Triple High-Voltage Scan Driver for TFT-LCD

Check for Samples: TPS65191

FEATURES

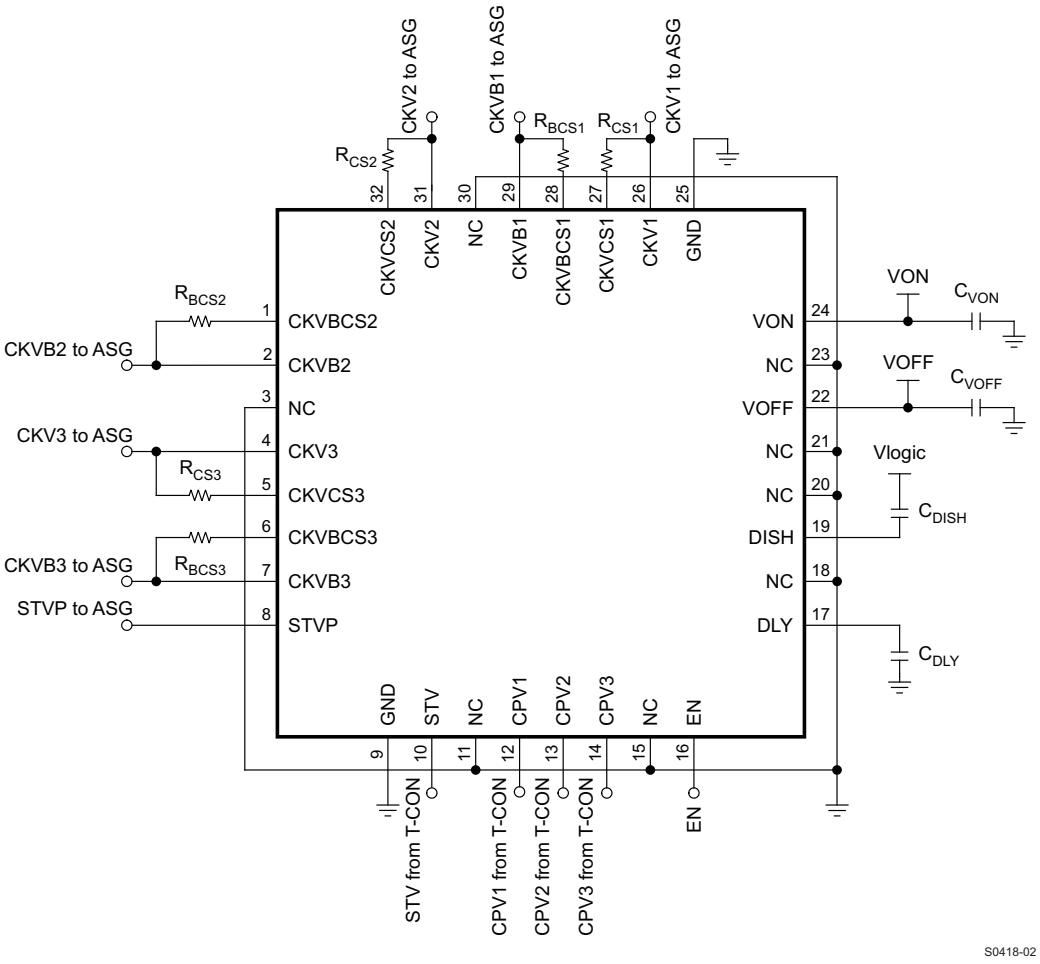
- **Triple High-Voltage Scan Driver**
- **Scan Driver Output Charge Share**
- **High Output-Voltage Level: Up to 35 V**
- **Low Output-Voltage Level: Down to –28 V**
- **Logic-Level Inputs**
- **32-pin 5-mm × 5-mm QFN Package**

APPLICATIONS

- **TFT LCD Using ASG (Amorphous Silicon Gate) Technology**

DESCRIPTION

The TPS65191 is a triple high-voltage scan driver to drive an ASG (amorphous silicon gate) circuit on TFT glass. Each single high-voltage scan driver receives logic-level inputs of CPVx and generates two high-voltage outputs of CKVx, CKVBx. The device receives a logic-level input of STV and generates a high-voltage output of STVP. These outputs are swings from Voff (–28 V) to Von (35 V) and are used to drive the ASG circuit and charge/discharge the capacitive loads of the TFT LCD. In order to reduce the power dissipation of device, a charge-share function is implemented. The device features discharge function, which shorts Voff to GND in order to shut down the panel faster when the LCD is turned off.



Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

ORDERING INFORMATION(1)

T_A	ORDERING P/N	PACKAGE	PACKAGE MARKING
–40°C to 85°C	TPS65191RHBR	32-pin 5-mm × 5-mm QFN	TPS65191

(1) The RHB package has quantities of 2500 devices per reel.

ABSOLUTE MAXIMUM RATINGS(1)

over operating free-air temperature range (unless otherwise noted)

	VALUE	UNIT
Voltage on pins CPVx, STV	–0.3 to 5.5	V
Voltage on pins EN	–0.3 to 5.5	V
Input voltage on VON(2)	40	V
Input voltage on VOFF(2)	–30	V
Voltage on CKVx, CKVBx, CKVCSx, CKVBCSx	–30 to 40	V
VON–VOFF	62	V
Voltage on STVP	–30 to 40	V
Voltage on DISH	–3.6 to 5.5	V
ESD rating, HBM	2	kV
ESD rating, MM	200	V
ESD rating, CDM	700	V
Continuous power dissipation	See Dissipation Rating Table	
Operating junction temperature range	–40 to 150	°C
Storage temperature range	–65 to 150	°C

(1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltage values are with respect to network ground terminal.

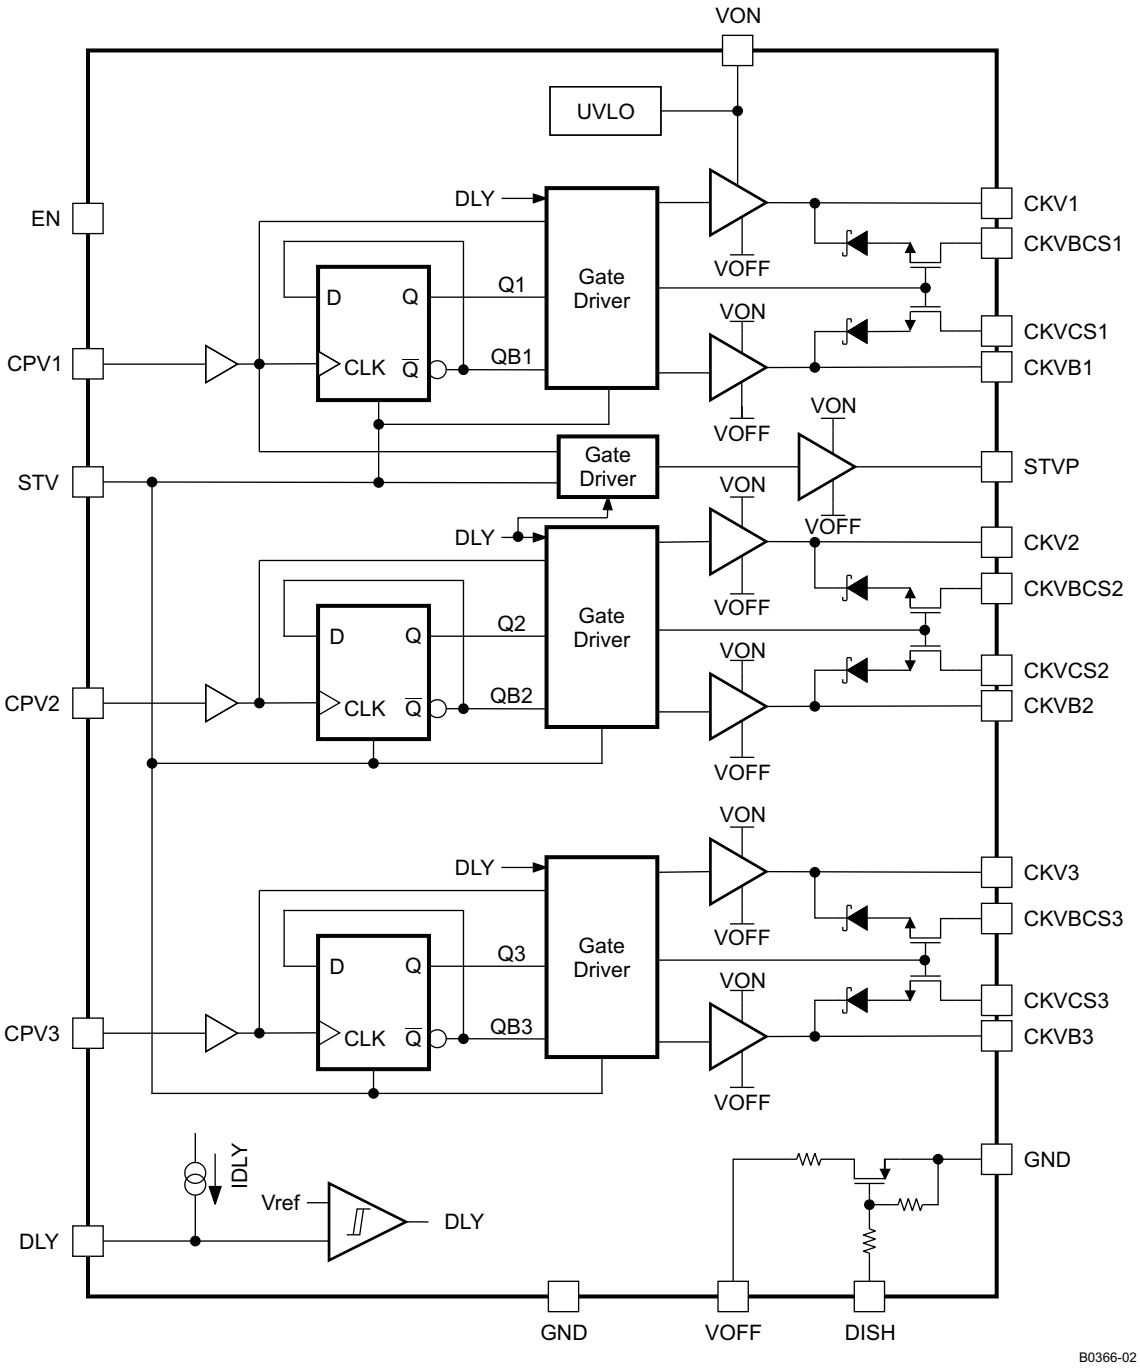
BLOCK DIAGRAM



DETAILED DESCRIPTION

UNDERVOLTAGE LOCKOUT

The device has an undervoltage lockout feature to avoid improper operation of the device when input voltage VON is low. When VON is lower than 10 V, the device shuts down, and outputs CKVx, CKVBx, and STVP enter the high-impedance state.

INPUT SIGNALS

The timing controller in the system provides input signals of TPS65191. STV is the synchronous signal for picture frames, and its frequency depends on frame rate. CPVx are the synchronous signals for horizontal lines, and their frequency depends on frame rate and vertical resolution.

OUTPUT SIGNALS

The STVP, CKVx, and CKVBx of scan-driver outputs are generated with internal switches. Table 1 and Table 2 show the logic diagrams of the scan-driver outputs.

Table 1. STVP Logic Diagram

INPUT		OUTPUT
STV	**CPV1**	**STVP**
LOW	Don't care	VOFF
HIGH	LOW	VON
HIGH	HIGH	High impedance

Table 2. CKVx, CKVBx, and Output Charge-Share Logic

INPUT		OUTPUT		
STV	**CPVx**	**CKVx**	**CKVBx**	**CHARGE SHARE**
LOW	LOW	High impedance	High impedance	Enable
LOW	Rising edge	Toggle state	Toggle state	Disable
LOW	HIGH	Previous state	Previous state	Disable
HIGH	LOW	VOFF	VON	Disable
HIGH	HIGH	VON	VOFF	Disable

OUTPUT CHARGE SHARE

Power dissipation can be reduced by the output charge share. Figure 18 shows the current flows when the charge share is enabled. CKVCSx and CKVBCSx are charge-share inputs. When the charge share is enabled, the charge that is in the capacitor of the positive voltage line is transferred to the capacitor of the negative voltage line. Charge-sharing resistors R_{CSx} and R_{BCSx} reduce the peak current into charge-share inputs, CKVCSx and CKVBCSx, during the output charge share. These resistors also control the slope of the output charge-share waveform. The smaller R_{CSx} and R_{BCSx}, the higher the peak current into the charge-share inputs and the steeper the slope of output charge-share waveform. The power dissipation in charge-sharing resistors should be taken into consideration. With 0603 size resistors, the power rating of two in parallel is good for most applications.

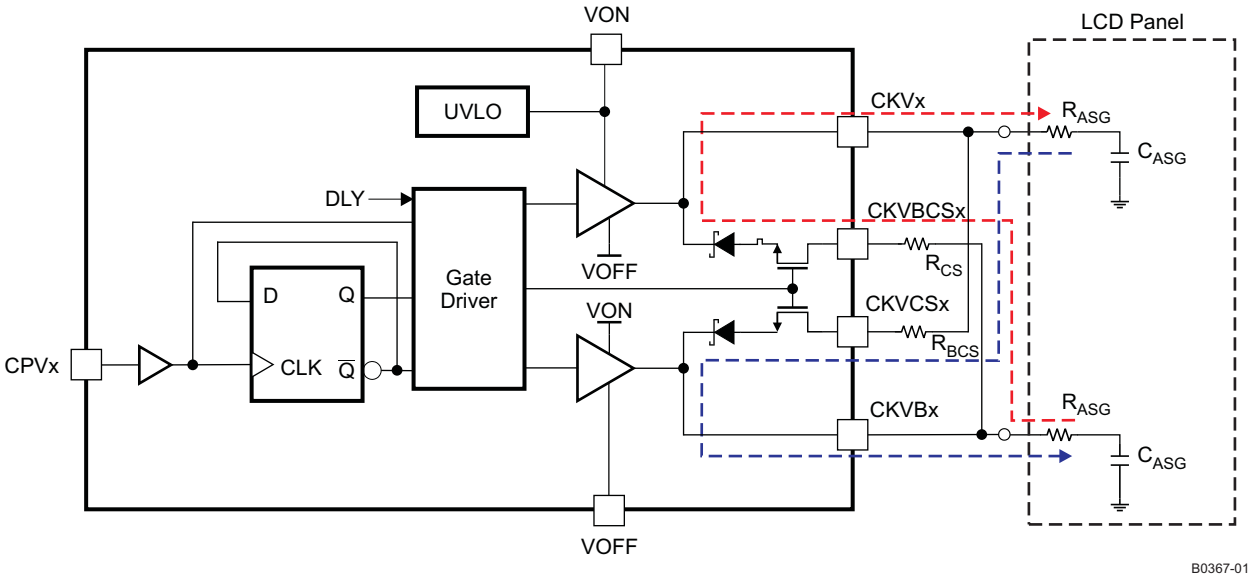


Figure 18. Single-Scan Driver Block Diagram

START-UP SEQUENCE (EN, DLY)

The TPS65191 has an adjustable start-up sequencing that is set by EN and DLY. When VON is below the UVLO threshold, all outputs are at high impedance. When EN is pulled LOW after UVLO threshold is reached, all outputs follow VOFF. Pulling EN high enables the device after a delay time set by the capacitor connected to DLY, and the delay time starts when EN = HIGH. If EN is pulled high before the UVLO threshold is reached, the delay starts when VON reaches the UVLO threshold. Pulling EN low disables the device, and outputs CKVx, CKVBx, and STVP follow VOFF as long as VON is higher than the UVLO threshold. For the typical start-up sequence, see Figure 19 and Figure 20.

SETTING THE DELAY TIME (DLY)

Connecting an external capacitor to the DLY pin sets the delay time. If no delay time is required, the DLY pin can be left floating. The external capacitor is charged with a constant-current source of typically 15 μA. The delay time is terminated when the capacitor voltage reaches the internal reference voltage of 2.9 V, and the final DLY voltage on an external capacitor is maximum 8 V. The voltage rating of the external capacitor must be higher than 8 V.

The external delay capacitor is calculated using the following formula:

$$C_{DLY} = \frac{\text{Delay time}}{R_{DLY}} = \frac{\text{Delay time}}{200\,k\Omega} \quad (1)$$

Example for setting a delay time of 10 ms:

$$C_{DLY} = \frac{10\,ms}{200\,k\Omega} = 50\,nF \approx 47\,nF \quad (2)$$

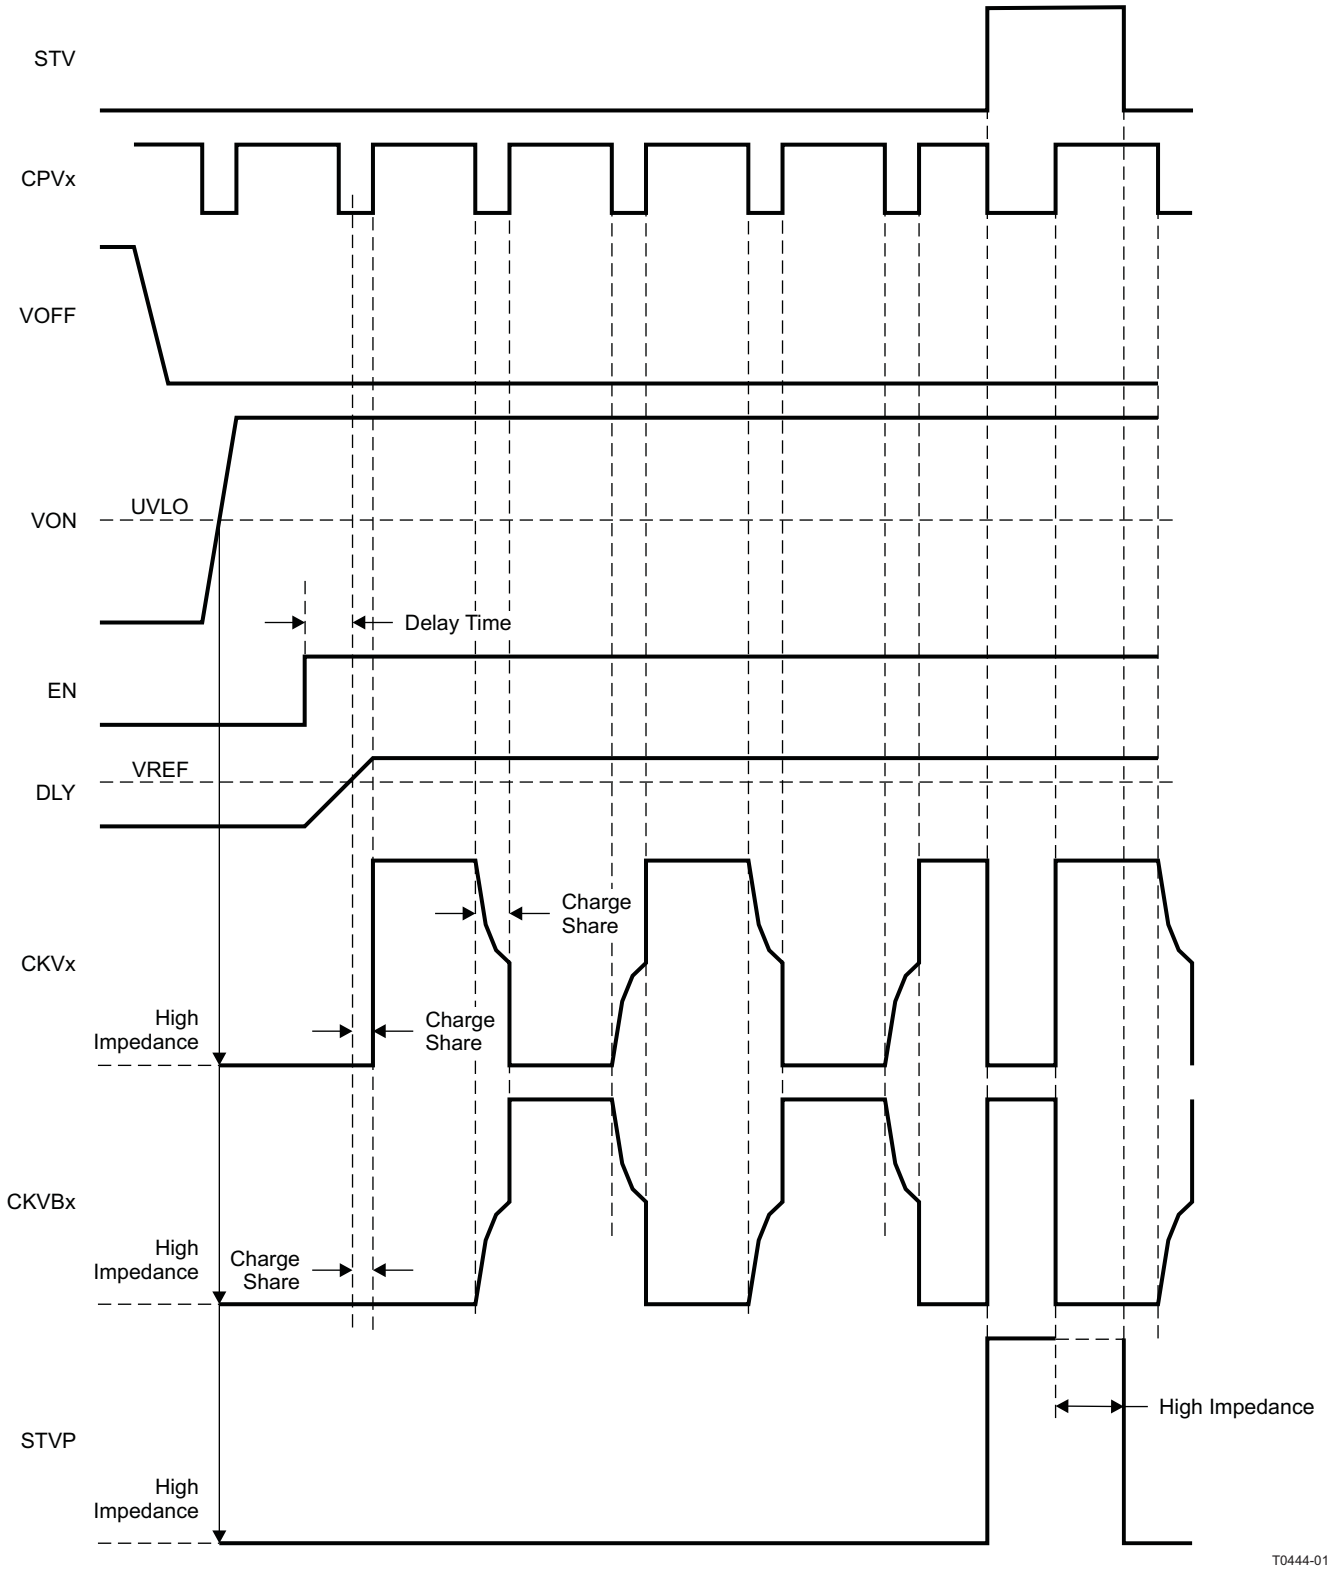

Figure 19. Start-Up Sequence With EN = High After UVLO Threshold

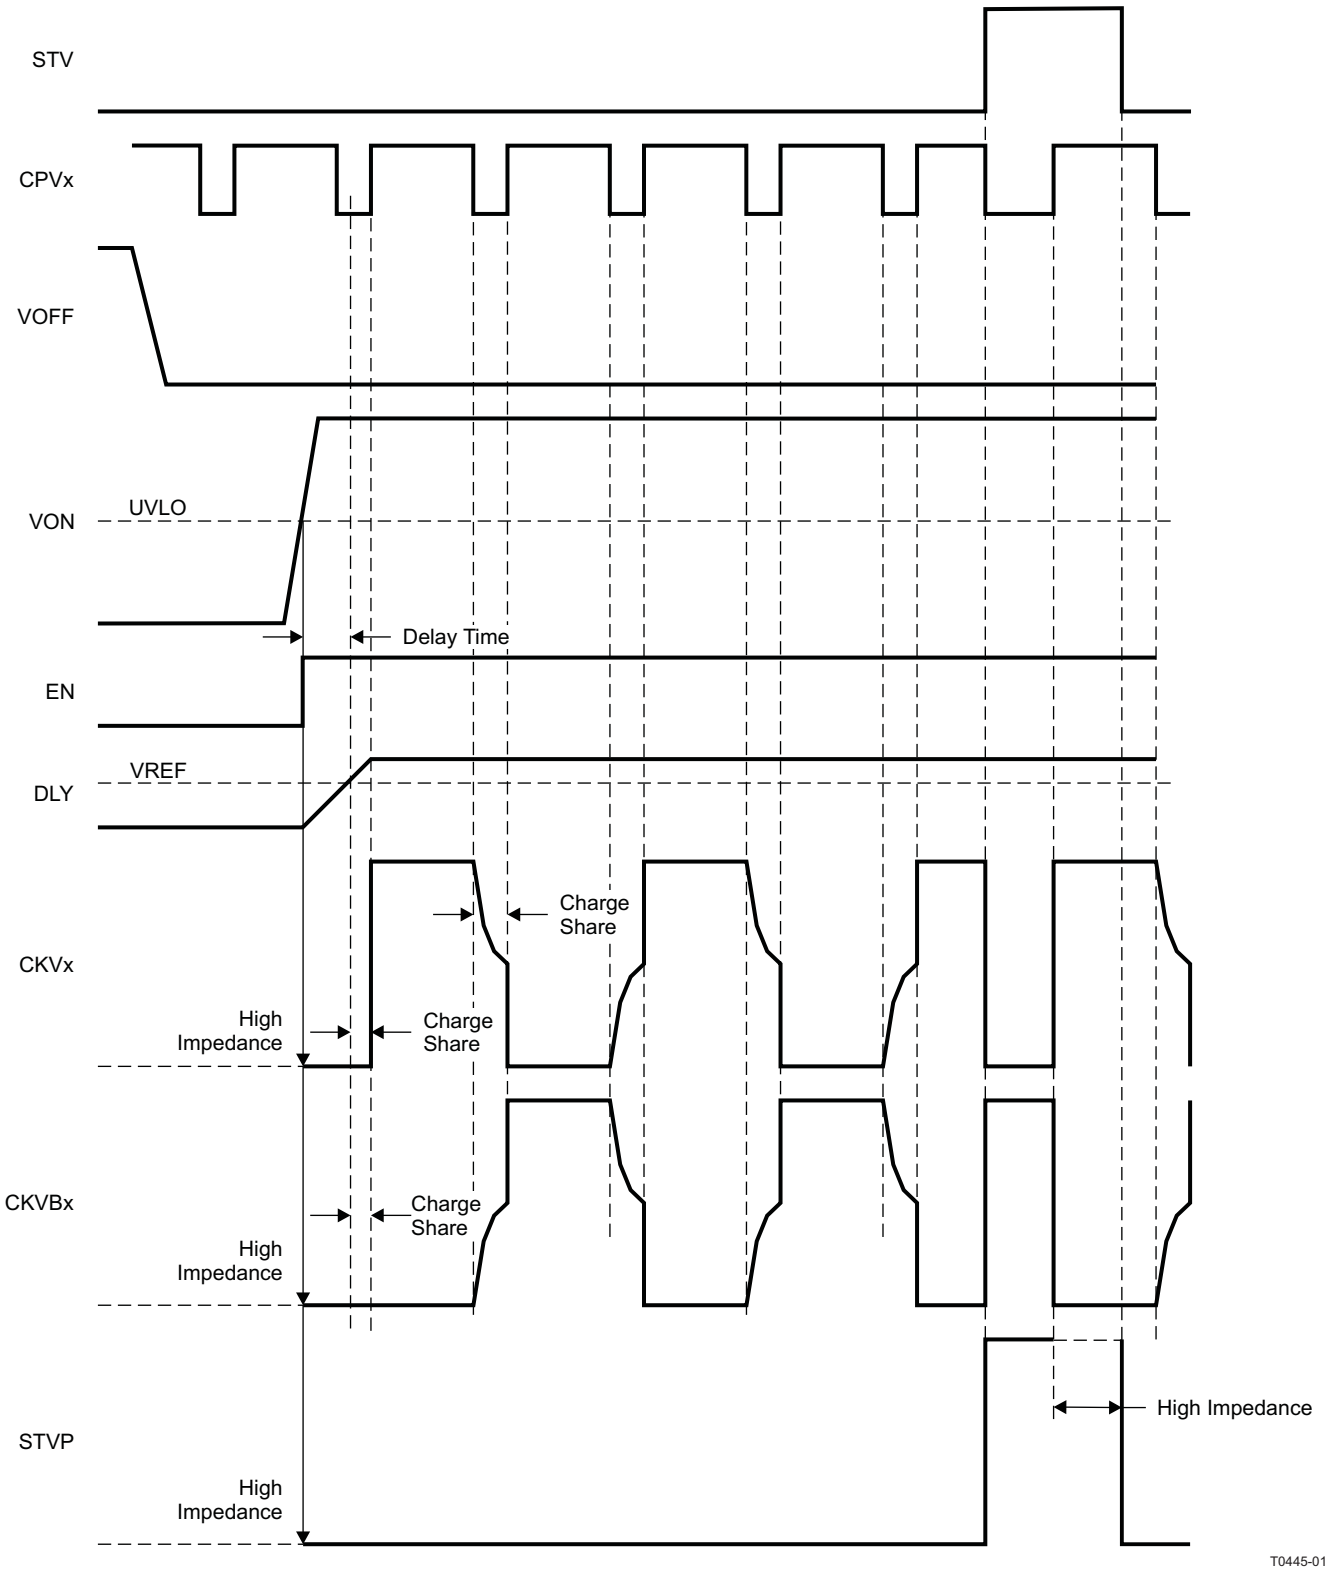

Figure 20. Start-Up Sequence With EN = High Before UVLO Threshold

TIMING DIAGRAM OF SCAN DRIVER

Figure 21 shows the typical timing diagram of the TPS65191.

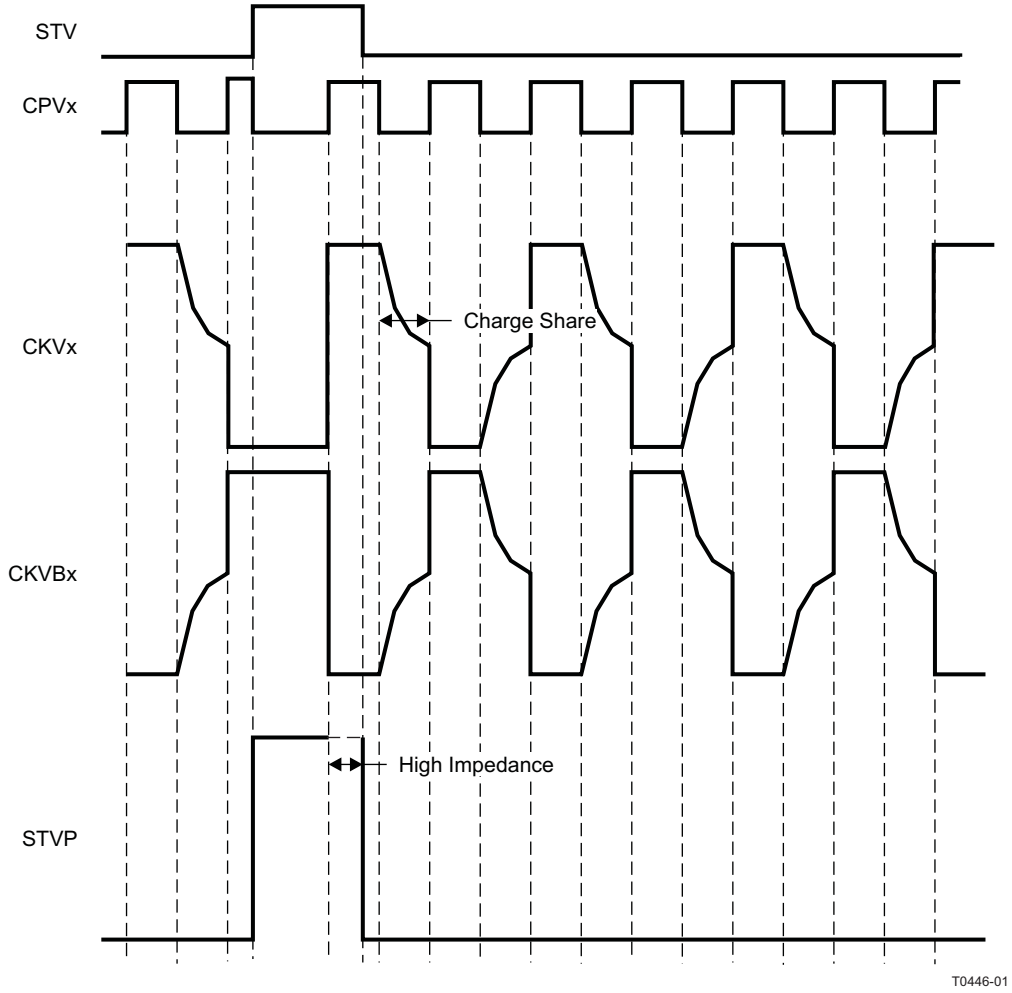

Figure 21. Scan Driver Timing Diagram

SUPPLY VOLTAGE VON and VOFF

The TPS65191 drives the capacitive load. The high peak currents should be supplied from VON on the rising edges of the outputs and VOFF on the falling edges of the outputs, respectively. Bypass capacitors of 1 μF must be placed as close as possible on both the VON and VOFF supplies. Depending on the peak current that the TPS65191 must deliver, the bypass capacitor can be bigger than 1 μF.

VOFF DISCHARGE

DISH controls the VOFF discharging time during the system power off. Figure 22 shows a typical application for VOFF discharge. DISH is connected to the system logic voltage through a capacitor. During the power off, the system logic voltage falls, and the voltage on DISH falls below ground level. Internal switch turns on when DISH is below –0.6V and VOFF is connected to ground through 1kΩ, which helps VOFF discharge. A 1-μF DISH capacitor is good for most applications. Figure 23 shows the typical power-off sequence of VOFF discharging. VOFF discharge can be disabled by connecting DISH to GND directly.

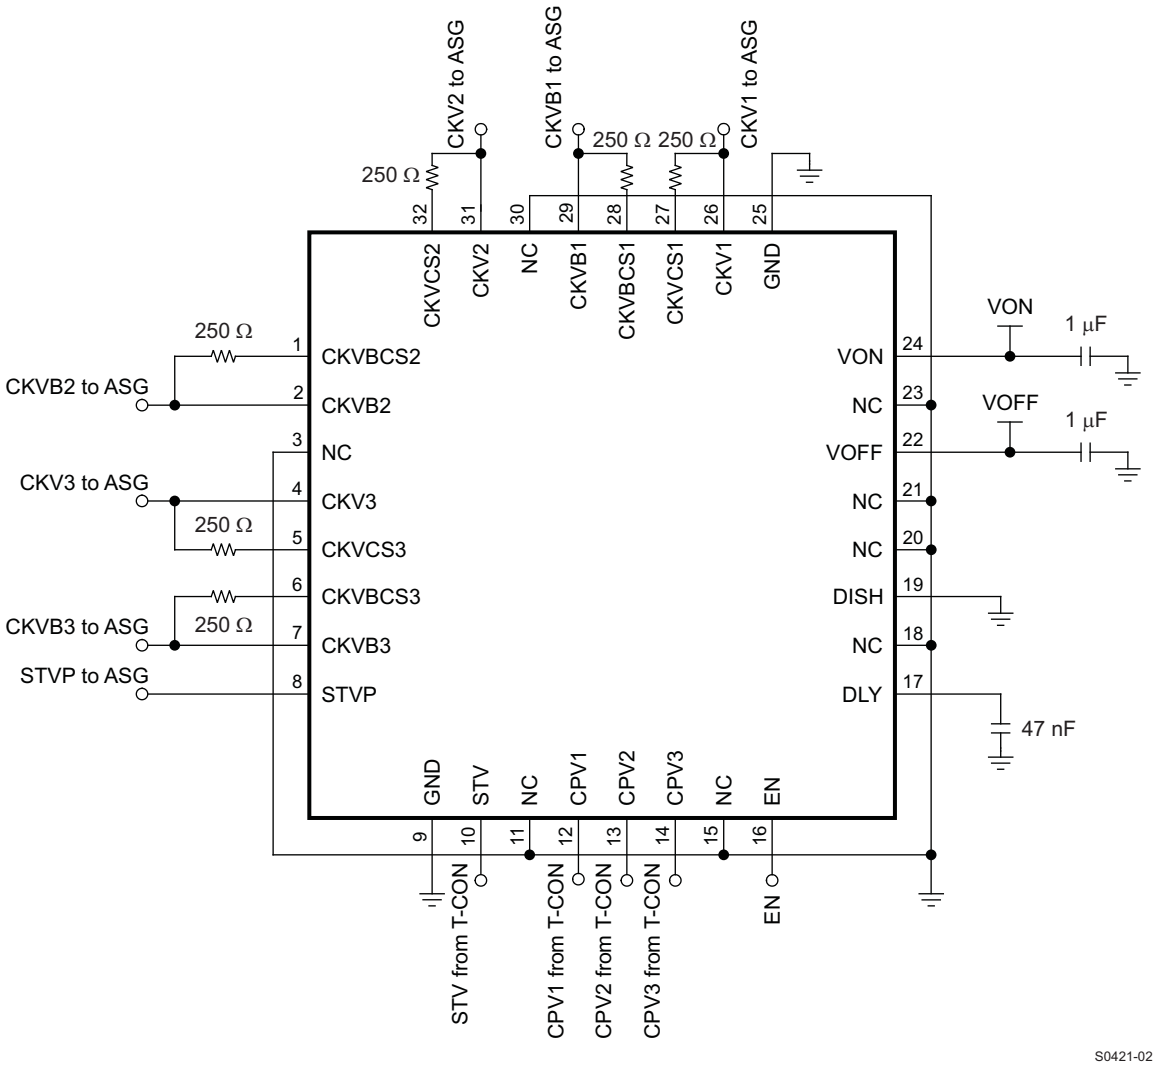

Figure 25. Typical Application With VOFF Discharge Disabled

REVISION HISTORY

Changes from Revision Original (July 2009) to Revision A	Page
• Changed upper voltage limit from 37 V to 40 V in three places in the Abs Max Ratings table	2

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS65191RHBR	NRND	VQFN	RHB	32	3000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 85	TPS 65191	

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.
