 1Hz interrupt

The 1Hz interrupt is generated being synchronized with counting up of the second counter.

Data can be read correctly if reading data after 1Hz interrupt occurred.

2. Using pair reading

There is a possibility that the clock data may be read incorrectly if the internal counter operates carry during reading. To ensure correct data reading, read the clock data twice as shown below. A pair of data read successively needs to match.

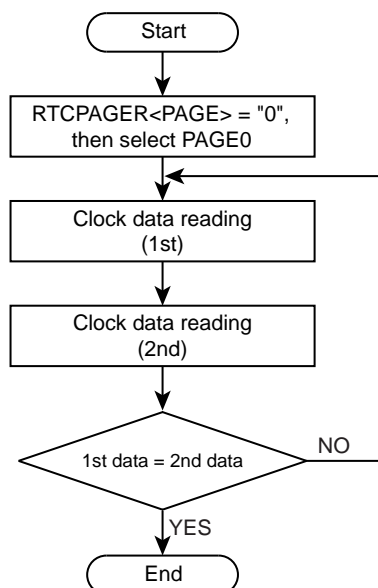

Figure 25-2 Flowchart of the clock data reading

### 25.4.2 Writing clock data

A carry during writing ruins correct data writing. The following procedure ensures the correct data writing.

1. Using 1 Hz interrupt

The 1Hz interrupt is generated by being synchronized with counting up of the second counter. If data is written in the time between 1Hz interrupt and subsequent one second count, it completes correctly.

2. Resetting counter

Write data after resetting the second counter.

The 1Hz-interrupt is generated one second after enabling the interrupt subsequent to counter reset.

The time must be set within one second after the interrupt.

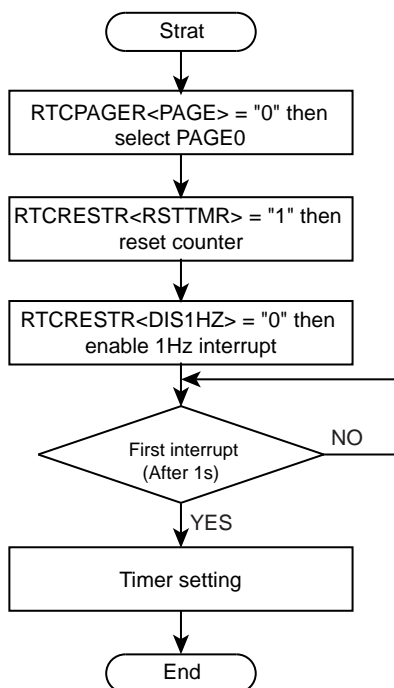

Figure 25-3 Flowchart of the clock data writing

### 3. Disabling the clock

Writing "0" to RTCPAGER<ENATMR> disables clock operation including a carry.

Stop the clock after the 1Hz-interrupt. The second counter keeps counting.

Set the clock again and enable the clock within one second before next 1Hz-interrupt

Figure 25-4 Flowchart of the disabling clock

25.4.3 Entering the Low Power Consumption Mode

To enter SLEEP mode, in which the system clock stops, after changing clock data, adjusting seconds or re-setting the clock, be sure to observe one of the following procedures

1. After changing the clock setting registers, setting the RTCPAGER<ADJUST> bit or setting the RTCRESTR<RSTTMR> bit, wait for one second for an interrupt to be generated.
2. After changing the clock setting registers, setting the RTCPAGER<ADJUST> bit or setting the RTCRESTR<RSTTMR> bit, read the corresponding clock register values, <ADJUST> or <RSTTMR> to make sure that the setting you have made is reflected.

25.5 Alarm function

By writing "1" to RTCPAGER<PAGE>, the alarm function of the PAGE1 registers is enabled.

The INTRTC interrupt signal is falling edge triggered. Specify the falling edge as the active state in the CG Interrupt Mode Control Register.

25.5.1 The INTRTC interrupt is generated when the values of the PAGE0 clock register and the PAGE1 alarm register correspond

when the values of the PAGE0 clock register and the PAGE1 alarm register correspond, the INTRTC interrupt is generated.

The alarm settings are shown as follows.

Initialize the alarm with alarm prohibited. Write "1" to RTCRESTR<RSTALM>.

It makes the alarm setting to be 00 minus, 00 hour, 01 day and Sunday.

Setting alarm for minus, hour, date and day is done by writing data to the relevant PAGE1 register.

Enable the alarm with the RTCPAGER<ENAALM> bit. Enable the interrupt with the RTCPAGER<INTENA> bit.

The following is an example program for generating INTRTC interrupt at noon (12:00) on Monday 5th.

	7	6	5	4	3	2	1	0		
RTCPAGER	←	0	0	0	0	1	0	0	1	Disable alarm, sets PAGE1
RTCRESTR	←	1	1	0	1	0	0	0	0	Initialize alarm
RTCDAYR	←	0	0	0	0	0	0	0	1	Monday
RTCDATER	←	0	0	0	0	0	1	0	1	5th day
RTCHOURR	←	0	0	0	1	0	0	1	0	Sets 12 o'clock
RTCMINR	←	0	0	0	0	0	0	0	0	Sets 00 minus
RTCPAGER	←	0	0	0	0	1	1	0	0	Enables alarm
RTCPAGER	←	1	0	0	0	1	1	0	0	Enables interrupts

The above alarm works in synchronization with the low-speed clock. When the CPU is operating at high frequency oscillation, a maximum of one clock delay at fs (about 30μs) may occur for the time register setting be become valid.

Note: To make the alarm work repeatedly (e.g. every Wednesday at 12:00), next alarm must be set during the INTETC interrupt routine that is generated when the time set for the alarm matches the RTC count.

## 26. Power-on-Reset Circuit (POR)

The power-on-reset circuit (POR) generates a power-on reset signal when power-on.

Power supply voltage is indicated as DVDD3.

### 26.1 Structure

Power-on-reset circuit consists of the reference voltage generation circuit, comparators, the LVD reset circuit and the power-on counter.

This circuit compares a voltage divided by the ladder resistor with a reference voltage generated in the reference voltage generation circuit in the comparator.

Figure 26-1 Power-on-reset circuit

For details of LVDRCR in LVD reset circuit, refer to Section "Voltage detection circuit (LVD)".

### 26.2 Function

At power-on, a power-on detection signal generates while power supply voltage is lower than the releasing voltage. Power-on detection signal is released at the timing when DVDD3 is over  $2.3 \pm 0.2$  V.

If the power-on detection signal is released and the reset detection signal is also released, the power-on counter starts to operate. After waiting time (approximately 0.8ms) has elapsed, the power-on reset signal is released.

During the power-on reset signal generation, the CPU and the peripheral functions are reset.

When a reset input is not used, supply voltage must be raised to the recommended operational voltage range until the power-on reset releasing. If power supply voltage does not reach to the recommended operational voltage range during this period, TMPM368FDXBG cannot operate properly.

Note: Due to the fluctuation of supply voltage, the power-on reset circuit may not operate properly. Users should give due consideration based on the electrical characteristic in the device designing.

Figure 26-2 Power-on-reset operation timing

## 27. Low Voltage Detection Circuit (LVD)

Low voltage detection circuit generates a reset signal or an interrupt signal by detecting a decreasing/increasing voltage.

Supply voltage is indicated as DVDD3.

Note: Due to the fluctuation of supply voltage, the power-on reset circuit may not operate properly. Users should give due consideration based on the electrical characteristic in the device designing.

### 27.1 Structure

The low voltage detection circuit consists of a reference voltage generation circuit, comparators and control registers.

Supply voltage is divided by a ladder resistor and input to the voltage selection circuit. In the voltage selection circuit, a voltage is chosen according to the detected voltage then compared with the reference voltage in the comparator. If the supply voltage is upper/lower than the detected voltage, a reset/interrupt signal occurs.

Figure 27-1 Block diagram of LVD (described only LVD interrupt circuit)

Refer to Section "Power-on-reset circuit" about the LVD reset circuit block diagram.

## 27.2 Registers

### 27.2.1 Register List

Base Address = 0x400F\_4000

Register name		Address(Base+)
LVD reset control register	LVDRCR	0x0000
LVD interrupt control register	LVDICR	0x0004
LVD status register	LVDSR	0x0008

### 27.2.2 LVDRCR (LVD reset control register)

After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Function
31 - 2	–	R	Read as "0".
1	LVDST2	R	Indicates LVDLVL2 low voltage detection status 0: Power supply voltage is upper than the detection voltage. 1: Power supply voltage is lower than the detection voltage.
0	LVDST1	R	Indicates LVDLVL1 low voltage detection status 0: Power supply voltage is upper than the detection voltage. 1: Power supply voltage is lower than the detection voltage.

Note: LVDSR is initialized by power-on-reset, LVD reset and reset with  $\overline{\text{RESET}}$  pin.

## 27.3 Operation Description

### 27.3.1 Detection Voltage Selection and Enabling/Disabling the Operation

The LVDICR register sets the following; choosing the detection voltage, setting the operation to enable/disable, choosing output conditions and setting the output to enable/disable. The LVDICR register is initialized with the power-on reset, the LVD reset or the reset by  $\overline{\text{RESET}}$  pin.

The LVDICR<LVDLVL2[2:0]> bit chooses the detection voltage. If LVDICR<LVDEN2> is set to "1", low voltage detection operation is enabled.

Note: While supply voltage is lower than the detection voltage, if low voltage detection operation is enabled, INTLVD will generate at this timing.

### 27.3.2 Lower Voltage Detection

If supply voltage is lower than the detection voltage level, INTLVD generates. When the LVDICR<INTSEL> is set to "1", if supply voltage is upper than the detection voltage, INTLVD generates.

After lower voltage detection, to detect INTLVD is required a certain time. If this period is shorter than expected, INTLVD may not generate.

If supply voltage is lower than 2.7V, MCU operation is not guaranteed. In this case, supply voltage must be decreased to 0V and then power-on.

Figure 27-2 low voltage detection Timing

## 28. Oscillation Frequency Detector (OFD)

The oscillation frequency detector circuit (OFD) detects abnormal clock frequency. To use the OFD, abnormal states of clock such as a harmonic, a subharmonic or stopped state can be detected.

The OFD monitors the target clock frequency using reference frequency and generates a reset signal if abnormal state is detected. TMPM368FDXBG uses internal high-speed oscillator clock 2 ( $f_{IHOSC2}$ ) as a reference and the target clock are an internal high-speed oscillator clock 1 ( $f_{IHOSC1}$ ) and an external high-speed oscillator clock ( $f_{EHOSC}$ ). They are selected by  $CGOSCCR<OSCSEL>$ .

Note: It is not guaranteed that OFD can detect all defects at any time, and it is not a circuit to measure error frequency.

### 28.1 Block diagram

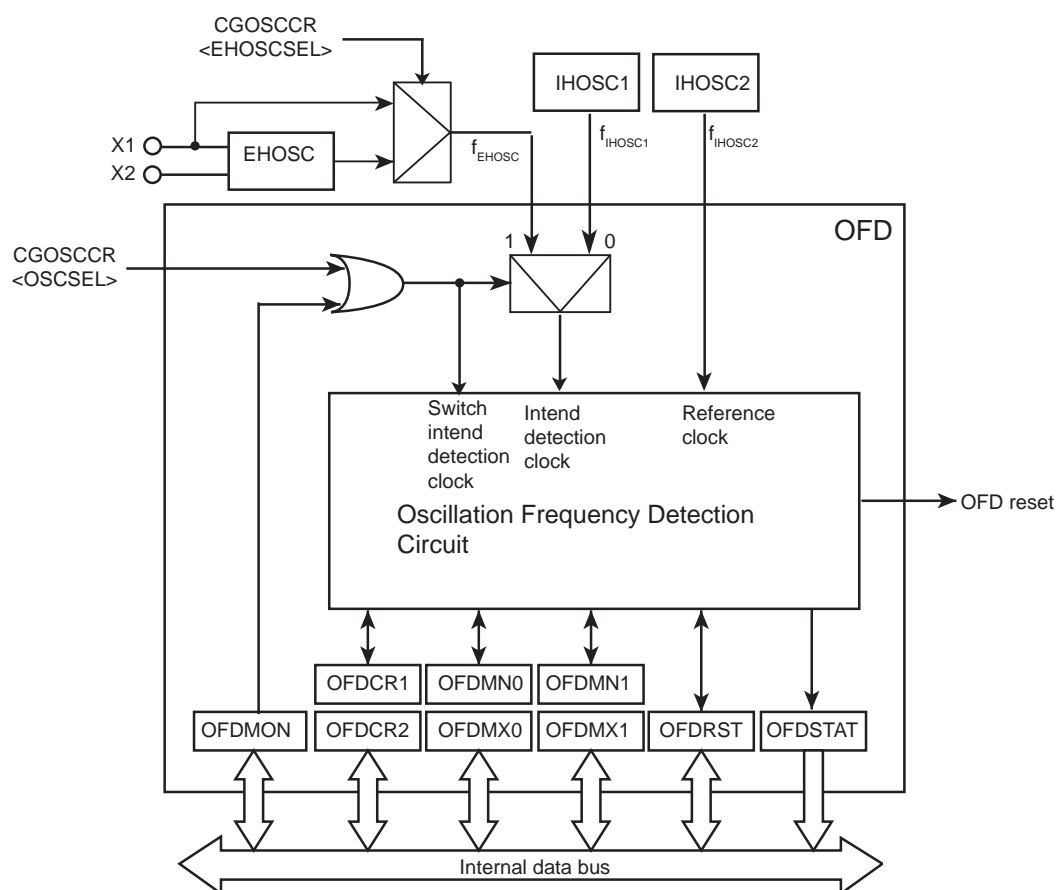

Figure 28-1 Oscillation Frequency Detector Block diagram

## 28.2 Registers

### 28.2.1 Register List

Base Address = 0x400F\_1000

Register name		Address(Base+)
Control register 1	OFDCR1	0x0000
Control register 2	OFDCR2	0x0004
Lower detection frequency setting register0 (IHOSC1)	OFDMN0	0x0008
Lower detection frequency setting register1 (EHOSC)	OFDMN1	0x000C
Higher detection frequency setting register0 (IHOSC1)	OFDMX0	0x0010
Higher detection frequency setting register1 (EHOSC)	OFDMX1	0x0014
Reset control register	OFDRST	0x0018
Status register	OFDSTAT	0x001C
External high frequency oscillaion clock monitor register	OFDMON	0x0020

Note:Access to the "Reserved" area is prohibited.

## 28.2.1.1 OFDCR1 (Control register 1)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	OFDWEN							
After reset	0	0	0	0	0	1	1	0

Bit	Bit Symbol	Type	Description
31-8	-	R	Read as 0.
7-0	OFDWEN[7:0]	R/W	Controls register write 0x06: Disable 0xF9: Enable Setting 0xF9 enables to write registers except OFDCR1. When writing a value except 0x06 or 0xF9, 0x06 is written. If writing register is disabled, reading from each register is enabled.

## 28.2.1.2 OFDCR2 (Control register 2)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16

After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	OFDEN							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Description
31-8	-	R	Read as 0.
7-0	OFDEN[7:0]	R/W	Controls frequency detecting. 0x00: Disable 0xE4: Enable Writing a value except 0x00 or 0xE4 is invalid and a value will not be changed.

## 28.2.1.3 OFDMN0 (Lower detection frequency setting register 0)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	OFDMN0
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	OFDMN0							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Description
31-9	-	R	Read as 0.
8-0	OFDMN0[8:0]	R/W	Sets internal lower detection frequency.

Note: Writing to the register of OFDMN0 is protected while OFD circuit is operating.

## 28.2.1.4 OFDMN1 (Lower detection frequency setting register 1)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	OFDMN1
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	OFDMN1							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Description
31-9	-	R	Read as 0.
8-0	OFDMN1[8:0]	R/W	Sets external lower detection frequency.

Note: Writing to the register of OFDMN1 is protected while OFD circuit is operating.

## 28.2.1.5 OFDMX0 (Higher detection frequency setting register 0)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	OFDMX0
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	OFDMX0							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Description
31-9	-	R	Read as 0.
8-0	OFDMX0[8:0]	R/W	Sets internal higher detection frequency.

Note: Writing to the register of OFDMX0 is protected while OFD circuit is operating.

## 28.2.1.6 OFDMX1 (Higher detection frequency setting register 1)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	OFDMX1
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	OFDMX1							
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Description
31-9	-	R	Read as 0.
8-0	OFDMX1[8:0]	R/W	Sets external higher detection frequency.

Note: Writing to the register of OFDMX1 is protected while OFD circuit is operating.

## 28.2.1.7 OFDRST (Reset control register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	-	-	OFDRSTEN
After reset	0	0	0	0	0	0	0	1

Bit	Bit Symbol	Type	Description
31-1	-	R	Read as 0.
0	OFDRSTEN	R/W	Controls generating a reset. 0: Disable 1: Enable

Note: Writing to the register of OFDRST is protected while OFD circuit is operating.

## 28.2.1.8 OFDSTAT (Status register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	-	OFDBUSY	FRQERR
After reset	0	0	0	0	0	0	0	0

Bit	Bit Symbol	Type	Description
31-2	-	R	Read as 0.
1	OFDBUSY	R	OFD operation 0: Run 1: Stop
0	FRQERR	R	Error detecting flag 0: No Error 1: Error

## 28.2.1.9 OFDMON (External high frequency oscillation clock monitor register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	-	-	OFDMON
After reset	0	0	0	0	0	0	0	1

Bit	Bit Symbol	Type	Description
31-1	-	R	Read as 0.
0	OFDMON	R/W	Select intended detection frequency 0: Normal detection mode Target clock which is selected by CGOSCCR<OSCSEL> 1: Monitor mode Monitor the oscillation condition of EHOSC when system is operated by IHOSC1

Note: Writing to the register of OFDRST is protected while OFD circuit is operating.

## 28.3 Operational Description

### 28.3.1 Setting

All register except OFDCR1 can not be written by reset. They are can be written by writing "0xF9" to OFDCR1.

The range of detection frequency is setting by OFDMX and OFDMN for each clock. The reset generation is set for enabling or disabling by OFDRST, and writing "0xE4" to OFDCR2 enables the oscillation frequency detection.

To protect the mistaken writting, shout be written "0x06" to OFDCR1. And the register should be modified when OFD is sttoped.

### 28.3.2 Operation

From the operation start-up to detection start-up, time length as two cycle of detecting clock is needed.

OFDSTAT<OFDBSY> can confirm whether it is operating. Detecting cycle is 256/reference clock frequency.

The oscillation condition can be confirmed by monitor function before system clock is chaged to the external oscilattion clock EHOSC. At this time, disable reset generation and monitor the oscillation condition by OFDSTAT<FRQERR>. Since the OFDSTAT<OFDBSY> changes to operating until the state of OFD-STAT<FRQERR> changes valid, time length as two cycle of detecting clock is needed.

When generating reset is enabled, OFD generates reset if the target clock frequency exceeds the frequency limit set by OFDMN and OFDMX. From detection of abnormal to reset generation, time length as two cycle of detecting clock is needed.

The reset generated by OFD does not make itself and OFD continues detected operation. Therefore, fosc is initialized to IHOSC1 and the target clock changes to IHOSC1 and detected operation is continued. When the target clock frequency is IHOSC1 and the reset generated by OFD, the reset is generated continuously until OFD detects correctly. From detection of abnormal to reset generation, time length as two cycle of detecting clock is needed.

Note: There are several factors of reset. Clock generator register CGRSTFLG can confirm the factors. For details of CGRSTFLG see chapter "exception."

### 28.3.3 Detection Frequency

The detection frequency have a detection frequency range and an undetectable frequency range because of oscillation accuracy. Therefore, it is undefined whether to be detected between detection frequency range and undetectable it.

The upper and lower limit of detecting frequency are calculated by the maximum error of a target clock and a reference clock.

By the way of rounding the calculated result when OFDMX and OFDMN are decided, the upper and lower limit of detecting and undetecting range shown as follows. The way of rounding is selected depending on the unevenness of the detected clock.

- In case of rounding up OFDMX and rounding down OFDMN

The target clock is higher than the upper limit of undetecting range and lower than the lower limit of undetecting range.

- In case of rounding down OFDMX and rounding down OFDMN

The target clock is lower than the upper limit of undetecting range and higher than the lower limit of undetecting range.

The higher and lower limit of the detection frequency is calculated from the maximum error of the target clock and the reference.

How to calculate the setup value of OFDMN/OFDMX is shown below when the target clock error is  $\pm 3\%$  (undetecting range) and the reference clock error is  $\pm 5\%$ . In this example, OFDMX is rounded up and OFDMN is rounded down.

target clock	10MHz $\pm 3\%$	Max. 10.3MHz	----- c
		Min. 9.7MHz	----- b
reference clock	10MHz $\pm 5\%$	Max. 10.5MHz	----- f
		Min. 9.5MHz	----- e

$$\text{OFDMX} = c \div e \times 64 = 69.39... = 70 \text{ (Rounding up to nearest decimal)} = 0x46$$

$$\text{OFDMN} = b \div f \times 64 = 59.12... = 59 \text{ (Rounding down to nearest decimal)} = 0x3B$$

At this time, the detecting range is calculated shown below.

$$a = e \times \text{OFDMN} \div 64 = 8.76$$

$$d = f \times \text{OFDMX} \div 64 = 11.5$$

And the undetecting range is calculated shown below.

$$g = e \times \text{OFDMX} \div 64 = 10.4$$

$$h = f \times \text{OFDMN} \div 64 = 9.68$$

Setting "0x46" to the register OFDMX and "0x3B" to the register OFDMN, when the target clock of higher than 11.5MHz or lower than 8.76MHz is detected, the oscillation frequency detector outputs a reset signal. And when the target clock of higher than 9.68MHz and lower than 10.4MHz is detected, the oscillation frequency detector does not output a reset signal.

Figure 28-2 shows the detection or undetectable and detectable frequency range.

Figure 28-2 Example of detection frequency range (in case of 10MHz)

28.3.4 Available Operation Mode

The oscillation frequency detection is available only in NORMAL and IDLE mode. Before shifting to another mode, disable the oscillation frequency detection.

### 28.3.5 Example of Operational Procedure

The example of operational procedure is shown below.

After reset, confirms various reset factor by CGRSTFLG. If the reset factor is not by the oscillation frequency detect, enable external oscillation, set register to use OFD and enable operation. Reset output must be disabled at this time.

After waiting the OFD operation is started, confirms abnormal status flag, and if there is not abnormal status, change to external oscillation clock.

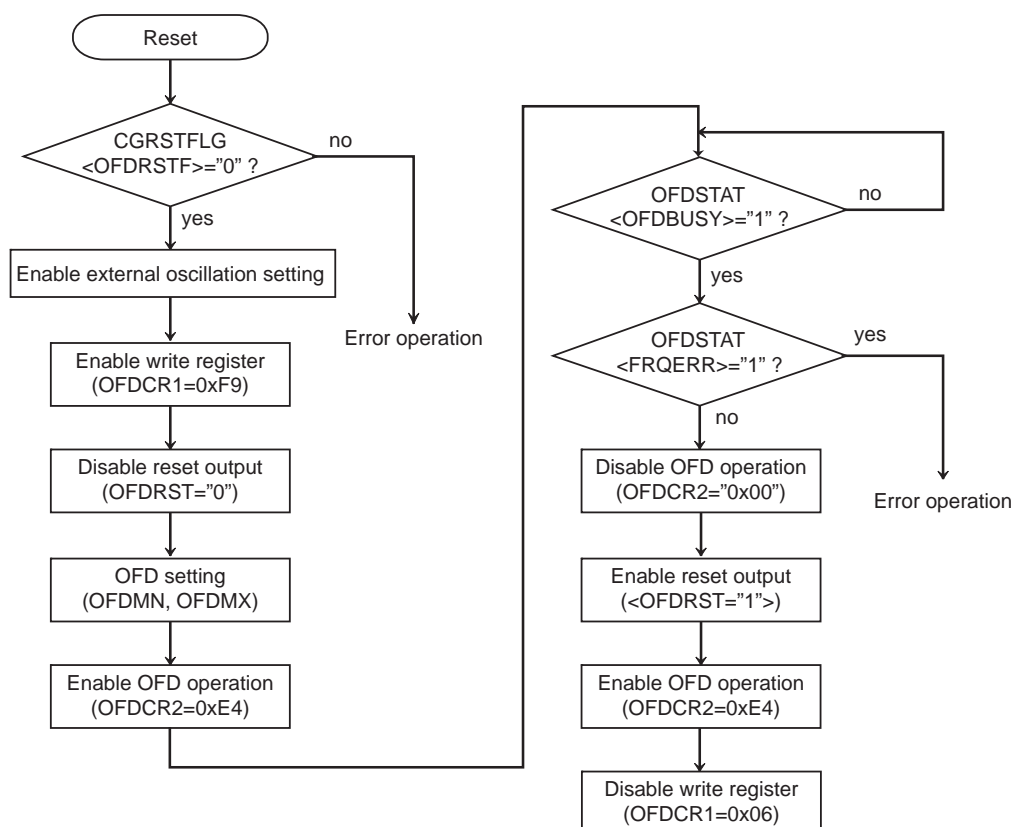

Figure 28-3 Example of operational procedure

## 29. Watchdog Timer(WDT)

The watchdog timer (WDT) is for detecting malfunctions (runaways) of the CPU caused by noises or other disturbances and remedying them to return the CPU to normal operation.

If the watchdog timer detects a runaway, it generates a INTWDT interrupt or reset.

Note: INTWDT interrupt is a factor of the non-maskable interrupts (NMI).

Also, the watchdog timer notifies of the detecting malfunction to the external peripheral devices from the watchdog timer pin ( $\overline{\text{WDTOUT}}$ ) by outputting "Low".

Note: This product does not have the watchdog timer out pin ( $\overline{\text{WDTOUT}}$ ).

### 29.1 Configuration

Figure 29-1 shows the block diagram of the watchdog timer.

Figure 29-1 Block Diagram of the Watchdog Timer

## 29.2 Register

The followings are the watchdog timer control registers and addresses.

Base Address = 0x400F\_2000

Register name		Address(Base+)
Watchdog Timer Mode Register	WDMOD	0x0000
Watchdog Timer Control Register	WDCR	0x0004

### 29.2.1 WDMOD(Watchdog Timer Mode Register)

	31	30	29	28	27	26	25	24

## 29.3 Operations

### 29.3.1 Basic Operation

The Watchdog timer consists of the binary counters that work using the system clock (f<sub>sys</sub>) as an input. Detecting time can be selected between 2<sup>15</sup>, 2<sup>17</sup>, 2<sup>19</sup>, 2<sup>21</sup>, 2<sup>23</sup> and 2<sup>25</sup> by the WDMOD<WDTP[2:0]>. The detecting time as specified is elapsed, the watchdog timer interrupt (INTWDT) generates, and the watchdog timer out pin ( $\overline{\text{WDTOUT}}$ ) output "Low".

To detect malfunctions (runaways) of the CPU caused by noise or other disturbances, the binary counter of the watchdog timer should be cleared by software instruction before INTWDT interrupt generates. If the binary counter is not cleared, the non-maskable interrupt generates by INTWDT. Thus CPU detects malfunction (runway), malfunction countermeasure program is performed to return to the normal operation.

Additionally, it is possible to resolve the problem of a malfunction (runaway) of the CPU by connecting the watchdog timer out pin to reset pins of peripheral devices.

Note: This product does not include a watchdog timer out pin ( $\overline{\text{WDTOUT}}$ ).

### 29.3.2 Operation Mode and Status

The watchdog timer begins operation immediately after a reset is cleared.

If not using the watchdog timer, it should be disabled.

The watchdog timer cannot be used as the high-speed frequency clock is stopped. Before transition to low modes, the watchdog timer should be disabled. In IDLE mode, its operation depends on the WDMOD <I2WDT> setting.

- STOP1 mode
- STOP2 mode

Also, the binary counter is automatically stopped during debug mode.

## 29.4 Operation when malfunction (runaway) is detected

### 29.4.1 INTWDT interrupt generation

In the Figure 29-2 shows the case that INTWDT interrupt generates (WDMOD<RESCR>="0").

When an overflow of the binary counter occurs, INTWDT interrupt generates. It is a factor of non-maskable interrupt (NMI). Thus CPU detects non-maskable interrupt and performs the countermeasure program.

The factor of non-maskable interrupt is the plural. CGNMIFLG identifies the factor of non-maskable interrupts. In the case of INTWDT interrupt, CGNMIFLG<NMIFLG0> is set.

When INTWDT interrupt generates, simultaneously the watchdog timer out ( $\overline{\text{WDTOUT}}$ ) output "Low".  $\overline{\text{WDTOUT}}$  becomes "High" by the watchdog timer clearing that is writing clear code 0x4E to the WDCR register.

Note: This product does not have the watchdog timer output pin( $\overline{\text{WDTOUT}}$ ).

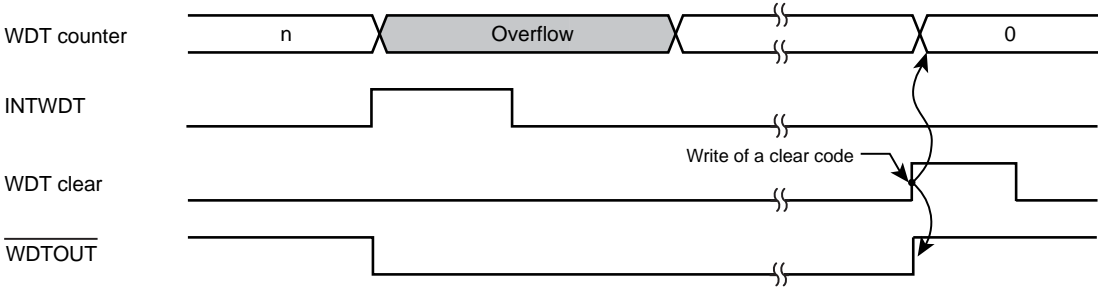

Figure 29-2 INTWDT interrupt generation

### 29.4.2 Internal reset generation

Figure 29-3 shows the internal reset generation (WDMOD<RESCR>="1").

MCU is reset by the overflow of the binary counter. In this case, reset status continues for 32 states. A clock is initialized so that input clock (fsys) is the same as a internal high-speed frequency clock (fosc). This means fsys = fosc.

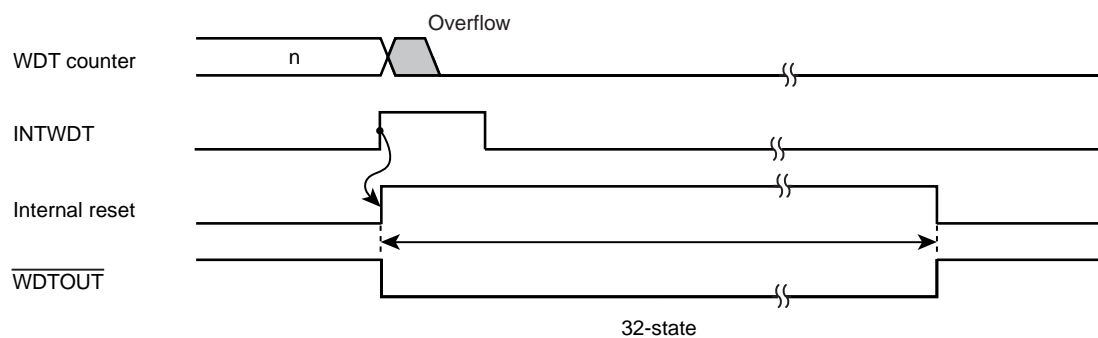

Figure 29-3 Internal reset generation

## 29.5 Control register

The watchdog timer (WDT) is controlled by two control registers WDMOD and WDCR.

### 29.5.1 Watchdog Timer Mode Register (WDMOD)

1. Specifying the detection time of the watchdog timer <WDTP[2:0]>.

Set the watchdog timer detecting time to WDMOD<WDTP[2:0]>. After reset, it is initialized to WDMOD<WDTP[2:0]> = "000".

2. Enabling/disabling the watchdog timer <WDTE>.

When resetting, WDMOD <WDTE> is initialized to "1" and the watchdog timer is enabled.

To disable the watchdog timer to protect from the error writing by the malfunction, first <WDTE> bit is set to "0", and then the disable code (0xB1) must be written to WDCR register.

To change the status of the watchdog timer from "disable" to "enable," set the <WDTE> bit to "1".

3. Watchdog timer out reset connection <RESCR>

This register specifies whether WDTOUT is used for internal reset or interrupt. After reset, WDMOD<RESCR> is initialized to "1", the internal reset is generated by the overflow of binary counter.

### 29.5.2 Watchdog Timer Control Register(WDCR)

This is a register for disabling the watchdog timer function and controlling the clearing function of the binary counter.

### 29.5.3 Setting example

#### 29.5.3.1 Disabling control

By writing the disable code (0xB1) to this WDCR register after setting WDMOD <WDTE> to "0," the watchdog timer can be disabled and the binary counter can be cleared.

		7	6	5	4	3	2	1	0	
WDMOD	←	0	-	-	-	-	-	-	-	Set <WDTE> to "0".
WDCR	←	1	0	1	1	0	0	0	1	Writes the disable code (0xB1).

#### 29.5.3.2 Enabling control

Set WDMOD <WDTE> to "1".

		7	6	5	4	3	2	1	0	
WDMOD	←	1	-	-	-	-	-	-	-	Set <WDTE> to "1".

#### 29.5.3.3 Watchdog timer clearing control

Writing the clear code (0x4E) to the WDCR register clears the binary counter and it restarts counting.

		7	6	5	4	3	2	1	0	
WDCR	←	0	1	0	0	1	1	1	0	Writes the clear code (0x4E).

#### 29.5.3.4 Detection time of watchdog timer

In the case that  $2^{21}/f_{sys}$  is used, set "011" to WDMOD<WDTP[2:0]>.

		7	6	5	4	3	2	1	0	
WDMOD	←	1	0	1	1	-	-	-	-	

## 30. Flash

This section describes the hardware configuration and operation of the flash memory.

### 30.1 Flash Memory

#### 30.1.1 Features

##### 1. Memory capacity

TMPM368FDXBG contains flash memory. The memory sizes and configurations are shown in the table below.

Independent write access to each block is available. When the CPU is to access the internal flash memory, 32-bit data bus width is used.

##### 2. Write / erase time

Writing is executed per page. TMPM368FDXBG contains 128 words.

Page writing requires 1.25ms (typical) regardless of number of words.

A block erase requires 0.1 sec. (typical).

The following table shows write and erase time per chip.

Product Name	Memory size	Block Configuration			# of words	Write time	Erase time
		128 KB	64 KB	32 KB			
TMPM368FDXBG	512 KB	3	1	2	128	1.28 s	0.4 s

Note: **The above values are theoretical values not including data transfer time. The write time per chip depends on the write method to be used by users.**

##### 3. Programming method

There are two types of the onboard programming mode for users to program (rewrite) the device while it is mounted on the user's board:

###### a. User boot mode

The use's original rewriting method can be supported.

###### b. Single boot mode

The rewriting method to use serial data transfer (Toshiba's unique method) can be supported.

4. Rewriting method

The flash memory included in this device is generally compliant with the applicable JEDEC standards except for some specific functions. Therefore, if a user is currently using an external flash memory device, it is easy to implement the functions into this device. Furthermore, the user is not required to build his/her own programs to realize complicated write and erase functions because such functions are automatically performed using the circuits already built-in the flash memory chip.

JEDEC compliant functions	Modified, added, or deleted functions
<ul style="list-style-type: none"><li>• Automatic programming</li><li>• Automatic chip erase</li><li>• Automatic block erase</li><li>• Data polling / toggle bit</li></ul>	<p>&lt;Modified&gt; Block protect (only software protection is supported)</p> <p>&lt;Deleted&gt; Erase resume - suspend function</p>

5. Protect/ Security Function

This device is also implemented with a read-protect function to inhibit reading flash memory data from any external writer device. On the other hand, rewrite protection is available only through command-based software programming; any hardware setting method to apply +12VDC is not supported. See the chapter "ROM protection" for details of ROM protection and security function.

Note: **If a password is set to 0xFF (erased data), it is difficult to protect data securely due to an easy-to-guess password. Even if Single Boot mode is not used, it is recommended to set a unique value as a password.**

## 30.1.2 Block Diagram of the Flash Memory Section

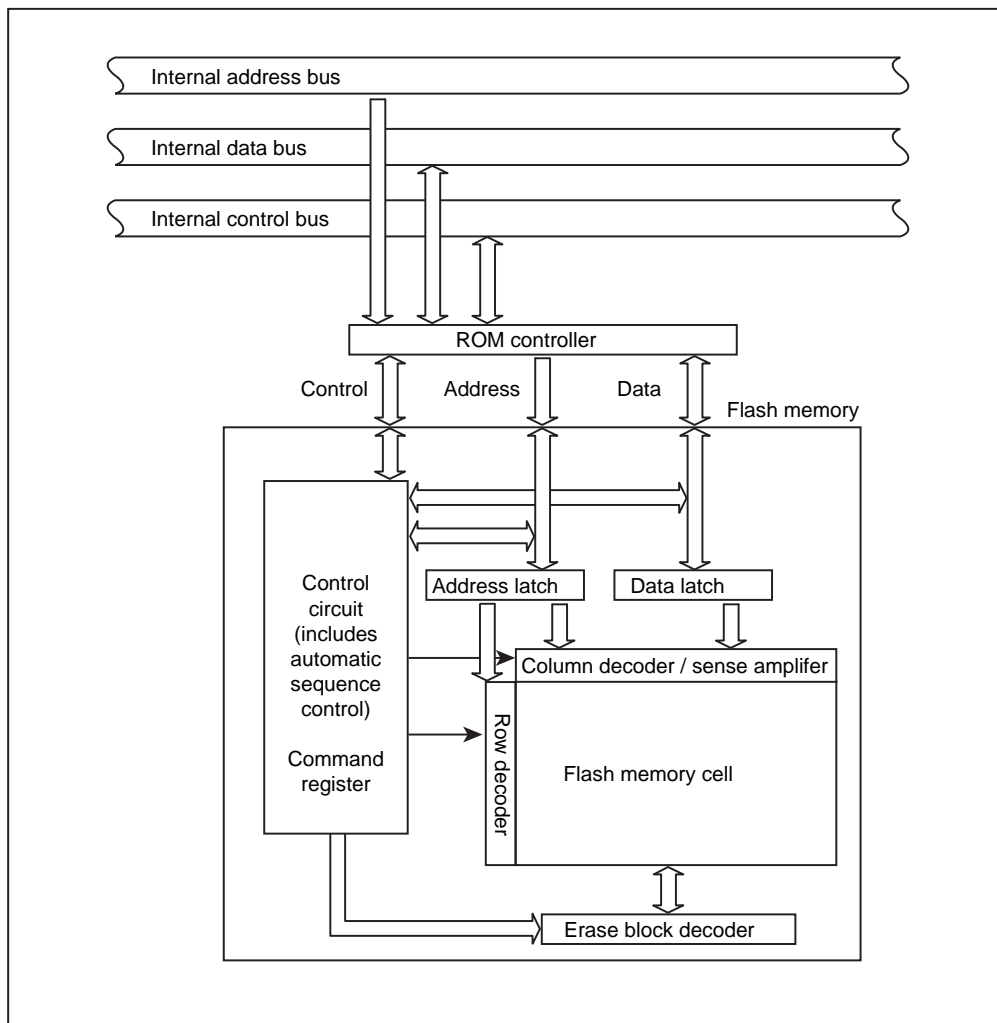

Figure 30-1 Block Diagram of the Flash Memory Section

### 30.2 Operation Mode

This device has three operation modes including the mode not to use the internal flash memory.

Table 30-1 Operation modes

Operation mode	Operation details
Single chip mode	After reset is cleared, it starts up from the internal flash memory.
Normal mode	In this operation mode, two different modes, i.e., the mode to execute user application programs and the mode to rewrite the flash memory onboard the user's set, are defined. The former is referred to as "normal mode" and the latter "user boot mode".  A user can uniquely configure the system to switch between these two modes. For example, a user can freely design the system such that the normal mode is selected when the port "A0" is set to "1" and the user boot mode is selected when it is set to "0". A user should prepare a routine as part of the application program to make the decision on the selection of the modes.
User boot mode	
Single boot mode	After reset is cleared, it starts up from the internal Boot ROM (Mask ROM). In the Boot ROM, an algorithm to enable flash memory rewriting on the user's set through the serial port of this device is programmed. By connecting to an external host computer through the serial port, the internal flash memory can be programmed by transferring data in accordance with predefined protocols.

Among the flash memory operation modes listed in the above table, the User Boot mode and the Single Boot mode are the programmable modes. These two modes, the User Boot mode and the Single Boot mode, are referred to as "Onboard Programming" modes where onboard rewriting of internal flash memory can be made on the user's set.

Either the Single Chip or Single Boot operation mode can be selected by externally setting the level of the BOOT (PB6) pin while the device is in reset status.

Table 30-2 Operating Mode Setting

Operation mode	Pin	
	<u>RESET</u>	<u>BOOT</u> (PB6)
Single chip mode	0 → 1	1
Single boot mode	0 → 1	0

Figure 30-2 Mode Transition Diagram

### 30.2.1 Reset

Regarding to reset, refer to "Reset Operation".

**Note:** While flash auto programming or erasing is in progress, at least 0.5  $\mu$ s of reset period is required regardless of the system clock frequency. In this condition, it takes approx. 2 ms to enable reading after reset.

### 30.2.2 User Boot Mode (Single chip mode)

User Boot mode is to use flash memory programming routine defined by users. It is used when the data transfer buses for flash memory program code on the old application and for serial I/O are different. It operates at the single chip mode; therefore, a switch from normal mode in which user application is activated at the single chip mode to User Boot Mode for programming flash is required. Specifically, add a mode judgment routine to a reset program in the user application.

The condition to switch the modes needs to be set by using the I/O of TMPM368FDXBG in conformity with the user's system setup condition. Also, flash memory programming routine that the user uniquely makes up needs to be set in the new application. This routine is used for programming after being switched to User Boot Mode. The execution of the programming routine must take place while it is stored in the area other than the flash memory since the data in the internal flash memory cannot be read out during delete / writing mode. Once re-programming is complete, it is recommended to protect relevant flash blocks from accidental corruption during subsequent Single-Chip (Normal mode) operations. Be sure not to cause any exceptions including a non-maskable while User Boot Mode.

(1-A) and (1-B) are the examples of programming with routines in the internal flash memory and in the external memory. For a detailed description of the erase and program sequence, refer to "30.3 On-board Programming of Flash Memory (Rewrite/Erase)".

30.2.2.1 (1-A) Method 1: Storing a Programming Routine in the Flash Memory

(1) Step-1

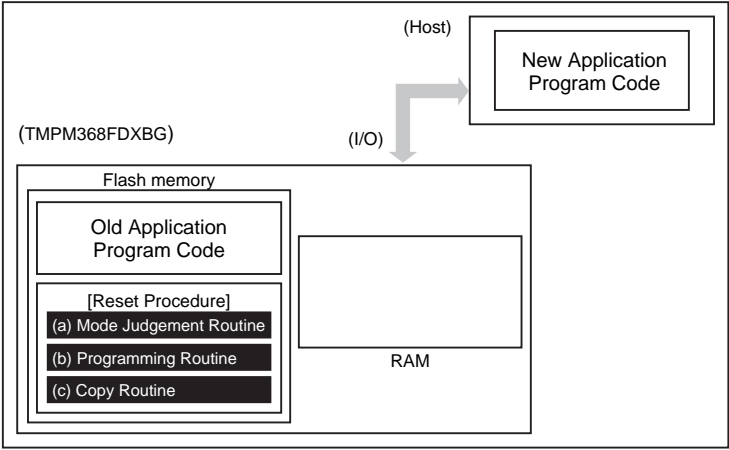

Determine the conditions (e.g., pin states) required for the flash memory to enter User Boot mode and the I/O bus to be used to transfer new program code. Create hardware and software accordingly. Before installing the TMPM368FDXBG on a printed circuit board, write the following program routines into an arbitrary flash block using programming equipment.

- (a) Mode judgment routine:

Code to determine whether or not to switch to User Boot mode
- (b) Programming routine:

Code to download new program code from a host controller and re-program the flash memory
- (c) Copy routine:

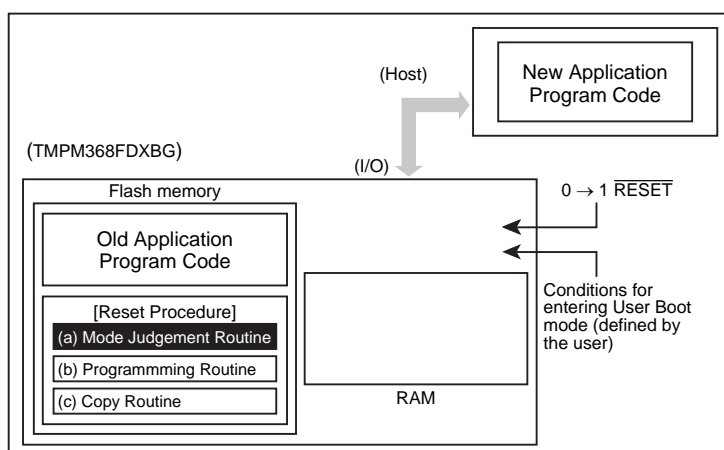

Code to copy the data described in (b) from the TMPM368FDXBG flash memory to either the TMPM368FDXBG on-chip RAM or external memory device.

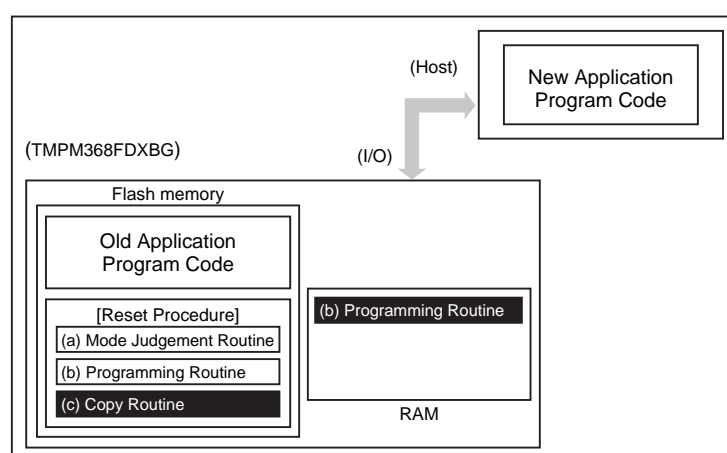

## (2) Step-2

The following description is the case that programming routines are installed in the reset processing program. After RESET pin is released, the reset procedure determines whether to put the TMPM368FDXBG flash memory in User Boot mode. If mode switching conditions are met, the flash memory enters User Boot mode. (All interrupts including NMI must be not used while in User Boot mode.)

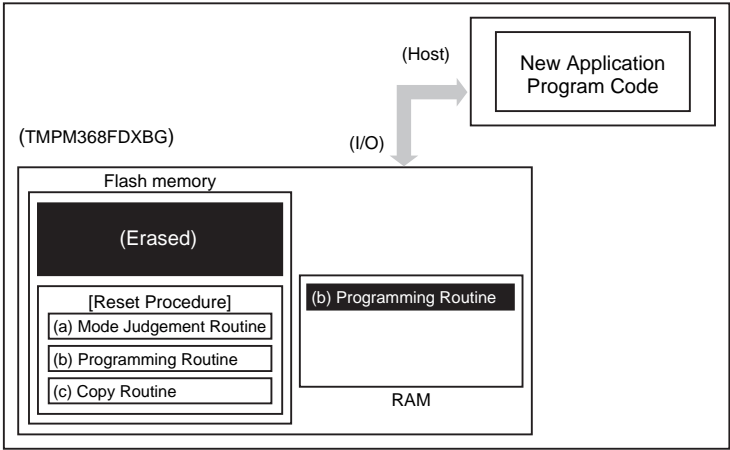

## (3) Step-3

Once transition to User Boot mode is occurred, execute the copy routine (c) to copy the flash programming routine (b) to the TMPM368FDXBG on-chip RAM.

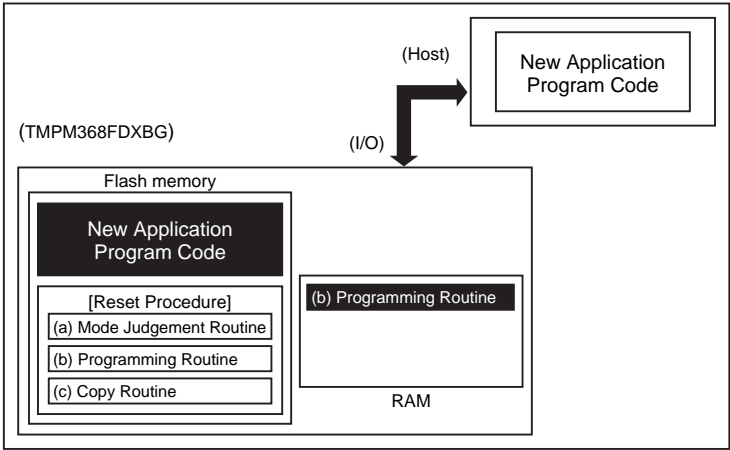

(4) Step-4

Jump program execution to the flash programming routine in the on-chip RAM to clear write or erase protection and erase a flash block containing the old application program code.

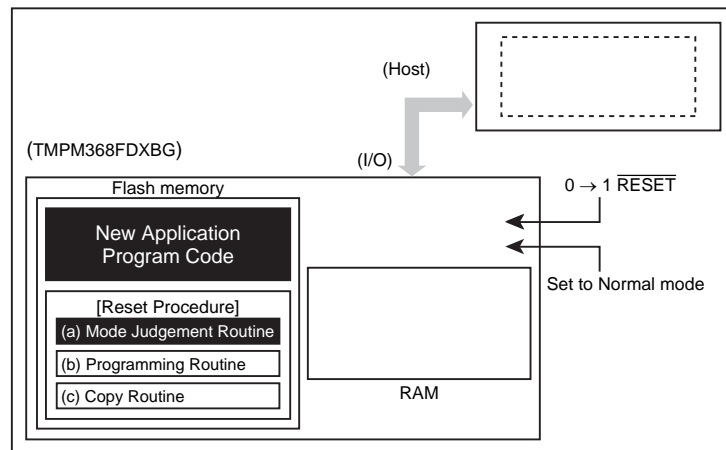

(5) Step-5

Continue executing the flash programming routine to download new program code from the host controller and program it into the erased flash block. When the programming is completed, the writing or erase protection of that flash block in the user's program area must be set.

## (6) Step-6

Set  $\overline{\text{RESET}}$  to "0" to reset the TMPM368FDXBG. Upon reset, the on-chip flash memory is set to Normal mode. After  $\overline{\text{RESET}}$  is released, the CPU will start executing the new application program code.

30.2.2.2 (1-B) Method 2: Transferring a Programming Routine from an External Host

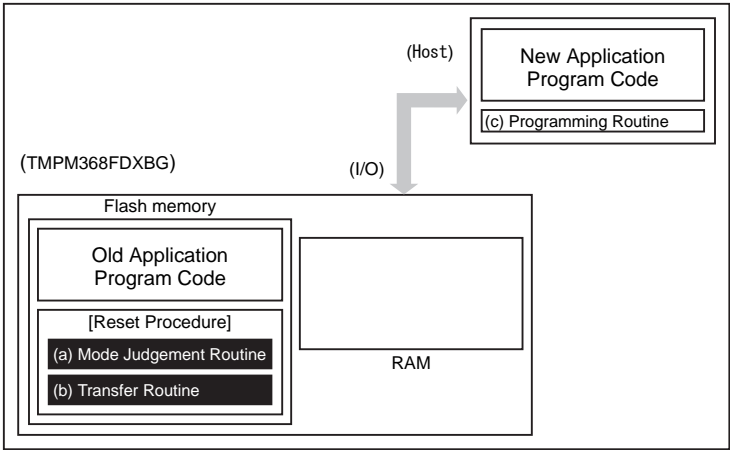

(1) Step-1

Determine the conditions (e.g., pin states) required for the flash memory to enter User Boot mode and the I/O bus to be used to transfer new program code. Create hardware and software accordingly. Before installing the TMPM368FDXBG on a printed circuit board, write the following program routines into an arbitrary flash block using programming equipment.

- (a) Mode judgment routine: Code to determine whether or not to switch to User Boot mode
- (b) Transfer routine: Code to download new program code from a host controller

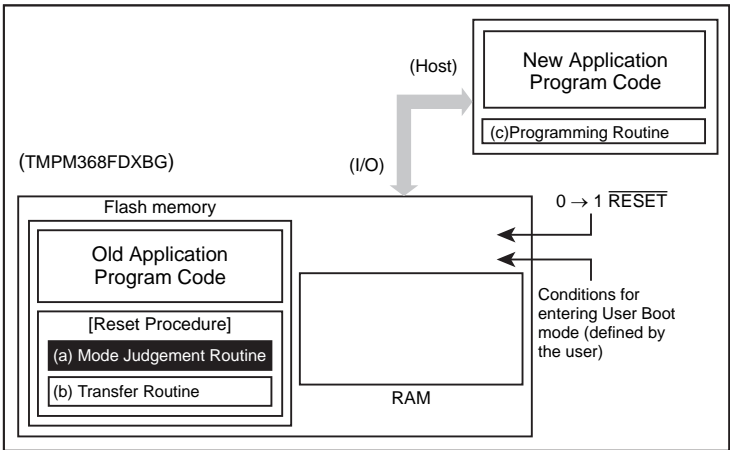

Also, prepare a programming routine shown below on the host controller:

- (c) Programming routine: Code to download new program code from an external host controller and re-program the flash memory

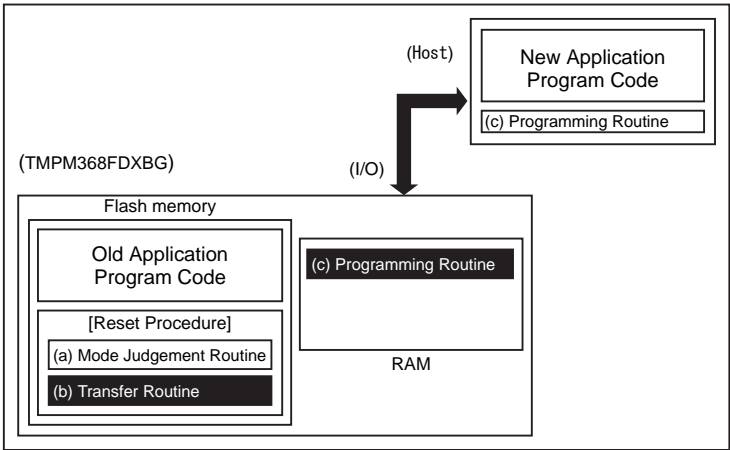

(2) Step-2

The following description is the case that programming routines are installed in the reset processing program. After RESET is released, the reset procedure determines whether to put the TMPM368FDXBG flash memory in User Boot mode. If mode switching conditions are met, the flash memory enters User Boot mode. (All interrupts including NMI must be not used while in User Boot mode).

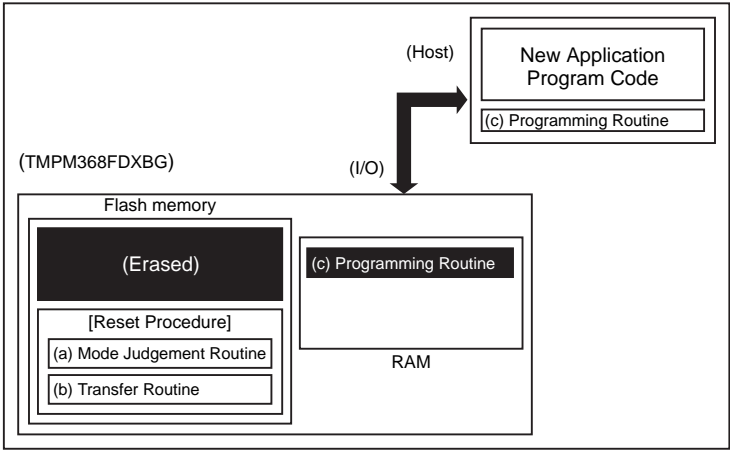

(3) Step-3

Once User Boot mode is entered, execute the transfer routine (b) to download the flash programming routine (c) from the host controller to the TMPM368FDXBG on-chip RAM.

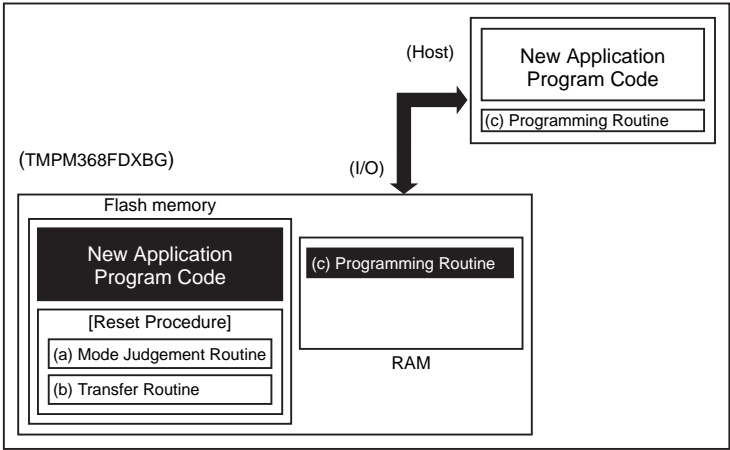

(4) Step-4

Jump program execution to the flash programming routine in the on-chip RAM to clear write or erase protection and erase a flash block containing the old application program code.

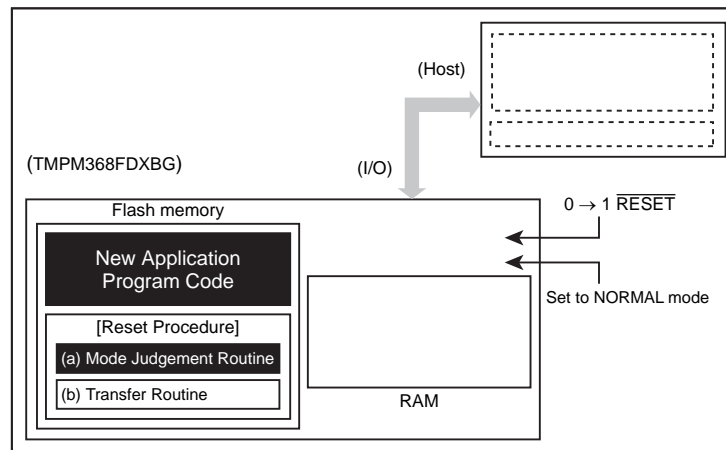

(5) Step-5

Continue executing the flash programming routine to download new program code from the host controller and program it into the erased flash block. When the programming is completed, the writing or erase protection of that flash block in the user program area must be set.

## (6) Step-6

Set  $\overline{\text{RESET}}$  to "0" low to reset the TMPM368FDXBG. Upon reset, the on-chip flash memory is set to Normal mode. After  $\overline{\text{RESET}}$  is released, the CPU will start executing the new application program code.

30.2.3 Single Boot Mode

In Single Boot mode, the flash memory can be re-programmed by using a program contained in the TMPM368FDXBG on-chip boot ROM. This boot ROM is a masked ROM. When Single Boot mode is selected upon reset, the boot ROM is mapped to the address region including the interrupt vector table while the flash memory is mapped to an address region different from it.

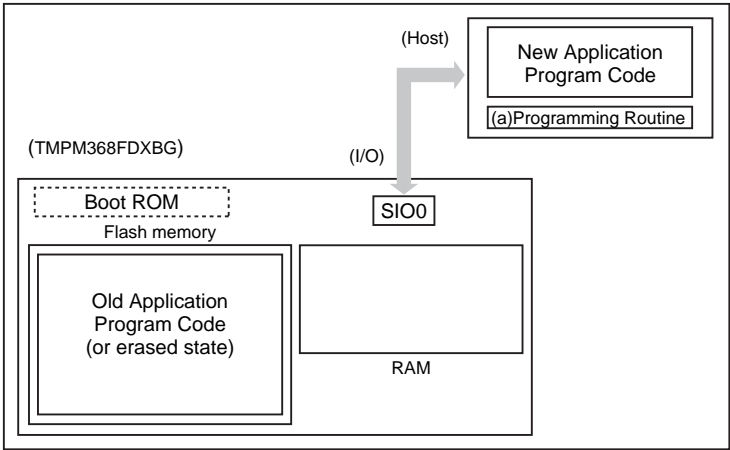

Single Boot mode allows for serial programming of the flash memory. Channel 0 of the SIO (SIO0) of the TMPM368FDXBG is connected to an external host controller. Via this serial link, a programming routine is downloaded from the host controller to the TMPM368FDXBG on-chip RAM. Then, the flash memory is re-programmed by executing the programming routine. The host sends out both commands and programming data to re-program the flash memory. Communications between the SIO0 and the host must follow the protocol described later. To secure the contents of the flash memory, the validity of the application’s password is verified before a programming routine is downloaded into the on-chip RAM. If password matching fails, the transfer of a programming routine itself is aborted. As in the case of User Boot mode, all interrupts including the non-maskable interrupt (NMI) must be disabled in Single Boot mode while the flash memory is being erased or programmed. In Single Boot mode, the boot-ROM programs 33are executed in Normal mode.

Once re-programming is complete, it is recommended to set the write/erase protection to the relevant flash blocks from accidental corruption during subsequent Single-Chip (Normal mode) operations.

30.2.3.1 (2-A) Using the Program in the On-Chip Boot ROM

(1) Step-1

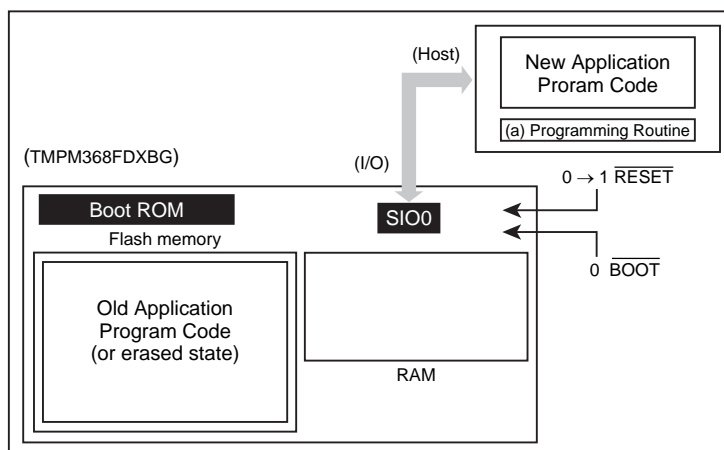

The flash block containing the old version of the program code does not need to be erased before executing the programming routine. Since a programming routine and programming data are transferred via the SIO (SIO0), the SIO0 must be connected to a host controller. Prepare a programming routine (a) on the host controller.

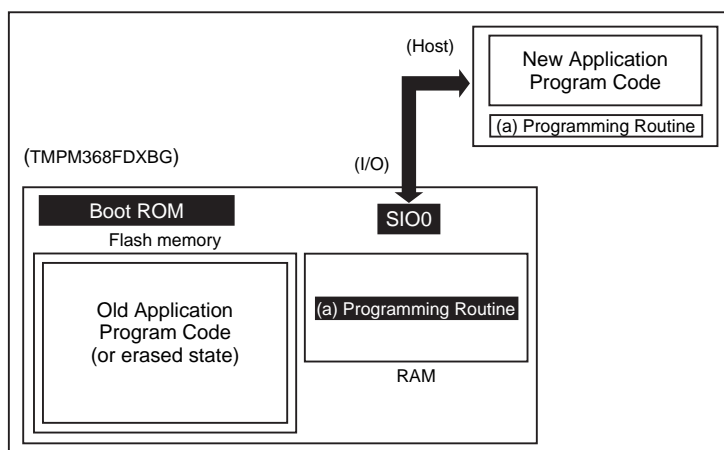

## (2) Step-2

Set the  $\overline{\text{RESET}}$  pin to "1" to cancel the reset of the TMPM368FDXBG when the  $\overline{\text{BOOT}}$  pin has already been set to "0". After reset, CPU reboots from the on-chip boot ROM. The 12-byte password transferred from the host controller via SIO0 is firstly compared to the contents of the special flash memory locations. (If the flash block has already been erased, the password is 0xFF).

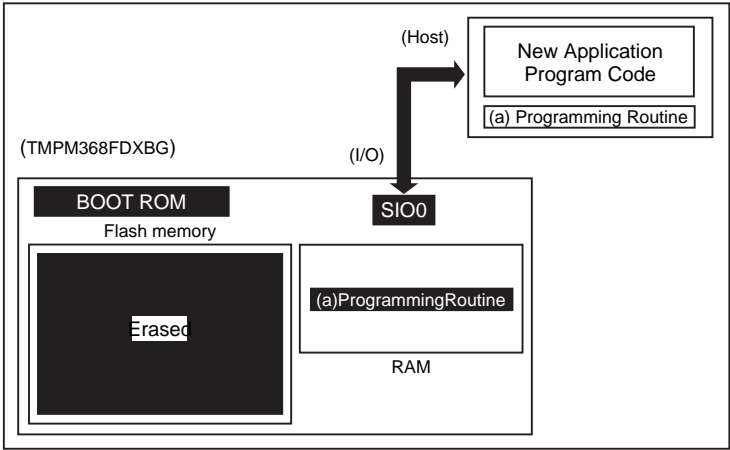

## (3) Step-3

If the password is correct, the boot program downloads the programming routine (a) from the host controller into the on-chip RAM of the TMPM368FDXBG. Regarding the address stored programming routine, refer to "30.2.5 Memory Map".

(4) Step-4

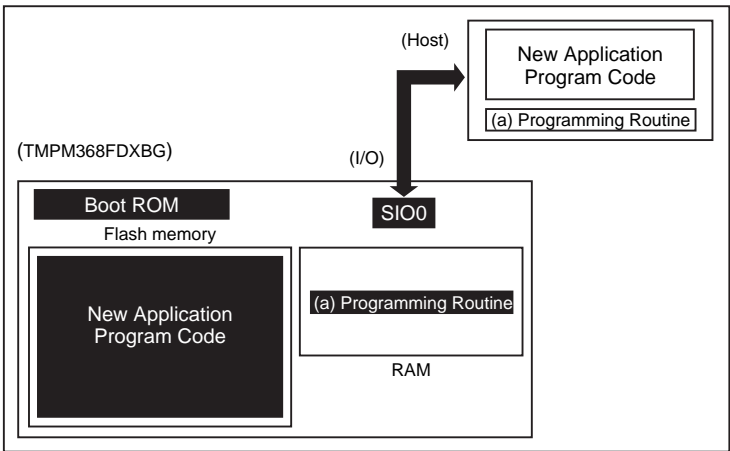

The CPU jumps to the programming routine (a) in the on-chip RAM to erase the flash block containing the old application program code. The Block Erase or Chip Erase command may be used.

(5) Step-5

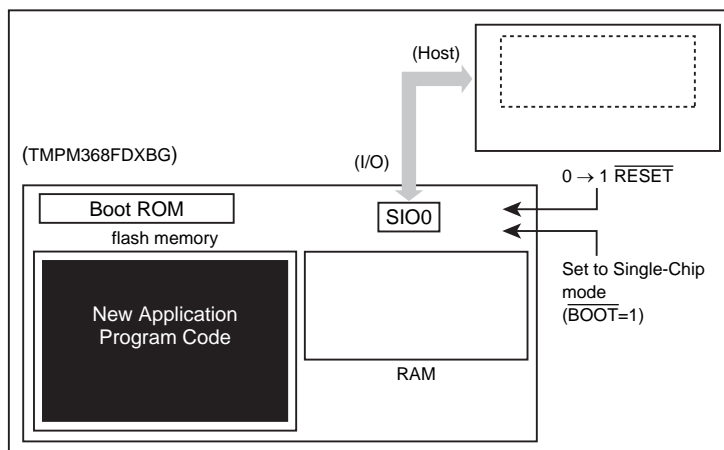

Next, the programming routine (a) downloads new application program code from the host controller and programs it into the erased flash block. When the programming is completed, the writing or erase protection of that flash block in the user's program area must be set.

In the example below, new program code comes from the same host controller via the same SIO0 channel as for the programming routine. However, once the programming routine has begun to execute in the on-chip RAM, it is free to change the transfer path and the source of the transfer. Create board hardware and a programming routine to suit your particular needs.

## (6) Step-6

When programming of the flash memory is complete, power off the board and disconnect the cable between the host and the target board. Turn on the power again so that the TMPM368FDXBG re-boots in Single-Chip (Normal) mode to execute the new program.

### 30.2.4 Configuration for Single Boot Mode

To execute the on-board programming, boot the TMPM368FDXBG with Single Boot mode following the configuration shown below.

$\overline{\text{BOOT}}(\text{PB6}) = 0$   
 $\overline{\text{RESET}} = 0 \rightarrow 1$

Set the  $\overline{\text{RESET}}$  input to "0", and set the each  $\overline{\text{BOOT}}$  (PB6) pins to values shown above, and then release  $\overline{\text{RESET}}$  pin (high).

30.2.5 Memory Map

Figure 30-3 shows a comparison of the memory maps in Normal and Single Boot modes. In Single Boot mode, the internal flash memory is mapped to 0x3F80\_0000 and later addresses, and the Internal boot ROM (Mask ROM) is mapped to 0x0000\_0000 through 0x0000\_27FF.

The internal flash memory and RAM addresses of each device are shown below.

Product Name	Flash Size	RAM Size	Flash Address (Single Chip / Single Boot Mode)	RAM Address
TMPM368FDXBG	512 KB	128 KB	0x0000_0000 to 0x0007_FFFF 0x3F80_0000 to 0x3F87_FFFF	0x2000_0000 to 0x2001_FFFF note)

Note 1: In case of TMPM368FDXBG a programming routine is stored from 0x2000\_0800 to the end of RAM.

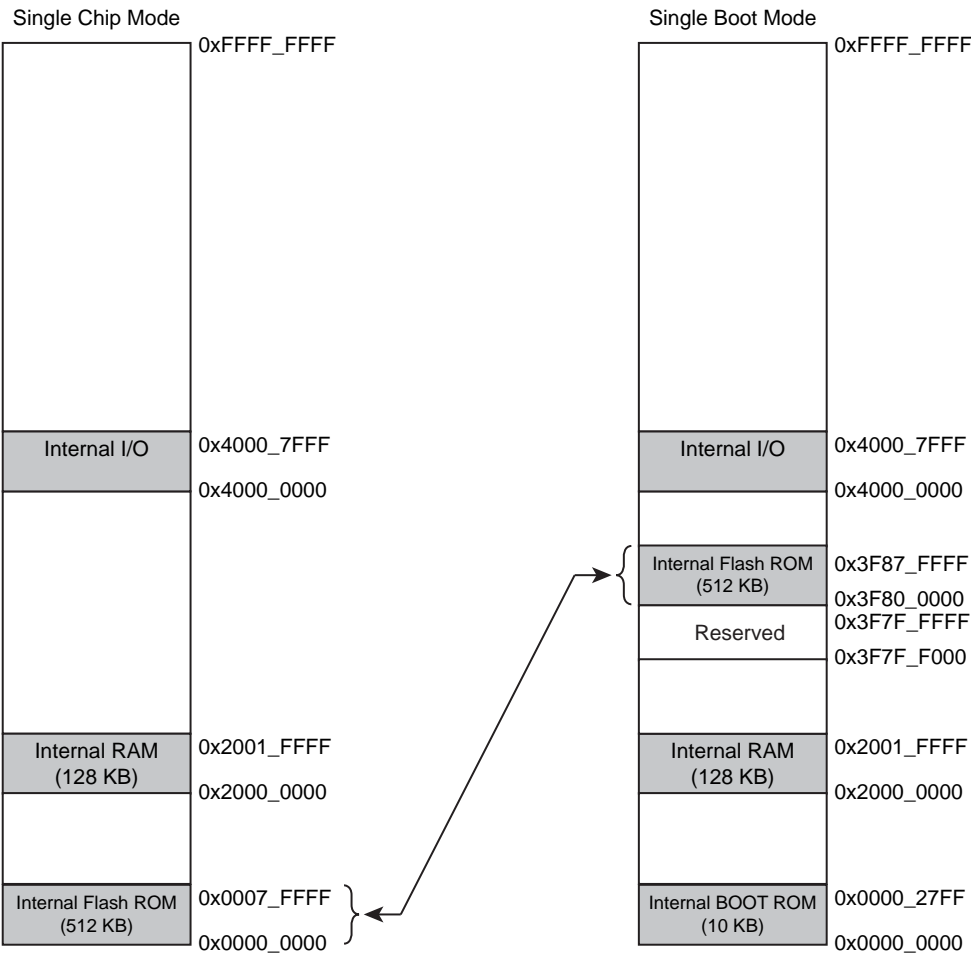

Figure 30-3 Memory Maps for TMPM368FDXBG

### 30.2.6 Interface specification

In Single Boot mode, an SIO channel is used for communications with a programming controller. Both UART (asynchronous) and I/O Interface (synchronous) modes are supported.

In USB Boot mode, USB port is used for communications with programming controller. The same configuration is applied to a communication format on a programming controller to execute the on-board programming in this mode.

The communication formats are shown below.

- UART communication

Communication channel : SIO channel 0

Serial transfer mode : UART (asynchronous), half -duplex, LSB first

Data length : 8 bits

Parity bit : None

STOP bit : 1 bit

Baud rate : Arbitrary baud rate

- I/O Interface mode

Communication channel : SIO channel 0

Serial transfer mode : I/O interface mode, full -duplex, LSB first

Synchronization clock (SCLK0) : Input mode

Handshaking signal : PE4 configured as an output mode

Baud rate : Arbitrary baud rate

- USB Boot mode

Communication port : USB-DDP, USB-DDM

Only full speed available

Transfer mode : control / bulk

USB clock : 48MHz ( $f_{osc}=8/12/16\text{MHz}$  crystal oscillator with PLL or external clock input)

Table 30-3 Required Pin Connections

Pin		Interface		
		UART	I/O Interface Mode	USB
Voltage supply pin	DVDD3A	o	o	o
	DVSSA	o	o	o
	DVDD3B	o	o	o
	DVSSB	o	o	o
	AVDD3A	o	o	o
	AVSSA	o	o	o
	AVDD3B	o	o	o
	AVSSB	o	o	o
	AVDD3_DA	o	o	o
	AVSS_DA	o	o	o
	RVDD3	o	o	o

Table 30-3 Required Pin Connections

Pin		Interface		
		UART	I/O Interface Mode	USB
Mode setting pin	MODE	Fixed to "L".		
	PE5	o (Fixed to "L")	o (Fixed to "L")	o (Fixed to "H")
	PK0	x	x	o (Detects Vbus connection) (note 1)
	BOOT (PB6)	o	o	o
	X1	-	-	o (8/12/16 MHz)
	PK2	x	x	o (USB_ECLK)
reset pin	RESET	o	o	o
Communication pin	PE0	x	o (Output mode) (note 2)	o (Output mode) (note 3)
	PE1	o (RXD0, Input mode)	o (RXD, Input mode)	o (Input mode) (note 4)
	PE2	o (TXD, Output mode)	o (TXD, Output mode)	o (Input mode) (note 4)
	PE3	x	o (SCLK0, Input mode)	o (Input mode) (note 4)
	USB-DDP	x	x	o
	USB-DDM	x	x	o

Note 1: This port is not used in Boot mode.

Note 2: In I/O interface mode, this port is used for hand shake signal.

Note 3: This port is used for control signal of the switch which is make USB-DDP pin to pull-up.

Note 4: In USB Boot mode, specifies the USB clock. Refer to below table.

PE3	PE2	PE1	fosc (MHz)	PLL	USB clock
0	0	0	8	6 times	8MHz x 3 = 48MHz
0	0	1	12	4 times	12MHz x 4 = 48MHz
0	1	0	-	-	USB_ECLK pin
0	1	1	-	-	USB_ECLK pin
1	0	0	16	3 times	16MHz x 3 = 48MHz
1	0	1	-	-	Reserved
1	1	0	-	-	USB_ECLK pin
1	1	1	-	-	USB_ECLK pin

### 30.2.7 Data Transfer Format

Table 30-4, Table 30-6 to Table 30-7 illustrate the operation commands and data transfer formats at each operation mode. In conjunction with this section, refer to "30.2.10 Operation of Boot Program".

Table 30-4 Single Boot Mode Commands

Code	Command
0x10	RAM transfer
0x40	Chip and protection bit erase

### 30.2.8 Restrictions on internal memories

Single Boot Mode places restrictions on the internal RAM and ROM as shown in Table 30-5.

Table 30-5 Restrictions in Single Boot Mode

Memory	Details
Internal RAM	A program contained in the BOOT ROM uses the area, through 0x2000_0000 to 0x2000_07FF, as a work area. Regarding the address stored programming routine, refer to "30.2.5 Memory Map"
Internal ROM	The following addresses are assigned for storing software ID information and passwords. Storing program in these addresses is not recommendable. 0x3F87_FFF0 to 0x3F87_FFFF

### 30.2.9 Transfer Format for Boot Program

The following tables shows the transfer format for each Boot program command. Use this section in conjunction with Chapter "30.2.10 Operation of Boot Program".

## 30.2.9.1 RAM Transfer

Table 30-6 Transfer Format for the RAM Transfer Command

	Byte	Data Transferred from the Controller to the TMPM368FDXBG	Baud rate	Data Transferred from the TMPM368FDXBG to the Controller
Boot ROM	1 byte	Serial operation mode and baud rate For UART mode : 0x86 For I/O Interface mode : 0x30	Desired baud rate (Note 1)	–
	2 byte	–		ACK for the serial operation mode byte • For UART mode - Normal acknowledge : 0x86 (The boot program aborts if the baud rate can not be set correctly.) • For I/O Interface mode - Normal acknowledge : 0x30
	3 byte	Command code (0x10)		–
	4 byte	–		ACK for the command code byte (Note 2) - Normal acknowledge : 0x10 - Negative acknowledge : 0xX1 - Communication error : 0xX8
	5 byte to 16 byte	Password sequence (12 bytes)) 0x3F87_FFF4 to 0x3F87_FFFF		–
	17 byte	Check SUM value for bytes 5 to 16		–
	18 byte	–		ACK for the checksum byte (Note 2) - Normal acknowledge : 0x10 - Negative acknowledge : 0xX1 - Communication error : 0xX8
	19 byte	RAM storage start address 31 to 24		–
	20 byte	RAM storage start address 23 to 16		–
	21 byte	RAM storage start address 15 to 8		–
	22 byte	RAM storage start address 7 to 0		–
	23 byte	RAM storage start address 15 to 8		–
	24 byte	RAM storage start address 7 to 0		–
	25 byte	Check SUM value for bytes 19 to 24		–
	26 byte	–		ACK for the checksum byte (Note 2) - Normal acknowledge : 0x10 - Negative acknowledge : 0xX1 - Communication error : 0xX8
	27 byte to mbyte	RAM storage data		–
	m+ 1 byte	Checksum value for bytes 27 to m		–
	m+ 2 byte	–		ACK for the checksum byte (Note 2) - Normal acknowledge : 0x10 - Negative acknowledge : 0xX1 - Communication error : 0xX8
RAM	m+ 3 byte	–		Jump to RAM storage start address

Note 1: In I/O Interface mode, the baud rate for the transfers of the first and second bytes must be 1/16 of the desired baud rate.

Note 2: In case of any negative acknowledge, the boot program returns to a state in which it waits for a command code (3rd byte). In I/O Interface mode, if a communication error occurs, a negative acknowledge does not occur.

Note 3: The 19th to 25th bytes must be within the RAM address range which is determined depend on each products. For detail of the RAM address, refer to "30.2.5 Memory Map".

## 30.2.9.2 Chip Erase and Protect Bit Erase

Table 30-7 Transfer Format for the Chip and Protection Bit Erase Command

	Byte	Data Transferred from the Controller to the TMPM368FDXBG	Baud rate	Data Transferred from the TMPM368FDXBG to the Controller
Boot ROM	1 byte	Serial operation mode and baud rate For UART mode : 0x86 For I/O Interface mode : 0x30	Desired baud rate (Note 1)	–
	2 byte	–		ACK for the serial operation mode byte • For UART mode - Normal acknowledge : 0x86 (The boot program aborts if the baud rate can not be set correctly.) • For I/O Interface mode - Normal acknowledge : 0x30
	3 byte	Command code (0x40)		–
	4 byte	–		ACK for the command code byte (Note 2) - Normal acknowledge : 0x10 - Negative acknowledge : 0xX1 - Communication error : 0xX8
	5 to 16 byte	Password data (12 bytes) when the data of 0x3F87_FFF0 is not 0xFF 0x3F87_FFF4 to 0x3F87_FFFF Dummy data (12 bytes) when the data of 0x3F87_FFF0 is 0xFF		–
	17 byte	Check Sum value for byte 5 to 16		–
	18 byte	–		ACK for the checksum byte (Note 2) - Normal acknowledge : 0x40 - Negative acknowledge : 0xX1 - Communication error : 0xX8
	19 byte	Chip erase command code (0x54)		–
	20 byte	–		ACK for the command code byte (Note 2) - Normal acknowledge : 0x54 - Negative acknowledge : 0xX1 - Communication error : 0xX8
	21 byte	–		ACK for the chip erase command code byte - Normal acknowledge : 0x4F - Negative acknowledge : 0x4C
	22 byte	(Wait for the next command code.)		–

Note 1: In I/O Interface mode, the baud rate for the transfers of the first and second byte must be 1/16 of the desired baud rate.

Note 2: In case of any negative acknowledge, the boot program returns to a state in which it waits for a command code (3rd byte). In I/O Interface mode, if a communication error occurs, a negative acknowledge does not occur.

### 30.2.10 Operation of Boot Program

When Single Boot mode is selected, the boot program is automatically executed on startup. The boot program offers these four commands, of which the details are provided on the following subsections.

#### 1. RAM Transfer command

The RAM Transfer command stores program code transferred from the host controller to the on-chip RAM and executes the program once the transfer is successfully completed. The user program RAM space can be assigned to the RAM space except boot program area (0x2000\_0000 to 0x2000\_07FF). For the detail of the RAM space, refer to "30.2.5 Memory Map".

The user program starts at the assigned RAM address.

The RAM Transfer command can be used to download a flash programming routine of your own; this provides the ability to control on-board programming of the flash memory in a unique manner. The programming routine must utilize the flash memory command sequences described in Section 30.3. Before initiating a transfer, the RAM Transfer command verifies a password sequence coming from the controller against that stored in the flash memory.

**Note:** If a password is set to 0xFF (erased data), it is difficult to protect data securely due to an easy-to-guess password. Even if Single Boot mode is not used, it is recommended to set a unique value as a password.

#### 2. Flash Memory Chip Erase and Protection Bit Erase command

This command erases the entire area of the flash memory automatically. All the blocks in the memory cell and their protection conditions are erased even when any of the blocks are prohibited from writing and erasing. This command can select whether a password is verified.

## 30.2.10.1 RAM Transfer Command

See Table 30-6 for the transfer format of this command.

1. The 1st byte specifies which one of the two serial operation modes is used. For a detailed description of how the serial operation mode is determined, see "30.2.10.4 Determination of a Serial Operation Mode" described later. If the mode is determined as UART mode, the boot program checks if the baud rate setting can be performed. During the first-byte processing, receiving operation is prohibited. (SC0MOD0<RXE>=0)

- To communicate in UART mode

The 1st byte is set to "0x86" and is transmitted from the controller to the target board at the specified baud rate by setting UART. If the serial operation mode is determined as UART, then the boot program checks if the baud rate setting can be performed. If that baud rate cannot be set, the boot program aborts and any subsequent communications cannot be done. Please refer to "Baud rate setting" for the method of judging whether the setting of the baud rate is possible.

- To communicate in I/O Interface mode

The 1st byte is set to "0x30" and is transmitted from the controller to the target board at 1/16 of the desired baud rate by the synchronous setting. Same as the 1st byte, a 1/16 of the specified baud rate is used in the 2nd transmission. From the 3rd byte (operation command data), users can transmit data at specified baud rate.

In I/O interface mode, CPU considers the reception terminal to be an input port and monitors the level of I/O port. If the baud rate is high or operation frequency is high, CPU may not distinguish the level of I/O port. To avoid this situation, the baud rate is set at the 1/16 of desired baud rate in the I/O interface. When the serial operation mode is determined as I/O Interface mode, SCLK Input mode is set. The controller must ensure that its AC timing restrictions are satisfied at the selected baud rate. In the case of I/O Interface mode, the boot program does not check the receive error flag; thus there is no error acknowledge response (bit 3, 0xX8).

2. The 2nd byte, transmitted from the target board to the controller, is an acknowledge response to the 1st byte where the serial operation mode is set. When 1st byte is determined as UART and can be set at the specified baud rate, data "0x86" is transmitted. When 1st byte is determined as I/O interface, data "0x30" is transmitted.

- UART mode

The 2nd byte is used for distinguishing whether the baud rate can be set. If the baud rate can be set, a value of SC0BRCE is renewed and data "0x86" is sent to the controller. If the baud rate cannot be set, transmit operation is stopped and no data is transmitted. After transmission of 1st byte completed, the controller allows for five seconds of time-out. If it does not receive 0x86 within the allowed time-out period, the controller should give up the communication. Receiving operation is permitted by setting SC0MOD0<RXE>=1, before loading 0x86 to the SIO transmit buffer.

- I/O Interface mode

The boot program sets a value of the SC0MOD0 and SC0CR registers to configure the I/O Interface mode and writes 0x30 to the SC0BUF. Then, the SIO0 waits for the SCLK4 signal to come from the controller. After the transmission of the 1st byte completed, the controller should send the SCLK clock to the target board after a certain idle time (several microseconds). This must be done at 1/16 of the desired baud rate. If the 2nd byte, which is from the target board to the controller, is 0x30, then the controller regards it as communication possible. From the 3rd byte, users can transmit data at specified baud rate. Receiving operation is permitted by setting SC0MOD0<RXE>=1, before loading 0x30 to the SIO.

3. The 3rd byte transmitted from the controller to the target board is a command. The code for the RAM Transfer command is 0x10.
4. The 4th byte, transmitted from the target board to the controller, is an acknowledge response to the 3rd byte. Before sending back the acknowledge response, the boot program checks for a receive error. If there is a receive error, the boot program transmits 0xX8 (bit 3) and returns to the state in which it waits for a command (the third byte) again. In this case, the upper four bits of the acknowledge response are undefined - they hold the same values as the upper four bits of the previously issued command. When the SIO0 is configured for I/O Interface mode, the boot program does not check for a receive error.

If the 3rd byte is equal to any of the command codes listed in Table 30-4, the boot program echoes it back to the controller. When the RAM Transfer command is received, the boot program echoes back a value of 0x10 and then branches to the RAM Transfer routine. Once this branch is taken, password verification is done. Password verification is detailed in the later Section "Password". If the 3rd byte is not a valid command, the boot program sends back 0xX1 (bit 0) to the controller and returns to the state in which it waits for a command (the third byte) again. In this case, the upper four bits of the acknowledge response are undefined - they hold the same values as the upper four bits of the previously issued command.

5. The 5th to 16th bytes transmitted from the controller to the target board, are a 12-byte password. Each byte is compared to the contents of following addresses in the flash memory. The verification is started with the 5th byte. If the password verification fails, the RAM Transfer routine sets the password error flag.

Product name	Area
TMPM368FDXBG	0x3F87_FFF4 to 0x3F87_FFFF

6. The 17th byte is a checksum value for the password sequence (5th to 16th bytes). To calculate the checksum value for the 12-byte password, add the 12 bytes together, ignore the carries and calculate the 8-bit two's complement by using lower 8 bits then transmit this checksum value from the controller. The checksum calculation is described in details in the later Section "Checksum Calculation".
7. The 18th byte, transmitted from the target board to the controller, is an acknowledge response to the 5th to 17th bytes. First, the RAM Transfer routine checks for a receive error in the 5th to 17th byte. If there is a receive error, the boot program sends back 0x18 (bit 3) and returns to the state in which it waits for a command (i.e., the 3rd byte) again. In this case, the upper four bits of the acknowledge response are the same as those of the previously issued command (i.e., 1). When the SIO0 is configured for I/O Interface mode, the RAM Transfer routine does not check for a receive error.

Next, the RAM Transfer routine performs the checksum operation to ensure 17th byte data integrity. Adding the series of the 5th to 16th bytes must result in 0x00 (with the carry dropped). In case of a checksum error, the RAM Transfer routine sends back 0x11 to the controller and returns to the state in which it waits for a command (i.e., the 3rd byte) again.

Finally, the password verification result is checked. If the following case is generated, the boot program transmits an acknowledge response (bit 0, 0x11) as a password error and waits for next operation command (3rd byte).

- Irrespective of the result of the password comparison, all the 12 bytes of a password in the flash memory are the same value other than 0xFF.
- Not the entire password bytes transmitted from the controller matched those contained in the flash memory.

When all the above verification has been successful, the RAM Transfer routine returns a normal acknowledge response (0x10) to the controller.

8. The 19th to 22nd bytes, transmitted from the controller to the target board, indicate the start address of the RAM region where subsequent data (e.g., a flash programming routine) should be stored. The 19th byte corresponds to bits 31 to 24 of the address and the 22nd byte corresponds to bits 7 to 0 of the address. The start address of the stored RAM must be even address.
9. The 23rd and 24th bytes, transmitted from the controller to the target board, indicate the number of bytes that will be transferred from the controller to be stored in the RAM. The 23rd byte corresponds to bits 15 to 8 of the number of bytes to be transferred, and the 24th byte corresponds to bits 7 to 0 of the number of bytes.
10. The 25th byte is a checksum value for the 19th to 24th bytes. To calculate the checksum value, add all these bytes together, ignore the carries and calculate the 8-bit two's complement by using lower 8 bits then transmit this checksum value from the controller. The checksum calculation is described in detail in the later Section "30.2.10.6 Checksum Calculation".
11. The 26th byte, transmitted from the target board to the controller, is an acknowledge response to the 19th to 25th bytes of data. First, the RAM Transfer routine checks for a receive error in the 19th to 25th bytes. If there is a receive error, the RAM Transfer routine sends back 0x18 and returns to the command wait state (i.e., the 3rd byte) again. In this case, the upper four bits of the acknowledge response are the same as those of the previously issued command (i.e., 1). When the SIO0 is configured for I/O Interface mode, the RAM Transfer routine does not check for a receive error.

Next, the RAM Transfer routine performs the checksum operation to ensure data integrity. Adding the series of the 19th to 24th bytes must result in 0x00 (with the carry dropped). In case of a checksum error, the RAM Transfer routine sends back 0x11 to the controller and returns to the state in which it waits for a command (i.e., the 3rd byte) again.

- The 19th to 25th bytes data must be determined by referring "30.2.5 Memory Map". They are set within the suitable range for each product to the end address of RAM.

When the above checks have been successful, the RAM Transfer routine returns a normal acknowledge response (0x10) to the controller.

12. The 27th to mth bytes from the controller are stored in the on-chip RAM of the TMPM368FDXBG. Storage begins at the address specified by the 19th to 22nd bytes and continues for the number of bytes specified by the 23rd to 24th bytes.
13. The (m+1) th byte is a checksum value. To calculate the checksum value, add the 27th to mth bytes together, ignore the carries and calculate the 8-bit two's complement by using lower 8 bits then transmit this checksum value from the controller. The checksum calculation is described in detail in later Section "30.2.10.6 Checksum Calculation".
14. The (m+2) th byte is a acknowledge response to the 27th to (m+1) th bytes. First, the RAM Transfer routine checks for a receive error in the 27th to (m+1) th bytes. If there is a receive error, the RAM Transfer routine sends back 0x18 (bit 3) and returns to the state in which it waits for a command (i.e., the 3rd byte) again. In this case, the upper four bits of the acknowledge response are the same as those of the previously issued command (i.e., 1). When the SIO0 is configured for I/O Interface mode, the RAM Transfer routine does not check for a receive error.

Next, the RAM Transfer routine performs the checksum operation to ensure data integrity. Adding the series of the 27th to (m+1) th bytes must result in 0x00 (with the carry dropped). In case of a checksum error, the RAM Transfer routine sends back 0x11 (bit 0) to the controller and returns to the command wait state (i.e., the 3rd byte) again. When the above checks have been completed successfully, the RAM Transfer routine returns a normal acknowledge response (0x10) to the controller.

15. If the (m+2) th byte was a normal acknowledge response, a branch is made to the address specified by the 19th to 22nd bytes.

30.2.10.2 Chip and Protection Bit Erase Command

See Table 30-7 for the transfer format of this command.

1. The processing of the 1st and 2nd bytes are the same as for the RAM Transfer command.
2. From the Controller to the TMPM368FDXBG

The 3rd byte, which the target board receives from the controller, is a command. The code for the Show Product Information command is 0x40.

3. From TMPM368FDXBG to the Controller

The 4th byte, transmitted from the target board to the controller, is an acknowledge response to the 3rd byte.

Before sending back the acknowledge response, the boot program checks for a receive error. If there was a receive error, the boot program transmits 0xX8 (bit 3) and returns to the command wait state again. In this case, the upper four bits of the acknowledge response are undefined - they hold the same values as the upper four bits of the previously issued command.

If the 3rd byte is equal to any of the command codes listed in Table 30-4, the boot program echoes it back to the controller. When the Show Flash Memory Sum command was received, the boot program echoes back a value of 0x40. If the 3rd byte is not a valid command, the boot program sends back 0xX1 (bit 0) to the controller and returns to the state in which it waits for a command (the third byte) again. In this case, the upper four bits of the acknowledge response are undefined - they hold the same values as the upper four bits of the previously issued command.

4. The 5th byte to 16th byte, transmitted from the target board to the controller, differ according to the Chip Erase Enable / Disable area (0x3F87\_FFF0).

If 0x3F87\_FFF0 is not the same value as 0xFF, a erase password is required. The 5th byte from the 16th byte becomes password data (12bytes). The verification is started with the 5th byte to compare with the addresses in the flash memory shown in the table below. If the password verification fails, the password error flag is set.

Product name	Password area
TMPM368FDXBG	0x3F87_FFF4 to 0x3F87_FFFF

If 0x3F87\_FFF0 is 0xFF, a password is not required. The 5th byte from 16th byte becomes dummy data.

5. The 17th byte is a checksum value. To calculate the checksum value, perform 8-bit unsigned addition of transmits data (5th byte to 16th byte), drop the carries and take the two's complement of the total sum. Transmit this checksum value from controller to the target board. The checksum calculation is described in details in a latter section "Checksum Calculation".
6. The 18th byte, transmitted from the target board to the controller, is an acknowledge response to the 5th to 17th bytes. First, the Chip and Protection bit Erase routine checks for a receive error in the 5th to 17th bytes. If there was a receive error, the boot program sends back 0x48 (bit3) and returns to the state in which it for a ccommand(i.e., the 3rd byte) again. Since the up-

per four bits of the transmitted data are the same as those of the previously issued command (i.e., 4). When the SIO0 is configured for I/O Interface mode, the Chip and Protection bit Erase routine does not check for a receive error.

Next, the Chip and Protection bit Erase routine performs the checksum operation to ensure data integrity. Adding the series of the 5th to 16th bytes must result in 0x00 (with the carry dropped). If it is not 0x00, one or more bytes of data have been corrupted. In case of a checksum error, the Chip and Protection bit Erase routine sends back the ACK response data (0x41) to the control and returns to the state in which it for a command (i.e., the 3rd byte) again.

Finally, the Chip and Protection bit Erase routine examines the result of the password verification. The following two cases are treated as a password error. In these cases, the Chip and Protection bit Erase routine sends back the ACK response error 0x41 (bit 0) to the controller and returns to the state in which it waits for a command (i.e., the 3rd byte) again.

- Irrespective of the result of the password comparison (from 5th byte to 16th byte), all the 12 bytes of a password in the flash memory are the same value other than 0xFF.
- Not the entire password bytes transmitted from the controller matched those contained in the flash memory.

When all the above verification has been successful, the Chip and Protection bit Erase routine returns a normal acknowledge response (0x40) to the controller.

7. From the controller to the TMPM368FDXBG

The 19th byte, transmitted from the target board to the controller, is the Chip Erase Enable command code (0x54).

8. From TMPM368FDXBG to the Controller

The 20th byte, transmitted from the target board to the controller, is an acknowledge response to the 19th byte.

Before sending back the acknowledge response, the boot program checks for a receive error. If there was a receive error, the boot program transmits 0xX8 (bit 3) and returns to the command wait state again. In this case, the upper four bits of the acknowledge response are undefined - they hold the same values as the upper four bits of the previously issued command.

If the 19th byte is equal to any of the command codes to enable erasing, the boot program echoes it back to the controller. When the Chip and Protection Erase command was received, the boot program echoes back a value of 0x54 and then branches to the Chip and Protection bit Erase routine. If the 5th byte is not a valid command, the boot program sends back 0xX1 (bit 0) to the controller and returns to the state in which it waits for a command (the third byte) again. In this case, the upper four bits of the acknowledge response are undefined - they hold the same values as the upper four bits of the previously issued command.

9. From TMPM368FDXBG to the Controller

The 21st byte indicates whether the Chip and Protection bit Erase command is normally completed or not.

At normal completion, completion code (0x4F) is sent.

When an error was detected, error code (0x4C) is sent.

10. The 22nd byte is the next command code.

### 30.2.10.3 Acknowledge Responses

The boot program represents processing states with specific codes. Table 30-8 to show the values of possible acknowledge responses to the received data. The upper four bits of the acknowledge response are equal to those of the command being executed. The 3rd bit indicates a receive error. The 0th bit indicates an invalid command error, a checksum error or a password error. The 1st bit and 2nd bit are always "0". Receive error checking is not done in I/O Interface mode.

Table 30-8 ACK Response to the Serial Operation Mode Byte

Return Value	Meaning
0x86	The SIO can be configured to operate in UART mode. (See Note)
0x30	The SIO can be configured to operate in I/O Interface mode.

**Note:**In the UART mode, if the baud rate setting cannot be set, the communication is stopped without any response.

Table 30-9 ACK Response to the Command Byte

Return Value	Meaning
0xX8 (See note)	A receive error occurred while receiving a command code.
0xX1 (See note)	An undefined command code was received. (Reception was completed normally.)
0x10	The RAM Transfer command was received.
0x40	The Chip Erase command was received.

**Note:**The upper four bits of the ACK response are the same as those of the previous command code.

Table 30-10 ACK Response to the Checksum Byte

Return Value	Meaning
0xN8 (See note)	A receive error occurred.
0xN1 (See note)	A checksum or password error occurred.
0xN0 (See note)	The checksum was correct.

**Note:**The upper four bits of the ACK response are the same as those of the operation command code. For example, it is 1 (N ; RAM transfer command data [7:4] ) when password error occurs.

Table 30-11 ACK Response to Chip and Protection Bit Erase Byte

Return Value	Meaning
0x54	The Chip Erase enabling command was received.
0x4F	The Chip Erase command was completed.
0x4C	The Chip Erase command was abnormally completed.

### 30.2.10.4 Determination of a Serial Operation Mode

The first byte from the controller determines the serial operation mode. To use UART mode for communications between the controller and the target board, the controller must firstly send a value of 0x86 at a desired baud rate to the target board. To use I/O Interface mode, the controller must send a value of 0x30 at 1/16 of the desired baud rate. Figure 30-4 shows the waveforms for the first byte in each mode.

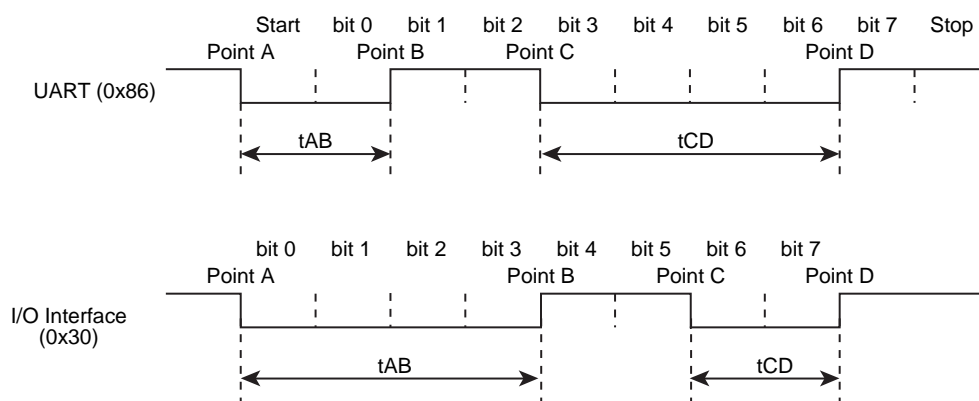

Figure 30-4 Serial Operation Mode Byte

After  $\overline{\text{RESET}}$  is released, the boot program monitors the first serial byte from the controller, with the SIO reception disabled, and calculates the intervals of  $t_{AB}$ ,  $t_{AC}$  and  $t_{AD}$ . Figure 30-5 shows a flowchart describing the steps to determine the intervals of  $t_{AB}$ ,  $t_{AC}$  and  $t_{AD}$ . As shown in the flowchart, the boot program captures timer counts when each time the logic transition occurs in the first serial byte. Consequently, the calculated  $t_{AB}$ ,  $t_{AC}$  and  $t_{AD}$  intervals tend to have slight errors. If the transfer goes at a high baud rate, the CPU might not be able to keep up with the speed of logic transitions at the serial receive pin. In particular, I/O Interface mode may have this problem since its baud rate is generally much higher than that for UART mode. To avoid such a situation, the controller should send the first serial byte at 1/16 of the desired baud rate.

The flowchart in Figure 30-5 shows how the boot program distinguishes between UART and I/O Interface modes. If the length of  $t_{AB}$  is equal to or less than the length of  $t_{CD}$ , the serial operation mode is determined as UART mode. If the length of  $t_{AB}$  is greater than the length of  $t_{CD}$ , the serial operation mode is determined as I/O Interface mode. Note that if the baud rate is too high or the timer operating frequency is too low, each timer value becomes small. It causes an unintentional behavior of the controller. To prevent this problem, reset UART mode within the programming routine.

For example, the serial operation mode may be determined to be I/O Interface mode when the intended mode is UART mode. To avoid such a situation, when UART mode is utilized, the controller should allow for a time-out period within which it expects to receive an echo-back (0x86) from the target board. The controller should give up the communication if it fails to get that echo-back within the allowed time. When I/O Interface mode is utilized, once the first serial byte has been transmitted, the controller should send the SCLK clock after a certain idle time to get an acknowledge response. If the received acknowledge response is not 0x30, the controller should give up further communications.

When the intended mode is I/O interface mode, the first byte does not have to be 0x30 as long as  $t_{AB}$  is greater than  $t_{CD}$  as shown above. 0x91, 0xA1 or 0xB1 can be sent as the first byte code to determine the falling edges of Point A and Point C and the rising edges of Point B and Point D. If  $t_{AB}$  is greater than  $t_{CD}$  and SIO is selected by the resolution of the operation mode determination, the second byte code is 0x30 even though the transmitted code on the first byte is not 0x30 (The first byte code to determine I/O interface mode is described as 0x30).

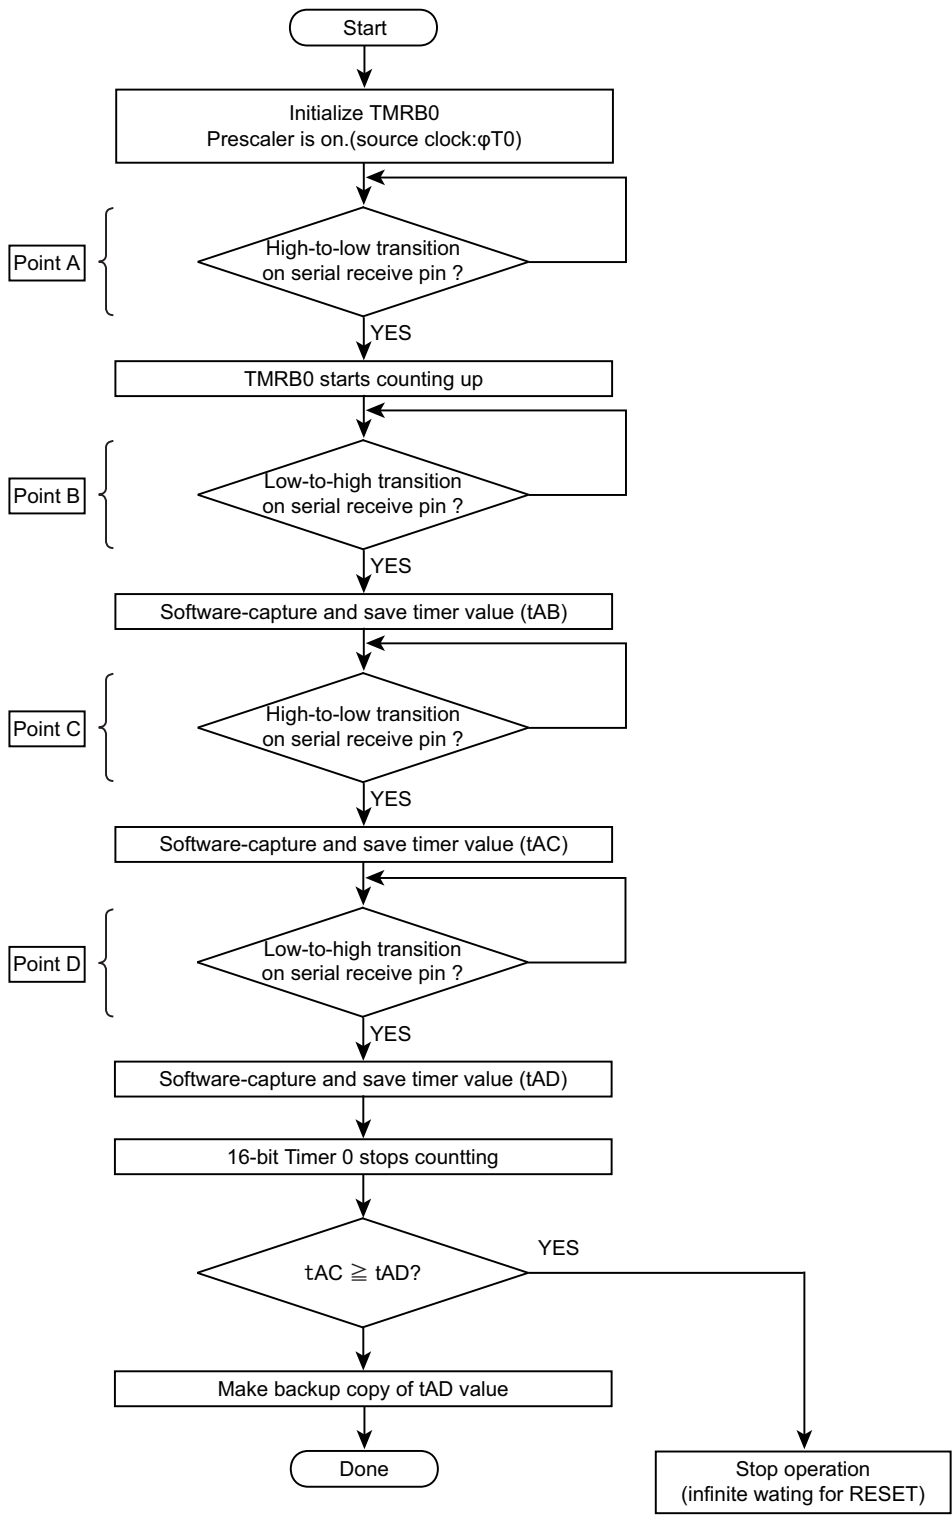

Figure 30-5 Serial Operation Mode Byte Reception Flowchart

Figure 30-6 Serial Operation Mode Determination Flowchart

30.2.10.5 Password

Verification methods differ according to operation commands. The password area is common to all commands, as shown below. Password verification is performed even if the security is enabled.

Product name	Area
TMPM368FDXBG	0x3F87_FFF4 to 0x3F87_FFFF

**Note:** If a password is set to 0xFF (erased data area), it is difficult to protect data securely due to an easy-to-guess password. Even if Single Boot mode is not used, it is recommended to set a unique value as a password.

(1) RAM Transfer command

If the password is set erased data (0xFF), it is difficult to protect data securely due to an easy-to-guess password. Even if Single Boot mode is not used, it is recommended to set a unique value as a password.

If all these address locations contain the same bytes of data other than 0xFF, a password area error occurs as shown in Figure 30-7. In this case, the boot program returns an error acknowledge (0x11) in response to the checksum byte (the 17th byte).

The password sequence received from the controller (5th to 16th bytes) is compared to the password stored in the flash memory. All of the 12 bytes must match to pass the password verification. Otherwise, a password error occurs, which causes the boot program to reply an error acknowledge in response to the checksum byte (the 17th byte).

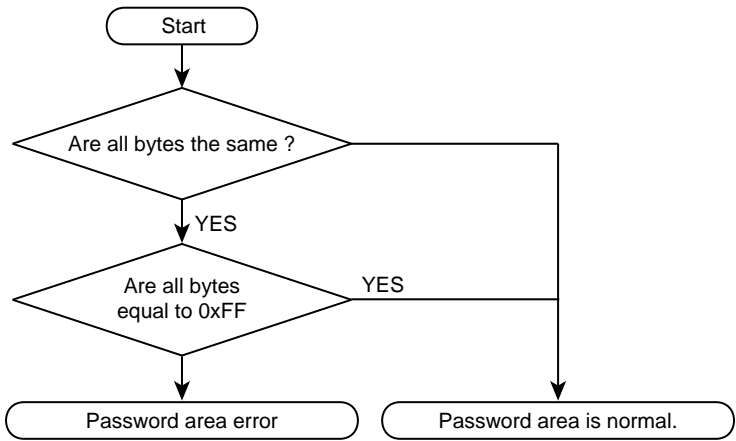

Figure 30-7 Password Area Verification Flowchart (1)

(2) Flash Memory Chip Erase and Protection Bit Erase

The Chip Erase Enable / Disable area specifies whether password verification is performed or not. The Chip Erase Enable / Disable area is as shown below.

Product name	Chip Erase Enable / Disable area
TMPM368FDXBG	0x3F87_FFF4 to 0x3F87_FFFF

As shown in the Figure 30-8, if the data contained in the Chip Erase Enable / Disable area is not 0xFF, password verification is executed. If all data in the password area are the same, it is determined as an error. The boot program returns an error acknowledge (0x41) in response to the checksum byte (the 17th byte).

The password sequence received from the controller (5th to 16th bytes) is compared to the password stored in the flash memory. All of the 12 bytes must match to pass the password verification. Otherwise, a password error occurs, which causes the boot program to reply error acknowledges in response to the checksum byte (the 17th byte).

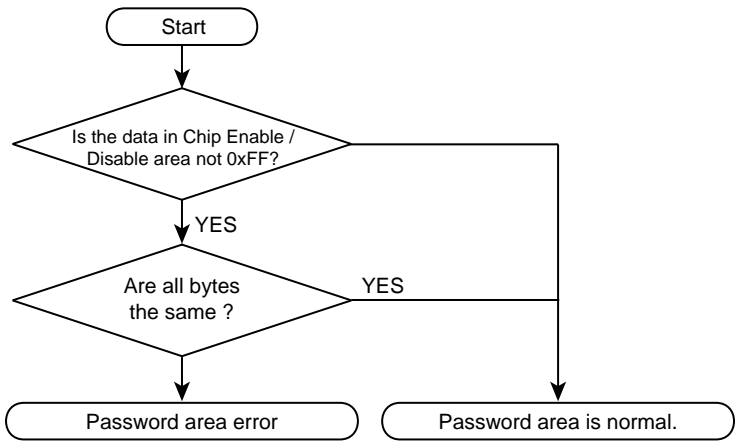

Figure 30-8 Password Area Verification Flowchart (2)

### 30.2.10.6 Checksum Calculation

The checksum byte for a series of bytes of data is calculated by adding the bytes together with dropping the carries, and taking the two's complement of the total sum. The controller must perform the same checksum operation in transmitting checksum bytes.

Example) To calculate the checksum for a series of 0xE5 and 0xF6:

Add the bytes together

$$0xE5 + 0xF6 = 0x1DB$$

Calculate the two's complement by using lower 8 bits, and that is the checksum byte. Then send 0x25 to the controller.

$$0 - 0xDB = 0x25$$

### 30.2.11 General Boot Program Flowchart

Figure 30-9 shows an overall flowchart of the boot program.

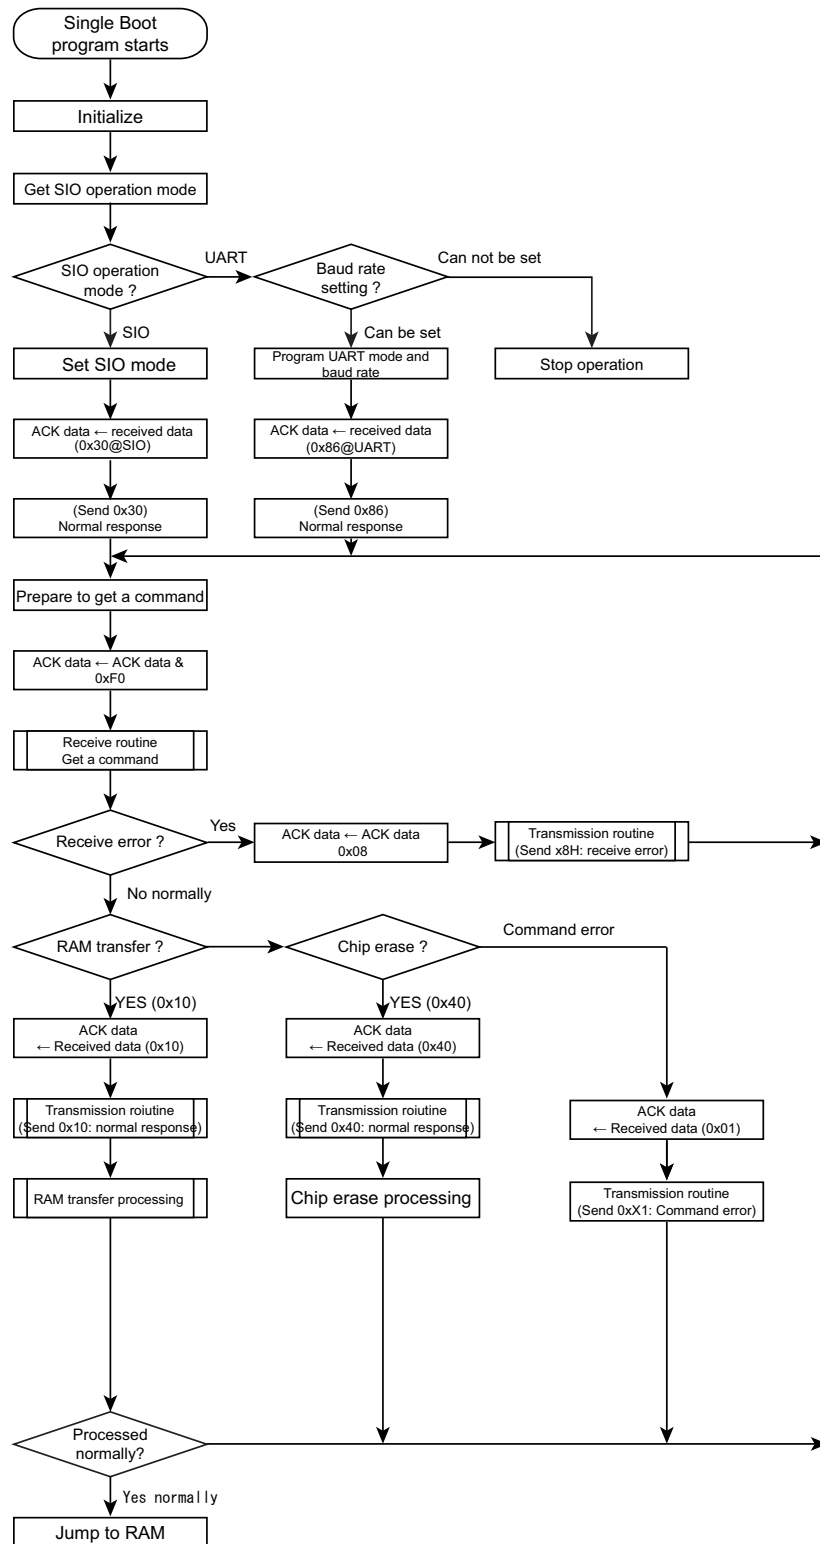

Figure 30-9 Overall Boot Program Flowchart

30.2.12 USB Boot

30.2.12.1 Boot Sequence

USB BOOT Sequence is shown as following table.

### 30.3 On-board Programming of Flash Memory (Rewrite/Erase)

In on-board programming, the CPU is to execute software commands for rewriting or erasing the flash memory. The rewrite/erase control program should be prepared by the user beforehand. Because the flash memory content cannot be read while it is being written or erased, it is necessary to run the rewrite/erase program from the internal RAM after shifting to the user boot mode.

#### 30.3.1 Flash Memory

Except for some functions, writing and erasing flash memory data are in accordance with the standard JEDEC commands.

In writing or erasing, use 32-bit data transfer command of the CPU to enter commands to the flash memory. Once the command is entered, the actual write or erase operation is automatically performed internally.

Table 30-19 Flash Memory Functions

Major functions	Description
Automatic page program	Writes data automatically per page.
Automatic chip erase	Erase the entire area of the flash memory automatically.
Automatic block erase	Erases a selected block automatically.
Protect function	The write or erase operation can be individually inhibited for each block.

##### 30.3.1.1 Block Configuration

Figure 30-10 Block Configuration of Flash Memory (TMPM368FDXBG)

### 30.3.1.2 Basic Operation

This flash memory device has the following two operation modes:

- The mode to read memory data (Read mode)
- The mode to automatically erase or rewrite memory data (Automatic operation)

Transition to the automatic mode is made by executing a command sequence while it is in the memory read mode. In the automatic operation mode, flash memory data cannot be read and any commands stored in the flash memory cannot be executed. In the automatic operation mode, any interrupt or exception generation cannot set the device to the read mode except when a hardware reset is generated. During automatic operation, be sure not to cause any exception other than reset and debug exceptions while a debug port is connected. Any exception generation cannot set the device to the read mode except when a hardware reset is generated.

#### (1) Read

When data is to be read, the flash memory must be set to the read mode. The flash memory will be set to the read mode immediately after power is applied, when CPU reset is removed, or when an automatic operation is normally terminated. In order to return to the read mode from other modes or after an automatic operation has been abnormally terminated, either the Read/reset command (a software command to be described later) or a hardware reset is used. The device must also be in the read mode when any command written on the flash memory is to be executed.

- Read / reset command and Read command (software reset)

When ID-Read command is used, the reading operation is terminated instead of automatically returning to the read mode. In this case, the Read/reset command can be used to return the flash memory to the read mode. Also, when a command that has not been completely written has to be canceled, the Read/reset command must be used. The Read command is used to return to the read mode after executing 32-bit data transfer command to write the data "0x0000\_00F0" to an arbitrary address of the flash memory.

- With the Read/reset command, the device is returned to the read mode after completing the third bus write cycle.

#### (2) Command write

This flash memory uses the command control method. Commands are executed by executing a command sequence to the flash memory. The flash memory executes automatic operation commands according to the address and data combinations applied (refer to Command Sequence).

If it is desired to cancel a command write operation already in progress or when any incorrect command sequence has been entered, the Read/reset command is to be executed. Then, the flash memory will terminate the command execution and return to the read.

While commands are generally comprised of several bus cycles and the operation applying to the 32-bit (word) data transmission command to the flash memory is called "bus write cycle". The bus write cycles have a specific sequential order and the flash memory will perform an automatic operation when the sequence of the bus write cycle data and address of command write is operated in accordance with a predefined specific order. If any bus write cycle does not follow a predefined command write sequence, the flash memory will terminate the command execution and return to the read mode.

Note 1: **Command sequences are executed from outside the flash memory area.**

Note 2: **Each bus write cycle must be sequentially executed by 32-bit data transmit command. While a command sequence is being executed, access to the flash memory is prohibited. Also, do not generate any interrupt (except debug exceptions when a debug port is connected). If such an operation is made, it may result in an unexpected read access to the flash memory, and the command sequencer may not be able to correctly recognize**

the command. While it may cause an abnormal termination of the command sequence, it also may cause an incorrect recognition of the command.

Note 3: For the command sequencer to recognize a command, the device must be in the read mode prior to executing the command. Be sure to check before the first bus write cycle where FCFLCS <RDY / BSY> is set to "1". It is recommended to subsequently execute a Read command.

Note 4: Upon issuing a command, if any address or data is incorrectly written, be sure to perform a software reset to return to the read mode again.

### 30.3.1.3 Commands

#### (1) Automatic Page Program

Writing to a flash memory device is to change "1" data cells to "0" data cells. Any "0" data cell cannot be changed to a "1" data cell. For changing "0" data cells to "1" data cells, it is necessary to perform an erase operation.

The automatic page programming function of this device writes data of each page. The TMPM368FDXBG contains 128 words in a page. A 128 word block is defined by the same [31:9] address. It starts from the address [8:0] = 0x00 and ends at the address [8:0] = 0x1FF. This programming unit is hereafter referred to as a "page".

Writing to data cells is automatically performed by an internal sequencer and no external control by the CPU is required. The state of automatic page programming (whether it is in writing operation or not) can be checked by FCFLCS [0] <RDY\_BSY>.

Also, any new command sequence is not accepted while it is in the automatic page programming mode. If it is desired to interrupt the automatic page programming, use the hardware reset function. If the operation is stopped by a hardware reset operation, it is necessary to once erase the page and then perform the automatic page programming again because writing to the page has not been normally terminated.

The automatic page programming operation is allowed only once for a page already erased. No programming can be performed twice or more. Note that rewriting to a page that has been once written requires execution of the automatic block erase or automatic chip erase command before executing the automatic page programming command again.

No automatic verify operation is performed internally to the device. So, be sure to read the data programmed to confirm that it has been correctly written.

The automatic page programming operation starts when the third bus write cycle of the command cycle is completed. After the fifth bus write cycle, data will be written sequentially starting from the next address of the address specified in the fourth bus write cycle (in the fourth bus write cycle, the page top address will be command written) (32 bits of data is input at one time). Be sure to use the 32-bit data transfer command in writing commands after the fourth bus cycle. At this time, any 32-bit data transfer commands shall not be placed across word boundary. After the fifth bus write cycle, data is command written to the same page area. Even if it is desired to write the page only partially, it is required to perform the automatic page programming for the entire page. In this case, the address input for the fourth bus write cycle shall be set to the top address of the page. Be sure to perform command write operation with the input data set to "1" for the data cells not to be set to "0". For example, if the top address of a page is not to be written, set the input data in the fourth bus write cycle to 0xFFFFFFFF as a command write.

Once the third bus cycle is executed, the automatic page programming is in operation. This condition can be checked by monitoring FCFLCS<RDY / BSY>. Any new command sequence is not accepted while it is in automatic page programming mode. If it is desired to stop operation, use the hardware reset function. Be careful in doing so because data cannot be written normally if the operation is interrupted. When a single page has been command written with normally terminating the automatic page writing process, FCFLCS<RDY / BSY> is set to "1" then it returns to the read mode.

When multiple pages are to be written, it is necessary to execute the page programming command for each page because the number of pages to be written by a single execution of the automatic page program command is limited to only one page. It is not allowed for automatic page programming to process input data across pages.

Data cannot be written to a protected block. When automatic programming is finished, it automatically returns to the read mode. This condition can be checked by monitoring FCFLCS<RDY\_BSY>. If automatic programming has failed, the flash memory is locked in the current mode and will not return to the read mode. For returning to the read mode, it is necessary to execute hardware reset to reset the flash memory or the device. In this case, while writing to the address has failed, it is recommended not to use the device or not to use the block that includes the failed address.

**Note: Software reset becomes ineffective after the fourth bus write cycle of the automatic page programming command.**

## (2) Automatic chip erase

The automatic chip erase operation starts when the sixth bus write cycle of the command cycle is completed.

This condition can be checked by monitoring FCFLCS<RDY / BSY>. While no automatic verify operation is performed internally to the device, be sure to read the data to confirm that data has been correctly erased. Any new command sequence is not accepted while it is in an automatic chip erase operation. If it is desired to stop operation, use the hardware reset function. If the operation is forced to stop, it is necessary to perform the automatic chip erase operation again because the data erasing operation has not been normally terminated.

Also, any protected block cannot be erased. If all the blocks are protected, the automatic chip erase operation will not be performed and it returns to the read mode after completing the sixth bus read cycle of the command sequence. When an automatic chip erase operation is normally terminated, it automatically returns to the read mode. If an automatic chip erase operation has failed, the flash memory is locked in the current mode and will not return to the read mode.

For returning to the read mode, it is necessary to execute hardware reset to reset the device. In this case, the failed block cannot be detected. It is recommended not to use the device anymore or to identify the failed block by using the block erase function for not to use the identified block anymore.

## (3) Automatic block erase (for each block)

The automatic block erase operation starts when the sixth bus write cycle of the command cycle is completed.

This status of the automatic block erase operation can be checked by monitoring FCFLCS<RDY / BSY>. While no automatic verify operation is performed internally to the device, be sure to read the data to confirm that data has been correctly erased. Any new command sequence is not accepted while it is in an automatic block erase operation. If it is desired to stop operation, use the hardware reset function. In this case, it is necessary to perform the automatic block erase operation again because the data erasing operation has not been normally terminated.

Also, any protected block cannot be erased. If an automatic block erase operation has failed, the flash memory is locked in the mode and will not return to the read mode. In this case, execute hardware reset to reset the device.

## (4) Automatic programming of protection bits (for each block)

This device is implemented with protection bits. This protection can be set for each block. See Table 30-23 for table of protection bit addresses. This device assigns 1 bit to 1 block as a protection bit. The applicable protection bit is specified by PBA in the seventh bus write cycle. By automatical-

ly programming the protection bits, write and/or erase functions can be inhibited (for protection) individually for each block. The protection status of each block can be checked by FCFLCS <BLPRO> to be described later. This status of the automatic programming operation to set protection bits can be checked by monitoring FCFLCS <RDY\_BSY>. Any new command sequence is not accepted while automatic programming is in progress to program the protection bits. If it is desired to stop the programming operation, use the hardware reset function. In this case, it is necessary to perform the programming operation again because the protection bits may not have been correctly programmed. If all the protection bits have been programmed, all FCFLCS <BLPRO> are set to "1" indicating that it is in the protected state. This disables subsequent writing and erasing of all blocks.

**Note: Software reset is ineffective in the seventh bus write cycle of the automatic protection bit programming command. FCFLCS <RDY\_BSY> turns to "0" after entering the seventh bus write cycle.**

#### (5) Automatic erasing of protection bits

Different results will be obtained when the automatic protection bit erase command is executed depending on the status of the protection bits and the security bits. It depends on whether all <BLPRO> in the FCFLCS register are set to "1" or not, when FCSECBIT<FCSECBIT> is set to "1". Be sure to check the value of FCFLCS <BLPRO> before executing the automatic protection bit erase command. See Chapter "Protect/security function" for details.

- When all the FCFLCS <BLPRO> are set to "1" (all the protection bits are programmed):

When the automatic protection bit erase command is command written, the flash memory is automatically initialized within the device. When the seventh bus write cycle is completed, the entire area of the flash memory data cells is erased and then the protection bits are erased. This operation can be checked by monitoring FCFLCS <RDY\_BSY>. If the automatic operation to erase protection bits is normally terminated, FCFLCS will be set to "0x00000001". Since no automatic verify operation is performed internally to the device, be sure to read the data to confirm that it has been correctly erased. For returning to the read mode while the automatic operation after the seventh bus cycle is in progress, it is necessary to use the hardware reset to reset the device. If this is done, it is necessary to check the status of protection bits by FCFLCS <BLPRO> after retuning to the read mode and perform either the automatic protection bit erase, automatic chip erase, or automatic block erase operation, as required.

- When FCFLCS <BLPRO> include "0" (not all the protection bits are programmed):

If the automatic protection bit is cleared to "0", the protection condition is canceled. With this device, protection bits can be programmed to an individual block and performed bit-erase operation in the four bits unit as shown in Table 30-23. The target bits are specified in the seventh bus write cycle. The protection status of each block can be checked by FCFLCS <BLPRO> to be described later. This status of the programming operation for automatic protection bits can be checked by monitoring FCFLCS <RDY\_BSY>. When the automatic operation to erase protection bits is normally terminated, the protection bits of FCFLCS <BLPRO> selected for erasure are set to "0".

In any case, any new command sequence is not accepted while it is in an automatic operation to erase protection bits. If it is desired to stop the operation, use the hardware reset function. When the automatic operation to erase protection bits is normally terminated, it returns to the read mode.

**Note: The FCFLCS <RDY / BSY> bit is "0" while in automatic operation and it turns to "1" when the automatic operation is terminated.**

#### (6) ID-Read

Using the ID-Read command, you can obtain the type and other information on the flash memory contained in the device. The data to be loaded will be different depending on the address [15:14] of the fourth and subsequent bus write cycles (recommended input data is 0x00). After the fourth bus write cycle, when an arbitrary flash memory area is read, the ID value will be loaded. Once the

fourth bus write cycle of an ID-Read command has passed, the device will not automatically return to the read mode. In this condition, the set of the fourth bus write cycle and ID-Read commands can be repeatedly executed. For returning to the read mode, use the Read/reset command or hardware reset command.

## 30.3.1.4 Flash control / status register

Base Address = 0x41FF\_F000

Register name		Address (Base+)
Reserved	-	0x0000, 0x0004
Security bit register	FCSECBIT	0x0010
Reserved	-	0x0014
Flash control register	FCFLCS	0x0020
Reserved	-	0x0024, 0x0028
Reserved	-	0x0040, 0x0044
Reserved	-	0x0050, 0x0058
Reserved	-	0x0060 to 0x00B8

Note: Do not access to the reserved address.

## (1) FCFLCS (Flash control register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	BLPRO5	BLPRO4	BLPRO3	BLPRO2	BLPRO1	BLPRO0
After reset	0	0	(Note 2)	(Note 2)	(Note 2)	(Note 2)	(Note 2)	(Note 2)
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	-	-	RDY_BSY
After reset	0	0	0	0	0	0	0	1

Bit	Bit Symbol	Type	Function
31 to 22	-	R	Read as 0.
21 to 16	BLPRO5 to BLPRO0	R	Protection for Block 5 to 0 0: disabled 1: enabled  Each of the protection bits represents the protection status of the corresponding block. When a bit is set to "1", it indicates that the block corresponding to the bit is protected. When the block is protected, data cannot be written to it.
15 to 1	-	R	Read as 0.
0	RDY_BSY	R	Ready / Busy (Note 1) 0: Auto operating 1: Auto operation terminated. Ready/Busy flag bit  The RDY_BSY output is provided as a means to monitor the status of automatic operation. This bit is a function bit for the CPU to monitor the function. When the flash memory is in automatic operation, it outputs "0" to indicate that it is busy. When the automatic operation is terminated, it returns to the ready state and outputs "1" to accept the next command. If the automatic operation has failed, this bit maintains the "0" output. By applying a hardware reset, it returns to "1".

Note 1: This command must be issued in the ready state. Issuing the command in the busy state may disable both correct command transmission and further command input. To exit from the condition, execute system reset. Refer to "Reset Operation" regarding to reset in this case.

Note 2: The value varies depending on protection applied.

## (2) FCSECBIT (Security bit register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	-	-	SECBIT
After reset	0	0	0	0	0	0	0	1

Bit	Bit Symbol	Type	Function
31-1	-	R	Read as 0.
0	SECBIT	R/W	Security bits 0:disabled 1:enabled

Note: This register is initialized by cold reset or releasing STOP2 mode of low power consumption mode.

### 30.3.1.5 List of Command Sequences

Table 30-20 shows the address and the data of each command of flash memory.

Bus cycles are "bus write cycles" except for the second bus cycle of the Read command, the fourth bus-cycle of the Read/reset command, and the fifth bus cycle of the ID-Read command. Bus write cycles are executed by 32-bit (word) data transfer commands. (In the following table, only lower 8 bits data are shown.)

See Table 30-21 for the detail of the address bit configuration. Use a value of "Addr." in the Table 30-20 for the address [15:8] of the normal command in the Table 30-21.

**Note: Always set "0" to the address bits [1:0] in the entire bus cycle.**

Table 30-20 Flash Memory Access from the Internal CPU

Command sequence	First bus cycle	Second bus cycle	Third bus cycle	Fourth bus cycle	Fifth bus cycle	Sixth bus cycle	Seventh bus cycle
	Addr.	Addr.	Addr.	Addr.	Addr.	Addr.	Addr.
	Data	Data	Data	Data	Data	Data	Data

	0xAA	0x55	0x6A	0xAA	0x55	0x6A	0x6A

#### Supplementary explanation

- RA: Read address
- RD: Read data
- IA: ID address
- ID: ID data
- PA: Program page address
- PD: Program data (32 bit data)

After fourth bus cycle, enter data in the order of the address for a page.

- BA: Block address
- PBA: Protection bit address

### 30.3.2 Address bit configuration for bus write cycles

Table 30-21 is used in conjunction with "Table 30-20 Flash Memory Access from the Internal CPU".

Address setting can be performed according to the normal bus write cycle address configuration from the first bus cycle. "0" is recommended in the Table 30-21 Address Bit Configuration for Bus Write Cycles can be changed as necessary.

Address	Addr [31:19]	Addr [18]	Addr [17]	Addr [16]	Addr [15]	Addr [14]	Addr [13:11]	Addr [10]	Addr [9]	Addr [8]	Addr [7:0]
Normal commands	Normal bus write cycle address configuration										
	Flash area	"0" is recommended.			Command						Addr[1:0]="0" (fixed) Others:0 (recommended)
ID-READ	IA: ID address (Set the fourth bus write cycle address for ID-Read operation)										
	Flash area	"0" is recommended.			ID address		Addr[1:0]="0" (fixed), Others:0 (recommended)				
Block erase	BA: Block address (Set the sixth bus write cycle address for block erase operation)										
	Block selection (Table 30-21)					Addr[1:0]="0" (fixed), Others:0 (recommended)					
Auto page programming	PA: Program page address (Set the fourth bus write cycle address for page programming operation)										
	Page selection									Addr[1:0]="0" (fixed) Others:0 (recommended)	
Protection bit programming	PBA: Protection bit address (Set the seventh bus write cycle address for protection bit programming)										
	Flash area	Protection bit selection (Table 30-22)			Fixed to "0".				Protect bit selection (Table 30-22)		Addr[1:0]="0" (fixed) Others:0 (recommended)
Protection bit erase	PBA: Protection bit address (Set the seventh bus erase cycle address for protection bit erasure)										
	Flash area	Protection bit selection (Table 30-23)			Fixed to "0".				Addr[1:0]="0" (fixed) Others:0 (recommended)		

As block address, specify any address in the block to be erased.

Table 30-21 Block Address Table

Block	Address (User boot mode)	Address (Single boot mode)	Size (K byte)
-------	-----------------------------	-------------------------------	------------------

TMPM368FDXBG

4	0x0000_0000 to 0x0000_7FFF	0x3F80_0000 to 0x3F80_7FFF	32
5	0x0000_8000 to 0x0000_FFFF	0x3F80_8000 to 0x3F80_FFFF	32
3	0x0001_0000 to 0x0001_FFFF	0x3F81_0000 to 0x3F81_FFFF	64
2	0x0002_0000 to 0x0003_FFFF	0x3F82_0000 to 0x3F83_FFFF	128
1	0x0004_0000 to 0x0005_FFFF	0x3F84_0000 to 0x3F85_FFFF	128
0	0x0006_0000 to 0x0007_FFFF	0x3F86_0000 to 0x3F87_FFFF	128

Note: As for the addresses from the first to the fifth bus cycles, specify the upper addresses of the blocks to be erased.

Table 30-22 Block Address Table

Block	Protect bit	The seventh bus write cycle address					
		Address [18]	Address [17]	Address [16:11]	Address [10]	Address 9]	Address [8]

## 31. ROM protection

### 31.1 Outline

The TPM368FDXBG offers two kinds of ROM protection/ security functions.

One is a write/ erase-protection function for the internal flash ROM data.

The other is a security function that restricts internal flash ROM data readout and debugging.

### 31.2 Features

#### 31.2.1 Write/ erase-protection function

The write/ erase-protection function enables the internal flash to prohibit the writing and erasing operation for each block.

To activate the function, write "1" to the corresponding bits to a block to protect. Writing "0" to the bits cancels the protection.

The protection settings of the bits can be monitored by the FCFLCS <BLPRO[5:0]> bit. See the chapter "Flash" for programming details.

#### 31.2.2 Security function

The security function restricts flash ROM data readout and debugging.

This function is available under the conditions shown below.

1. The FCSECBIT <SECBIT> bit is set to "1".
2. All the protection bits (the FCFLCS<BLPRO> bits) used for the write/erase-protection function are set to "1".

Table 31-1 shows details of the restrictions by the security function.

Table 31-1 Restrictions by the security function

Item	Details
1) ROM data readout	Data can be read from CPU.
2) Debug port	Communication of JTAG/SW and trace are prohibited
3) Command for flash memory	Writing a command to the flash memory is prohibited. An attempt to erase the contents in the bits used for the write/erase-protection erases all the protection bits.

### 31.3 Register

Base Address = 0x41FF\_F000

Register name		Address (Base+)
Reserved	-	0x0000, 0x0004
Security bit register	FCSECBIT	0x0010
Reserved	-	0x0014
Flash control register	FCFLCS	0x0020
Reserved	-	0x0024 to 0x0FFF

Note:Access to the "Reserved" area is prohibited.

## 31.3.1 FCFLCS (Flash control register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	BLPRO5	BLPRO4	BLPRO3	BLPRO2	BLPRO1	BLPRO0
After reset	0	0	(Note2)	(Note2)	(Note2)	(Note2)	(Note2)	(Note2)
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	-	-	RDY_BSY
After reset	0	0	0	0	0	0	0	1

Bit	Bit Symbol	Type	Function
31-22	-	R	Read as 0.
21-16	BLPRO5 to BLPRO0	R	Protection for Block5 to 0 0: disabled 1: enabled Protection status bits Each of the protection bits represents the protection status of the corresponding block. When a bit is set to "1", it indicates that the block corresponding to the bit is protected. When the block is protected, data cannot be written to it.
15-1	-	R	Read as 0.
0	RDY_BSY	R	Ready/Busy (Note 1) 0: Auto operating 1: Auto operation terminated Ready/Busy flag bit The RDY_BSY output is provided as a means to monitor the status of automatic operation. This bit is a function bit for the CPU to monitor the function. When the flash memory is in automatic operation, it outputs "0" to indicate that it is busy. When the automatic operation is terminated, it returns to the ready state and outputs "1" to accept the next command. If the automatic operation has failed, this bit maintains the "0" output. By applying a hardware reset, it returns to "1".

Note 1: **This command must be issued in the ready state. Issuing the command in the busy state may disable both correct command transmission and further command input. To exit from the condition, execute system reset. Refer to "Reset" in "Flash" section regarding to reset in this case.**

Note 2: **The value varies depending on protection applied.**

## 31.3.2 FCSECBIT (Security bit register)

	31	30	29	28	27	26	25	24
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	23	22	21	20	19	18	17	16
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	15	14	13	12	11	10	9	8
bit symbol	-	-	-	-	-	-	-	-
After reset	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0
bit symbol	-	-	-	-	-	-	-	SECBIT
After reset	0	0	0	0	0	0	0	1

Bit	Bit Symbol	Type	Function
31-1	-	R	Read as 0.
0	SECBIT	R/W	Security bit 0: Disabled 1: Enabled

Note: This register is initialized by cold reset and releasing STOP2 mode of the low power consumption mode.

## 31.4 Writing and erasing

### 31.4.1 Protection bits

To write the protection bits or to erase the protection bits is used by command sequence.

Writing to the protection bits is done on block-by-block basis. Erasing to the protection bits is done on the unit, from block0 to block3 and from block 4 to block 5.

When the settings for all the blocks are "1" and FCSECBIT<SECBIT> is "1", the security function is enabled. In this condition, the chip erase is done and all protect bits are erased by erasing the protect bits. Therefore, the protect bit should be erased after FCSECBIT<SECBIT> makes "0".

See the chapter "Flash" for details.

### 31.4.2 Security bit

The FCSECBIT <SECBIT> bit that activates security function is set to "1" at a power-on reset right after power-on.

The bit is rewritten by the following procedure.

1. Write the code 0xa74a9d23 to FCSECBIT register.
2. Write data within 16 clocks from the above.1.

Note: The above procedure is enabled only when using 32-bit data transfer command.

## 32. Debug Interface

### 32.1 Specification Overview

TMPM368FDXBG contains the Serial Wire JTAG Debug Port (SWJ-DP) unit for interfacing with the debugging tools and the Embedded Trace Macrocell™(ETM) unit for instruction trace output. Trace data is output to the dedicated pins (TRACEDATA[3:0], SWV) for the debugging via the on-chip Trace Port Interface Unit (TPIU).

For details about SWJ-DP, ETM and TPIU, refer to "Cortex-M3 Technical Reference Manual".

### 32.2 SWJ-DP

SWJ-DP supports the Serial Wire Debug Port (SWCLK, SWDIO) and the JTAG Debug Port (TDI, TDO, TMS, TCK,  $\overline{\text{TRST}}$ ).

### 32.3 ETM

ETM supports four data signal pins (TRACEDATA[3:0]), one clock signal pin (TRACECLK) and trace output from Serial Wire Viewer (SWV).

### 32.4 Pin Functions

The debug interface pins can also be used as general-purpose ports.

The PA1 and PA2 pins are shared between the JTAG debug port function and the Serial Wire Debug Port function. The PA0 pin is shared between the JTAG debug port function and the SWV trace output function.

Table 32-1 SWJ-DP,ETM Debug Functions

SWJ-DP Pin Name	General- purpose Port Name	JTAG Debug Function		SW Debug Function	
		I / O	Explanation	I / O	Explanation
TMS / SWDIO	PA1	Input	JTAG Test Mode Selection	I / O	Serial Wire Data Input/Output
TCK / SWCLK	PA2	Input	JTAG Test Check	Input	Serial Wire Clock
TDO / SWV	PA0	Output	JTAG Test Data Output	(Output) (Note)	(Serial Wire Viewer Output)
TDI	PA3	Input	JTAG Test Data Input	-	-
TRST	PA4	Input	JTAG Test RESET	-	-
TRACECLK	PA5	Output	TRACE Clock Output		
TRACEDATA0	PA6	Output	TRACE DATA Output0		
TRACEDATA1	PA7	Output	TRACE DATA Output1		
TRACEDATA2	PB0	Output	TRACE DATA Output2		
TRACEDATA3	PB1	Output	TRACE DATA Output3		

Note:When SWV function is used.

After reset, PA0, PA1 and, PA2, PA3 and PA4 pins are configured as debug port function pins. The functions of other debug interface pins need to be programmed as required.

When using a low power consumption mode, take note of the following points.

Note:If PA1 and PA0 are configured as TMS/SWDIO and TDO/SWV, output continues to be enabled even in STOP mode regardless of the setting of the CGSTBYCR<DRVE>.

Table 32-2 summarizes the debug interface pin and related port settings after reset.

Table 32-2 Debug Interface Pins and Related Port Settings after Reset

Port Name (Bit Name)	Debug Function	Value of Related port settings after reset					
		Function (PxFR)	Input (PxIE)	Output (PxCR)	Pull-up (PxPUP)	Pull-down (PxPDN)	Open-drain (PxOD)
PA1	TMS/SWDIO	1	1	1	1	0	0
PA2	TCK/SWCLK	1	1	0	0	1	0
PA0	TDO/SWV	1	0	1	0	0	0
PA3	TDI	1	1	0	1	0	0
PA4	TRST	1	1	0	1	0	0
PA5	TRACECLK	0	0	0	0	0	0
PA6	TRACEDATA0	0	0	0	0	0	0
PA7	TRACEDATA1	0	0	0	0	0	0
PB0	TRACEDATA2	0	0	0	0	0	0
PB1	TRACEDATA3	0	0	0	0	0	0

## 32.5 Peripheral Functions in Halt Mode

When the Cortex-M3 core enters in the halt mode, the watchdog-timer (WDT) automatically stops. Other peripheral functions continue to operate.

## 32.6 Connection with a Debug Tool

### 32.6.1 About connection with debug tool

Concerning a connection with debug tools, refer to manufactures recommendations.

Debug interface pins contain a pull-up resistor and a pull-down resistor. When debug interface pins are connected with external pull-up or pull-down, please pay attention to input level.

Note: Ensure that to measure the power-consumption with debug tool connected in STOP1/STOP2 mode is prohibited.

### 32.6.2 Important points of using debug interface pins used as general-purpose ports

When setting a debugging interface terminal to a general-purpose port by a user's program after reset release, after that the control from a debugging tool is impossible.

Please note that it is necessary to prepare for the structure which changes the general-purpose port to the debugging interface function by some kind of methods to connect a debugging tool again.

Table 32-3 Example Table of using debug interface pins

	Debug interface pins						
	$\overline{\text{TRST}}$	TDI	TDO / SWV	TCK / SWCLK	TMS / SWDIO	TRACE DATA[3:0]	TRACE CLK
JTAG+SW (After reset)	o	o	o	o	o	x	x
JTAG+SW (without $\overline{\text{TRST}}$ )	x (Note)	o	o	o	o	x	x
JTAG+TRACE	o	o	o	o	o	o	o
SW	x	x	x	o	o	x	x
SW+SWV	x	x	o	o	o	x	x

o : Enabled x : Disabled (Usable as general-purpose port)

Note: For the treatment of the pin of which the  $\overline{\text{TRST}}$  function is assigned, select the  $\overline{\text{TRST}}$  function with the function register and set the pin to OPEN or "High level".

## 33. JTAG Interface

### 33.1 Overview

The TPM368FDXBG provides a boundary-scan interface that is compatible with Joint Test Action Group (JTAG) specifications and uses the industry-standard JTAG protocol (IEEE Standard 1149.1 • 1990 <Includes IEEE Standard 1449.1a • 1993>).

This chapter describes the JTAG interface, with the descriptions of boundary scan and the pins and signals used by the interface.

#### 1. JTAG standard version

IEEE Standard 1149.1 • 1990 (Includes IEEE Standard 1149.1a • 1993)

#### 2. JTAG instructions

Standard instructions (BYPASS, SAMPLE/PRELOAD, EXTEST)

HIGHZ instruction

CLAMP instruction

However, the SAMPLE/RELOAD instruction doesn't function because internal circuit reset starts as for TPM368FDXBG while JTAG is operating.

#### 3. IDCODE

Not available

#### 4. Pins excluded from boundary scan register (BSR)

- a. Oscillator circuit pins (X1, X2)
- b. DAC pin (DA0, DA1)
- c. JTAG control pins (BSC)
- d. Power supply/GND pins (including reference supply pin for ADC and DAC)
- e. TEST pins (FTEST3)
- f. Function pins ( $\overline{\text{RESET}}$ )
- g. Control pins (MODE)

Note: Please note the input level to the analog input pins.

### 33.2 Signal Summary and Connection Example

The JTAG interface signals are listed below.

- TDI JTAG serial data input
- TDO JTAG serial data output
- TMS JTAG test mode select
- TCK JTAG serial clock input
- $\overline{\text{TRST}}$  JTAG test reset input
- BSC ICE/JTAG test select input (compatible with the Enable signal)  
0: ICE, 1: JTAG

The TMPM368FDXBG supports debugging by connecting the JTAG interface with a JTAG-compliant development tool.

For information about debugging, refer to the specification of the development tool used.

Figure 33-1 Example of connection with a JTAG development tool

Mode Setting Pin (BSC)	Operation mode
0	Set this pin to 0 except for Boundary Scan Mode. The TMPM368FDXBG operates as regular Debug Mode. Note: Debugging is not available if the internal BOOT is running.
1	The TMPM368FDXBG operates in Boundary Scan Mode.

### 33.3 Outline

With the evolution of ever-denser integrated circuits (ICs), surface-mounted devices, double-sided component mounting on printed-circuit boards (PCBs), and set-in recesses, in-circuit tests that depend upon physical contact like the connection of the internal board and chip has become more and more difficult to use. The more ICs have become complex, the larger and more difficult the test program became.

As one of the solutions, boundary-scan circuits started to be developed. A boundary-scan circuit is a series of shift register cells placed between the pins and the internal circuitry of the IC to which the said pins are connected. Normally, these boundary-scan cells are bypassed; when the IC enters test mode, however, the scan cells can be directed by the test program to pass data along the shift register path and perform various diagnostic tests. To accomplish this, the tests use the five signals, TCK, TMS, TDI, TDO and  $\overline{\text{TRST}}$ .

The JTAG boundary-scan mechanism (hereinafter referred to as JTAG mechanism in the chapter) allows testing of the connections between the processor, the printed circuit board to which it is attached, and the other components on the circuit board.

The JTAG mechanism cannot test the processor alone.

### 33.4 JTAG Controller and Registers

The processor contains the following JTAG controller and registers.

- Instruction register
- Boundary scan register
- Bypass register
- Device identification register
- Test Access Port (TAP) controller

JTAG basically operates to monitor the TMS input signal with the TAP controller state machine. When the monitoring starts, the TAP controller determines the test functionality to be implemented. This includes both loading the JTAG instruction register (IR) and beginning a serial data scan through a data register (DR), as shown in Table 33-1. As the data is scanned, the state of the TMS pin signals each new data word and indicates the end of the data stream. The data register is selected according to the contents of the instruction register.

### 33.5 Instruction Register

The JTAG instruction register includes four shift register-based cells. This register is used to select the test to be performed and/or the test data register to be accessed. As listed in Table 33-1, this instruction codes select either the boundary scan register or the bypass register.

Table 33-1 JTAG Instruction Register Bit Configuration

Instruction code (MSB to LSB)	Instruction	Selected data register
0000	EXTEST	Boundary scan register
0001	SAMPLE/PRELOAD	Boundary scan register
0100 to 1110	Reserved	Reserved
0010	HIGHZ	Bypass register
0011	CLAMP	Bypass register
1111	BYPASS	Bypass register

Figure 33-2 shows the format of the instruction register.

Figure 33-2 Instruction register

The instruction code is shifted out to the instruction register from the LSB.

Figure 33-3 Instruction Register Shift Direction

The bypass register is 1 bit wide. When the TAP controller is in the Shift-DR (bypass) state, the data on the TDI pin is shifted into the bypass register, and the bypass register output shifts to the data out on the TDO output pin.

In essence, the bypass register is an alternative route which allows bypassing of board-level devices in the serial boundary-scan chain, which are not required for a specific test. The logical location of the bypass register in the boundary-scan chain is shown in Figure 33-4.

Use of the bypass register speeds up access to the boundary scan register in the IC that remains active in the board-level test data path.

Figure 33-4 Bypass Register Operation

### 33.6 Boundary Scan Register

The boundary scan register provides all the inputs and outputs of the TMPM368FDXBG processor except some analog outputs and control signals. The pins of the TMPM368FDXBG allow any pattern to be driven by scanning the data into the boundary scan register in the Shift-DR state. Incoming data to the processor is examined by enabling the boundary scan register and shifting the data when the BSR is in the Capture-DR state.

The boundary scan register is a single, 231-bit-wide, shift register-based path containing cells connected to the input and output pads on the TMPM368FDXBG.

The TDI input is loaded to the LSB of the boundary scan register. The MSB of the boundary scan register is shifted out on the TDO output.

## 33.7 Test Access Port (TAP)

The Test Access Port (TAP) consists of the five signal pins:  $\overline{\text{TRST}}$ , TDI, TDO, TMS and TCK. These pins control a test by communicating the serial test data and instructions.

As Figure 33-5 shows, data is serially scanned into one of the three registers (instruction register, bypass register or boundary scan register) on the TDI pin, or it is scanned out from one of these three registers on the TDO pin.

The TMS input controls the state transitions of the main TAP controller state machine. The TCK input is a special test clock that allows serial JTAG data to be shifted synchronously, independent of any chip-specific or system clocks.

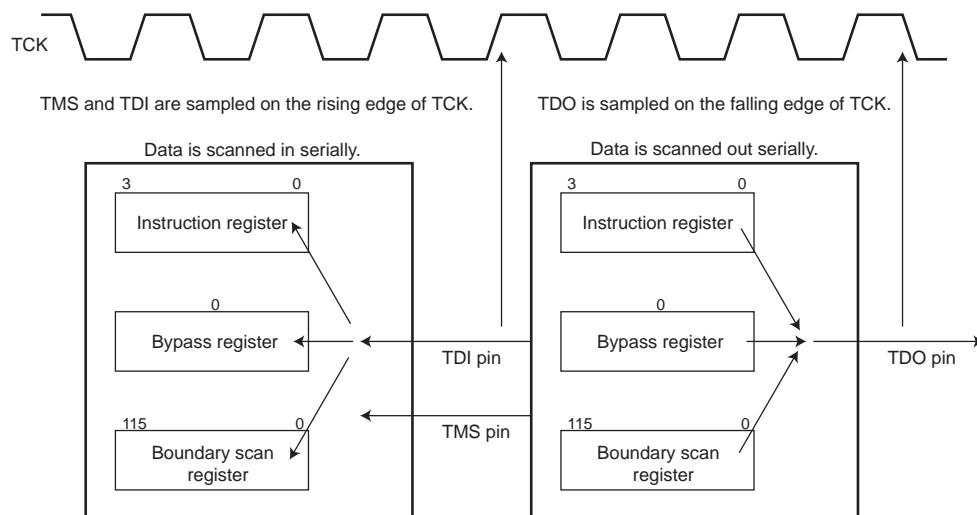

Figure 33-5 JTAG Test Access Port

Data on the TDI and TMS pins are sampled on the rising edge of the TCK input clock signal. Data on the TDO pin changes on the falling edge of the TCK clock signal.

## 33.8 TAP Controller

The processor incorporates the 16-state TAP controller stipulated in the IEEE JTAG specification.

## 33.9 Resetting the TAP Controller

The TAP controller state machine can be put into the Reset state by the following method.

Assertion of the  $\overline{\text{TRST}}$  signal input (low) resets the TAP controller. After the processor reset state is released, keep the TMS input signal asserted through five consecutive rising edges of TCK input. Keeping TMS asserted maintains the Reset state.

## 33.10 State Transitions of the TAP Controller

The state transition diagram of the TAP controller is shown in Figure 33-6. Each arrow between states is labeled with a 1 or 0, indicating the logic value of TMS that must be set up before the rising edge of TCK to cause the transition.

Figure 33-6 TAP Controller State Transition Diagram

The following paragraphs describe each of the controller states. The left column in Figure 33-6 is the data column, and the right column is the instruction column. The data column and instruction column reference the data register (DR) and the instruction register (IR), respectively.

- Test-Logic-Reset

When the TAP controller is in the Reset state, the device identification register is selected by default. The MSB of the boundary scan register is cleared to 0 which disables the outputs.

The TAP controller remains in this state while TMS is high. If TMS is held low while the TAP controller is in this state, then the controller moves to the Run-Test/Idle state.

- Run-Test/Idle

In the Run-Test/Idle state, the IC is put in test mode only when certain instructions such as a built-in self test (BIST) instruction are present. For instructions that do not cause any activities in this state, all test data registers selected by the current instruction retain their previous states.

The TAP controller remains in this state while TMS is held low. When TMS is held high, the controller moves to the Select-DR-Scan state.

- Select-DR-Scan

This is a temporary controller state. Here, the IC does not execute any specific functions.

If TMS is held low when the TAP controller is in this state, the controller moves to the Capture-DR state. If TMS is held high, the controller moves to the Select-IR-Scan state.

- Select-IR-Scan

This is a temporary controller state. Here, the IC does not execute any specific functions.

If TMS is held low when the TAP controller is in this state, the controller moves to the Capture-IR state. If TMS is held high, the controller returns to the Test-Logic-Reset state.

- Capture-DR

In this state, if the test data register selected by the current instruction has parallel inputs, then data is parallel-loaded into the shift portion of the data register. If the test data register does not have parallel inputs, or if data needs not be loaded into the selected data register, then the data register retains its previous state.

If TMS is held low when the TAP controller is in this state, the controller moves to the Shift-DR state. If TMS is held high, the controller moves to the Exit 1-DR state.

- Shift-DR

In this controller state, the test data register connected between TDI and TDO shifts data out serially.

When the TAP controller is in this state, then it remains in the Shift-DR state if TMS is held low, or moves to the Exit 1-DR state if TMS is held high.

- Exit 1-DR

This is a temporary controller state.

If TMS is held low when the TAP controller is in this state, the controller moves to the Pause-DR state. If TMS is held high, the controller moves to the Update-DR state.

- Pause-DR

This state allows the shifting of the data register selected by the instruction register to be temporarily suspended. Both the instruction register and the data register retain their current states.

When the TAP controller is in this state, then it remains in the Pause-DR state if TMS is held low, or moves to the Exit 2-DR state if TMS is held high.

- Exit 2-DR

This is a temporary controller state.

When the TAP controller is in this state, it returns to the Shift-DR state if TMS is held low, or moves on to the Update-DR state if TMS is held high.

- Update-DR

In this state, data is latched, on the rising edge of TCK, onto the parallel outputs of the data registers from the shift register path. The data held at the parallel output does not change while data is shifted in the associated shift register path.

When the TAP controller is in this state, it moves to either the Run-Test/Idle state if TMS is held low, or the Select-DR-Scan state if TMS is held high.

- Capture-IR

In this state, data is parallel-loaded into the instruction register. The data to be loaded is "0001". The Capture-IR state is used for testing the instruction register. Faults in the instruction register, if any, may be detected by shifting out the loaded data.

When the TAP controller is in this state, it moves to either the Shift-IR state if TMS is held low, or the Exit 1-IR state if TMS is high.

- Shift-IR

In this state, the instruction register is connected between TDI and TDO and shifts the captured data toward its serial output on the rising edge of TCK.

When the TAP controller is in this state, it remains in the Shift-IR state if TMS is low, or moves to the Exit 1-IR state if TMS is high.

- Exit 1-IR

This is a temporary controller state.

When the TAP controller is in this state, it moves to either the Pause-IR state if TMS is held low, or the Update-IR state if TMS is held high.

- Pause-IR

This state allows the shifting of the instruction register to be temporarily suspended. Both the instruction register and the data register retain their current states.

When the TAP controller is in this state, it remains in the Pause-IR state if TMS is held low, or moves to the Exit 2-IR state if TMS is held high.

- Exit 2-IR

This is a temporary controller state.

When the TAP controller is in this state, it moves to either the Shift-IR state if TMS is held low, or the Update-IR state if TMS is held high.

- Update-IR

This state allows the instruction previously shifted into the instruction register to be output in parallel on the rising edge of TCK. Then it becomes the current instruction, setting a new operational mode.

When the TAP controller is in this state, it moves to either the Run-Test/Idle state if TMS is low, or the Select-DR-Scan state if TMS is high.

### 33.11 Boundary Scan Order

The below table shows the boundary scan order with respect to the processor signals.

TDI → 1 (PA5)→ 2(PA6)→ – →69(PI4)→70( $\overline{\text{NMI}}$ )→TDO

Table 33-2 JTAG Scan Order of the TMPM368FDXBG Processor Pins

No.	Pin Name	No.	Pin Name	No.	Pin Name
	TDI				
1	PA5	21	PB4	41	PE6
2	PA6	22	PB3	42	PE5
3	PA7	23	PB2	43	PE4
4	PB0	24	PG7	44	PE3
5	PB1	25	PG6	45	PE2
6	PL3	26	PG5	46	PE1
7	PL2	27	PG4	47	PE0
8	PL1	28	PG3	48	PI3
9	PL0	29	PG2	49	PI2
10	PK0	30	PG1	50	PI1
11	PK1	31	PG0	51	PI0
12	PK2	32	PF7	52	PI7
13	PK3	33	PF6	53	PI6
14	PK4	34	PF5	54	PI5
15	PH0	35	PF4	55	PI4
16	PH1	36	PF3	56	$\overline{\text{NMI}}$
17	PH2	37	PF2	57	TDO
18	PH3	38	PF1		
19	PB6	39	PF0		
20	PB5	40	PE7		

## 33.12 Instructions Supported by the JTAG Controller Cells

This section describes the instructions supported by the JTAG controller cells of the TMPM368FDXBG.

### 1. EXTEST instruction

The EXTEST instruction is used for external interconnect tests. The EXTEST instruction permits BSR cells at output pins to shift out test patterns in the Update-DR state and those at input pins to capture test results in the Capture-DR state.

Typically, before EXTEST is executed, the initialization pattern is shifted into the boundary scan register using the SAMPLE/PRELOAD instruction. If the boundary scan register is not reset, indeterminate data will be transferred in the Update-DR state and bus conflicts between ICs may occur. Figure 33-7 shows data flow when the EXTEST instruction is selected.

Figure 33-7 Test Data Flow when the EXTEST Instruction is Selected

The following steps describe the basic test procedure of the external interconnect test.

1. Reset the TAP controller to the Test-Logic-Reset state.
  2. Load the instruction register with the SAMPLE/PRELOAD instruction. This causes the boundary scan register to be connected between TDI and TDO.
  3. Reset the boundary scan register by shifting certain data in.
  4. Load the test pattern into the boundary scan register.
  5. Load the instruction register with the EXTEST instruction.
  6. Capture the data applied to the input pin into the boundary scan register.
  7. Shift out the captured data while simultaneously shifting the next test pattern in.
  8. Send out the test pattern in the boundary scan register at the output on the output pin.
- Repeat steps 6 to 8 for each test pattern.

### 2. SAMPLE/PRELOAD instruction

This instruction targets the boundary scan register between TDI and TDO. As its name implies, the SAMPLE/PRELOAD instruction provides two functions.

SAMPLE allows the input and output pads of an IC to be monitored. While it does so, it does not disconnect the system logic from the IC pins. SAMPLE is executed in the Capture-DR state. It is mainly used to capture the values of the IC's I/O pins on the rising edge of TCK during normal operation. Figure 33-8 shows the flow of data for the SAMPLE phase of the SAMPLE/PRELOAD instruction.

Figure 33-8 Test Data Flow while the SAMPLE is Selected

PRELOAD allows the boundary scan register to be reset before any other instruction is selected. For example, prior to selection of the EXTEST instruction, PRELOAD is used to load reset data into the boundary scan register. PRELOAD permits data shifting of the boundary scan register without interfering with the normal operation of the system logic. Figure 33-9 shows the data flow for the PRELOAD phase of the SAMPLE/PRELOAD instruction.

Figure 33-9 Test Data Flow while PRELOAD is Selected

3. BYPASS instruction

This instruction targets the bypass register between JTDI and JTDO. The bypass register provides the shortest serial path that bypasses the IC (between JTDI and JTDO) when the test does not require control or monitoring of the IC. The BYPASS instruction does not cause interference in the normal operation of the on-chip system logic. Figure 33-10 shows the data flow through the bypass register when the BYPASS instruction is selected.

Figure 33-10 Test Data Flow when the BYPASS Instruction is Selected

4. CLAMP instruction

The CLAMP instruction outputs the value that boundary scan register is programmed according to the PRELOAD instruction, and execute Bypass operation.

The CLAMP instruction selects the bypass register between TDI and TDO.

#### 5. HIGHZ instruction

The HIGHZ instruction disables the output of the internal logical circuits. When the HIGHZ instruction is executed, it places the 3-state output pins in the high-impedance state.

The HIGHZ instruction also selects the bypass register between TDI and TDO.

- Notes

This section describes the cautions of the JTAG boundary-scan operations specific to the processor.

1. Please note the input level to the analog input pins.
2. The JTAG circuit can be released from the reset state by either of the following two methods:  
Assert  $\overline{\text{TRST}}$ , initialize the JTAG circuit, and then deassertion  $\overline{\text{TRST}}$ .  
Supply the TCK signal for 5 or more clock pulses to TCK while pulling the TMS pin High.

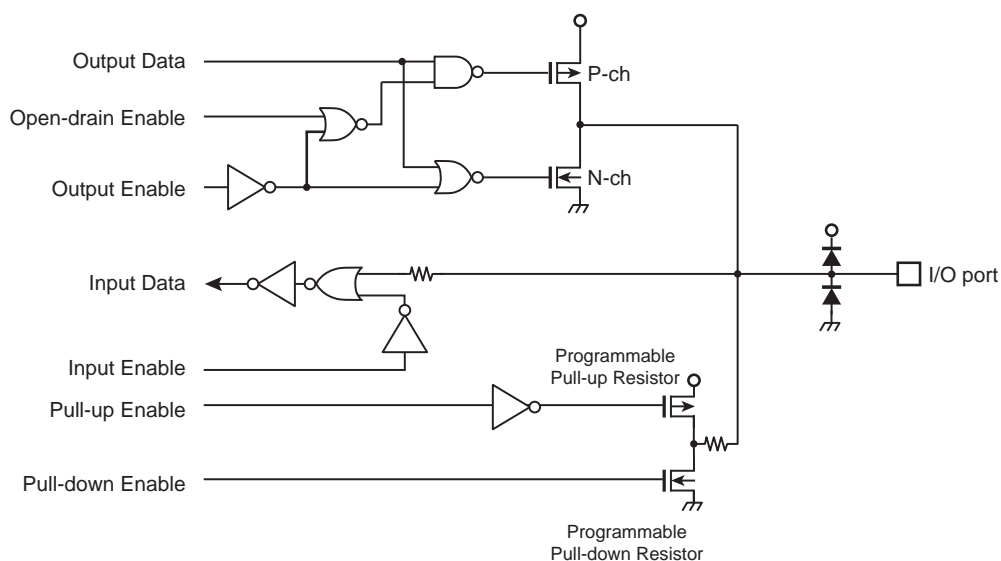

## 34. Port Section Equivalent Circuit Schematic

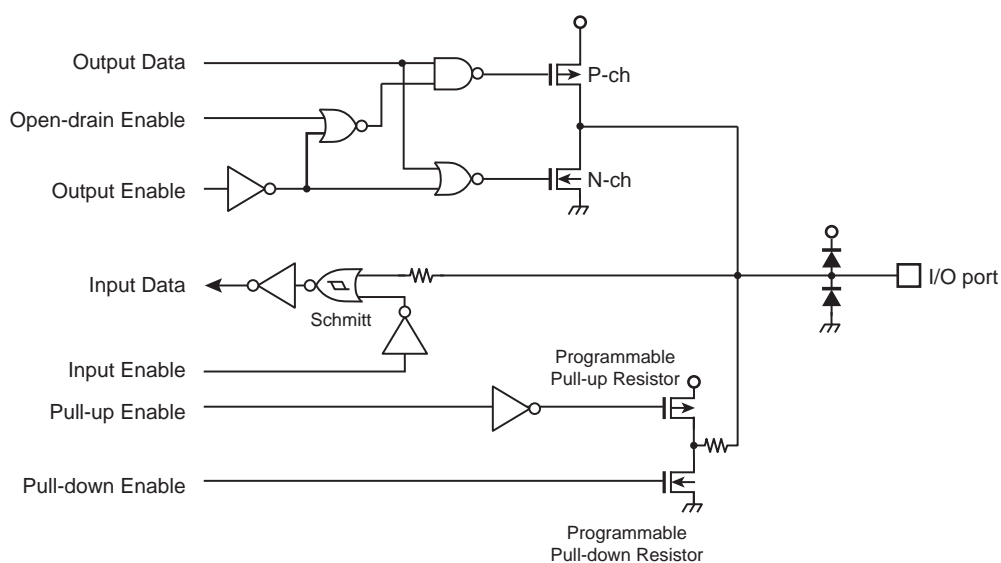

Basically, the gate symbols written are the same as those used for the standard CMOS logic IC [74HCXX] series.

The input protection resistance ranges from several tens of OHM to several hundred OHM. Feedback resistor and Damping resistor are shown with a typical value.

### 34.1 PB4, PK2

### 34.2 PA0 to 7, PB0 to 3, 5, PE0 to 7, PF0 to 7, PG0 to 7, PH0 to 3, PK1, PK3 to 4, PL0 to 3

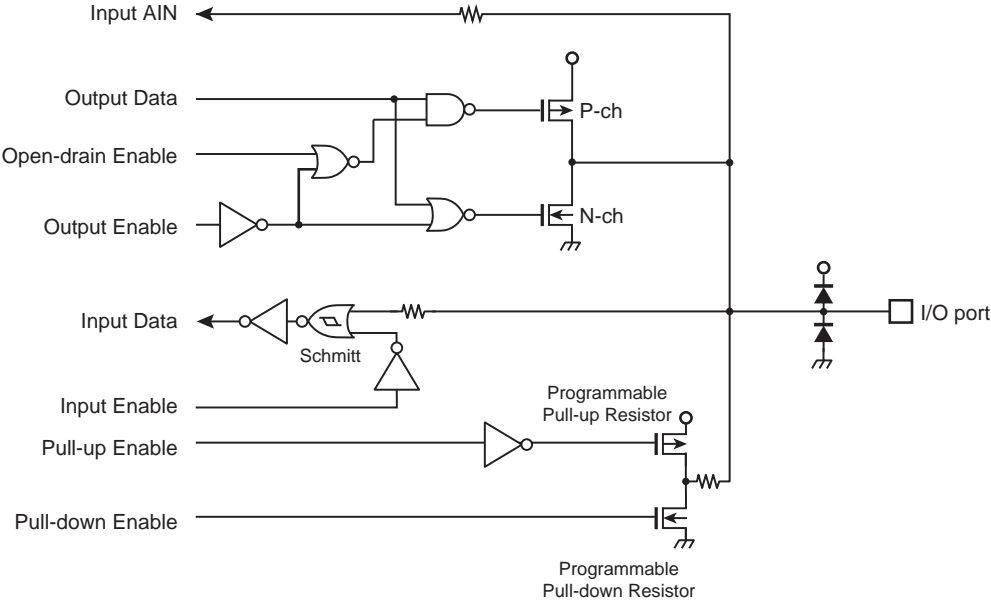

34.3 PK0

Note: Only when input is enabled, these pins tolerate 5V inputs.

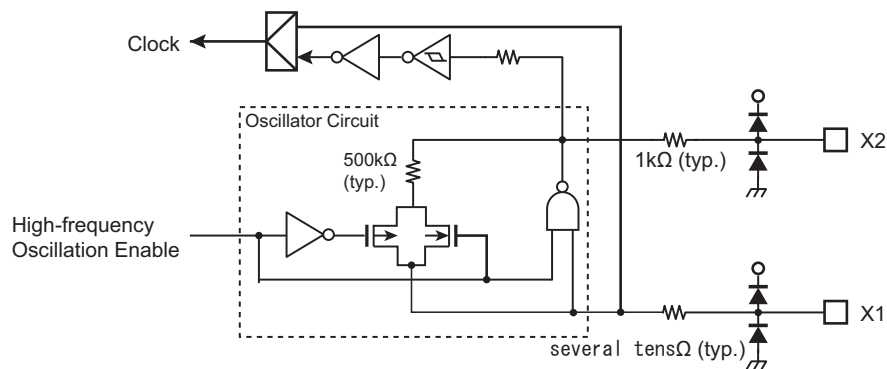

34.4 PI0 to 7

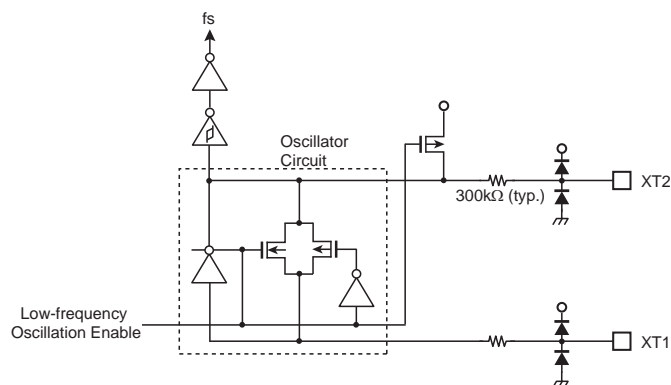

## 34.5 PB6

## 34.7 XT1, XT2

34.8  $\overline{\text{RESET}}$ ,  $\overline{\text{NMI}}$

34.9 BSC

34.10 MODE

34.11 FTEST3

## 34.12 VREFHA, VREFHB, VREFLA, VREFLB

## 35. Electrical Characteristics

### 35.1 Absolute Maximum Ratings

Parameter		Symbol	Rating	Unit
Supply voltage		DVDD3A/B	-0.3 to 3.9	V
		RVDD3	-0.3 to 3.9	
		AVDD3A/B	-0.3 to 3.9	
		AVDD3_DA	-0.3 to 3.9	
Input voltage	Except 5V tolerant pin	$V_{IN1}$	-0.3 to VDD + 0.3	V
	5V tolerant pin	$V_{IN2}$	-0.3 to 5.5	
Low-level output current	Per pin	$I_{OL}$	5	mA
	Total	$\Sigma I_{OL}$	50	
High-level output current	Per pin	$I_{OH}$	-5	
	Total	$\Sigma I_{OH}$	50	
Power consumption (Ta = 85 °C)		PD	600	mW
Soldering temperature (10 s)		$T_{SOLDER}$	260	°C
Storage temperature		$T_{STG}$	-55 to 125	°C
Operating Temperature	Except during Flash W/E	$T_{OPR}$	-40 to 85	°C
	During Flash W/E		0 to 70	

Note: **Absolute maximum ratings are limiting values of operating and environmental conditions which should not be exceeded under the worst possible conditions. The equipment manufacturer should design so that no Absolute maximum rating value is exceeded with respect to current, voltage, power consumption, temperature, etc. Exposure to conditions beyond those listed above may cause permanent damage to the device or affect device reliability, which could increase potential risks of personal injury due to IC blowup and/or burning.**

## 35.2 DC Electrical Characteristics (1/2)

DVDD3A = DVDD3B=RVDD3 = AVDD3A = AVDD3B = AVDD3\_DA = 2.7 V to 3.6 V  
DVSSA = DVSSB = AVSSA = AVSSB = VREFLA = VREFLB = AVSS\_DA = 0V, Ta = -40 to 85 °C

Parameter		Symbol	Condition	Min.	Typ. (Note 1)	Max.	Unit
Supply voltage	DVDD3A	VDD	$f_{OSC} = 8$ to $16$ MHz without USB	2.7	–	3.6	V
	DVDD3B AVDD3A,AVDD3B RVDD3		$f_{sys} = 1$ to $80$ MHz $f_s = 30$ to $34$ kHz with USB	3	–	3.45	V
Low-level Input voltage	PB4, PK2	$V_{IL1}$	$2.7\text{ V} \leq \text{VDD} \leq 3.6\text{ V}$	–0.3	–	$0.2\text{ VDD}$	V
	PA0 to 7, PB0 to 6 PE0 to 7, PF0 to 7, PG0 to 7,PH0 to 3, PIO to 7 PK1,3 to 4, PL0 to 3 RESET, NMI, MODE X1, BSC	$V_{IL2}$					
	PK0	$V_{IL3}$					
High-level Input voltage	PB4, PK2	$V_{IH1}$	$2.7\text{ V} \leq \text{VDD} \leq 3.6\text{ V}$	$0.8\text{ VDD}$	–	$\text{VDD} + 0.3$	V
	PA0 to 7, PB0 to 6 PE0 to 7, PF0 to 7, PG0 to 7,PH0 to 3, PIO to 7 PK1,3 to 4, PL0 to 3 RESET, NMI, MODE X1, BSC	$V_{IH2}$					
	PK0	$V_{IH3}$				5.5	
Low-level output voltage		$V_{OL}$	$I_{OL} = 2\text{ mA}$	–	–	0.4	V
High-level output voltage		$V_{OH}$	$I_{OH} = -2\text{ mA}$	2.4	–	VDD	V
Input leakage current		$I_{LI1}$	$0.0 \leq V_{IN} \leq \text{VDD}$	–	0.02	$\pm 5$	$\mu\text{A}$
Output leakage current		$I_{LO}$	$0.2 \leq V_{IN} \leq \text{VDD} - 0.2$	–	0.05	$\pm 10$	
Pull-up resistor at Reset		RRST	–	–	50	75	k $\Omega$
Schmitt trigger input width		VTH1	$2.7\text{ V} \leq \text{VDD} \leq 3.6\text{ V}$	0.3	0.6	–	V
Programmable pull-up/pull-down resistor		PKH	–	–	50	75	k $\Omega$
Power supply variation rate in operation range	VRS	RVDD3 = DVDD3A		–	–	6	mV/ $\mu\text{s}$
	VFS			–	–	-18	
Pin capacitance (Except power supply pins)		$C_{IO}$	$f_c = 1\text{ MHz}$	–	–	10	pF
Low-level output current		$I_{OL1}$	Per pin	–	–	2	mA
		$\Sigma I_{OL}$	Total, all ports	–	–	35	mA
High-level output current		$I_{OH1}$	Per pin	–	–	-2	mA
		$\Sigma I_{OH}$	Total, all ports	–	–	-35	mA

Note 1: Ta = 25 °C, DVDD3A = DVDD3B = RVDD3 = AVDD3A = AVDD3B = 3.3 V, unless otherwise noted.

Note 2: The same voltage must be supplied to DVDD3A, DVDD3B, AVDD3A, AVDD3B, AVDD3\_DA and RVDD3.

Note 3: VRS(Rising), VFS(Falling) should be measured at a strict level against a characteristics.

### 35.3 DC Electrical Characteristics (2/2)

DVDD3A = DVDD3B=RVDD3 = AVDD3A = AVDD3B = AVDD3\_DA = 2.7 V to 3.6 V, Ta = -40 to 85 °C

Parameter	Symbol	Condition	Min.	Typ. (Note 1)	Max.	Unit
NORMAL (Note 2) Gear 1/1	I <sub>DD</sub>	fsys = 80 MHz	–	60	88	mA
IDLE (Note 3)			–	43	72	
STOP1		–	–	1.0	18	
STOP2		–	–	18	110	μA

Note 1: Ta = 25 °C, DVDD3A = DVDD3B = AVDD3 = RVDD3 = 3.3, unless otherwise noted.

Note 2: Measurement condition of I<sub>DD</sub> NORMAL :

Execution program: Dhrystone V2.1 (built-in FLASH operation)

All peripheral functions stopped.

Note 3: Measurement condition of I<sub>DD</sub> IDLE:

All peripheral functions stopped.

The currents flow through DVDD3A, DVDD3B, AVDD3 and RVDD3 are included in IDD.

## 35.4 12-bit A/D Converter Electrical Characteristics

DVDD3A = RVDD3 = AVDD3A = AVDD3B = 2.7 V to 3.6 V

DVSSA = AVSSA = AVSSB = VREFLA = VREFLB = 0V, Ta = -40 to 85 °C

Parameter		Symbol	Condition	Min.	Typ.	Max	Unit
Analog reference voltage (+)		VREFH	–	AVDD3-0.3	–	AVDD3	V
Analog input voltage		VAIN	–	VREFL	–	VREFH	V
Power supply current of analog reference voltage	AD conversion	IREF	–	–	1.5	2.3	mA
	Non-AD conversion		–	–	0.02	0.1	μA
Consumption current			–	–	1.5	2.5	mA
INL error		–	AIN resistance ≤ 600 Ω AIN load capacitance ≥ 30 pF Conversion time ≥ 1.0 μs	–	5	6	LSB
DNL error				–	3	6	
Zero-scale error				–	3	6	
Full-scale error				–	4	9	
Total error				–	7	9	
INL error		–	AIN resistance ≤ 600 kΩ AIN load capacitance ≥ 0.1μF Conversion time ≥ 1.0 μs	–	5	6	
DNL error				–	3	6	
Zero-scale error				–	3	6	
Full-scale error				–	4	8	
Total error				–	7	8	
INL error		–	AIN resistance ≤ 5 kΩ AIN load capacitance ≥ 0.1μF Conversion time ≥ 1.0 μs	–	5	6	
DNL error				–	3	6	
Zero-scale error				–	3	6	
Full-scale error				–	4	8	
Total error				–	7	8	
Conversion time		Tconv	–	1.0	–	10	μs

Note 1: 1LSB = (VREFH – VREFL)/4096 [V]

Note 2: Peripheral functions are disabled.

## 35.5 10-bit D/A Converter Electrical Characteristics

DVDD3A = RVDD3 = AVDD3\_DA = 2.7 V to 3.6 V

DVSSA = AVSS\_DA = 0V, Ta = -40 to 85 °C

Parameter	Symbol	Condition	Min.	Typ.	Max	Unit
Consumption current	IAVDD3_DA	–	–	350	550	μA
Settling time	Tset	–	–	–	3	μs
			–	–	1(Note 2)	
Output current	IOUT	–	–	–	± 1000	μA
Output voltage range	VOUT	AVSS_DA = 0V	+ 0.3	–	AVDD3_DA - 0.3	V
Total error	TERR	–	–	–	2	LSB

Note 1: Ensure that external capacity of output pins (DA0,DA1) are maximum 30pF per one channel.

Note 2: The change margin is within ± 16LSB compared to immediate previous setting value.

Note 3: 1LSB = (AVDD3\_DA – AVSS\_DA)/1024 [V]

Note 4: Relative accuracy is not guaranteed when two channels operate simultaneously.

## 35.6 AC Electrical Characteristics

### 35.6.1 AC Measurement Condition

The AC characteristics data of this chapter is measured under the following conditions unless otherwise noted.

- Output levels: High =  $0.8 \times DVDD3A$ ,  $0.8 \times AVDD3A$
- Output levels: Low =  $0.2 \times DVDD3A$ ,  $0.2 \times AVDD3A$
- Input levels: Refer to low-level input voltage and high-level input voltage in "DC Electrical Characteristics".
- Load capacity: CL = 30pF

### 35.6.2 Serial Channel (SIO/UART)

#### 35.6.2.1 I/O Interface Mode

In the table below, the letter x represents the SIO operation clock SCLK Clock Low width (input) cycle time which is identical to the fsys cycle time. It varies depending on the programming of the clock gear function.

##### (1) SCLK input mode

[Data Input]

Parameter	Symbol	Equation		48 MHz		80 MHz		Unit
		Min.	Max	Min.	Max	Min.	Max	
SCLK Clock High width (input)	$t_{SCH}$	4x	–	83.3	–	50	–	ns
SCLK Clock Low width (input)	$t_{SCL}$	4x	–	83.3	–	50	–	
SCLK cycle	$t_{SCY}$	$t_{SCH} + t_{SCL}$	–	166.6	–	100	–	
Valid Data Input ← SCLK rise or fall (Note 1)	$t_{SRD}$	30	–	30.0	–	30.0	–	
SCLK rise or fall → Input Data hold (Note 1)	$t_{HSR}$	x + 30	–	50.8	–	42.5	–	

[Data Output]

Parameter	Symbol	Equation		48 MHz		80 MHz		Unit
		Min.	Max	Min.	Max	Min.	Max	
SCLK Clock High width (input)	$t_{SCH}$	4x	–	107.5 (Note 3)	–	82.5 (Note 3)	–	ns
SCLK Clock Low width (input)	$t_{SCL}$	4x	–	107.5 (Note 3)	–	82.5 (Note 3)	–	
SCLK cycle	$t_{SCY}$	$t_{SCH} + t_{SCL}$	–	215	–	165	–	
Output Data ← SCLK rise or fall (Note 1)	$t_{OSS}$	$t_{SCY}/2 - 3x - 45$	–	0 (Note 2)	–	0 (Note 2)	–	
SCLK rise or fall → Output Data hold (Note 1)	$t_{OHS}$	$t_{SCY}/2$	–	107.5	–	82.5	–	

Note 1: SCLK rise/fall : SCLK rise mode uses the rise timing of SCLK. SCLK fall mode uses the fall timing of SCLK.

Note 2: Use the frequency of SCLK in a range where the calculation value keeps positive.

Note 3: The value indicates a minimum value that enables  $t_{OSS}$  to be zero or more.

(2) SCLK Output Mode

Parameter	Symbol	Equation		48 MHz		80 MHz		Unit
		Min.	Max	Min.	Max	Min.	Max	
SCLK cycle (programmable)	t <sub>SCY</sub>	4x	–	83.2	–	50	–	ns
Output Data ← SCLK rise	t <sub>OSS</sub>	t <sub>SCY</sub> /2 – 20	–	21.6	–	5	–	
SCLK rise → Output Data hold	t <sub>OHS</sub>	t <sub>SCY</sub> /2 – 20	–	21.6	–	5	–	
Valid Data Input ← SCLK rise	t <sub>SRD</sub>	45	–	45	–	45	–	
SCLK rise → Input Data hold	t <sub>HSR</sub>	0	–	0	–	0	–	

### 35.6.3 Serial Bus Interface (I2C/SIO)

#### 35.6.3.1 I2C Mode

In the table below, the letter x represents the I2C operation clock cycle time which is identical to the fsys cycle time. It varies depending on the programming of the clock gear function. It varies depending on the programming of the clock gear function.

n denotes the value of n programmed into the SCK (SCL output frequency select) field in the SBIxCR.

Parameter	Symbol	Equation		Standard Mode		Fast Mode		Unit
		Min.	Max	Min.	Max	Min.	Max	
SCL Clock frequency	$t_{SCL}$	0	–	0	100	0	400	kHz
Hold time for START condition	$t_{HD; STA}$	–	–	4.0	–	0.6	–	$\mu s$
SCL Low width (Input) (Note 1)	$t_{LOW}$	–	–	4.7	–	1.3	–	$\mu s$
SCL High width (Input) (Note 2)	$t_{HIGH}$	–	–	4.0	–	0.6	–	$\mu s$
Setup time for a repeated START condition	$t_{SU; STA}$	(Note 5)	–	4.7	–	0.6	–	$\mu s$
Data hold time (Input) (Note 3, 4)	$t_{HD; DAT}$	–	–	0.0	–	0.0	–	$\mu s$
Data setup time	$t_{SU; DAT}$	–	–	250	–	100	–	ns
Setup time for a STOP condition	$t_{SU; STO}$	–	–	4.0	–	0.6	–	$\mu s$
Bus free time between stop condition and start condition	$t_{BUF}$	(Note 5)	–	4.7	–	1.3	–	$\mu s$

Note 1: SCL clock Low width (output):  $(2^{n-1} + 58)/x$

Note 2: SCL clock High width (output):  $(2^{n-1} + 14)/x$

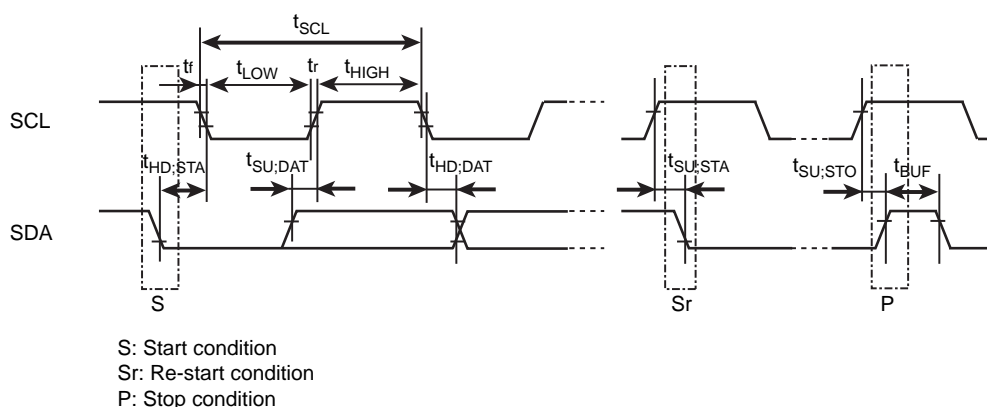

On I2C-bus specification, maximum Speed of Standard Mode/fast mode is 100kHz/400kHz. Internal SCL Frequency setting should comply with fsys and Note1 & Note2 shown above.

Note 3: The output data hold time is equal to 4x of internal SCL.

Note 4: The Philips I2C-bus specification states that a device must internally provide a hold time of at least 300 ns for the SDA signal to bridge the undefined region of the falling edge of SCL. However, this SBI does not satisfy this requirement. Also, the output buffer for SCL does not incorporate slope control of the falling edges; therefore, the equipment manufacturer should design so that the input data hold time shown in the table is satisfied, including tr/td of the SCL and SDA lines.

Note 5: Software -dependent

Note 6: The Philips I2C-bus specification instructs that if the power supply to a Fast-mode device is switched off, the SDA and SCL I/O pins must be floating so that they don't obstruct the bus lines. However, this SBI does not satisfy this requirement.

### 35.6.3.2 Clock-Synchronous 8-bit SIO mode

In the table below, the letter x represents the I2C operation clock cycle time which is identical to the fsys cycle time. It varies depending on the programming of the clock gear function.

#### (1) SCK input mode (SCK duty=50%)

[Data Input]

Parameter	Symbol	Equation		48 MHz		80 MHz		Unit
		Min.	Max	Min.	Max	Min.	Max	
SCK Clock High width (input)	$t_{SCH}$	4x	–	83.3	–	50	–	ns
SCK Clock Low width (input)	$t_{SCL}$	4x	–	83.3	–	50	–	
SCK cycle	$t_{SCY}$	$t_{SCH} + t_{SCL}$	–	166.6	–	100	–	
Valid Data input ← SCK rise or	$t_{SRD}$	30 – x	–	9.2	–	17.5	–	
SCK rise → Input Data hold	$t_{HSR}$	2x + 30	–	71.7	–	55.0	–	

[Data Output]

Parameter	Symbol	Equation		48 MHz		80 MHz		Unit
		Min.	Max	Min.	Max	Min.	Max	
SCK Clock High width (input)	$t_{SCH}$	4x	–	107.5 (Note1)	–	82.5 (Note1)	–	ns
SCK Clock Low width (input)	$t_{SCL}$	4x	–	107.5 (Note1)	–	82.5 (Note1)	–	
SCK cycle	$t_{SCY}$	$t_{SCH} + t_{SCL}$	–	215	–	165	–	
Output Data ← SCK rise	$t_{OSS}$	$t_{SCY}/2 - 3x - 45$	–	0 (Note2)	–	0 (Note2)	–	
SCK rise → Output Data hold	$t_{OHS}$	$t_{SCY}/2 + x$	–	128.3	–	95	–	

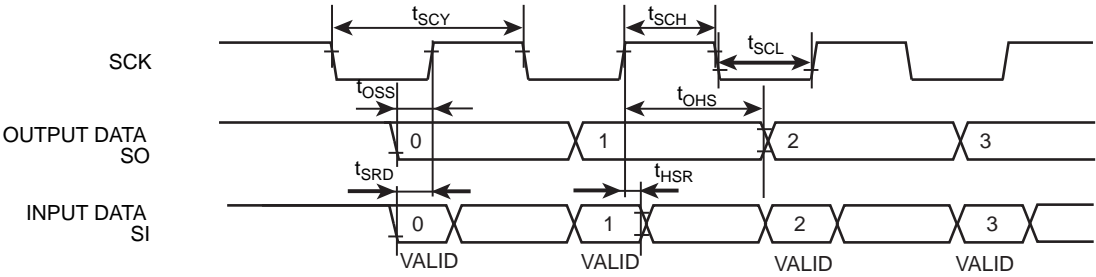

Note 1: The value indicates a minimum value that enables  $t_{OSS}$  to be zero or more.

Note 2: Keep this value positive by adjusting SCK cycle.

#### (2) SCK output mode (for an SCK signal with a 50% duty cycle)

Parameter	Symbol	Equation		48 MHz		80 MHz		Unit
		Min.	Max	Min.	Max	Min.	Max	
SCK cycle (programmable)	$t_{SCY}$	16x	–	333.3	–	200	–	ns
Output Data ← SCK rise	$t_{OSS}$	$t_{SCY}/2 - 20$	–	146.6	–	80	–	
SCK rise → Output Data hold	$t_{OHS}$	$t_{SCY}/2 - 20$	–	146.6	–	80	–	
Valid Data input ← SCK rise	$t_{SRD}$	x + 45	–	65.8	–	57.5	–	
SCK rise → Input Data hold	$t_{HSR}$	0	–	0	–	0	–	

## 35.6.4 Synchronous Serial Interface (SSP)

### 35.6.4.1 AC Measurement Condition

The letter "T" used in the equations in the table represents the period of internal bus frequency (fsys).

- Output levels : High =  $0.7 \times DVDD3A$ , Low =  $0.3 \times DVDD3A$
- Input levels: High =  $0.9 \times DVDD3A$ , Low =  $0.1 \times DVDD3A$
- Load capacitance  $CL=30pF$

Note: The "Equation" column in the table shows the specifications under the conditions  $DVDD3A = 2.7V$  to  $3.6V$ .

10MHz type@ch0/1

Parameter	Symbol	Equation		fsys=48MHz (m=6,n=16)	fsys=80MHz (m=8, n=24)	Unit
		Min.	Max			
SPxCLK cycle (master)	$T_m$	(m)T At least 100ns or more	–	125 (8MHz)	100 (10MHz)	ns
SPxCLK cycle (slave)	$T_s$	(n)T At least 300ns or more	–	333 (3MHz)	300 (3.3MHz)	
SPxCLK rise up time	$t_r$	–	15	15	15	
SPxCLK fall down time	$t_f$	–	15	15	15	
Master mode: SPxCLK low level pulse width	$t_{WLM}$	(m)T/2 - 15	–	47.5	35	
Master mode: SPxCLK high level pulse width	$t_{WHM}$	(m)T/2 - 15	–	47.5	35	
Slave mode: SPxCLK Low level pulse width	$t_{WLS}$	(n)T/2 - 15	–	151.7	135	
Slave mode: SPxCLK high level pulse width	$t_{WHS}$	(n)T/2 - 15	–	151.7	135	
Master mode: SPxCLK rise/fall to output data valid	$t_{ODSM}$	–	15	15	15	
Master mode: SPxCLK rise/fall to output data hold	$t_{ODHM}$	(m)T/2 - 15	–	47.5	35	
Master mode: Input data valid to SPxCLK rise/fall	$t_{IDSM}$	30	–	30	30	
Master mode: SPxCLK rise/fall to input data hold	$t_{IDHM}$	0	–	0	0	
Master mode: SPxFSS valid to SPxCLK rise/fall	$t_{OFSM}$	(m)T - 15	(m)T + 15	110 to 140	85 to 115	
Slave mode: SPxCLK rise/fall to output data valid delay time	$t_{ODSS}$	–	(3T) + 40	102.5	77.5	
Slave mode: SPxCLK rise/fall (Output data hold)	$t_{ODHS}$	(n)T/2 + (2T)	–	208.3	175	
Slave mode: Input data valid to SPxCLK rise/fall	$t_{IDSS}$	10	–	10	10	
Slave mode: SPxCLK rise/fall to input data hold	$t_{IDHS}$	(3T) + 15	–	77.5	52.5	
Slave mode: SPxFSS valid to SPxCLK rise/fall	$t_{OFSS}$	(n)T + 10	–	343.3	310	

20MHz type@ch2

Parameter	Symbol	Equation		fsys=48MHz (m=4,n=12)	fsys=80MHz (m=4, n=12)	Unit
		Min.	Max			
SPxCLK cycle (master)	$T_m$	(m)T At least 50ns or more	–	83.3 (12MHz)	50 (20MHz)	ns
SPxCLK cycle (slave)	$T_s$	(n)T At least 150ns or more	–	250 (4MHz)	150 (6.6MHz)	
SPxCLK rise up time	$t_r$	–	10	10	10	
SPxCLK fall down time	$t_f$	–	10	10	10	
Master mode: SPxCLK Low level pulse width	$t_{WLM}$	(m)T/2 - 10	–	31.6	15	
Master mode: SPxCLK high level pulse width	$t_{WHM}$	(m)T/2 - 10	–	31.6	15	
Slave mode: SPxCLK Low level pulse width	$t_{WLS}$	(n)T/2 - 10	–	115	65	
Slave mode: SPxCLK high level pulse width	$t_{WHS}$	(n)T/2 - 10	–	115	65	
Master mode: SPxCLK rise/fall to output data valid	$t_{ODSM}$	–	10	10	10	
Master mode: SPxCLK rise/fall to output data hold	$t_{ODHM}$	(m)T/2 - 10	–	31.6	15	
Master mode: Input data valid to SPxCLK rise/fall	$t_{IDSM}$	15	–	15	15	
Master mode: SPxCLK rise/fall to input data hold	$t_{IDHM}$	0	–	0	0	
Master mode: SPxFSS valid to SPxCLK rise/fall	$t_{OFSM}$	(m)T - 15	(m)T + 15	68 to 98	35 to 65	
Slave mode: SPxCLK rise/fall to output data valid delay time	$t_{OBSS}$	–	(3T) + 30	92.5	67.5	
Slave mode: SPxCLK rise/fall (Output data hold)	$t_{ODHS}$	(n)T/2 + (2T)	–	166.6	100	
Slave mode: Input data valid to SPxCLK rise/fall	$t_{IDSS}$	10	–	10	10	
Slave mode: SPxCLK rise/fall to input data hold	$t_{IDHS}$	(3T) + 15	–	77.5	52.5	
Slave mode: SPxFSS valid to SPxCLK rise/fall	$t_{OFSS}$	(n)T + 10	–	260	160	

Note: Baud rate clock is set under below condition:

- Master mode:

$$m = (<CPSDVSR> \times (1 + <SCR>)) = f_{sys} / f_{SPxCLK}$$

<CPSDVSR> is set only even number and "m" must set between the range of  $65024 \geq m \geq 2$ .

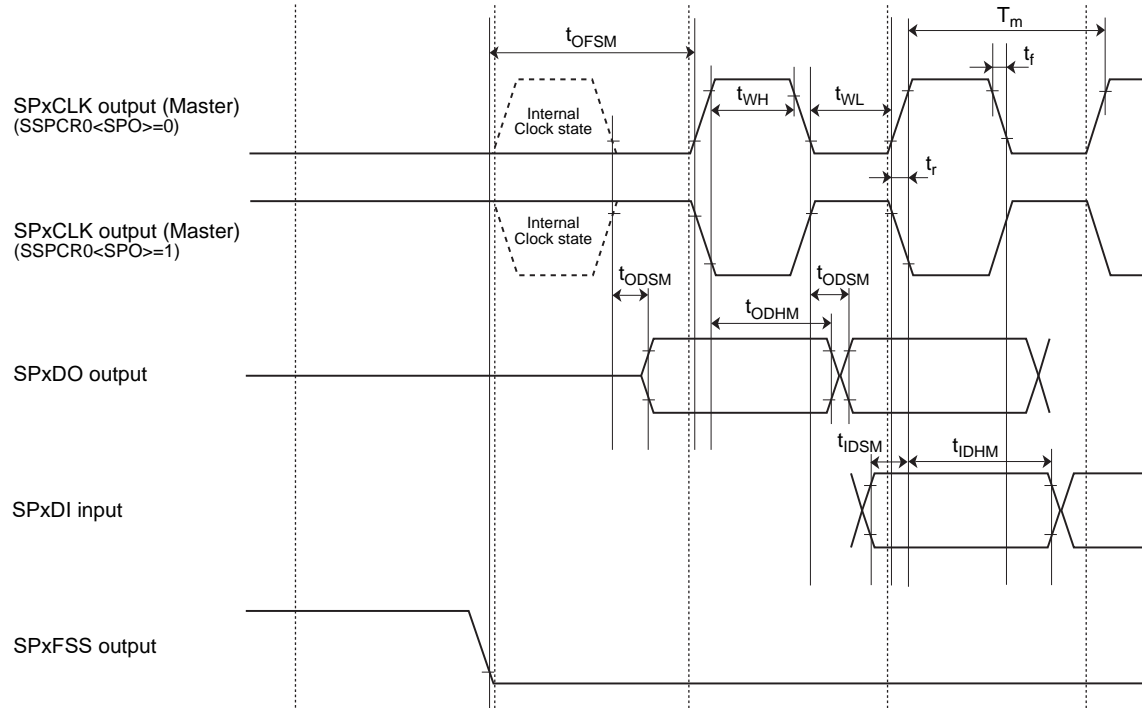

- Slave mode

$$n = f_{sys} / f_{SPxCLK} \quad (65024 \geq n \geq 12)$$

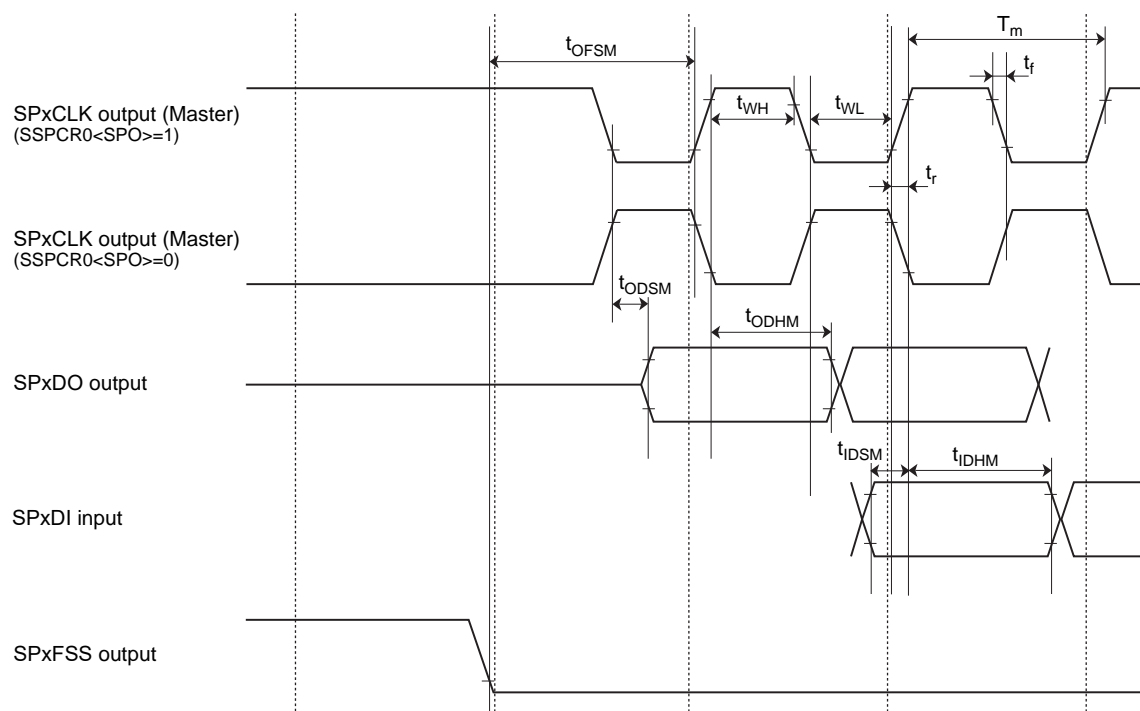

#### 35.6.4.2 SSP SPI mode (Master)

- $f_{sys} \geq 2 \times f_{SPxCLK}$  (Maximum)
- $f_{sys} \leq 65024 \times f_{SPxCLK}$  (Minimum)

(1) Master SSPCR0<SPH>="0" (Data is latched on the first edge.)

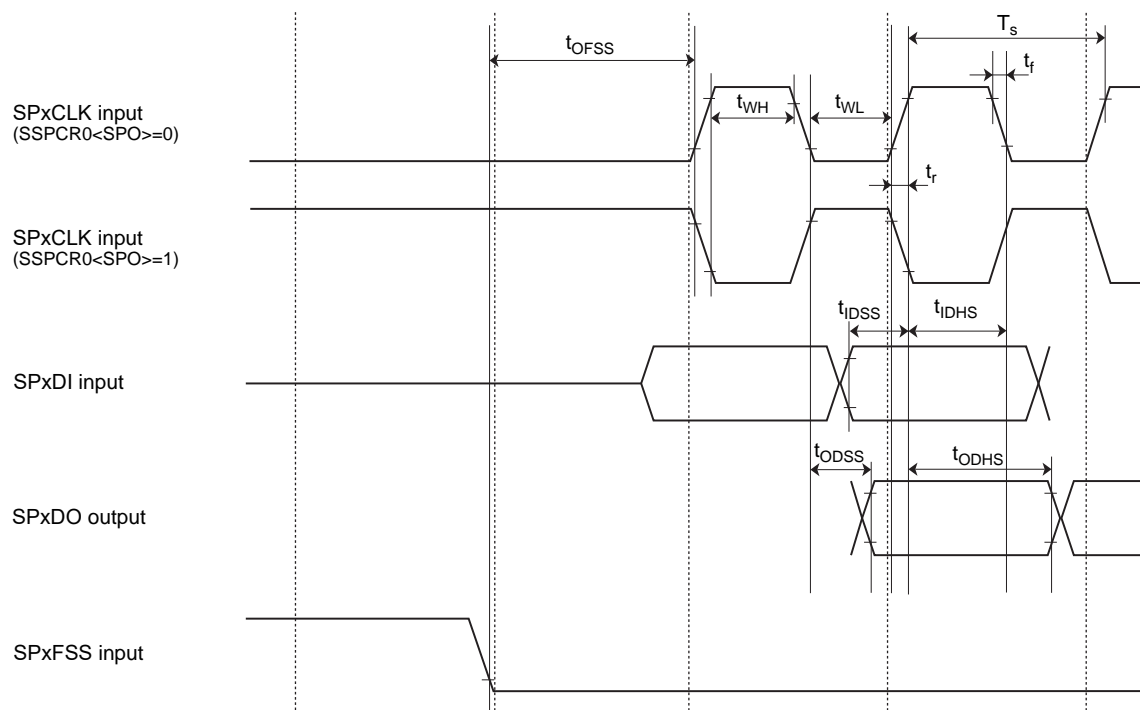

(2) Master SSPCR0<SPH>="1" (Data is latched on the second edge)

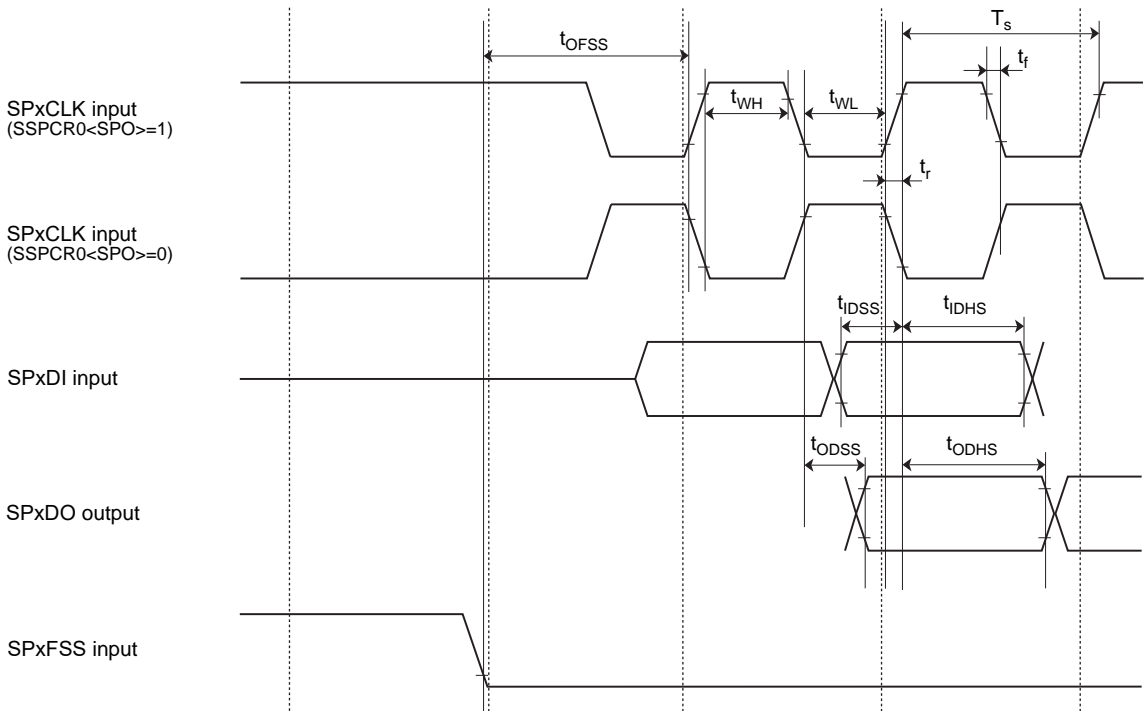

### 35.6.4.3 SSP SPI mode (Slave)

- $f_{sys} \geq 12 \times f_{SPxCLK}$  (Maximum)
- $f_{sys} \leq 65024 \times f_{SPxCLK}$  (Minimum)

(3) Slave SSPCR0<SPH>="0" (Data is latched on the first edge.)

(4) Slave SSPCR0<SPH>="1" (Data is latched on the second edge.)

### 35.6.5 Event Counter

In the table below, the letter x represents the TMRB operation clock cycle time which is identical to the fsys cycle time. It varies depending on the programming of the clock gear function.

Parameter	Symbol	Equation		48 MHz		80 MHz		Unit
		Min.	Max	Min.	Max	Min.	Max	
Clock low pulse width	$t_{VCKL}$	$2x + 100$	–	141.7	–	125	–	ns
Clock high pulse width	$t_{VCKH}$	$2x + 100$	–	141.7	–	125	–	ns

### 35.6.6 Capture

In the table below, the letter x represents the TMRB operation clock cycle time which is identical to the fsys cycle time. It varies depending on the programming of the clock gear function.

Parameter	Symbol	Equation		48 MHz		80 MHz		Unit
		Min.	Max	Min.	Max	Min.	Max	
Low pulse width	$t_{CPL}$	$2x + 100$	–	141.7	–	125	–	ns
High pulse width	$t_{CPH}$	$2x + 100$	–	141.7	–	125	–	ns

### 35.6.7 External Interrupt

In the table below, the letter x represents the fsys cycle time.

#### 1. Except STOP1 and STOP2 release interrupts

Parameter	Symbol	Equation		48 MHz		80 MHz		Unit
		Min.	Max	Min.	Max	Min.	Max	
INT0 to D low-level pulse width	$t_{INTAL}$	$x + 100$	–	120.8	–	112.5	–	ns
INT0 to D high-level pulse width	$t_{INTAH}$	$x + 100$	–	120.8	–	112.5	–	ns

#### 2. STOP1 release interrupts

Parameter	Symbol	Min.	Max	Unit
$\overline{NMI}$ , INT0 to B,D low-level pulse width	$t_{INTBL}$	100	–	$\mu s$
INT0 to B,D high-level pulse width	$t_{INTBH}$	100	–	

#### 3. STOP2 release interrupts

Parameter	Symbol	Min.	Max	Unit
$\overline{NMI}$ , INT0 to B,D low-level pulse width	$t_{INTCL}$	1	–	ms
INT0 to B,D high-level pulse width	$t_{INTCH}$	1	–	

35.6.8  $\overline{\text{NMI}}$

Parameter	Symbol	Min.	Max	Unit
$\overline{\text{NMI}}$ Low-level pulse width	$t_{\text{INTCL}}$	100	–	ns

35.6.9 SCOUT

Parameter	Symbol	Equation		48 MHz		80 MHz		Unit
		Min.	Max	Min.	Max	Min.	Max	
High-level pulse width	$t_{\text{SCH}}$	$0.5T - 5$	–	5.4	–	1.25	–	ns
Low-level pulse width	$t_{\text{SCL}}$	$0.5T - 5$	–	5.4	–	1.25	–	ns

Note: In the above table, the letter T represents the cycle time of the SCOUT output clock.

## 35.6.10 ADC and DAC trigger Input

Parameter	Symbol	Formula		48MHz		80MHz		Unit
		Min.	Max	Min.	Max	Min.	Max	
Low-level pulse width	$T_{ADL}$	$2/f_{sys} + 20$	–	62	–	45	–	ns
High-level pulse interval	$T_{ADH}$	$2/f_{sys} + 20$	–	62	–	45	–	

## 35.6.11 USB Timing (Full-speed)

DVDD3B = 3.0 V to 3.45 V@ fusbclk = 48MHz

Parameter	Symbol	Min.	Max	Unit
USB-DDP, USB-DDM Supply rise time	$t_R$	4	20	ns
USB-DDP, USB-DDM Supply withdraw time	$t_F$	4	20	
Data Line crossover voltage	$V_{CRS}$	1.3	2.0	V

## 35.6.12 External Bus Interface AC Characteristics

### 35.6.12.1 AC Measurement Condition

- DVDD3A=2.7 to 3.6V
- Output levels: High =  $0.7 \times \text{DVDD3A}$ , Low =  $0.3 \times \text{DVDD3A}$
- Input levels: High =  $0.7 \times \text{DVDD3A}$ , Low =  $0.3 \times \text{DVDD3A}$
- Load capacitance: CL = 30pF

## 35.6.12.2 Multiplex Bus mode

Conditional variable : ALE = 1, RWS = 1, TW = 2, RWH = 1, CSH = 1 @tsys=tcyc=20.8ns

ALE = 1, RWS = 1, TW = 3, RWH = 1, CSH = 1 @tsys=tcyc=12.5ns

- ALE : Conditional variable ( $ALE = 1 + n$ ;  $n = 0, 1, 2, 4$ )
- RWS: Number of setup cycle insertion before  $\overline{RD}$ ,  $\overline{WR}$  asserted ( $TW = 0, 1, 2$  or  $4$ )
- TW : Number of internal wait insertion ( $TW = 0$  to  $15$ )
- RWH: Number of  $\overline{RD}$ ,  $\overline{WR}$  hold cycle insertion ( $RWH = 0$  to  $6$  or  $8$ )
- CSH :Number of  $\overline{CSx}$  hold cycle insertion ( $CSH = 0, 1, 2$  or  $4$ )

DVDD3A = 3.6V to 2.7V

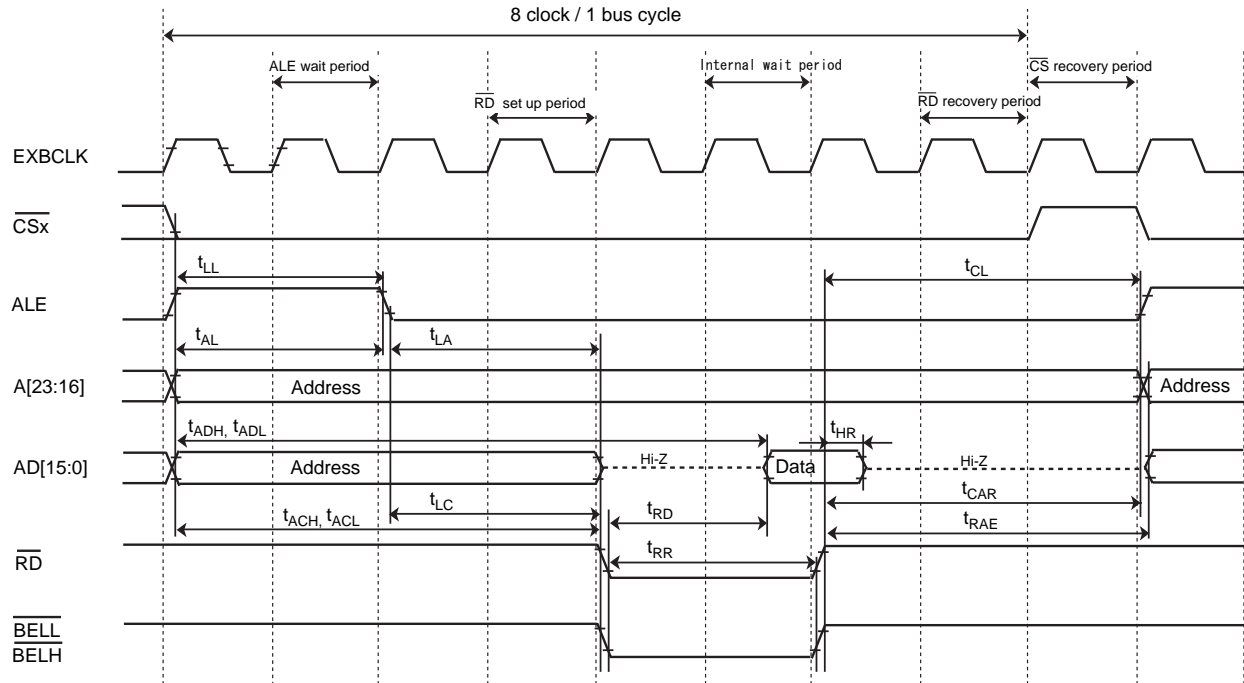

Parameter	Sym- bol	Equation		48MHz		80MHz		Unit
		Min.	Max	Min.	Max	Min.	Max	
System clock period (x)	t <sub>sys</sub>	x	–	20.8	–	12.5	–	ns
External bus clock (EXBCLK)	t <sub>cyc</sub>	x	–	20.8	–	12.5	–	
A[23:0] valid to ALE low	t <sub>AL</sub>	$x(1+ALE)-15$	–	26.6	–	10	–	
ALE hold after A[23:0] hold	t <sub>LA</sub>	$x(1+RWS)-7$	–	34.6	–	18	–	
ALE width high	t <sub>LL</sub>	$x(1+ALE)-15$	–	26.6	–	10	–	
ALE low to $\overline{RD}$ or $\overline{WR}$ asserted	t <sub>LC</sub>	$x(1+RWS)-7$	–	34.6	–	18	–	
$\overline{RD}$ or $\overline{WR}$ negated to ALE high	t <sub>CL</sub>	$x(1+RWH+CSH)-15$	–	47.5	–	22.5	–	
$\overline{RD}$ or $\overline{WR}$ negated to A[23:16] hold	t <sub>CAR</sub>	$x(1+RWH+CSH)-15$	–	47.5	–	22.5	–	
A[15:0] valid to D[15:0] input A[23:16] valid to D[15:0] input	t <sub>ADL</sub> t <sub>ADH</sub>	–	$x(3+ALE+RWS+TW)-45$	–	100.8	–	55	
A[15:0] valid to $\overline{RD}$ or $\overline{WR}$ asserted A[23:16] valid to $\overline{RD}$ or $\overline{WR}$ asserted	t <sub>ACL</sub> t <sub>ACH</sub>	$x(2+ALE+RWS)-19$	–	64.3	–	31	–	
$\overline{RD}$ asserted to D[15:0] data in	t <sub>RD</sub>	–	$x(1+TW)-35$	–	27.5	–	15	
$\overline{RD}$ width low	t <sub>RR</sub>	$x(1+TW)-12$	–	50.4	–	38	–	
$\overline{RD}$ negated to D[15:0] hold	t <sub>HR</sub>	0	–	0	–	0	–	
$\overline{RD}$ negated to A[23:0] output	t <sub>RAE</sub>	$x(1+RWH+CSH)-15$	–	47.4	–	22.5	–	
$\overline{WR}$ width low	t <sub>WW</sub>	$x(1+TW)-15$	–	47.4	–	35	–	
D[15:0] valid to $\overline{WR}$ negated	t <sub>DW</sub>	$x(1+TW)-15$	–	47.4	–	35	–	
$\overline{WR}$ negated to D[15:0] hold	t <sub>WD</sub>	$x(1+RWH)-10$	–	31.6	–	15	–	

1. Read cycle timing (minimum cycle)  
(Neither Cycle expander, ALE wait, RD setup, Internal wait, CS recovery nor RD recovery function are used.)

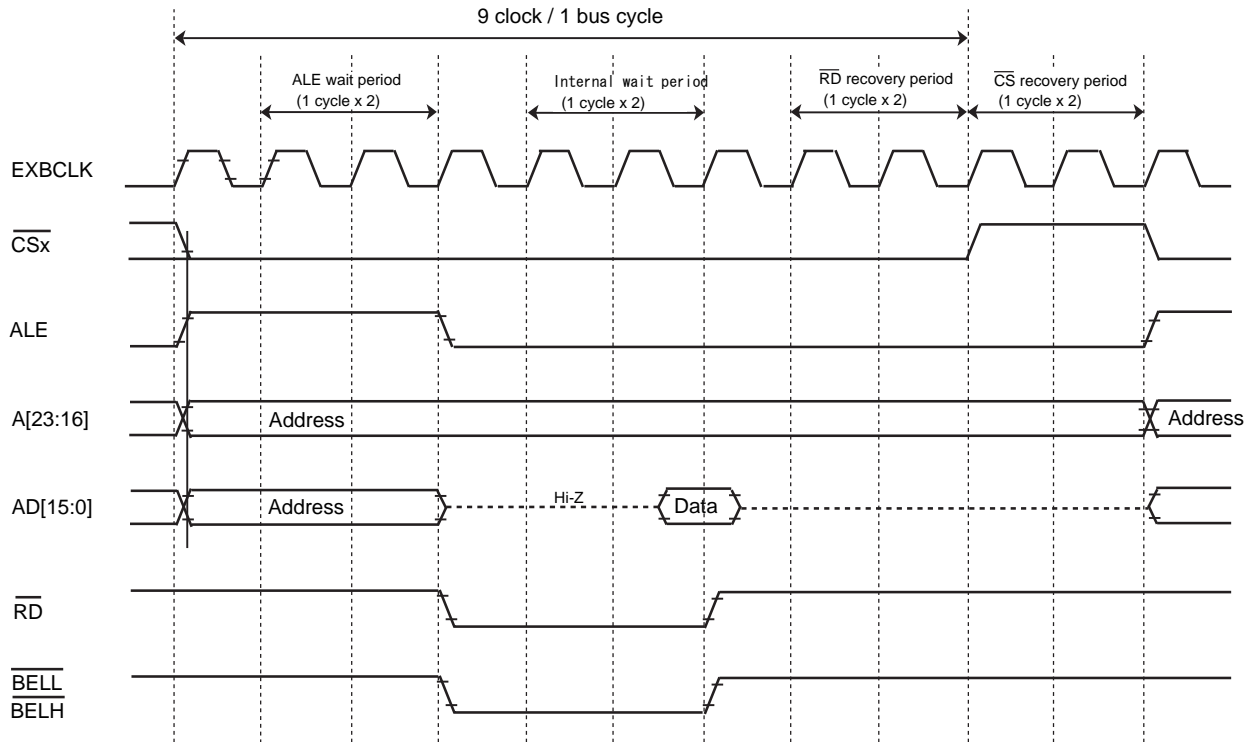

2. Read cycle timing (1 bus cycle per 8 clock)

(ALE wait, RD setup, Internal wait, CS recovery and RD recovery function are set to 1 cycle though Cycle expander function is not used.)

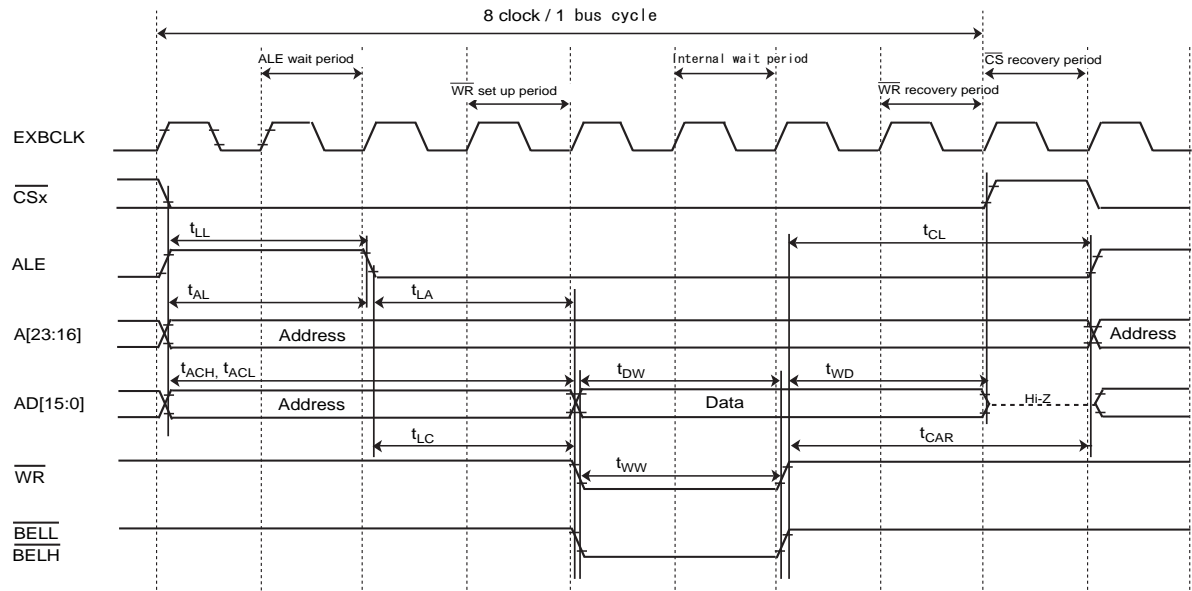

3. Read cycle timing (1 bus cycle per 9 clock)
- (ALE wait, RD setup, Internal wait, CS recovery and RD recovery function are set to 1 cycle though Cycle expander function is set double.)

4. Write cycle timing (minimum bus cycle)
- (Neither Cycle expander, ALE wait, WR setup, Internal wait, CS recovery nor WR recovery function are used.)

5. Write cycle timing (1 bus cycle per 8 clock)
- (ALE wait, WR setup, Internal wait, CS recovery and WR recovery function are set to 1 cycle though Cycle expander function is not used.)

### 35.6.13 Debug Communication

#### 35.6.13.1 AC Measurement Condition

- Output levels: High =  $0.8 \times DVDD3A$ , Low =  $0.2 \times DVDD3A$
- Input levels: Low =  $0.8 \times DVDD3A$ , Low =  $0.2 \times DVDD3A$
- Load capacitance: CL = 30pF

#### 35.6.13.2 SWD Interface

Parameter	Symbol	Min.	Max	Unit
CLK cycle	$T_{dck}$	100	–	ns
CLK rise → Output data hold	$T_{d1}$	4	–	
CLK rise → to output data valid	$T_{d2}$	–	30	
Input data valid → CLK rise	$T_{ds}$	20	–	
CLK rise → Input data hold	$T_{dh}$	15	–	

#### 35.6.13.3 JTAG Interface

Parameter	Symbol	Min.	Max	Unit
CLK cycle	$T_{dck}$	100	–	ns
CLK fall→ Output data hold	$T_{d3}$	4	–	
CLK fall→ to output data valid	$T_{d4}$	–	50	
Input data valid → CLK rise	$T_{ds}$	20	–	
CLK rise → Input data hold	$T_{dh}$	15	–	

35.6.14 ETM Trace

35.6.14.1 AC Measurement Condition

- Output levels: High =  $0.5 \times DVDD3A$ , Low =  $0.5 \times AVDD3A$
- Input levels: High =  $0.8 \times DVDD3A$ , Low =  $0.2 \times AVDD3A$
- Load capacity: CL = 30pF

35.6.14.2 ETM Trace

Parameter	Symbol	Min.	Max	Unit
TRACECLK cycle	$t_{clk}$	25	–	ns
TRACEDATA valid ← TRACECLK rise	$t_{setupr}$	2	–	
TRACECLK rise → TRACEDATA hold	$t_{holdr}$	1	–	
TRACEDATA valid ← TRACECLK fall	$t_{setupf}$	2	–	
TRACECLK fall→ TRACEDATA hold	$t_{holdf}$	1	–	

35.6.15 On-chip Oscillator Characteristic

Parameter	Symbol	Condition	Min.	Typ.	Max	Unit
Oscillation frequency	IHOSC	Ta = -40 to 85°C	9.7	10.0	10.3	MHz

Note: Do not use an on-chip oscillator as a system clock (fsys) when high-accuracy oscillation frequency is required.

35.6.16 External Oscillator

Parameter	Symbol	Condition	Min.	Typ.	Max	Unit
High-frequency oscillation	EHOSC	Ta = -40 to 85°C	8	–	16	MHz

## 35.6.17 External Clock Input

Parameter	Symbol	Min.	Typ.	Max	Unit
External clock frequency	$t_{ehcin}$	8	–	16	MHz
External clock duty	–	–	50	–	%
External clock input rise time	$t_r$	–	–	10	ns
External clock input fall time	$t_f$	–	–	10	ns

## 35.6.18 USB External Clock Input

Parameter	Symbol	Min.	Typ.	Max	Unit
External clock frequency	$t_{USB\_ECLK}$	8	–	48	MHz
External clock duty	–	–	50	–	%
External clock input rise time	$t_r$	–	–	4	ns
External clock input fall time	$t_f$	–	–	4	ns

## 35.6.19 Flash Characteristic

Parameter	Condition	Min.	Typ.	Max	Unit
Guaranteed number of Flash memory programming	$T_a = 0 \text{ to } 70^\circ\text{C}$	–	–	100	times

## 35.7 Recommended Oscillation Circuit

Figure 35-1 High-frequency oscillation connection

Figure 35-2 Low-frequency oscillation connection

Note: To obtain a stable oscillation, load capacity and the position of the oscillator must be configured properly. Since these factors are strongly affected by substrate patterns, please evaluate oscillation stability using the substrate you use.

The TMPM368FDXBG has been evaluated by the oscillator vender below. Please refer this information when selecting external parts

### 35.7.1 Ceramic Oscillator

The TMPM368FDXBG recommends the high-frequency oscillator by Murata Manufacturing Co., Ltd.

Please refer to the Murata Website for details.

### 35.7.2 Crystal Oscillator

The TMPM368FDXBG recommends the low-frequency oscillator by KYOCERA Corporation.

Please refer to the KYOCERA Website for details.

### 35.7.3 Precautions for designing printed circuit board

Be sure to design printed circuit board patterns that connect a crystal unit with other oscillation elements so that the length of such patterns become shortest possible to prevent deterioration of characteristics due to

stray capacitances and wiring inductance. For multi-layer circuit boards, it is important not to wire the ground and other signal patterns right beneath the oscillation circuit. For more information, please refer to the URL of the oscillator vendor.

36. Package Dimensions

Type : P-TFBGA109-0909-0.65-001

Dimensions

Unit: mm

## RESTRICTIONS ON PRODUCT USE

Toshiba Corporation and its subsidiaries and affiliates are collectively referred to as "TOSHIBA". Hardware, software and systems described in this document are collectively referred to as "Product".

- TOSHIBA reserves the right to make changes to the information in this document and related Product without notice.
- This document and any information herein may not be reproduced without prior written permission from TOSHIBA. Even with TOSHIBA's written permission, reproduction is permissible only if reproduction is without alteration/omission.
- Though TOSHIBA works continually to improve Product's quality and reliability, Product can malfunction or fail. Customers are responsible for complying with safety standards and for providing adequate designs and safeguards for their hardware, software and systems which minimize risk and avoid situations in which a malfunction or failure of Product could cause loss of human life, bodily injury or damage to property, including data loss or corruption. Before customers use the Product, create designs including the Product, or incorporate the Product into their own applications, customers must also refer to and comply with (a) the latest versions of all relevant TOSHIBA information, including without limitation, this document, the specifications, the data sheets and application notes for Product and the precautions and conditions set forth in the "TOSHIBA Semiconductor Reliability Handbook" and (b) the instructions for the application with which the Product will be used with or for. Customers are solely responsible for all aspects of their own product design or applications, including but not limited to (a) determining the appropriateness of the use of this Product in such design or applications; (b) evaluating and determining the applicability of any information contained in this document, or in charts, diagrams, programs, algorithms, sample application circuits, or any other referenced documents; and (c) validating all operating parameters for such designs and applications. **TOSHIBA ASSUMES NO LIABILITY FOR CUSTOMERS' PRODUCT DESIGN OR APPLICATIONS.**
- **PRODUCT IS NEITHER INTENDED NOR WARRANTED FOR USE IN EQUIPMENTS OR SYSTEMS THAT REQUIRE EXTRAORDINARILY HIGH LEVELS OF QUALITY AND/OR RELIABILITY, AND/OR A MALFUNCTION OR FAILURE OF WHICH MAY CAUSE LOSS OF HUMAN LIFE, BODILY INJURY, SERIOUS PROPERTY DAMAGE AND/OR SERIOUS PUBLIC IMPACT ("UNINTENDED USE").** Except for specific applications as expressly stated in this document, Unintended Use includes, without limitation, equipment used in nuclear facilities, equipment used in the aerospace industry, lifesaving and/or life supporting medical equipment, equipment used for automobiles, trains, ships and other transportation, traffic signaling equipment, equipment used to control combustions or explosions, safety devices, elevators and escalators, and devices related to power plant. IF YOU USE PRODUCT FOR UNINTENDED USE, TOSHIBA ASSUMES NO LIABILITY FOR PRODUCT. For details, please contact your TOSHIBA sales representative or contact us via our website.
- Do not disassemble, analyze, reverse-engineer, alter, modify, translate or copy Product, whether in whole or in part.
- Product shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable laws or regulations.
- The information contained herein is presented only as guidance for Product use. No responsibility is assumed by TOSHIBA for any infringement of patents or any other intellectual property rights of third parties that may result from the use of Product. No license to any intellectual property right is granted by this document, whether express or implied, by estoppel or otherwise.
- **ABSENT A WRITTEN SIGNED AGREEMENT, EXCEPT AS PROVIDED IN THE RELEVANT TERMS AND CONDITIONS OF SALE FOR PRODUCT, AND TO THE MAXIMUM EXTENT ALLOWABLE BY LAW, TOSHIBA (1) ASSUMES NO LIABILITY WHATSOEVER, INCLUDING WITHOUT LIMITATION, INDIRECT, CONSEQUENTIAL, SPECIAL, OR INCIDENTAL DAMAGES OR LOSS, INCLUDING WITHOUT LIMITATION, LOSS OF PROFITS, LOSS OF OPPORTUNITIES, BUSINESS INTERRUPTION AND LOSS OF DATA, AND (2) DISCLAIMS ANY AND ALL EXPRESS OR IMPLIED WARRANTIES AND CONDITIONS RELATED TO SALE, USE OF PRODUCT, OR INFORMATION, INCLUDING WARRANTIES OR CONDITIONS OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, ACCURACY OF INFORMATION, OR NONINFRINGEMENT.**
- Do not use or otherwise make available Product or related software or technology for any military purposes, including without limitation, for the design, development, use, stockpiling or manufacturing of nuclear, chemical, or biological weapons or missile technology products (mass destruction weapons). Product and related software and technology may be controlled under the applicable export laws and regulations including, without limitation, the Japanese Foreign Exchange and Foreign Trade Law and the U.S. Export Administration Regulations. Export and re-export of Product or related software or technology are strictly prohibited except in compliance with all applicable export laws and regulations.
- Please contact your TOSHIBA sales representative for details as to environmental matters such as the RoHS compatibility of Product. Please use Product in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. **TOSHIBA ASSUMES NO LIABILITY FOR DAMAGES OR LOSSES OCCURRING AS A RESULT OF NONCOMPLIANCE WITH APPLICABLE LAWS AND REGULATIONS.**
