DESCRIPTION

The TR3002 is phase-locked loop (PLL) LSIs for general purpose application. All functions are controlled through 2 serial bus lines.

FEATURES

- Operate at input frequency ranging from 1.5~150 MHz during FMIN input .
- All functions controlled through 2 serial bus lines.
- CMOS structure with operating power supply rang of VDD=2.2~3.6V.

PIN DESCRIPTION

Pin No.	Symbol	Pin name	Description
1	DO	Phase comparator Output	These pins are for phase comparator tri-state output.
2	X1	Crystal oscillator pins	These pins set the reference frequency of the reference counter.
3	X2		
4	DA	Shift register data input	These pins set the frequency of PLL.
5	CK	Shift register clock input	
7	FMIN	High frequency input	These pins input high frequency local oscillator signals by capacitor coupling.
6	VSS	Power supply pins	VDD=2.2~3.6V
8	VDD		

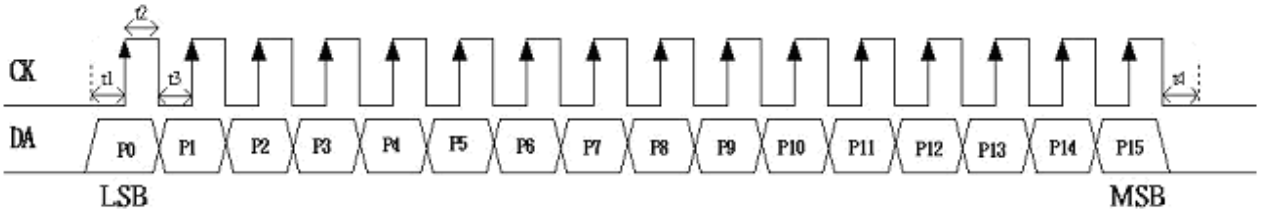
FUNCTION DESCRIPTION

Serial I/O ports

The block diagram shows that the functions are controlled by setting data in the 16 bits registers. Each bit of data in these registers is transferred through the serial ports between the controller and the DA and CK pins.

Serial transfer format

The serial transfer format consists of 16 data bits (Fig. 1).



t1,t2,t3,t4 > 4us

Fig.1

Serial data transfer

Serial data are transferred in sync with the clock signal. Since the receiving side receives the serial data as valid data when the clock signal rises, it is effective for the sending side to produce output in sync with the clock signal fall.

Programmable counter

The programmable counter section consists of 16bit programmable binary counter.

Setting programmable counter

The divisor for the programmable counter is set as binary data in bits P0~P15.(fig.1)
Divisor setting range n=100H~FF00H (256~65280)

Crystal oscillator pins(X1, X2)

As fig.2 shows, the clock necessary for internal operation is produced by connecting a crystal oscillator between capacitors.
