

SINGLE-SUPPLY DUAL OPERATIONAL AMPLIFIER

DESCRIPTION

The UTC M2904 consists of two independent, high gain, internally frequency compensated operation amplifiers which were designed specifically to operate from a single power supplies is also possible and the low power supply current drain is independent of the magnitude of the power supply voltage.

FEATURES

- *Single Supply
- *Operating Voltage: +3V~+32V
- *Low Operating Current: 0.7mA (typ.)
- *Slew Rate: $0.5V/\mu s$ (typ.)

APPLICATIONS

*transducer amplifiers, DC gain blocks, and all the conventional op amp circuits which now can be more easily implemented in single power supply systems.

TYPICAL CHARACTERISTICS

APPLICATION

The UTC M2904, in its static state (No in and output condition) when design, QU being biased by constant current (break down beam) yet, QL stays OFF.

While using with both power source mode, the cross-over distortion might occur instantly when QL ON.

There might be cases when application for amplifier of audio signals, not only distortion but also the apparent frequency bandwidth being narrowed remarkably. It is adjustable especially when using both power source mode, constantly to use with higher on QU than the load current (including feedback current), and then connect the pull-down resistor RP at the part between output and GND pins.
