LOW-VOLTAGE OCTAL FET BUS SWITCH

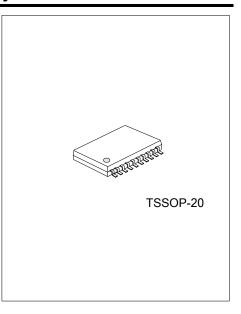

DESCRIPTION

The **U74CBTLV3245** provides eight bits of high-speed bus switching in a standard '245 device pinout. The low on-state resistance of the switch allows connections to be made with minimal propagation delay.

The device is organized as one 8-bit switch. When output enable (\overline{OE}) is low, the 8-bit bus switch is on, and port A is connected to port B. When \overline{OE} is high, the switch is open, and the high-impedance state exists between the two ports.

This device is fully specified for partial-power-down applications using I_{OFF} . The I_{OFF} feature ensures that damaging current will not backflow through the device when it is powered down. The device has isolation during power off.

To ensure the high-impedance state during power up or power down, \overline{OE} should be tied to V_{CC} through a pullup resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

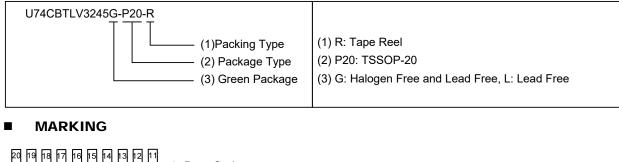

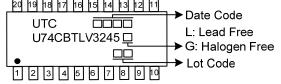

FEATURES

- * 5Ω Switch Connection Between Two Ports
- * Standard '245-Type Pinout
- * Isolation Under Power-Off Conditions
- * Rail-to-Rail Switching on Data I/O Ports
- * IOFF Supports Partial-Power-Down Mode Operation

Preliminary

ABSOLUTE MAXIMUM RATING (unless otherwise specified)(Note 1)

PARAMETER	SYMBOL	RATINGS	UNIT
Supply Voltage	V _{CC}	-0.5 ~ 4.6	V
Input Voltage (Note 2)	VI	-0.5 ~ 4.6	V
Continuous channel current		128	mA
Input Clamp Current (V _{I/O} <0)	l _{iK}	-50	mA
Storage Temperature	T _{STG}	-65 ~ +150	°C

Notes: 1. Absolute maximum ratings are those values beyond which the device could be permanently damaged. Absolute maximum ratings are stress ratings only and functional device operation is not implied.

2. The input and output negative-voltage ratings may be exceeded if the input and output clamp-current ratings are observed.

RECOMMENDED OPERATING COMDITIONS

PARAMETER	SYMBOL	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Supply Voltage	Vcc		2.3		3.6	V
	N/	V _{CC} =2.3V~2.7V	1.7			V
High-control input voltage	VIH	V _{CC} =2.7V~3.6V	2			V
	N/	V _{CC} =2.3V~2.7V			0.7	V
Low-control input voltage	VIL	V _{CC} =2.7V~3.6V			0.8	V
Operating Temperature	T _A		-40		+85	°C

Note: All unused control inputs of the device must be held at V_{CC} or GND to ensure proper device operation.

Notes: 1. All typical values are at V_{CC} =3.3V, T_A =25°C, unless otherwise Specified.

2. This is the increase in supply current for each input that is at the specified voltage level, rather than V_{CC} or GND.

3. Measured by the voltage drop between the A and B terminals at the indicated current through the switch. On-state resistance is determined by the lower of the voltages of the two (A or B) terminals.
