Note (1) Temperature and relative humidity range is shown in the figure below.

(a) 90 %RH Max. (Ta $~\leq~$ 40 °C).

- (b) Wet-bulb temperature should be 39 °C Max. (Ta > 40 °C).
- (c) No condensation.
- Note (2) The maximum operating temperature is based on the test condition that the surface temperature of display area is less than or equal to 65 °C with LCD module alone in a temperature controlled chamber. Thermal management should be considered in final product design to prevent the surface temperature of display area from being over 65 °C. The range of operating temperature may degrade in case of improper thermal management in final product design.
- Note (3) 10 ~ 200 Hz, 10 min, 1 time each X, Y, Z.
- Note (4) At testing Vibration and Shock, the fixture in holding the module has to be hard and rigid enough so that the module would not be twisted or bent by the fixture.

5.4 COLOR DATA INPUT ASSIGNMENT

The brightness of each primary color (red, green and blue) is based on the 10-bit gray scale data input for the color. The higher the binary input, the brighter the color. The table below provides the assignment of the color versus data input.

6.2 POWER ON/OFF SEQUENCE

6.2.1 POWER ON/OFF SEQUENCE(Ta = 25 ± 2 °C)

To prevent a latch-up or DC operation of LCD module, the power on/off sequence should be as the diagram below.

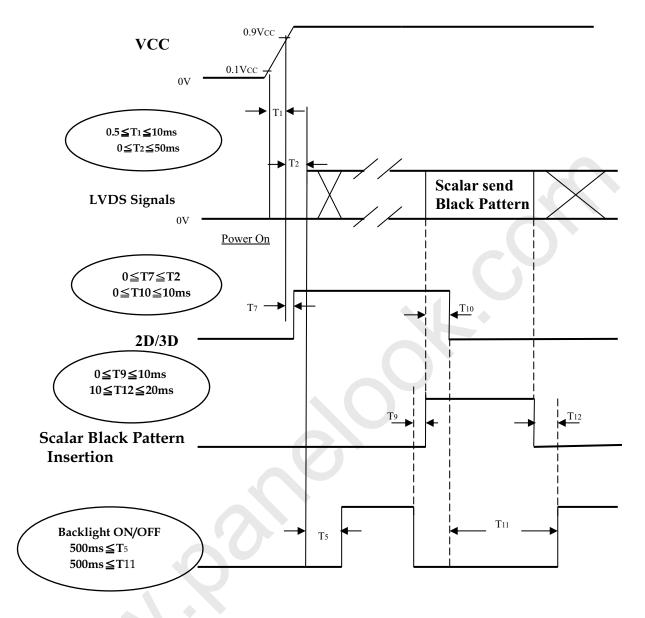

Version 1.0

6.2.2 2D to 3D SIGNAL SEQUENCE WITHOUT VCC TURN OFF AND TURN ON

- Note (1) The supply voltage of the external system for the module input should follow the definition of Vcc. Note (2) Apply the LED voltage within the LCD operation range. When the backlight turns on before the LCD operation or the LCD turns off before the backlight turns off, the display may momentarily become abnormal screen.
- Note (3) In case of Vcc is in off level, please keep the level of input signals on the low or high impedance. If T2<0,that maybe cause electrical overstress failure.
- Note (4) T4 should be measured after the module has been fully discharged between power off and on period.
- Note (5) Interface signal shall not be kept at high impedance when the power is on.

Note (1) Light source is the standard light source "C" which is defined by CIE and driving voltages are based on suitable gamma voltages. The calculating method is as following :

- 1. Measure Module's and BLU's spectrums. W, R, G, B are with signal input. BLU(for V420H2_LS1) is supplied by CMI.
- 2. Calculate cell's spectrum.
- 3. Calculate cell's chromaticity by using the spectrum of standard light source "C"
- Note (2) Light source is the BLU which is supplied by CMI and driving voltages are based on suitable gamma voltages.
- Note (3) Definition of Viewing Angle (θx , θy):

Viewing angles are measured by Conoscope Cono-80 (or Eldim EZ-Contrast 160R)

PRODUCT SPECIFICATION

Note (4) Definition of Contrast Ratio (CR):

The contrast ratio can be calculated by the following expression.

Contrast Ratio (CR) = L255 / L0

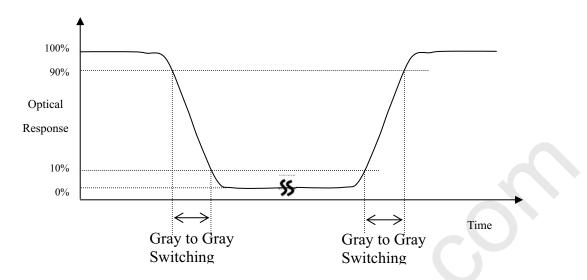

- L 255: Luminance of gray level 255
- L 0: Luminance of gray level 0
- CR = CR (1), where CR (X) is corresponding to the Contrast Ratio of the point X at Figure in Note (7).

Note (5) Definition of Gray to Gray Switching Time:

The driving signal means the signal of gray level 0, 124, 252, 380, 508, 636, 764, 892 and 1023. Gray to gray average time means the average switching time of gray level 0, 124, 252, 380, 508,636, 764, 892 and 1023.

Note (6) Measurement Setup:

The LCD module should be stabilized at given temperature for 1 hour to avoid abrupt temperature change during measuring. In order to stabilize the luminance, the measurement should be executed after lighting backlight for 1 hour in a windless room.

Note (7) Definition of White Variation (δW):

Measure the luminance of gray level 255 at 5 points

δW = Maximum [L (1), L (2), L (3), L (4), L (5)] / Minimum [L (1), L (2), L (3), L (4), L (5)]

10. INTERNATIONAL STANDARD

10.1 ASSEMBLY AND HANDLING PRECAUTIONS

- [1] Do not apply rough force such as bending or twisting to the module during assembly.
- [2] It is recommended to assemble or to install a module into the user's system in clean working areas. The dust and oil may cause electrical short or worsen the polarizer.
- [3] Do not apply pressure or impulse to the module to prevent the damage of LCD panel and Backlight.
- [4] Always follow the correct power-on sequence when the LCD module is turned on. This can prevent the damage and latch-up of the CMOS LSI chips.
- [5] The distance between COF edge and rib of BLU must bigger than 5mm. This can prevent the damage of COF when assemble the module.
- [6] Do not design sharp-pointed structure / parting line / tooling gate on the COF position of plastic parts, because the burr will scrape the COF.
- [7] If COF would bended to assemble in the module. Do not put the IC location on the bending corner of COF.
- [8] The gap between COF IC and any structure of BLU must bigger than 2mm. This can prevent the damage of COF IC
- [9] Bezel opening must have no burr. Burr will scrape the panel surface.
- [10] Bezel of module and bezel of set can not press or touch the panel surface. It will make light leakage or scrape.
- [11] When module used FFC / FPC, but no FFC / FPC to be attached in the open cell. Customer can refer the FFC / FPC drawing and buy it by self.
- [12] The gap between Panel and any structure of Bezel must bigger than 2mm. This can prevent the damage of Panel.
- [13] Do not plug in or pull out the I/F connector while the module is in operation.
- [14] Do not disassemble the module.
- [15] Use a soft dry cloth without chemicals for cleaning, because the surface of polarizer is very soft and easily scratched.
- [16] Moisture can easily penetrate into LCD module and may cause the damage during operation.
- [17] When storing modules as spares for a long time, the following precaution is necessary.
 - [17.1] Do not leave the module in high temperature, and high humidity for a long time. It is highly recommended to store the module with temperature from 0 to 35°C at normal humidity without condensation.
 - [17.2] The module shall be stored in dark place. Do not store the TFT-LCD module in direct sunlight or fluorescent light.
- [18] When ambient temperature is lower than 10°C, the display quality might be reduced.

10.2 SAFETY PRECAUTIONS

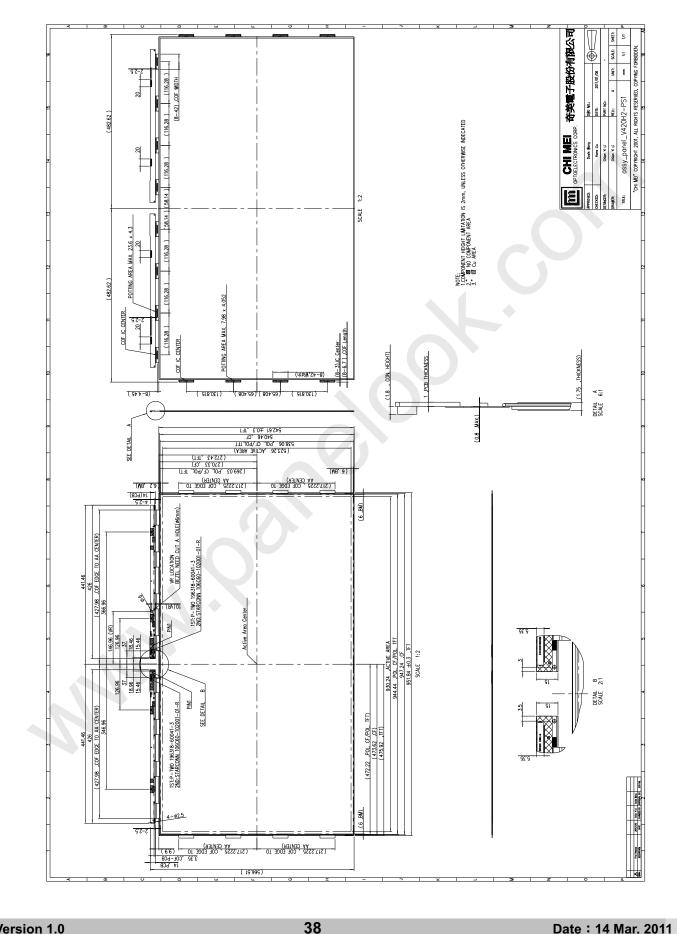

- [1] The startup voltage of a Backlight is approximately 1000 Volts. It may cause an electrical shock while assembling with the inverter. Do not disassemble the module or insert anything into the Backlight unit.
- [2] If the liquid crystal material leaks from the panel, it should be kept away from the eyes or mouth. In case of contact with hands, skin or clothes, it has to be washed away thoroughly with soap.
- [3] After the module's end of life, it is not harmful in case of normal operation and storage.
