## 4-Terminal Adjustable Voltage Regulators

Linear Division Voltage Regulators

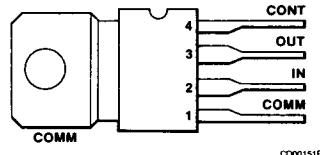

**Description**

The  $\mu$ A78MG and  $\mu$ A79MG are 4-terminal adjustable voltage regulators. They are designed to deliver continuous load currents of up to 500 mA with a maximum input voltage of +40 V for the positive regulator  $\mu$ A78MG and -40 V for the negative regulator  $\mu$ A79MG. Output current capability can be increased to greater than 10 A through use of one or more external transistors. The output voltage range of the  $\mu$ A78MG positive voltage regulator is 5.0 V to 30 V and the output voltage range of the negative  $\mu$ A79MG is -30 to -2.2 V. For systems requiring both a positive and negative, the  $\mu$ A78MG and  $\mu$ A79MG are excellent for use as a dual tracking regulator. These 4-terminal voltage regulators are constructed using the Fairchild Planar process.

- Output Current In Excess Of 0.5 A
- $\mu$ A78MG Positive Output Voltage +5.0 To +30 V
- $\mu$ A79MG Negative Output Voltage -30 V To -2.2 V
- Internal Thermal Overload Protection
- Internal Short Circuit Current Protection
- Output Transistor Safe-Area Protection

**Absolute Maximum Ratings**

Storage Temperature Range	-65°C to +150°C
Operating Junction Temperature Range	0°C to 150°C
Lead Temperature (soldering, 10 s)	265°C
Internal Power Dissipation	Internally Limited
Input Voltage	
$\mu$ A78MGC	+40 V
$\mu$ A79MGC	-40 V
Control Lead Voltage	
$\mu$ A78MGC	0 V $\leq$ V+ $\leq$ V <sub>O</sub>
$\mu$ A79MGC	V <sub>O</sub> - $\leq$ -V $\leq$ 0 V

### Notes

1.  $V_O$  is defined for the  $\mu$ A78MGC as  $V_O = \frac{R_1 + R_2}{R_2} (5.0)$ . The  $\mu$ A79MGC as  $V_O = \frac{R_1 + R_2}{R_2} (-2.23)$ .

2. Dropout voltage is defined as that input/output voltage differential which causes the output voltage to decrease by 5% of its initial value.

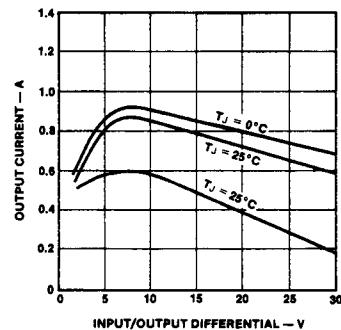

3. All characteristics except noise voltage and ripple rejection ratio are measured using pulse techniques ( $t_W \leq 10$  ms, duty cycle  $\leq 5\%$ ). Output voltage changes due to changes in internal temperature must be taken into account separately.

4. The convention for negative regulators is the Algebraic value, thus  $-15$  V is less than  $-10$  V.

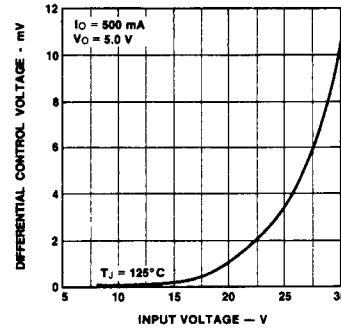

5. All characteristics except noise voltage and ripple rejection ratio are measured using pulse techniques ( $t_W \leq 10$  ms, duty cycle  $\leq 5\%$ ). Output voltage changes due to changes in internal temperature must be taken into account separately.

**Design Considerations**

The μA78MG and μA79MG variable voltage regulators have an output voltage which varies from  $V_{CONT}$  to typically

$$V_I - 2.0 \text{ V} \text{ by } V_O = V_{CONT} \frac{(R_1 + R_2)}{R_2}$$

The nominal reference in the μA78MG is 5.0 V and μA79MG is -2.23 V. If we allow 1.0 mA to flow in the control string to eliminate bias current effects, we can make  $R_2 = 5 \text{ k}\Omega$  in the μA78MG. The output voltage is then:  $V_O = (R_1 + R_2)$  Volts, where  $R_1$  and  $R_2$  are in  $\text{k}\Omega$ s.

Example: If  $R_2 = 5.0 \text{ k}\Omega$  and  $R_1 = 10 \text{ k}\Omega$  then  $V_O = 15 \text{ V}$  nominal, for the μA78MG;  $R_2 = 2.2 \text{ k}\Omega$  and  $R_1 = 12.8 \text{ k}\Omega$  then  $V_O = -15.2 \text{ V}$  nominal, for the μA79MG.

By proper wiring of the feedback resistors, load regulation of the devices can be improved significantly.

Both μA78MG and μA79MG regulators have thermal overload protection from excessive power, internal short circuit protection which limits each circuit's maximum current, and output transistor safe-area protection for reducing the

output current as the voltage across each pass transistor is increased.

Although the internal power dissipation is limited, the junction temperature must be kept below the maximum specified temperature in order to meet data sheet specifications. To calculate the maximum junction temperature or heat sink required, the following thermal resistance values should be used:

Package	Typical $\theta_{JC}$	Max $\theta_{JC}$	Typical $\theta_{JA}$	Max $\theta_{JA}$
Power Watt	8.0	12.0	70	75

$$P_D \text{ Max} = \frac{T_J \text{ Max} - T_A}{\theta_{JC} + \theta_{CA}} \text{ or}$$

$$\frac{T_J \text{ Max} - T_A}{\theta_{JA}} \text{ (Without a heat sink)}$$

$$\theta_{CA} = \theta_{CS} + \theta_{SA}$$

Solving for  $T_J$ :

$$T_J = T_A + P_D(\theta_{JC} + \theta_{CA}) \text{ or}$$

$$T_A + P_D\theta_{JA} \text{ (Without heat sink)}$$

Where

- $T_J$  = Junction Temperature
- $T_A$  = Ambient Temperature
- $P_D$  = Power Dissipation
- $\theta_{JC}$  = Junction-to-case thermal resistance
- $\theta_{CA}$  = Case-to-ambient thermal resistance
- $\theta_{CS}$  = Case-to-heat sink thermal resistance
- $\theta_{SA}$  = Heat sink-to-ambient thermal resistance
- $\theta_{JA}$  = Junction-to-ambient thermal resistance

#### Typical Applications for $\mu$ A78MG (Note 1)

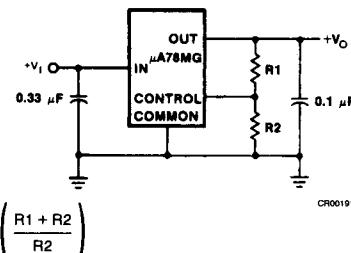

Bypass capacitors are recommended for stable operation of the  $\mu$ A78MG over the input voltage and output current ranges. Output bypass capacitors will improve the transient response of the regulator.

The bypass capacitors, ( $0.33 \mu F$  on the input,  $0.1 \mu F$  on the output) should be ceramic or solid tantalum which have good high frequency characteristics. The bypass capacitors should be mounted with the shortest leads, and if possible, directly across the regulator terminals.

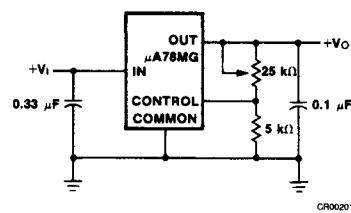

#### Note

- All resistor values in ohms.

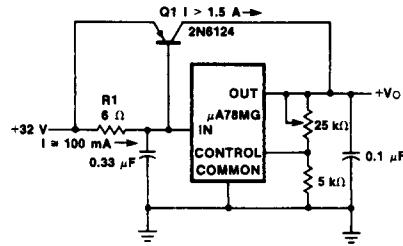

#### Basic Positive Regulator

#### Positive 5.0 V to 30 V Adjustable Regulator

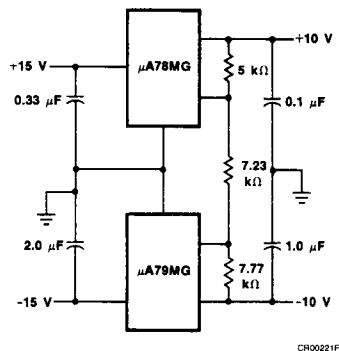

#### Positive 5.0 V to 30 V Adjustable Regulator $I_O > 1.5$ A

$$R1 = \frac{\beta V_{BE}(Q1)}{I_R \text{ Max}(\beta) - I_O}$$

**Typical Applications for μA78MG (Note 1) (Cont.)**

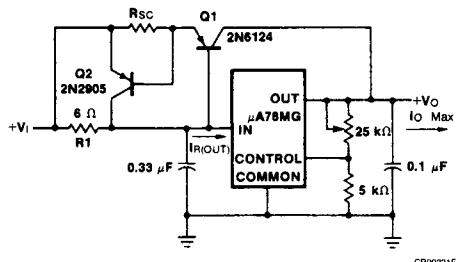

**± 10 V, 500 mA Dual Tracking Regulator**

**Note**

External series pass device is not short circuit protected.

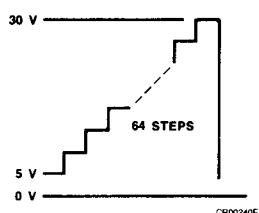

**Positive High Current Short Circuit Protected Regulator**

$$R1 = \frac{\beta V_{BE(Q1)}}{V_R \text{ Max}(\beta + 1) - I_{O \text{ Max}}}$$

If load is not ground referenced, connect reverse biased diodes from outputs to ground.

**Output Waveform**

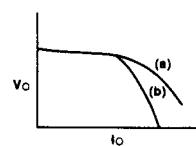

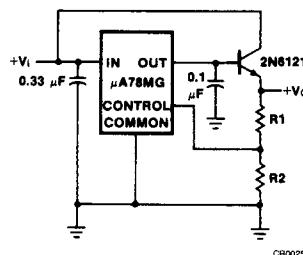

**Note**

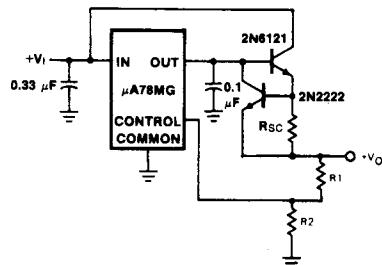

1. All resistor values in ohms.

**Positive High-Current Voltage Regulator**

**External Series Pass (a)**

**Short-Circuit Limit (b)**

**Typical Applications for μA79MG (Note 1)**

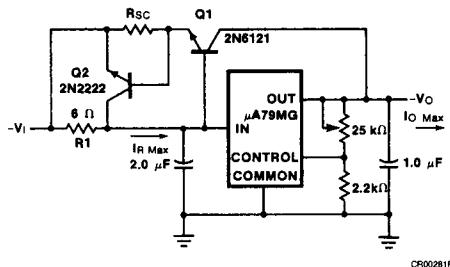

Bypass capacitors are recommended for stable operation of the μA79MG over the input voltage and output current ranges. Output bypass capacitors will improve the transient response of the regulator.

The bypass capacitors, (2.0 μF on the input, 1.0 μF on the output) should be ceramic or solid tantalum which have good high frequency characteristics. If aluminum electrolytics are used, their values should be 10 μF or larger. The bypass capacitors should be mounted with the shortest leads, and if possible, directly across the regulator terminals.
