6. INTERNAL MEMORY SIZE SELECT REGISTER (IMS)

The IMS is a register that prevents by software a part of the internal memory from being used. By using this register, the memory of the μ PD78F4218Y can be mapped in the same manner as a mask ROM model with different internal memory (ROM and RAM) capacity.

This register is set by using an 8-bit memory manipulation instruction.

Its value is set to FFH by RESET input.

Figure 6-1. Format of Internal Memory Size Select Register (IMS)

Address: 0FFFCH	At reset: FFH	W						
IMS	7	6	5	4	3	2	1	0
	1	1	ROM1	ROM0	1	1	RAM1	RAM0

ROM1	ROM0	Selects internal ROM capacity
0	0	64K bytes
0	1	128K bytes
1	0	192K bytes
1	1	256K bytes

RAM1	RAM0	Selects peripheral RAM capacity
0	0	3072 bytes
0	1	6656 bytes
1	0	7168 bytes
1	1	12288 bytes

Caution IMS is not provided on the mask ROM models (μ PD784217Y and 784218Y).

The value to be set to the IMS to map the memory of the μ PD78F4218Y in the same manner as the mask ROM model is shown in Table 6-1.

Table 6-1. Set Value of Internal Memory Size Select Register (IMS)

Mask ROM Model	Set Value of IMS
μ PD784217Y	EFH
μ PD784218Y	FFH

7. PROGRAMMING FLASH MEMORY

The flash memory can be written with the μ PD78F4218Y mounted on the target board (on-board). To do so, connect a dedicated flash writer (Flashpro II) to the host machine and target system.

Remark Flashpro II is a product of Naito Densei Machida Mfg. Co., Ltd.

7.1 Selecting Communication Mode

To write the flash memory, use Flashpro II and serial communication. Select a serial communication mode from those listed in Table 7-1 in the format shown in Figure 7-1. Each communication mode is selected by the number of V_{PP} pulses shown in Table 7-1.

Table 7-1. Communication Modes

Communication Mode	Number of Channels	Pins Used	Number of V_{PP} Pulses
3-wire serial I/O	3	SCK0/SCL0/P27 SO0/P26 SI0/SDA0/P25	0
		SCK1/ASCK1/P22 SO1/TxD1/P21 SI1/RxD1/P20	1
		SCK2/ASCK2/P72 SO2/TxD2/P71 SI2/RxD2/P70	2
UART	2	TxD1/SO1/P21 RxD1/SI1/P20	8
		TxD2/SO2/P71 RxD2/SI2/P70	9

Caution Be sure to select a communication mode with the number of V_{PP} pulses shown in Table 7-1.

Figure 7-1. Communication Mode Selecting Format

7.2 Flash Memory Programming Function

The flash memory is written by transferring or receiving commands and data in a selected communication mode. The major functions of flash memory programming are listed in Table 7-2.

Table 7-2. Major Functions of Flash Memory Programming

Function	Description
Batch erasure	Erases all contents of memory.
Block erasure	Erases contents of specified memory block with one memory block consisting of 16K bytes.
Batch blank check	Checks erased status of entire memory.
Block blank check	Checks erased status of specified block
Data write	Writes flash memory based on write start address and number of data to be written (in bytes).
Batch verify	Compares all contents of memory with input data.
Block verify	Compares contents of specified memory block with input data.

7.3 Connecting Flashpro II

The Flashpro II and μ PD78F4218Y are connected differently depending on the selected communication mode (3-wire serial I/O or UART). Figures 7-2 and 7-3 show the connections in the respective communication modes.
