Winbond Electronics Corp.

128K × 8 CMOS FLASH MEMORY

GENERAL DESCRIPTION

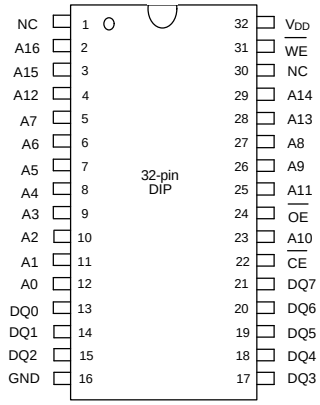
The W29C010 is a 1-megabit, 5-volt only CMOS flash memory organized as 128K × 8 bits. The device can be programmed and erased in-system with a standard 5V power supply. A 12-volt V_{PP} is not required. The unique cell architecture of the W29C010 results in fast program/erase operations with extremely low current consumption (compared to other comparable 5-volt flash memory products). The device can also be programmed and erased using standard EPROM programmers.

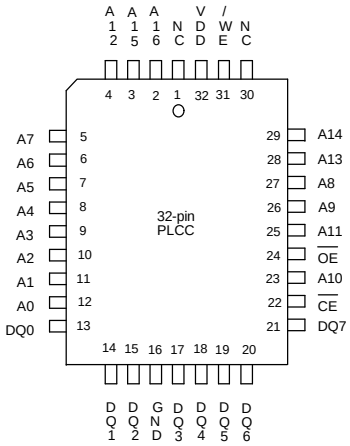
FEATURES

- Single 5-volt program and erase operations
- Fast page-write operations
  - 128 bytes per page
  - Page program cycle: 10 mS (max.)
  - Effective byte-program cycle time: 39 μS
  - Optional software-protected data write
- Fast chip-erase operation: 50 mS
- Read access time: 45/70/90 nS
- Typical page program/erase cycles: 1K/10K
- Ten-year data retention
- Software and hardware data protection
- Low power consumption
  - Active current: 25 mA (typ.)
  - Standby current: 20 μA (typ.)
- Automatic program timing with internal V_{PP} generation
- End of program detection
  - Toggle bit
  - Data polling
- Latched address and data
- TTL compatible I/O
- JEDEC standard byte-wide pinouts
- Available packages: 32-pin 600 mil DIP, 450 mil SOP, TSOP and PLCC

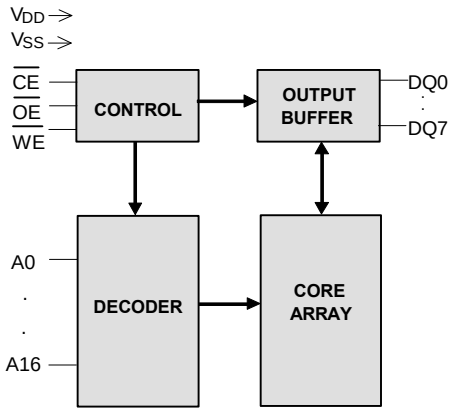
Publication Release Date: April 1997
Revision A1

PIN CONFIGURATIONS





BLOCK DIAGRAM



PIN DESCRIPTION

SYMBOL	PIN NAME
A0–A16	Address Inputs
DQ0–DQ7	Data Inputs/Outputs
$\overline{CE}$	Chip Enable
$\overline{OE}$	Output Enable
$\overline{WE}$	Write Enable
VDD	Power Supply
GND	Ground
NC	No Connection

Winbond Electronics Corp.

FUNCTIONAL DESCRIPTION

Read Mode

The read operation of the W29C010 is controlled by $\overline{CE}$ and $\overline{OE}$, both of which have to be low for the host to obtain data from the outputs. $\overline{CE}$ is used for device selection. When $\overline{CE}$ is high, the chip is de-selected and only standby power will be consumed. $\overline{OE}$ is the output control and is used to gate data from the output pins. The data bus is in high impedance state when either $\overline{CE}$ or $\overline{OE}$ is high. Refer to the timing waveforms for further details.

Page Write Mode

The W29C010 is programmed on a page basis. Every page contains 128 bytes of data. If a byte of data within a page is to be changed, data for the entire page must be loaded into the device. Any byte that is not loaded will be erased to "FFh" during programming of the page.

The write operation is initiated by forcing $\overline{CE}$ and $\overline{WE}$ low and $\overline{OE}$ high. The write procedure consists of two steps. Step 1 is the byte-load cycle, in which the host writes to the page buffer of the device. Step 2 is an internal programming cycle, during which the data in the page buffers are simultaneously written into the memory array for non-volatile storage.

During the byte-load cycle, the addresses are latched by the falling edge of either $\overline{CE}$ or $\overline{WE}$, whichever occurs last. The data are latched by the rising edge of either $\overline{CE}$ or $\overline{WE}$, whichever occurs first. If the host loads a second byte into the page buffer within a byte-load cycle time (T_{BLC}) of 200 µS, after the initial byte-load cycle, the W29C010 will stay in the page load cycle. Additional bytes can then be loaded consecutively. The page load cycle will be terminated and the internal programming cycle will start if no additional byte is loaded into the page buffer within 300 µS (T_{BLCO}) from the last byte-load cycle, i.e., there is no subsequent $\overline{WE}$ high-to-low transition after the last rising edge of $\overline{WE}$. A_7 to A_{16} specify the page address. All bytes that are loaded into the page buffer must have the same page address. A_0 to A_6 specify the byte address within the page. The bytes may be loaded in any order; sequential loading is not required.

In the internal programming cycle, all data in the page buffers, i.e., 128 bytes of data, are written simultaneously into the memory array. Before the completion of the internal programming cycle, the host is free to perform other tasks such as fetching data from other locations in the system to prepare to write the next page.

Software-protected Data Write

The device provides a JEDEC-approved optional software-protected data write. Once this scheme is enabled, any write operation requires a series of three-byte program commands (with specific data to a specific address) to be performed before the data load operation. The three-byte load command sequence begins the page load cycle, without which the write operation will not be activated. This write scheme provides optimal protection against inadvertent write cycles, such as cycles triggered by noise during system power-up and power-down.

The W29C010 is shipped with the software data protection enabled. To enable the software data protection scheme, perform the three-byte command cycle at the beginning of a page load cycle. The device will then enter the software data protection mode, and any subsequent write operation must be preceded by the three-byte program command cycle. Once enabled, the software data protection will remain enabled unless the disable commands are issued. A power transition will not reset the

software data protection feature. To reset the device to unprotected mode, a six-byte command sequence is required. See Table 3 for specific codes and Figure 10 for the timing diagram.

Hardware Data Protection

The integrity of the data stored in the W29C010 is also hardware protected in the following ways:

(1) Noise/Glitch Protection: A $\overline{WE}$ pulse of less than 15 nS in duration will not initiate a write cycle.

(2) V_{DD} Power Up/Down Detection: The programming operation is inhibited when V_{DD} is less than 3.8V.

(3) Write Inhibit Mode: Forcing $\overline{OE}$ low, $\overline{CE}$ high, or $\overline{WE}$ high will inhibit the write operation. This prevents inadvertent writes during power-up or power-down periods.

Data Polling (DQ_7)-Write Status Detection

The W29C010 includes a data polling feature to indicate the end of a programming cycle. When the W29C010 is in the internal programming cycle, any attempt to read DQ_7 of the last byte loaded during the page/byte-load cycle will receive the complement of the true data. Once the programming cycle is completed. DQ_7 will show the true data.

Toggle Bit (DQ_6)-Write Status Detection

In addition to data polling, the W29C010 provides another method for determining the end of a program cycle. During the internal programming cycle, any consecutive attempts to read DQ_6 will produce alternating 0's and 1's. When the programming cycle is completed, this toggling between 0's and 1's will stop. The device is then ready for the next operation.

5-Volt-only Software Chip Erase

The chip-erase mode can be initiated by a six-byte command sequence. After the command loading cycles, the device enters the internal chip erase mode, which is automatically timed and will be completed in 50 mS. The host system is not required to provide any control or timing during this operation.

Product Identification

The product ID operation outputs the manufacturer code and device code. Programming equipment automatically matches the device with its proper erase and programming algorithms.

The manufacturer and device codes can be accessed by software or hardware operation. In the software access mode, a six-byte command sequence can be used to access the product ID. A read from address 0000H outputs the manufacturer code (DAh). A read from address 0001H outputs the device code (C1h). The product ID operation can be terminated by a three-byte command sequence.

In the hardware access mode, access to the product ID is activated by forcing $\overline{CE}$ and $\overline{OE}$ low, $\overline{WE}$ high, and raising A9 to 12 volts.

Winbond Electronics Corp.

TABLE OF OPERATING MODES

Operating Mode Selection

Operating Range = 0 to 70°C (Ambient Temperature), V_{DD} = 5V ±10%, V_{SS} = 0V, V_{HH} = 12V

MODE	PINS				
	$\overline{CE}$	$\overline{OE}$	$\overline{WE}$	ADDRESS	DQ.
Read	V_{IL}	V_{IL}	V_{IH}	A_{IN}	Dout
Write	V_{IL}	V_{IH}	V_{IL}	A_{IN}	Din
Standby	V_{IH}	X	X	X	High Z
Write Inhibit	X	V_{IL}	X	X	High Z/D_{OUT}
	X	X	V_{IH}	X	High Z/D_{OUT}
Output Disable	X	V_{IH}	X	X	High Z

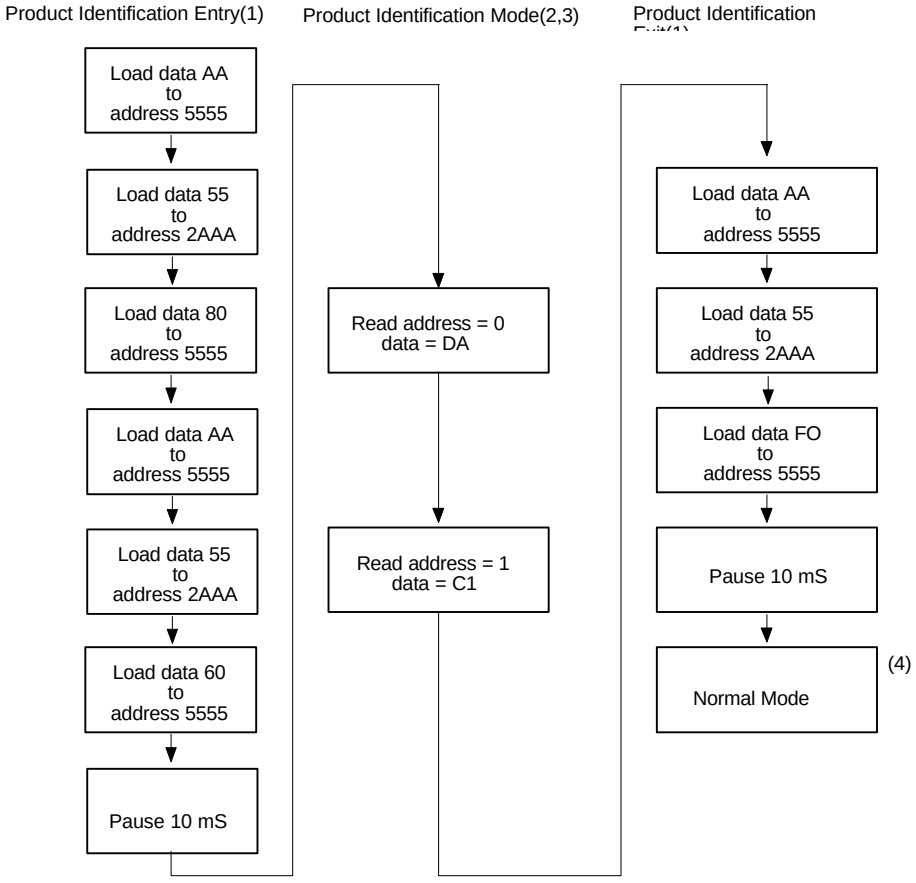
Software Product Identification Acquisition Flow



Notes for software product identification:

(1) Data format: DQ7–DQ0 (Hex); address format: A14–A0 (Hex).
(2) A1–A16 = V_{IL}; manufacture code is read for A0 = V_{IL}; device code is read for A0 = V_{IH}.
(3) The device does not remain in identification mode if power down.
(4) The device returns to standard operation mode.
(5) This product supports both the JEDEC standard 3 byte command code sequence and original 6 byte command code sequence. For new designs, Winbond recommends that the 3 byte command code sequence be used.
