UT54ACTS220

Clock and Wait-State Generation Circuit

Datasheet November 2010 www.aeroflex.com/logic

FEATURES

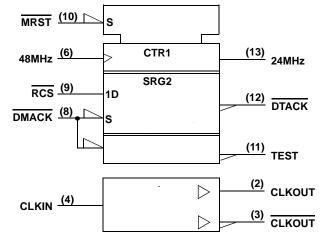

- \Box 1.2 μ CMOS
 - Latchup immune
- ☐ High speed
- ☐ Low power consumption
- ☐ Single 5 volt supply
- ☐ Available QML Q or V processes
- ☐ Flexible package
 - 14-pin DIP
 - 14-lead flatpack
- ☐ UT54ACTS220 SMD 5962-96753

DESCRIPTION

The UT54ACTS220 is designed to be a companion chip to UTMC's UT69151 SµMMIT family for the purpose of generating clock and wait-state signals. The device contains a divide by two circuit that accepts TTL input levels and drives CMOS output buffers. The chip accepts a 48MHz clock and generates a 24MHz clock. The 48MHz clock can have a duty cycle that varies by \pm 20%. The UT54ACT220 generates a 24MHz clock with a \pm 5% duty cycle variation. The wait-state circuit generates a single wait-state by delaying the falling edge of \overline{DTACK} into the SµMMIT. The clock/timing device generates \overline{DTACK} from the falling edge of input \overline{RCS} which is synchronized by the falling edge of 24MHz. The SµMMIT drives inputs \overline{RCS} and \overline{DMACK} .

The devices are characterized over full military temperature range of -55 $^{\circ}$ C to +125 $^{\circ}$ C.

PIN DESCRIPTION

Pin Number	Pin Name	Description
2	CLKOUT	Buffered version of CLKIN.
3	CLKOUT	Inverted version of CLKIN.
4	CLKIN	Clock Input. This signal can be any arbitrary signal that the user wishes to buffer.
6	48MHz	48MHz Clock. The 24MHz clock is created by dividing this signal by two.
8	DMACK	DMA <u>Acknow</u> ledge. This input is generated by the $S\mu MMIT$. When high, this signal will cause <u>DTACK</u> output to be forced high.
9	RCS	RAM Chip Select. This input is generated by the SµMMIT.
10	MRST	Master Reset. This input can be used to preset 24MHz, \overline{DTACK} and TEST. For normal operation tie \overline{MRST} to V_{DD} through a resistor.
11	TEST	Test output signal.
12	DTACK	Data Transfer Acknowledge. This signal can be used to drive the \overline{DTACK} signal of the SµMMIT if the user requires one wait state during the memory transfer.
13	24MHz	24MHz Clock. This output runs at half the frequency of the 48MHz input. The falling edge of $24MHz$ is the signal that latches the \overline{DTACK} outputs. 24MHz is forced high whenever \overline{MRST} is low. Properly loaded, 24MHz will have a 50% duty cycle \pm 5%.

FUNCTIONAL TIMING: Single SµMMIT Wait-State

For both read and write memory cycles, \overline{DTACK} is an input to the SµMMIT E and SµMMIT LXE/DXE. A non-wait state memory requires two clock cycles, T_1 and T_2 of figure 1. For accessing slower memory devices, the UT54ACTS220 holds \overline{DTACK} to a logical "1". This results in the stretching of memory cycles by one clock to three clock cycles, T_W of figure 1. The SµMMIT E and SµMMIT LXE/DXE samples the \overline{DTACK} on the rising edge of the 24 MHz clock. If \overline{DTACK} is not generated before the rising edge of the clock, the SµMMIT E and SµMMIT LXE/DXE extends the memory cycle.

ABSOLUTE MAXIMUM RATINGS

SYMBOL	PARAMETER	LIMIT	UNITS
V_{DD}	Supply voltage	-0.3 to 7.0	V
$V_{\mathrm{I/O}}$	Voltage any pin	-0.3 to V _{DD} +0.3	V
T_{STG}	Storage Temperature range	-65 to +150	°C
$T_{ m J}$	Maximum junction temperature	+175	°C
T_{LS}	Lead temperature (soldering 5 seconds)	+300	°C
$\Theta_{ m JC}$	Thermal resistance junction to case	20	°C/W
I _I	DC input current	±10	mA
P_{D}	Maximum power dissipation	1	W

Note:

RECOMMENDED OPERATING CONDITIONS

SYMBOL	PARAMETER	LIMIT	UNITS
V _{DD}	Supply voltage	4.5 to 5.5	V
V _{IN}	Input voltage any pin	0 to V _{DD}	V
T_{C}	Temperature range	-55 to + 125	°C
48MHz	Duty Cycle	50 ± 20%	MHz

^{1.}Stresses outside the listed absolute maximum ratings may cause permanent damage to the device. This is a stress rating only, functional operation of the device at these or any other conditions beyond limits indicated in the operational sections is not recommended. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Notes:

- 1. Functional tests are conducted in accordance with MIL-STD-883 with the following input test conditions: $V_{IH} = V_{IH}(min) + 20\%$, 0%; $V_{IL} = V_{IL}(max) + 0\%$, 50%, as specified herein, for TTL, CMOS, or Schmitt compatible inputs. Devices may be tested using any input voltage within the above specified range, but are guaranteed to $V_{IH}(min)$ and $V_{IL}(max)$.
- 2. Supplied as a design limit but not guaranteed or tested.
- 3. Per MIL-PRF-38535, for current density \leq 5.0E5 amps/cm², the maximum product of load capacitance (per output buffer) times frequency should not exceed 3,765 pF/MHz.
- 4. Not more than one output may be shorted at a time for maximum duration of one second.
- 5. Capacitance measured for initial qualification and when design changes may affect the value. Capacitance is measured between the designated terminal and V_{SS} at frequency of 1MHz and a signal amplitude of 50mV rms maximum.
- 6. Maximum allowable relative shift equals 50mV.
- 7. All specifications valid for radiation dose ≤ 1E6 rads(Si).
- 8. Power does not include power contribution of any TTL output sink current.
- 9. Power dissipation specified per switching output.
- 10. This value is guaranteed based on characterization data, but not tested.

Notes:

- 1. Lead finish (A,C, or X) must be specified.
- 2. If an "X" is specified when ordering, part marking will match the lead finish and will be either "A" (solder) or "C" (gold).
- $3. \ Total \ dose \ radiation \ must \ be \ specified \ when \ ordering. \ QML \ Q \ and \ QML \ V \ not \ available \ without \ radiation \ hardening. For prototype \ inquiries, \ contact \ factory.$
- 4. Device type 02 is only offered with a TID tolerance guarantee of 3E5 rads(Si) or 1E6 rads(Si) and is tested in accordance with MIL-STD-883 Test Method 1019 Condition A and section 3.11.2. Device type 03 is only offered with a TID tolerance guarantee of 1E5 rads(Si), 3E5 rads(Si), and 5E5 rads(Si), and is tested in accordance with MIL-STD-883 Test Method 1019 Condition A.
